# Contents

<b>Chapter 1: Overview.....</b>	<b>1</b>
1.1 Command-Line Interface (CLI).....	1
1.1.1 Accessing the EOS CLI.....	2
1.1.2 Processing Commands.....	2
1.1.3 Kernel-based Virtual Machine Commands and Configuration.....	10
1.1.4 Switch Platforms.....	14
1.1.5 Command Modes.....	23
1.1.6 Managing Switch Configuration Settings.....	25
1.1.7 Other Command-Line Interfaces.....	28
1.1.8 Directory Structure.....	28
1.1.9 Command-Line Interface Commands.....	30
<b>Chapter 2: Booting the Switch.....</b>	<b>77</b>
2.1 Boot Loader About.....	77
2.2 Configuration Files.....	77
2.2.1 boot-config.....	77
2.2.2 running-config.....	81
2.2.3 startup-config.....	81
2.3 Supervisor Redundancy.....	82
2.3.1 Redundancy Supervisor Protocols.....	82
2.3.2 Configuring Supervisor Redundancy.....	83
2.4 System Reset.....	83
2.4.1 Typical Reset Sequence.....	84
2.4.2 Switch Recovery.....	85
2.4.3 Display Reload Cause.....	85
2.4.4 Configuring Zero Touch Provisioning.....	86
2.4.5 Configuring the Networks.....	88
2.5 About Shell.....	88
2.5.1 About Shell Operation.....	88
2.5.2 Accessing the About Shell.....	89
2.5.3 About File Structure.....	90
2.5.4 Booting From the About Shell.....	90
2.5.5 About Commands.....	91
2.6 About Configuration Commands.....	93
2.6.1 CONSOLE SPEED.....	94
2.6.2 NET Commands.....	95
2.6.3 PASSWORD (ABOOT).....	96
2.6.4 SWI.....	97
2.7 Switch Booting Commands.....	98
2.7.1 boot console.....	99
2.7.2 boot secret.....	100
2.7.3 boot system.....	102
2.7.4 delete startup-config.....	103
2.7.5 protocol.....	104
2.7.6 redundancy.....	105
2.7.7 redundancy manual switchover.....	106
2.7.8 reload.....	107
2.7.9 reload (scheduled).....	109

2.7.10 show redundancy file-replication.....	111
2.7.11 show redundancy status.....	112
2.7.12 show redundancy switchover sso.....	112
2.7.13 show reload.....	114
2.7.14 show reload cause.....	115

## **Chapter 3: Initial Configuration and Recovery..... 117**

3.1 Initial Switch Access.....	117
3.1.1 Zero Touch Provisioning.....	117
3.1.2 Manual Provisioning.....	118
3.2 Connection Management.....	122
3.3 Configure Session.....	123
3.3.1 Configuration Session.....	124
3.3.2 Configure Replace.....	124
3.3.3 Configuration CLI.....	124
3.4 Recovery Procedures.....	125
3.4.1 Removing the Enable Password from the Startup Configuration.....	125
3.4.2 Reverting the Switch to the Factory Default Startup Configuration.....	126
3.4.3 Restoring the Factory Default EOS Image and Startup Configuration.....	127
3.4.4 Restoring the Configuration and Image from a USB Flash Drive.....	128
3.5 Session Management Commands.....	129
3.5.1 configure replace.....	130
3.5.2 configure session.....	131
3.5.3 domain (XMPP Management).....	132
3.5.4 idle-timeout (Console Management).....	133
3.5.5 idle-timeout (SSH Management).....	134
3.5.6 idle-timeout (Telnet Management).....	135
3.5.7 management api http-commands.....	136
3.5.8 management console.....	137
3.5.9 management ssh.....	138
3.5.10 management telnet.....	139
3.5.11 management xmpp.....	140
3.5.12 protocol http (API Management).....	141
3.5.13 protocol https (API Management).....	142
3.5.14 protocol https certificate (API Management).....	143
3.5.15 server (XMPP Management).....	144
3.5.16 session privilege (XMPP Management).....	145
3.5.17 show inventory.....	146
3.5.18 show xmpp neighbors.....	147
3.5.19 show xmpp status.....	148
3.5.20 show xmpp switch-group.....	149
3.5.21 shutdown (API Management).....	150
3.5.22 shutdown (Telnet Management).....	151
3.5.23 shutdown (XMPP Management).....	152
3.5.24 switch-group (XMPP Management).....	153
3.5.25 username (XMPP Management).....	155
3.5.26 vrf (API Management).....	156
3.5.27 vrf (XMPP Management).....	157
3.5.28 xmpp send.....	158
3.5.29 xmpp session.....	159

## **Chapter 4: Administering the Switch..... 161**

4.1 Managing the Switch Name.....	161
4.1.1 Assigning a Name to the Switch.....	161

4.1.2 Specifying DNS Addresses.....	162
4.2 System Clock and Time Protocols.....	163
4.2.1 Configuring the Time Zone.....	163
4.2.2 Setting the System Clock Manually.....	164
4.2.3 Displaying the Time.....	164
4.2.4 Network Time Protocol (NTP).....	164
4.3 Managing Display Attributes.....	166
4.3.1 Banners.....	167
4.3.2 Configuring prompt.....	167
4.4 Logging of Event Notifications.....	168
4.4.1 Managing TCAM Capacity Warnings.....	168
4.5 Event Monitor.....	169
4.5.1 Description.....	169
4.5.2 Configuring the Event Monitor.....	169
4.5.3 Querying the Event Monitor.....	171
4.5.4 Accessing Event Monitor Database Records.....	172
4.6 Managing EOS Extensions.....	173
4.6.1 Installing EOS Extensions.....	173
4.6.2 Installing EOS Extensions on a Dual-Supervisor Switch.....	173
4.6.3 Verifying EOS Extensions Installation.....	174
4.6.4 Uninstalling an EOS Extension.....	174
4.7 Switch Administration Commands.....	176
4.7.1 banner login.....	178
4.7.2 banner motd.....	179
4.7.3 clear ptp interface counters.....	180
4.7.4 clock set.....	181
4.7.5 clock timezone.....	182
4.7.6 dns domain.....	183
4.7.7 email.....	184
4.7.8 event-monitor backup max-size.....	185
4.7.9 event-monitor backup path.....	186
4.7.10 event-monitor buffer max-size.....	187
4.7.11 event-monitor clear.....	188
4.7.12 event-monitor interact.....	189
4.7.13 event-monitor sync.....	190
4.7.14 event-monitor.....	191
4.7.15 hostname.....	193
4.7.16 ip domain lookup.....	194
4.7.17 ip domain-list.....	195
4.7.18 ip host.....	196
4.7.19 ip name-server.....	197
4.7.20 ipv6 host.....	198
4.7.21 logging format sequence-numbers.....	199
4.7.22 logging repeat-messages.....	200
4.7.23 no event-monitor.....	201
4.7.24 ntp authenticate.....	202
4.7.25 ntp authentication-key.....	203
4.7.26 ntp local-interface.....	204
4.7.27 ntp serve all.....	205
4.7.28 ntp serve.....	206
4.7.29 ntp server.....	207
4.7.30 ntp trusted-key.....	209
4.7.31 prompt.....	210
4.7.32 show banner.....	212
4.7.33 show clock.....	213
4.7.34 show event-monitor arp.....	214

4.7.35 show event-monitor igmpsnooping.....	216
4.7.36 show event-monitor mac.....	217
4.7.37 show event-monitor mroute.....	219
4.7.38 show event-monitor neighbor.....	221
4.7.39 show event-monitor route6.....	223
4.7.40 show event-monitor route.....	225
4.7.41 show event-monitor sqlite.....	227
4.7.42 show event-monitor stpunstable.....	228
4.7.43 show hostname.....	229
4.7.44 show hosts.....	230
4.7.45 show ip domain-name.....	231
4.7.46 show ip name-server.....	232
4.7.47 show local-clock time-properties.....	233
4.7.48 show ntp associations.....	234
4.7.49 show ntp status.....	235

## **Chapter 5: Timing Protocols..... 237**

5.1 Setting the PTP Mode.....	237
5.2 Enabling PTP on an Interface.....	238
5.3 Configuring the PTP Domain.....	238
5.4 Configuring the Offset Hold Time.....	238
5.5 Setting the PTP Priority.....	239
5.6 Configuring the Source IP.....	239
5.7 Configuring the TTL for PTP Packets.....	239
5.8 Configuring PTP Monitoring.....	239
5.9 Setting the PTP Announce Interval.....	240
5.10 Setting the PTP Timeout Interval.....	241
5.11 Configuring the PTP Delay Mechanism.....	241
5.12 Setting the Delay Request Interval.....	241
5.13 Setting the Peer Delay Request Interval.....	241
5.14 Setting the Peer Link Propagation Threshold.....	242
5.15 Setting the Interval for Sending Synchronization Messages.....	242
5.16 Setting the PTP Transport Type.....	242
5.17 Viewing PTP Settings and Status.....	242
5.17.1 Displaying General PTP Information.....	242
5.17.2 Displaying PTP Clock Properties.....	243
5.17.3 Displaying PTP Foreign Master.....	243
5.17.4 Displaying PTP Information for all Interfaces.....	243
5.17.5 Displaying PTP Interface Counters.....	244
5.17.6 Displaying PTP Local Clock and Offset.....	244
5.17.7 Displaying PTP Masters Information.....	245
5.17.8 Displaying PTP Monitoring Information.....	245
5.17.9 Displaying PTP Source IP.....	245
5.18 Precision Time Protocol (PTP) Commands.....	247
5.18.1 ptp announce interval.....	248
5.18.2 ptp announce timeout.....	249
5.18.3 ptp delay-mechanism.....	250
5.18.4 ptp delay-req interval.....	251
5.18.5 ptp domain.....	252
5.18.6 ptp enable.....	253
5.18.7 ptp forward-v1.....	254
5.18.8 ptp hold-ptp-time.....	255
5.18.9 ptp mode.....	256
5.18.10 ptp monitor threshold mean-path-delay.....	257
5.18.11 ptp monitor threshold offset-from-master.....	258

5.18.12	ptp monitor threshold skew.....	259
5.18.13	ptp monitor.....	260
5.18.14	ptp pdelay-neighbor-threshold.....	261
5.18.15	ptp pdelay-req interval.....	262
5.18.16	ptp priority1.....	263
5.18.17	ptp priority2.....	264
5.18.18	ptp role.....	265
5.18.19	ptp source ip.....	266
5.18.20	ptp sync timeout.....	267
5.18.21	ptp sync-message interval.....	268
5.18.22	ptp transport.....	269
5.18.23	ptp ttl.....	270
5.18.24	show ptp foreign-master-record.....	271
5.18.25	show ptp interface counters.....	272
5.18.26	show ptp interface.....	273
5.18.27	show ptp local-clock.....	274
5.18.28	show ptp masters.....	275
5.18.29	show ptp monitor.....	276
5.18.30	show ptp source ip.....	277
5.18.31	show ptp.....	278

## **Chapter 6: Switch Environment Control..... 279**

6.1	Environment Control Introduction.....	279
6.2	Environment Control Overview.....	279
6.2.1	Temperature.....	279
6.2.2	Fans.....	279
6.2.3	Power.....	280
6.3	Configuring and Viewing Environment Settings.....	280
6.3.1	Overriding Automatic Shutdown.....	280
6.3.2	Viewing Environment Status.....	282
6.3.3	Locating Components on the Switch.....	283
6.4	Environment Commands.....	285
6.4.1	environment fan-speed.....	286
6.4.2	environment insufficient-fans action.....	288
6.4.3	environment overheat action.....	290
6.4.4	locator-led.....	292
6.4.5	show environment power.....	293
6.4.6	show environment temperature.....	294
6.4.7	show locator-led.....	296
6.4.8	show system environment all.....	297
6.4.9	show system environment cooling.....	298

## **Chapter 7: Upgrades and Downgrades..... 301**

7.1	Upgrade/Downgrade Overview.....	301
7.2	Accelerated Software Upgrade (ASU).....	301
7.2.1	Upgrading the EOS image with Accelerated Software Upgrade.....	302
7.3	Leaf Smart System Upgrade (Leaf SSU).....	305
7.3.1	Upgrading the EOS image with Smart System Upgrade.....	305
7.4	Standard Upgrades and Downgrades.....	311
7.4.1	Upgrading or Downgrading the EOS on a Single-Supervisor Switch.....	311
7.4.2	Upgrading or Downgrading the EOS on a Dual-Supervisor Switch.....	314
7.5	Upgrade/Downgrade Commands.....	319
7.5.1	install.....	320
7.5.2	reload fast-boot.....	321

7.5.3 reload hitless.....	322
<b>Chapter 8: Security.....</b>	<b>323</b>
8.1 User Security.....	323
8.1.1 AAA Configuration.....	323
8.2 Control Plane Security.....	407
8.2.1 Transport Layer Security.....	407
8.2.2 802.1X Port Security.....	439
8.3 Data Plane Security.....	469
8.3.1 IP NAT.....	470
8.3.2 Media Access Control Security.....	470
8.3.3 Internet Protocol Security (IPsec).....	470
8.3.4 Macro-Segmentation Service (CVX).....	470
<b>Chapter 9: Quality of Service and Traffic Management.....</b>	<b>473</b>
9.1 Quality of Service.....	473
9.1.1 Quality of Service Conceptual Overview.....	473
9.1.2 QoS Configuration: Platform-Independent Features.....	481
9.1.3 QoS Configuration: Arad Platform Switches.....	483
9.1.4 QoS Configuration: Jericho Platform Switches.....	492
9.1.5 QoS Configuration: FM6000 Platform Switches.....	501
9.1.6 QoS Configuration: Petra Platform Switches.....	508
9.1.7 QoS Configuration: Trident and Tomahawk Platform Switches.....	515
9.1.8 QoS Configuration: Trident II and Helix Platform Switches.....	524
9.1.9 ACL based QoS Configuration.....	533
9.1.10 Quality of Service Configuration Commands.....	536
9.2 Traffic Management.....	629
9.2.1 Traffic Management Conceptual Overview.....	630
9.2.2 Traffic Management Configuration Arad Platform Switches.....	632
9.2.3 Traffic Management Configuration FM6000 Platform Switches.....	642
9.2.4 Traffic Management Configuration Petra Platform Switches.....	650
9.2.5 Traffic Management Configuration Trident Platform Switches.....	654
9.2.6 Traffic Management Configuration Trident II Platform Switches.....	664
9.2.7 Traffic Management Configuration Commands.....	668
<b>Chapter 10: Interface Configuration.....</b>	<b>753</b>
10.1 Ethernet Ports.....	753
10.1.1 Ethernet Ports Introduction.....	753
10.1.2 Ethernet Standards.....	753
10.1.3 Ethernet Physical Layer.....	755
10.1.4 Interfaces.....	759
10.1.5 Ethernet Configuration Procedures.....	761
10.1.6 Ethernet Configuration Commands.....	785
10.2 Port Channels and LACP.....	836
10.2.1 Port Channel Introduction.....	836
10.2.2 Port Channel Conceptual Overview.....	837
10.2.3 Port Channel Configuration Procedures.....	838
10.2.4 Load Balancing Hash Algorithms.....	844
10.2.5 Port Channel and LACP Configuration Commands.....	851
10.3 Multi-Chassis Link Aggregation.....	905
10.3.1 MLAG Introduction.....	905
10.3.2 MLAG Conceptual Overview.....	906
10.3.3 MLAG Maintenance.....	908

---

10.3.4	Configuring MLAG.....	911
10.3.5	MLAG Implementation Example.....	917
10.3.6	MLAG Commands.....	926
10.4	Data Transfer.....	942
10.4.1	Data Transfer Introduction.....	942
10.4.2	Data Transfer Methods.....	943
10.4.3	MAC Address Table.....	946
10.4.4	Configuring Ports.....	950
10.4.5	Monitoring Links.....	962
10.4.6	Data Transfer Commands.....	974
 <b>Chapter 11: Layer 2 Configuration.....</b>		<b>1067</b>
11.1	Spanning Tree Protocol.....	1067
11.1.1	Introduction to Spanning Tree Protocols.....	1067
11.1.2	Spanning Tree Overview.....	1067
11.1.3	Configuring a Spanning Tree.....	1073
11.1.4	STP Commands.....	1088
11.2	Link Layer Discovery Protocol.....	1158
11.2.1	LLDP Introduction.....	1158
11.2.2	LLDP Overview.....	1158
11.2.3	LLDP Configuration Procedures.....	1159
11.2.4	LLDP Configuration Commands.....	1166
11.3	Virtual LANs (VLANs).....	1184
11.3.1	VLAN Introduction.....	1184
11.3.2	VLAN Conceptual Overview.....	1184
11.3.3	VLAN Configuration Procedures.....	1187
11.3.4	VLAN Configuration Commands.....	1198
11.4	DCBX and Flow Control.....	1233
11.4.1	Introduction.....	1233
11.4.2	Overview.....	1234
11.4.3	DCBX Configuration and Verification.....	1234
11.4.4	Configuring Priority-Flow-Control (PFC).....	1235
11.4.5	Configuring PFC Watchdog.....	1236
11.4.6	DCBX and Flow Control Commands.....	1240
 <b>Chapter 12: Layer 3 Configuration.....</b>		<b>1261</b>
12.1	IPv4.....	1261
12.1.1	IPv4 Addressing.....	1261
12.1.2	IPv4 Routing.....	1270
12.1.3	IPv4 Multicast Counters.....	1274
12.1.4	Route Management.....	1277
12.1.5	IPv4 Route Scale.....	1284
12.1.6	IP Source Guard.....	1291
12.1.7	DHCP Relay Across VRF.....	1293
12.1.8	TCP MSS Clamping.....	1295
12.1.9	IPv4 GRE Tunneling.....	1298
12.1.10	IPv4 Commands.....	1302
12.2	IPv6.....	1399
12.2.1	Introduction.....	1399
12.2.2	IPv6 Description.....	1400
12.2.3	Configuring IPv6.....	1402
12.2.4	IPv6 Commands.....	1413
12.3	ACLs and Route Maps.....	1466

12.3.1 ACL, Service ACL, Route Map, Prefix List, and RACL Divergence	
Introduction.....	1466
12.3.2 Access Control Lists.....	1466
12.3.3 Service ACLs.....	1486
12.3.4 RACL Sharing on SVIs.....	1490
12.3.5 Route Maps.....	1493
12.3.6 Prefix Lists.....	1497
12.3.7 ACL, Route Map, and Prefix List Commands.....	1501
12.4 VARP.....	1579
12.4.1 VRRP and VARP Conceptual Overview.....	1580
12.4.2 VRRP and VARP Implementation Procedures.....	1581
12.4.3 VRRP and VARP Implementation Examples.....	1588
12.4.4 VRRP and VARP Configuration Commands.....	1593
12.5 OpenFlow.....	1619
12.5.1 OpenFlow Introduction.....	1620
12.5.2 OpenFlow Description.....	1620
12.5.3 OpenFlow Configuration.....	1625
12.5.4 OpenFlow Commands.....	1629
12.6 DirectFlow.....	1650
12.6.1 Introduction.....	1650
12.6.2 DirectFlow Configuration.....	1652
12.6.3 DirectFlow Feature Interactions.....	1654
12.6.4 DirectFlow Commands.....	1658
12.7 Decap Groups.....	1675
12.7.1 Decap Groups Description.....	1675
12.7.2 Decap Groups Configuration.....	1676
12.7.3 Decap Commands.....	1677
12.8 Nexthop Groups.....	1683
12.8.1 Nexthop Group Description.....	1683
12.8.2 Nexthop Group Configuration.....	1684
12.8.3 Nexthop Group Commands.....	1689
12.9 Global Knob to Set MTU for all Layer 3 Interfaces.....	1699
12.9.1 Platform Compatibility.....	1699
12.9.2 Global Knob to Set MTU for all Layer 3 Interfaces Configuration.....	1699
12.9.3 Show Commands.....	1699
12.9.4 Troubleshooting.....	1700
12.9.5 Limitations.....	1700

## **Chapter 13: IP Services..... 1701**

13.1 CloudVision eXchange (CVX).....	1701
13.1.1 Upgrading CVX.....	1701
13.1.2 CVX Overview.....	1702
13.1.3 CVX Services.....	1703
13.1.4 Deploying CVX.....	1704
13.1.5 CVX Configuration.....	1711
13.1.6 CVX Secure out-of-band Connection.....	1717
13.1.7 CVX High Availability.....	1720
13.1.8 CVX VIP.....	1727
13.1.9 CVX Command Descriptions.....	1729
13.2 CVX Client Configuration.....	1755
13.3 CVX Server Configuration.....	1756

## **Chapter 14: Routing Protocols..... 1759**

14.1 Routing Information Protocol (RIP).....	1759
--	------

14.1.1 RIP Conceptual Overview.....	1759
14.1.2 Running RIP on the Switch.....	1760
14.1.3 Configuring RIP on Multiple VRFs.....	1763
14.1.4 RIP Commands.....	1764
14.2 Open Shortest Path First – Version 2.....	1777
14.2.1 OSPFv2 Introduction.....	1777
14.2.2 OSPFv2 Conceptual Overview.....	1778
14.2.3 Configuring OSPFv2.....	1780
14.2.4 OSPFv2 Configuration Examples.....	1796
14.2.5 OSPFv2 Commands.....	1805
14.3 Open Shortest Path First – Version 3.....	1873
14.3.1 OSPFv3 Introduction.....	1873
14.3.2 OSPFv3 Conceptual Overview.....	1873
14.3.3 Configuring OSPFv3.....	1876
14.3.4 OSPFv3 Configuration Examples.....	1889
14.3.5 OSPFv3 Commands.....	1898
14.4 IS-IS.....	1963
14.4.1 IS-IS Introduction.....	1963
14.4.2 IS-IS Segment Routing.....	1964
14.4.3 IS-IS Graceful Restart.....	1964
14.4.4 IS-IS Configuration.....	1964
14.4.5 IS-IS Commands.....	1989
14.5 Border Gateway Protocol (BGP).....	2051
14.5.1 BGP Conceptual Overview.....	2052
14.5.2 Configuring BGP.....	2052
14.5.3 BGP Examples.....	2084
14.5.4 BGP Commands.....	2088
14.6 Maintenance Mode.....	2235
14.6.1 Overview.....	2235
14.6.2 Maintenance Mode Elements.....	2236
14.6.3 Maintenance Mode Features.....	2240
14.6.4 Maintenance Mode Configuration.....	2240
14.6.5 Maintenance Mode Commands.....	2256
14.7 Bidirectional Forwarding Detection.....	2304
14.7.1 Introduction.....	2304
14.7.2 BFD Configuration.....	2306
14.7.3 BFD Commands.....	2311

## **Chapter 15: Multicast..... 2329**

15.1 Multicast Architecture.....	2329
15.1.1 Overview.....	2329
15.1.2 Multicast Architecture Description.....	2329
15.1.3 Multicast Listener Discovery (MLD).....	2331
15.1.4 Static IP Mroute.....	2334
15.1.5 Configuring Multicast.....	2337
15.1.6 Multicast Commands.....	2345
15.2 IGMP and IGMP Snooping.....	2386
15.2.1 IGMP Snooping.....	2386
15.2.2 IGMP Host Proxy Description.....	2387
15.2.3 Supported Features.....	2388
15.2.4 IGMP Protocols.....	2388
15.2.5 Configuring IGMP.....	2389
15.2.6 Configuring IGMP Snooping.....	2392
15.2.7 IGMP Host Proxy.....	2402
15.2.8 IGMP and IGMP Snooping Commands.....	2405

15.3 Protocol Independent Multicast.....	2490
15.3.1 Introduction.....	2491
15.3.2 Overview.....	2491
15.3.3 Configuring PIM.....	2493
15.3.4 Multicast Example.....	2500
15.3.5 PIM Commands.....	2504
15.4 Multicast Source Discovery Protocol (MSDP).....	2551
15.4.1 MSDP Introduction.....	2552
15.4.2 MSDP Description.....	2552
15.4.3 MSDP Configuration.....	2554
15.4.4 MSDP Commands.....	2556
15.5 Audio Video Bridging (AVB).....	2579
15.5.1 AVB Overview.....	2579
15.5.2 AVB Protocols.....	2580
15.5.3 AVB Configuration.....	2581
15.5.4 AVB Command Descriptions.....	2586

**Chapter 16: Virtual Extensible LANs (VXLANs)..... 2597**

16.1 VXLAN Introduction.....	2597
16.2 VXLAN Description.....	2597
16.2.1 VXLAN Architecture.....	2597
16.2.2 VXLAN Processes.....	2598
16.2.3 Multicast and Broadcast over VXLAN.....	2599
16.2.4 VXLAN Gateway.....	2600
16.2.5 VXLAN and MLAG.....	2600
16.2.6 Data Structures.....	2602
16.3 VXLAN Configuration.....	2602
16.3.1 Configuring the VTI.....	2602
16.3.2 Head End Replication Configuration.....	2605
16.3.3 VXLAN Routing Configuration.....	2605
16.3.4 Configuring VXLAN Routing with Overlay VRFs.....	2610
16.3.5 Configuring VXLAN over MLAG.....	2610
16.3.6 Configuring VXLAN Control Service.....	2611
16.3.7 Configuring VXLAN Multicast Decapsulation.....	2611
16.3.8 VXLAN Rules Support for Mirror ACLs Configuration.....	2612
16.3.9 Displaying VXLAN Configuration.....	2612
16.4 VXLAN Command Descriptions.....	2615
16.4.1 clear vxlan counters.....	2616
16.4.2 interface vxlan.....	2617
16.4.3 ip address virtual.....	2618
16.4.4 show service vxlan.....	2619
16.4.5 show vxlan address-table.....	2620
16.4.6 show vxlan counters.....	2621
16.4.7 show vxlan flood vtep.....	2623
16.4.8 show vxlan vtep.....	2624
16.4.9 vxlan flood vtep.....	2625
16.4.10 vxlan multicast-group decap.....	2627
16.4.11 vxlan multicast-group.....	2628
16.4.12 vxlan source-interface.....	2629
16.4.13 vxlan udp-port.....	2630
16.4.14 vxlan vlan vni.....	2631
16.4.15 vxlan vni notation dotted.....	2632

**Chapter 17: Ethernet VPN (EVPN)..... 2633**

17.1	EVPN Overview.....	2633
17.1.1	EVPN Terminology.....	2634
17.1.2	EVPN Service Models.....	2637
17.1.3	VCS and EVPN in DCI.....	2639
17.1.4	EVPN MPLS LAYER 3 VPN (Type-5 Route).....	2640
17.2	EVPN Layer 3 Core Operations.....	2641
17.2.1	MAC Address Learning.....	2641
17.2.2	ARP Suppression.....	2643
17.2.3	MAC Mobility.....	2643
17.2.4	MAC Address Damping.....	2644
17.2.5	Broadcast and Multicast Traffic.....	2644
17.3	Integrated Routing and Bridging.....	2645
17.3.1	IP VPN.....	2649
17.4	VPN MPLS Transport Options.....	2652
17.4.1	LDP.....	2655
17.4.2	ISIS-SR.....	2657
17.4.3	BGP-LU (BGP-SR).....	2658
17.5	EVPN Type-5 Routes: IP Prefix Advertisement.....	2660
17.6	Inter-VRF Local Route Leaking.....	2663
17.6.1	Inter-VRF Local Route Leaking using BGP VPN.....	2663
17.6.2	Inter-VRF Local Route Leaking using VRF-leak Agent.....	2667
17.7	Configuring EVPN.....	2668
17.7.1	Configuring BGP-EVPN and VCS on CVX.....	2668
17.8	Sample Configurations.....	2669
17.8.1	EVPN VXLAN IRB Sample Configuration.....	2669
17.8.2	Multi-Tenant EVPN VXLAN IRB Sample Configuration.....	2674
17.8.3	EVPN MPLS Sample Configuration.....	2696
17.8.4	IP VPNs Sample Configuration.....	2710
17.9	EVPN and VCS Commands.....	2729
17.9.1	next-hop resolution disabled.....	2730
17.9.2	redistribute bgp evpn vxlan.....	2731
17.9.3	redistribute service vxlan.....	2732
17.9.4	router general.....	2733
17.9.5	route-target export.....	2734
17.9.6	route-target import.....	2735
17.9.7	route-target route-map.....	2736
17.9.8	route-target.....	2738
17.9.9	show bgp evpn.....	2739
17.9.10	show ip bgp vrf.....	2741
17.9.11	show ip route vrf.....	2742
17.9.12	show ipv6 bgp vrf.....	2743
17.9.13	show ipv6 route vrf.....	2744
17.9.14	show service vxlan address-table.....	2745
17.9.15	show vrf leak flapping.....	2746
17.9.16	vni-aware-bundle.....	2747

## **Chapter 18: Multiprotocol Label Switching (MPLS)..... 2749**

18.1	MPLS.....	2749
18.1.1	MPLS Description.....	2749
18.1.2	MPLS Configuration.....	2750
18.2	BGP/MPLS L3 VPN.....	2754
18.2.1	Platform Compatibility.....	2754
18.2.2	Operation.....	2755
18.2.3	Configuration.....	2756
18.2.4	Show Commands.....	2761

18.2.5 Syslog Messages.....	2765
18.2.6 Limitations.....	2765
18.3 MPLS Commands.....	2767
18.3.1 mpls ip.....	2768
18.3.2 mpls static.....	2770
18.3.3 show mpls route summary.....	2773
18.3.4 show mpls route.....	2774

## **Chapter 19: Visibility and Monitoring Services.....2775**

19.1 Test Access Point (TAP) Aggregation.....	2775
19.1.1 TAP Aggregation Introduction.....	2775
19.1.2 TAP Aggregation Description.....	2775
19.1.3 TAP Aggregation Configuration.....	2778
19.1.4 TAP Aggregation Traffic Steering.....	2792
19.1.5 TAP Aggregation GUI.....	2795
19.1.6 TAP Aggregation Keyframe and Timestamp Configuration.....	2797
19.1.7 TAP Aggregation Commands.....	2800
19.2 Latency Analyzer (LANZ).....	2839
19.2.1 Introduction to LANZ.....	2840
19.2.2 LANZ Overview.....	2840
19.2.3 Configuring LANZ.....	2841
19.2.4 LANZ Commands.....	2852
19.3 Sampled Flow Tracking.....	2887
19.3.1 Sampled Flow Tracking Overview.....	2888
19.3.2 Configuring Sampled Flow Tracking.....	2888
19.3.3 Sampled Flow Tracking Configuration Examples.....	2890
19.3.4 Sampled Flow Tracking Commands.....	2892
19.4 sFlow.....	2911
19.4.1 sFlow Conceptual Overview.....	2911
19.4.2 sFlow Configuration Procedures.....	2913
19.4.3 sFlow Configuration Commands.....	2917
19.5 SNMP.....	2932
19.5.1 SNMP Introduction.....	2932
19.5.2 SNMP Conceptual Overview.....	2933
19.5.3 Configuring SNMP.....	2934
19.5.4 SNMP Commands.....	2941
19.6 VM Tracer.....	2972
19.6.1 VM Tracer Introduction.....	2972
19.6.2 VM Tracer Description.....	2973
19.6.3 VM Tracer Configuration Procedures.....	2974
19.6.4 VM Tracer Configuration Commands.....	2979
19.7 MapReduce Tracer.....	3004
19.7.1 MapReduce Tracer Introduction.....	3004
19.7.2 MapReduce Tracer Configuration.....	3006
19.7.3 Displaying MapReduce Tracer Results.....	3010
19.7.4 MapReduce Tracer Command Descriptions.....	3017

## Overview

---

Arista Networks features switches with high-density, non-blocking Ethernet ports that are controlled through an extensible, Linux-based, modular network operating system. The intended audience for this manual is network administrators who configure Arista switches. A working knowledge of network administration is assumed.

### New Features

This guide may not describe the features added in the most recent EOS version. For information on undocumented features, consult the TOI documents here: <https://eos.arista.com/toi/>.

### Switch Platforms

A list of Arista switches and detailed information about each is available online here: <https://www.arista.com/en/products>.

Recently released switches may not appear in the list, but can be found in the most recent Release Notes (found under Active Releases here: <https://www.arista.com/support/software-download>).

### CloudVision

The configuration tasks required for deployment of CloudVision, CVX, and CVP are described in the CloudVision Configuration Guide. The latest version can be found here: <https://www.arista.com/en/cg-cv/>.

### Supported Features

For the complete supported-features list in the latest EOS release, see <https://www.arista.com/en/support/product-documentation/supported-features>.

For details on a specific release, please see the Release Notes (found under Active Releases here: <https://www.arista.com/en/support/software-download>).

This section contains the following topic:

- [Command-Line Interface \(CLI\)](#)

## 1.1 Command-Line Interface (CLI)

The command-line interface (CLI) is one tool for controlling the switch and displaying information about its status and configuration. This chapter describes the use of the CLI.

This chapter includes these sections:

- [Accessing the EOS CLI](#)
- [Processing Commands](#)
- [Kernel-based Virtual Machine Commands and Configuration](#)
- [Switch Platforms](#)
- [Command Modes](#)
- [Managing Switch Configuration Settings](#)
- [Other Command-Line Interfaces](#)

- [Directory Structure](#)
- [Command-Line Interface Commands](#)

### 1.1.1 Accessing the EOS CLI

You can open an EOS CLI session through these connections:

- Ethernet management ports
- console port
- Telnet connections
- Secure Shell (SSH)

The following figure displays the EOS CLI in a Secure Shell connection.

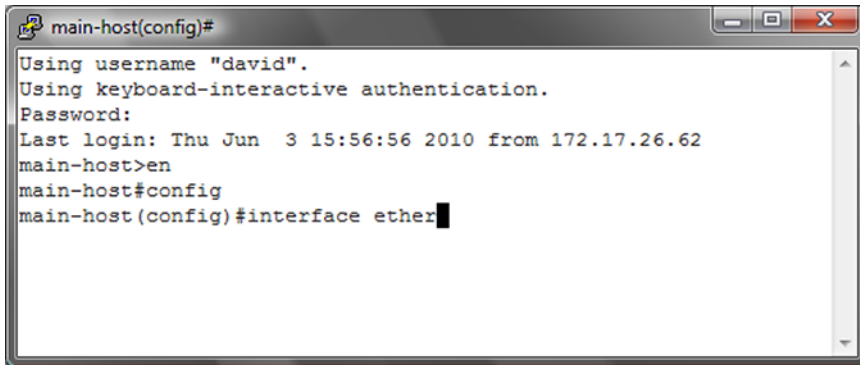

Figure 1: EOS Command-Line Interface

### 1.1.2 Processing Commands

#### 1.1.2.1 Command Execution

Command keywords are not case-sensitive. The CLI also accepts truncated keywords that uniquely correspond to one command.

- The command abbreviation **con** does not execute a command in Privileged EXEC mode because the names of two commands begin with these letters: **configure** and **connect**.

```
switch# con
% Ambiguous command
```

- The command abbreviation **conf** executes **configure** in Privileged EXEC mode because no other command name begins with **conf**.

```
switch# conf
switch(config)#
```

#### 1.1.2.2 Creating an Alias

The alias command creates an alias for a CLI command. Entering the alias in the CLI executes the corresponding command.

##### Example

- This command makes **srie** an alias for the command **show running-config interface ethernet 1-5**.

```
switch(config)#alias srie show running-config interface ethernet 1-5
switch(config)#srie
interface Ethernet1
```

```

switchport access vlan 33
storm-control broadcast level 1
spanning-tree portfast
spanning-tree bpduguard enable
interface Ethernet2
switchport access vlan 33
spanning-tree portfast
interface Ethernet3
switchport access vlan 33
spanning-tree portfast
spanning-tree bpduguard enable
interface Ethernet4
interface Ethernet5
shutdown

```

### 1.1.2.3 Cursor Movement Keystrokes

EOS supports these cursor movement keystrokes:

- **Ctrl-B** or the **Left Arrow** key: moves cursor to the left.
- **Ctrl-F** or the **Right Arrow** key: moves cursor to the right.
- **Ctrl-A**: moves cursor to beginning of line.
- **Ctrl-E**: moves cursor to end of line.
- **Esc-B**: moves cursor left one word.
- **Esc-F**: moves cursor right one word.

### 1.1.2.4 History Substitution Keystrokes

The history buffer retains the last 20 commands entered. History substitution keystrokes that access previously entered commands include:

- **Ctrl-P** or the **Up Arrow** key: Recalls the most recent buffered commands. Repeat to recall older commands.
- **Ctrl-N** or the **Down Arrow** key: Recalls more recent commands after using the **Ctrl-P** or the **Up Arrow**. Repeat to recall newer commands.

The `show history` command in Privileged EXEC mode displays the history buffer contents.

```

switch#show history
en
config
exit
show history

```

### 1.1.2.5 Command Lists and Syntax Assistance

EOS CLI uses widely followed conventions for providing command lists and syntax assistance. These conventions are available in all command modes.

- To display all commands available at this level, type a question mark (?):

```

switchName>?
clear          Reset functions
connect       Open a terminal connection
default       Set a command to its defaults
disable       Turn off privileged commands
enable       Turn on privileged commands
exit         Exit from the EXEC
logout       Exit from the EXEC
no           Negate a command or set its defaults

```

```

ping      Send echo messages
show     Show running system information
ssh      Open ssh connection
tcpdump  Monitor packets with tcpdump
telnet   Open a telnet connection
terminal Configure the terminal
traceroute Trace route to destination
watch    Execute a command repeatedly
who      Display information about terminal lines
zerotouch ZeroTouch configuration

```

- To display a list of commands beginning with a specific character sequence, type the sequence followed by a question mark.

```

switch# di?
diff dir disable

```

- To display a command's keywords or arguments, type a question mark as an argument.

```

switch> ping ?
WORD Ping destination address or hostname
ip IPv4 echo
ipv6 IPv6 echo
mpls Send echo messages for LSP
vrf Ping in a VRF

```

- The switch accepts an address-mask or CIDR notation (address-prefix) in commands that require an IP address and mask. For example, these commands are processed identically:

```

switch(config)# ip route 0.0.0.0 255.255.255.255 10.1.1.254

switch(config)# ip route 0.0.0.0/32 10.1.1.254

```

- The switch accepts an address-wildcard or CIDR notation in commands requiring an IP address and wildcard. Wildcards use zeros to mask portions of the IP address and are found in some protocol configuration statements, including OSPF. The switch processes these commands identically:

```

switch(config-router-ospf)# network 10.255.255.1 0.0.0.255 area 15

switch(config-router-ospf)# network 10.255.255.1/24 area 15

```

### 1.1.2.6 Regular Expressions

A regular expression is a search pattern composed of symbols, letters and numbers. Some CLI parameters are defined as regular expressions for specifying more expressive search criteria. The switch uses regular expression pattern matching in several BGP commands.

The functionality of a regular expression for an AS-Path varies based on BGP regex asn and string mode configurations in the `ip as-path regex-mode` command.

The following tables describe the behavior of special characters in asn and string modes respectively.

Special Characters	Characters Names	Description	Examples
.	Period	Matches any AS number.	'.' matches '200'. '10.20' matches '10 30 20', but does not match '10 20'.
^	Caret	Matches the specified expression at the beginning of an input string. Also used to exclude expressions in brackets while matching.	'^123' matches '123', '123 456', '123 456 789', and so on; but does not match '1234'. '[!12]' matches '1', '2', '3', and so on; but does not match '12'.
*	Asterisk	Matches an entire AS number that appears either zero or more times.	'200_100*_300' matches '200 300', '200 100 300', '200 100 100 300', and so on. '^100*\$' matches empty AS path, '100', '100 100', '100 100 100', and so on.
+	Plus sign	Matches an entire AS number appearing either one or more times.	'10_20+_30' matches '10 20 30', '10 20 20 30' and so on; but does not match '10 200 30'.
\$	Dollar sign	Matches the specified expression at the end of an input string.	'1_2_3\$' matches '1 2 3', but does not match '1 2 3 4'.
[]	Brackets	Matches either an AS number, or a range of AS numbers separated by a hyphen.	'[10_20_30-39]' matches '10', '20', '30', '31',... '39'.
?	Question mark	Matches either zero or one occurrence of the pattern but the previous operand or entire AS number may appear zero or one time.	'100_200?' matches '100' and '100 200'. '100_200?\$' does not match with '100 20'.
	Pipe	Matches the specified AS number on either side of the vertical bar.	'6400 6500' matches either '6400' or '6500'.
()	Parenthesis	Nests specified AS numbers for matching.	'^(100(200 300))\$' matches either '100 200' or '100 300'. '^100_200 300_400\$' matches AS path either "100 200" or "300 400".
_	Underscore	Matches specified AS numbers that are converted into AS number delimiters.	'_123_456_' matches '123 456'. '_333_444_' matches '111 222 {333 444}'.

**Note:** Precede the question mark (?) with **Ctrl+V** sequence to prevent it from being interpreted as a help command.

Special Characters	Characters Names	Description	Examples
.	Period	Matches any single character.	'1.2' matches '102'.
^	Caret	Matches the specified expression at the beginning of an input string.	'^123' matches '123', '1234', '12345', and so on. It also matches '123 456', '123 456 789', and so on.
*	Asterisk	Matches either zero or more sequences of the expression preceding the asterisk.	'^5*\$' matches an empty AS path, '5', '55', '555', and so on.
+	Plus sign	Matches either one or more sequences of the expression preceding the plus sign.	'5+' matches to '5', '55', '555', and so on.
\$	Dollar sign	Matches the expression at the end of an input string.	'123\$' matches '123', but does not match '1234'.
[]	Brackets	Matches either characters or a range of characters separated by a hyphen, within left and right brackets.	'[025-7]' matches '0', '2', and digits from '5' to '7'; but does not match digits from '1', '3', '4', '8', and '9'.
?	Question mark	Matches either zero or one occurrence of the pattern.	'12?3' matches '13' and '123'.
	Pipe	Matches either one of the expressions or expression patterns on either side of the vertical bar.	'14(36 75)12' matches either '143612' or '147512'; but does not match '1412', '14367512', '14363612' or '14757512'.
()	Parenthesis	Nests specified expressions for matching.	'(17)*' matches any number of the two-character string '17'.
_	Underscore	For AS-Path regex, '_' matches curly brackets '{}', the beginning of input string, the end of input string, or space.	'_1300_' matches '100 {1300 1400}', '100 1300 200', and so on.
{}	Braces	Matches repetitions of the previous expression with the number of repetitions provided in braces.	'10{2,3}' matches '100' and '1000'.
\	Backslash	Matches the character following the backslash and special characters.	'\42' matches '(42'.

Precede the question mark (?) with **Ctrl+V** sequence to prevent it from being interpreted as a help command.

### 1.1.2.7 Scheduling CLI Commands

The [schedule](#) command facilitates the periodic execution of the specified CLI command. Command parameters configure the time to start script execution, the interval between consecutive execution instances, the maximum time to execute the script, and the maximum number of files log that needs to be created.

The `schedule config` command sets configuration parameters to the CLI scheduler.

The `show schedule` command lists the commands currently scheduled for periodic execution and displays the summary of the specified scheduled command.

### Examples

- This command schedules the execution of a script once every 12 hours and the script execution is terminated if it exceeds 40 minutes. When `max-log-files` is set to zero, the script output is not logged.

```
switch# schedule ms_1 interval 720 timeout 40 max-log-files 0 command
bash /mnt/flash/myscript.sh
```

- This command saves the running configuration contents to a log file every hour, terminates the script execution if it exceeds 30 minutes and creates up to 24 log files.

```
switch#schedule backup-test interval 60 max-log-files 24 command show
running-config
```

- This command allows the switch to concurrently execute up to 2 scheduled commands.

```
switch(config)#schedule config max-concurrent-jobs 2
switch(config)#
```

- This command lists the commands that are scheduled for periodic execution.

```
switch(config)#schedule config max-concurrent-jobs 3
switch(config)#show schedule summary
Maximum concurrent jobs 3
Prepend host name to logfile: No
Name          At time    Last      Interval  Timeout   Max      Logfile Location
Status
              time      (mins)    (mins)    log
              files
-----
tech-support  now        00:29     60        30        100     flash:schedule/tech-support/
Success
thelp        12:02:00  00:02     60        40        100     flash:schedule/thelp/      Fail
06/05/2018
switch(config)#
```

### 1.1.2.8 Running Bash Shell Commands Automatically with Event Handlers

Event handlers execute a Linux Bash shell command in response to a specific system event. An event handler consists of a Bash command, a trigger and a delay; when the trigger event occurs, the action is scheduled to run after **delay** seconds.

To create an event handler, use the `event-handler` command. This creates a new event handler and places the CLI in event handler configuration mode for that handler. Use the `action bash` command to configure a Bash command to run when the handler is triggered, and the `trigger` command to specify the trigger. Event handlers can be triggered by various events, including:

- system booting
- a change in a specified interface's operational status or IP address
- a change in the `startup-config` file
- a state change in a virtual machine monitored by VM Tracer

To change the delay period between the trigger and the action, use the `delay` command.

When an action is run, certain information is passed to it through environment variables. For the boot trigger, no variables are set. For the **interface** triggers, the following variables are set and passed to the action:

- \$INTF** interface name

- **`$OPERSTATE`** current operational status of the specified interface
- **`$IP-PRIMARY`** current primary IP address of the specified interface

To execute more than one Bash command in response to a trigger, create a script containing the desired commands and enter the file path to the script as the argument of the `action bash` command.

To display information about all event handlers or about a specific event handler, use the `show event-handler` command.

The `no event-handler` command deletes an event handler.

## Examples

- These commands create an event handler named “eth\_4” which will send email to a specified address when there is a change in the operational status of Ethernet interface 4:

```
switch(config)#event-handler eth_4
switch(config-event-eth_4)#action bash email x@yz.com -s "Et4
$OPERSTATE"
switch(config-event-eth_4)#trigger on-intf ethernet 4 operstatus
switch(config-event-eth_4)#delay 60
switch(config-event-eth_4)#exit
switch(config)#
```

The above handler uses the `$OPERSTATE` variable to include the current operational state (“linkup” or “linkdown”) in the subject of the email. Note that the action will only function if email has been configured on the switch.

- These commands create an event handler named “onStartup” which will execute a user-defined script 60 seconds after the system boots.

```
switch(config)#event-handler onStartup
switch(config-event-onStartup)#action bash /mnt/flash/startupScript1
switch(config-event-onStartup)#trigger onboot
switch(config-event-onStartup)#delay 60
switch(config-event-onStartup)#exit
switch(config)#
```

The above handler will also be executed on exiting from event-handler configuration mode.

- This command displays information about all event handlers configured on the system.

```
switch#show event-handler
Event-handler onStartup
Trigger: onBoot delay 60 seconds
Action: /mnt/flash/startupScript1
Last Trigger Activation Time: 1 minutes 51 seconds ago
Total Trigger Activations: 1
Last Action Time: 51 seconds ago
Total Actions: 1

switch#
```

- This command deletes the event handler named “onStartup”.

```
switch(config)#no event-handler onStartup
switch(config)#
```

### 1.1.2.9 Running Adverse Drop Counters Monitor with Event Handlers

A monitoring capability for adverse drop counters can be used as a warning that the system is encountering an abnormal condition. The adverse drop counter monitor runs periodically (with a default of 60 seconds) and performs the following actions:

- Reads the values of adverse drop counters.
- Compares each value to the value read in the previous run.
- If counter values increase more than a certain threshold (with a default of 100), it is considered as a threshold violation.
- If any counter has more than a certain number of threshold violations within a specific time window (with a default of 3 violations within 15 minutes) a syslog message is logged.

No configuration is required to enable adverse drop counters monitor with event handlers. It is enabled by default and can be disabled, and can be customized for duration of time window and threshold levels. To customize the delay, polling interval, and condition for width, violation count, and threshold of this event handler, use the `event-handler DropCountersHandler` command. To display details of this event handler, use the `show event-handler DropCountersHandler` command.

#### Examples

- These commands customize the delay, polling interval, and condition for width, violation count, and threshold of this event handler. Each parameter may be customized separately, with all other parameters remaining unchanged.

```
switch(config)#event-handler DropCountersHandler
switch(config-DropCountersHandler)#action bash DropCounterLog.py -l
switch(config-DropCountersHandler)#delay 0
switch(config-DropCountersHandler)#trigger on-counters
switch(config-DropCountersHandler-counters)#poll interval 60
switch(config-DropCountersHandler-counters)#condition
bashCmd."DropCounterMonitor.py" -w 800" > 0
switch(config-DropCountersHandler-counters)#condition
bashCmd."DropCounterMonitor.py" -c 5" > 0
switch(config-DropCountersHandler-counters)#condition
bashCmd."DropCounterMonitor.py" -t 200" > 0
switch(config-DropCountersHandler-counters)#
```

- This command disables this event handler.

```
switch(config)#no event-handler DropCountersHandler
switch(config)#
```

- This command displays details of this event-handler.

```
switch(config)#show event-handler DropCountersHandler
Event-handler DropCountersHandler (BUILT-IN)
Trigger: on-counters delay 0 seconds
  Polling Interval: 60 seconds
  Condition: bashCmd."DropCounterMonitor.py" > 0
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: DropCounterLog.py -l
Action expected to finish in less than 20 seconds
Total Polls: 39
Last Trigger Detection Time: 38 minutes 22 seconds ago
Total Trigger Detections: 1
Last Trigger Activation Time: 38 minutes 22 seconds ago
Total Trigger Activations: 1
Last Action Time: Never
Total Actions: 1
```

```
switch(config)#
```

### 1.1.3 Kernel-based Virtual Machine Commands and Configuration

Arista's EOS has leveraged its unmodified Linux kernel, and embraced open source standards-based technology that has brought operating system virtualization to Ethernet switching, utilizing the kernel-based virtual machine (KVM) as follows:

- The hypervisor is the Linux kernel.
- The core virtualization infrastructure is provided by the kernel module.
- The CPU-specific implementation is provided by the processor-specific module (Intel or AMD).
- The generic machine emulator and virtualizer KVM is provided by a Modified Quick Emulator (QEMU), which transforms the Linux kernel into the hypervisor.

The standard Linux kernel is the hypervisor, resulting in changes to the standard kernel (such as memory support and scheduler). Optimizations to these Linux components (such as a new scheduler in the 2.6 kernel) benefit both the hypervisor (host operating system) and Linux guest operating systems. With the kernel acting as the hypervisor, the switch can run other operating systems, such as Windows or Linux.

All components required are pre-installed with the Arista EOS software image, requiring only the download of the image. A few additional configuration steps get the KVM fully operational.

This chapter contains the following sections:

- [KVM Commands](#)
- [KVM Configuration](#)

#### 1.1.3.1 KVM Commands

The following table covers KVM commands used throughout the configuration.

**Table 1: KVM Commands**

Command	Description
comment	Up to 240 character comment for this mode.
default	Set a command to its defaults.
disk-image	Add Virtual Machine disk image.
enable	Enable VM.
exit	Exit from Virtual Machine configuration mode.
memory-size	Set memory size.
no	Negate a command or set its defaults.
show	Show running system information.
virtual-nic	Add virtual NIC.
vnc-port	Set VNC server port.
!!	Append to comment.

##### 1.1.3.1.1 CLI Commands

The following KVM CLI commands are used throughout the configuration.

## vm

In `config` mode, the `vm` CLI command creates or deletes a KVM configuration, or enters `config-vm` mode. A newly created KVM will have an empty config file path and is disabled.

The CLI command syntax is as follows:

```
[no] vm NAME
```

## config-file

In `config-vm` mode, the `config-file` CLI command sets the path of the `libvirt` config file, using standard file syntax (e.g. `flash:vm/NetscalerVPX.xml` or `sata1:vm/NetscalerVPX.xml` or `/mnt/sata1/vm/NetscalerVPX.xml`). Changing this value does not affect the state of a currently enabled KVM. To use the new file, the user must disable and then re-enable the KVM.

The CLI command syntax is as follows:

```
config-file [PATH]
```

## enabled

In `config-vm` mode, the `enabled` CLI command allows enabling a currently disabled VM, causing it to start up immediately. If a VM is enabled in the `startup-config`, it starts up automatically when EOS boots (or when `VirtAgent` starts).

The CLI command syntax is as follows:

```
[no] enabled
```

Disabling a currently enabled VM initiates a shutdown process in the following sequence:

- Attempt to shut down the VM politely if the guest OS supports ACPI.
- If the VM is still running after 30 seconds, terminate it.

## show vm

In `enable` mode, the `show vm` CLI command prints information about the configuration and status of a KVM, or of all KVMs if `NAME` is omitted, as follows:

- Configuration: Name, config file path, and enabled.
- Status: PID, log file path, and serial console pty path.
- Current resource usage: RES, CPU%
- (Detailed only) contents of the config file.
- (Detailed only) contents of the log file.

The CLI command syntax is as follows:

```
show vm [detailed] [NAME]
```

## attach vm

In `enable` mode, the `attach vm` CLI command connects to a KVM's serial console pty (using `virsh console`).

**Note:** Press `Ctrl-]` to exit to the CLI.

The CLI command syntax is as follows:

```
attach vm [NAME]
```

## show tech-support

The CLI command syntax is as follows:

---

```
show tech-support [detailed] [NAME]
```

## reload

In **enable** mode, the **reload** CLI command is executed before restarting the system, and will shut down currently enabled KVMs using the same process as the **no enabled** command in **config-vm** mode.

The CLI command syntax is as follows:

```
reload
```

### 1.1.3.2 KVM Configuration

Arista EOS enables kernel-based virtual machine (KVM) instances by running KVM on the control-plane CPU of the switch. KVM instances can be defined from the CLI.

To configure a KVM, you must download the virtual machine image and configure the EOS.

This section contains the following topics:

- [Configuring a KVM](#)
- [Configuring a Guest KVM](#)

#### 1.1.3.2.1 Configuring a KVM

To configure a KVM, perform the following steps:

1. Download the Virtual Machine Image to /mnt/flash
2. Name the virtual machine: `switch(config)#virtual-machine [kvm_name]`

##### Example:

```
switch(config)#virtual-machine foo
```

3. Provide a pointer to the image: `switch(config-vm-foo)#disk-image [file:[path]] image-format [format]`

##### Example:

```
disk-image file:/mnt/flash/fedora.img image-format qcow2
```

4. Define the amount of memory allocated: `switch(config-vm-foo)#memory-size [size in bytes]`
5. Bind the virtual NIC to an SVI (or management interface): `switch(config-vm-foo)#virtual-nic 1 vlan [1-4] switch(config-vm-foo)#virtual-nic 1 management [1-4]`
6. Create the VNC server's tcp port (display): `switch(config-vm-foo)#vnc-port [vnc-port number]`
7. Enable the virtual machine: `switch(config-vm-foo)#enable`

Optionally attach to the virtual machine via VNC client pointed to the switch's IP address. However, if Kernel **hair-pinning** is currently not enabled, preventing communication directly with the local switch, all traffic must have a destination on another networked device (such as a router, switch, or server).

For specifics about KVM please visit <http://www.linux-kvm.org/>.

**Note:** In the Real VNC Viewer for **Options**, **Expert**, and **ColorLevel1**, if the default value is **pal8**, establishing a session may fail. If this occurs, set this value to **full** and **reconnect**.

##### Example

```
switch#copy http://berrange.fedorapeople.org/images/2012-02-
```

```
29/f16-x86_64-openstack-sda.qcow2
(http://berrange.fedorapeople.org/images/2012-02-29/f16-x86_64-
openstack-sda.qcow2) flash:
...
switch(config)#virtual-machine foo
switch(config-vm-foo)#disk-image file:/mnt/flash/fedora.img image-
format qcow2
switch(config-vm-foo)#memory-size 512
switch(config-vm-foo)#virtual-nic 1 vlan 1
switch(config-vm-foo)#virtual-nic 2 management 1
switch(config-vm-foo)#vnc-port 5900
switch(config-vm-foo)#enable
```

### 1.1.3.2.2 Configuring a Guest KVM

To configure a guest KVM, perform the following steps:

1. Download the Virtual Machine Image to **/mnt/flash**
2. Name the virtual machine: `switch(config)#virtual-machine [guest_name]`

**Example:**

```
switch(config)#virtual-machine guest123
```

3. Provide a pointer to the image: `switch(config-vm-guest123)#disk-image [file:[path] image-format [format]`

**Example:**

```
switch(config-vm-guest123)#disk-image flash:f16-x86_64-openstack-
sda.qcow2 image-format ?
iso iso image format qcow qcow image format qcow2 qcow2 image format
raw raw image format
vmdk vmdk image format switch(config-vm-guest123)#disk-image
flash:f16-x86_64-openstack-sda.qcow2 image-format qcow2
```

4. Define the amount of memory allocated: `switch(config-vm-guest123)#memory-size [size in bytes]`
5. Bind the virtual NIC to an SVI (or management interface): `switch(config-vm-guest123)#virtual-nic 1 vlan [1-4] switch(config-vm-guest123)#virtual-nic 2 management [1-4]`
6. Create the VNC server's tcp port (display): `switch(config-vm-guest123)#vnc-port [vnc-port number]`
7. Enable the virtual machine: `switch(config-vm-guest123)#enable`

**Example**

```
switch#copy http://berrange.fedorapeople.org/images/2012-02-
29/f16-x86_64-openstack-sda.qcow2
(http://berrange.fedorapeople.org/images/2012-02-29/f16-x86_64-
openstack-sda.qcow2) flash:
...
switch#config terminal
switch(config)#virtual-machine ?
WORD Virtual Machine name
switch(config)#virtual-machine foo
switch(config-vm-foo)#disk-image flash:f16-x86_64-openstack-sda.qcow2
image-format ?
iso iso image format
qcow qcow image format
qcow2 qcow2 image format
```

```

raw          raw image format
vmdk         vmdk image format
switch(config-vm-foo)#disk-image flash:f16-x86_64-openstack-sda.qcow2
image-format qcow2
switch(config-vm-foo)#memory-size 1024
switch(config-vm-foo)#virtual-nic ?
    <1-4>      Virtual NIC Id
switch(config-vm-foo)#virtual-nic 1 ?
    Management Management interface
    Vlan        Vlan interface
switch(config-vm-foo)#virtual-nic 1 vlan 1
switch(config-vm-foo)#virtual-nic 2 management 1
switch(config-vm-foo)#enable
switch(config-vm-foo)#
switch(config-vm-foo)#^Z
switch#write mem
switch#
switch#show virtual-machine detail
Virtual Machine: foo
    Enabled:          Yes
    State:            Running
    Disk Image:       /mnt/flash/f16-x86_64-openstack-sda.qcow2
    Disk Image Format: qcow2
    Memory Size:     1024MB
    VNC port:        5900
    Virtual Nic:     vnic1
        Mac Address:  52:54:00:ee:11:c9
        Device:       Vlan1
        Model Type:   e1000
    Virtual Nic:     vnic2
        Mac Address:  52:54:00:df:2a:e1
        Device:       Management1
        Model Type:   e1000
switch#

```

## 1.1.4 Switch Platforms

Features and CLI commands vary by switch platform. CLI options may also vary by switch platform for commands that are available on all platforms. Command descriptions in this manual describe feature availability and command parameters on the basis of switch platform, noting exceptions that exist among models that use a common platform.

- <https://www.arista.com/en/products/switches> lists the Arista switches and platforms upon which they operate.
- <https://www.arista.com/en/support/product-documentation/supported-features> lists Arista switch feature availability by switch platform. For the latest features, also consult the Release Notes, available at <https://www.arista.com/en/support/software-download>.

These sections describe the following topics:

- [Viewing the Model Number](#)
- [Determining a Switch's Operating Platform](#)
- [Modular System Platforms – 7500 and 7500E Series Switches](#)
- [Viewing Modules on 7300 Series Modular Switches](#)
- [Multi-Chip Devices](#)

### 1.1.4.1 Viewing the Model Number

To view the switch's model number through the CLI, enter the `show version` command.

## Example

- This command displays the model number, serial number, system MAC address, and manufacturing information of a DCS-7150S-64 switch.

```
switch> show version
Arista DCS-7150S-64-CL-F
Hardware version:    01.01
Serial number:      JPE13120819
System MAC address: 001c.7326.fd0c

Software image version: 4.13.2F
Architecture:         i386
Internal build version: 4.13.2F-1649184.4132F.2
Internal build ID:    eeb3c212-b4bd-4c19-ba34-1b0aa36e43f1

Uptime:              16 hours and 39 minutes
Total memory:        4017088 kB
Free memory:         1348228 kB

switch>
```

### 1.1.4.2 Modular System Platforms – 7500 and 7500E Series Switches

Modular switch platforms depend on their installed modules along with the fabric and forwarding software modes. The `show module` command displays the fabric modules in the switch. System performance in switches containing both module types is based on first-generation fabric capabilities. Best practice is to avoid switch configurations with mixed fabric modules.

These sections describe modular switch components and software modes that program their capacities.

#### 1.1.4.2.1 Fabric Modules and Fabric Mode – 7500 and 7500E Series Switches

Each modular switch fabric module is categorized as first-generation or E-Series:

- First-generation fabric modules support all basic switch functions.
- E-Series fabric modules support faster fabric link speeds, greater internal table capacities, and advanced encoding formatting.

Fabric mode determines the switch's fabric performance capabilities. This mode must match the fabric modules in the switch. Fabric mode settings include:

- **fe600**: Supports first-generation fabric modules.
- **fe1600**: Supports E-Series fabric modules.

E-series fabric modules can operate in **fe600** mode, but are limited to first-generation fabric performance. First-generation modules cannot operate in **fe1600** mode. Switches containing both types of modules must be set to **fe600** mode. Best practice is to avoid switch configurations with mixed fabric modules.

When a switch reloads, fabric mode is determined by the following (in order of precedence):

1. Switches reloading in **petraA** forwarding compatibility mode ( [Linecard Modules and Forwarding Compatibility Mode – 7500 and 7500E Series](#)) also reload in **fe600** fabric mode.
2. As specified by the `platform sand fabric mode (7500 and 7500E Series)` statement in `running-config`.
3. The first fabric module that becomes operational as the switch reloads.

In switches with a homogeneous module set, the fabric mode matches its fabric modules. Switches with a mixed set of modules are typically reloaded in **fe600** mode because first generation modules are

---

usually operational before E-Series modules. However, the fabric mode in mixed module switches that are reloading cannot be guaranteed in the absence of the first two conditions.

### Example

- This command configures the switch to reload in fe1600 fabric mode to support E-series fabric modules. After issuing this command, the switch should be reset only after exchanging all switch fabric modules to E-series modules.

```
switch(config)#platform sand fabric mode fe1600
switch(config)#exit
switch#show platform sand compatibility
Configuration      Status
Forwarding mode    None               Arad
Fabric mode        Fe1600            Fe600
switch#
```

#### 1.1.4.2.2 Determining a Switch's Operating Platform

##### FM6000 Platforms

To determine the operating platform on switch, display `platform` command options from Global Configuration command mode.

- This command displays the operating platform of a switch operating on the FM6000 platform (7150 Series switches).

```
switch(config)# platform ?
fm6000  FM6000 chip

switch(config)#platform
```

##### Arad and Petra Platforms

The `platform ?` command displays the same options on Arad and Petra platform switches. Refer to [Viewing the Model Number](#) to determine the switch's model number.

- Fixed system switches (DCS-7048 Series) operate on the Petra platform.
- Modular switches (DCS-7500 Series) operate on Arad and Petra platforms. [Modular System Platforms – 7500 and 7500E Series Switches](#) describe platform usage on these switches.

Arad and Petra platform switch typically utilize multiple chips. [Multi-Chip Devices](#) describe methods of determining the port distribution on multi-chip platforms.

### Example

- These commands display platform options of a switch operating on either Petra or Arad platforms.

```
switch(config)# platform ?
arad      Arad switch chip
fe1600    Fe1600 chip
fe600     Fe600 fabric chip
petraA    PetraA switch chip
ptp       Precision Time Protocol
sand      Sand platform

switch(config)#platform
```

## Trident and Trident II Platforms

The `platform ?` command returns **trident** on switches that operate on Trident or Trident II platforms. Trident II platform switches include options that configure the forwarding and routing tables. To determine the Trident platform that a switch uses, display **platform trident** options.

- These commands indicate that the switch is operating on the Trident II platform:

```
switch(config)# platform ?
  ptp          Precision Time Protocol
  trident      Trident chip

switch(config)# platform trident ?
  fabric              Fabric configuration
  forwarding-table    Forwarding table configuration
  mmu                 Trident MMU configuration
  routing-table       Routing table configuration

switch(config)#platform trident
```

Fixed and Modular switches are available that operate on the Trident II platform. Refer to [Viewing the Model Number](#) to determine the switch's model number. [Viewing Modules on 7300 Series Modular Switches](#) displays the modules on a Trident II platform modular switch.

Trident II platform switches typically utilize multiple chips. [Multi-Chip Devices](#) describes methods of determining port distribution on multi-chip platforms.

### 1.1.4.2.3 Linecard Modules and Forwarding Compatibility Mode – 7500 and 7500E Series

Each modular switch linecard module is categorized as first-generation or E-Series:

- First-generation linecard modules support all basic switch functions.
- E-Series linecard modules support provide faster data processing, greater internal table capacities, and advanced encoding formatting.

The forwarding compatibility mode determines the switch's performance capabilities when forwarding data between linecard interfaces. Forwarding compatibility mode settings include:

- **PetraA:** Supports first-generation linecard modules.
- **Arad:** Supports E-Series linecard modules.

Forwarding compatibility mode determines the operational capacity of installed linecards. The following table lists the affect of the forwarding compatibility mode on linecard module types.

**Table 2: Linecard Module and Forwarding Mode Performance**

Linecard Module Type	Forwarding Compatibility Mode	Linecard Operating Capacity
First-generation	petraA	First-generation performance capacity.
First-generation	arad	Linecard is powered-down.
E-Series	petraA	First-generation performance capacity.
E-Series	arad	E-series performance capacity.

**Note:** Switches must contain E-Series fabric modules to operate at E-Series performance capacities.

The forwarding compatibility mode is configured by the `platform sand forwarding mode (7500 and 7500E Series)` command. This command may be required after exchanging a linecard for a different module type or in switches containing first-generation and E-series linecards.

Without a `platform sand forwarding mode (7500 and 7500E Series)` command, forwarding compatibility mode is determined by the first linecard that is operational after reloading the switch. In a switch that is reloaded with a homogeneous module set, forwarding compatibility mode matches its linecards. Switches with a mixed set of modules are typically reloaded in **petraA** mode because first generation modules are usually operational before E-Series modules. However, forwarding compatibility mode in mixed module switches that are reloading is not guaranteed without a `platform sand forwarding mode` command.

### Example

This command changes the forwarding software mode to support E-series linecard modules. This command should be run only after exchanging all linecards to E-series modules.

```
switch(config)# platform sand forwarding mode arad
switch(config)#
```

#### 1.1.4.2.4 Viewing Modules – 7500 and 7500E Series

The `show module` command displays the model number of all installed modules.

- This command displays the modules of a 7504 switch that contains first-generation modules.

```
switch>show module
Module Ports Card Type Model Serial No.
-----
1 2 DCS-7500 Series Supervisor Module 7500-SUP JSH11440327

### 1.1.4.4 Multi-Chip Devices

Trident II, Petra, and Arad platform switches and linecards utilize multiple chips, with Ethernet ports evenly distributed among the chips. Creating multi-port data structures (including port channels) that include ports from multiple chips protects against the failure of an individual chip on a device.

The following sections describe methods of determining port distribution on various switch platforms

#### Petra Fixed Switches

7048-Series switches are Petra platform devices that distribute ports among two PetraA chips. The `show platform petraA port-info routing` command displays the ports that are controlled by each chip.

#### Example

- This command displays the following Ethernet port distribution on a DCS-7048-T switch:
  - Petra0 chip controls Ethernet 1 through Ethernet 32
  - Petra1 chip controls Ethernet 33 through Ethernet 52

```

switch#show platform petraA port-info routing

## Petra Modular Switches

Linecards on 7500-Series modular switches distribute Ethernet ports among multiple `petraA` chips. The `show platform petraA port-info routing` command displays the ports that are controlled by each chip on all PetraA linecards or on a single linecard.

### Example

- This command displays the following Ethernet port distribution on linecard 4 of a DCS-7504 switch:
  - Petra4/0 chip controls Ethernet 4/1 through Ethernet 4/8
  - Petra4/1 chip controls Ethernet 4/9 through Ethernet 4/16
  - Petra4/2 chip controls Ethernet 4/17 through Ethernet 4/24
  - Petra4/3 chip controls Ethernet 4/25 through Ethernet 4/32
  - Petra4/4 chip controls Ethernet 4/33 through Ethernet 4/40
  - Petra4/5 chip controls Ethernet 4/41 through Ethernet 4/48

```

## Arad Modular Switches

7500-E Series linecards distribute Ethernet ports among multiple Arad chips. The **show platform arad port-info routing** command displays the ports that are controlled by each chip on all Arad linecards.

### Example

- This command displays the following Ethernet port distribution on the 7500E-72S-LC linecard that is inserted as module 3 in a DCS-7508E switch:
  - Arad3/0 chip: Ethernet 3/1 – Ethernet 3/20
  - Arad3/1 chip: Ethernet 3/21 – Ethernet 3/34 and Ethernet 3/49/1 – Ethernet 3/49/12
  - Arad3/2 chip: Ethernet 3/35 – Ethernet 3/48 and Ethernet 3/50/1 – Ethernet 3/50/12

```

## Trident II Fixed Switches

Trident II platform devices distribute their ports among multiple Trident II chips. The `show platform trident system port` command displays the ports that are controlled by each chip.

### Example

- This command displays the following Ethernet port distribution on a DCS-7250QX-64-F switch:
  - Trident 0 chip controls Ethernet 1/1 through Ethernet 16/4
  - Trident 1 chip controls Ethernet 17/1 through Ethernet 32/4
  - Trident 2 chip controls Ethernet 33/1 through Ethernet 48/4
  - Trident 3 chip controls Ethernet 49/1 through Ethernet 64/4

```

switch#show platform trident system port

## Trident II Modular Switches

Linecards on 7300-Series modular switches distribute Ethernet ports among multiple Trident II chips. The `show platform trident system port` command can display the ports that are controlled by each chip on all linecards or on a single chip.

- This command displays the following Ethernet port distribution on DCS-7304-F switch that contains a 7300X-32Q-LC linecard as module 3:
  - Trident 0 chip controls Ethernet 1/1 through Ethernet 16/4 (on module 3)
  - Trident 1 chip controls Ethernet 17/1 through Ethernet 32/4 (on module 3)

```
switch#show platform trident system port
```

Intf	Chip	ModId	Logical	Port	
				Physical	MMU
Ethernet3/1/1	Linecard3/0	5	1	17	4
Ethernet3/2/1	Linecard3/0	5	2	21	5
Ethernet3/16/3	Linecard3/0	5	51	111	102
Ethernet3/16/4	Linecard3/0	5	52	112	103
Ethernet3/32/3	Linecard3/1	6	63	111	102
Ethernet3/32/4	Linecard3/1	6	64	112	103

```
switch#
```

## 1.1.5 Command Modes

Command modes define the user interface state. Each mode is associated with commands that perform a specific set of network configuration and monitoring tasks.

- [Mode Types](#) lists the available modes.
- [Navigating Through Command Modes](#) lists mode entry and exit commands.
- [Command Mode Hierarchy](#) describes the mode structure.
- [Group-Change Configuration Modes](#) describes editing aspects of these modes.

### 1.1.5.1 Mode Types

The switch includes these command modes:

- **EXEC:** EXEC mode commands display system information, perform basic tests, connect to remote devices, and change terminal settings. When logging into EOS, you enter EXEC mode.

EXEC mode prompt: `switch>`

- **Privileged EXEC:** Privileged EXEC mode commands configure operating and global parameters. The list of Privileged EXEC commands is a superset of the EXEC command set. You can configure EOS to require password access to enter Privileged EXEC from EXEC mode.

Privileged EXEC mode prompt: `switch#`

- **Global Configuration:** Global Configuration mode commands configure features that affect the entire system, such as system time or the switch name.

Global Configuration mode prompt: `switch(config)#`

- **Interface Configuration:** Interface configuration mode commands configure or enable Ethernet, VLAN, and Port-Channel interface features.

Interface Configuration mode prompt: `switch(config-if-Et24)#`

- **Protocol specific mode:** Protocol specific mode commands modify global protocol settings. Protocol specific mode examples include **ACL Configuration** and **Router BGP Configuration**.

The prompt indicates the active command mode. For example, the Router BGP command prompt is `switch(config-router-bgp)#`

### 1.1.5.2 Navigating Through Command Modes

To change the active command mode, perform one of these actions:

- To enter EXEC mode, log into the switch.
- To enter Privileged EXEC mode from EXEC, type **enable** (or **en**) followed, if prompted, by the **enable** password:

```
switch>en
Password:
switch#
```

- To enter Global Configuration mode from Privileged EXEC, type **configure** (or **config**):

```
switch#config
switch(config)#
```

- To enter Interface Configuration mode from Global Configuration, type **interface** and the name of the interface to be modified:

```
switch(config)#interface Et24
switch(config-if-Et24)#
```

- To enter a protocol specific configuration mode from Global Configuration, type the required command for the desired mode.

```
switch(config)#router bgp 100
switch(config-router-bgp)#
```

- To return one level from any configuration mode, type **exit**.

```
switch(config)#exit
switch#
```

- To return to Privileged EXEC mode from any configuration mode, type **end** or **Ctrl-Z**.

```
switch(config-if-Et24)#<Ctrl-z>
switch#
```

- To return to EXEC mode from Privileged EXEC mode, type **disable** (or **dis**).

```
switch#dis
switch>
```

- To exit EOS and log out of the CLI, type **exit** from EXEC mode or Privileged EXEC mode.

```
switch#exit

login:
```

### 1.1.5.3 Command Mode Hierarchy

Command modes are hierarchical. The parent mode of a specified command mode is the mode that contains the command that enters the specified mode.

#### Example

- EXEC mode contains the **enable** command, which enters Privileged EXEC mode. Therefore, EXEC is the parent mode of Privileged EXEC.

Commands that are executable in a specified command mode include all commands available in the specified mode plus all commands executable from its parent mode.

**Example**

- EXEC mode includes the `ping` command. EXEC mode is the parent mode of Privileged EXEC mode. Therefore, Privileged EXEC mode includes `ping`.

Additionally, Privileged EXEC is the parent mode of Global Configuration mode. Therefore, Global Configuration mode also includes `ping`.

Executing a configuration mode command from a child mode may change the active command mode.

**Example**

- Global Configuration mode contains `interface ethernet` and `ip access-list` commands, which enter Interface Configuration and Access Control List (ACL) Configuration modes, respectively. When the switch is in Interface Configuration mode, the `ip access-list` command is available and changes the active mode to ACL Configuration.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#ip access-list master-list
switch(config-acl-master-list)#
```

The `exit` command changes the active command mode to its parent mode. When executed from Privileged EXEC or EXEC modes, the `exit` command terminates the session.

**Example**

- This command exits Global Configuration mode to Privileged EXEC mode.

```
switch(config)#exit
switch#
```

- This command terminates the user session.

```
switch#exit
```

**1.1.5.4 Group-Change Configuration Modes**

Group-change modes apply all changes made during an edit session only after exiting the mode. Changes are stored when the user exits the mode, either through an `exit` or `end` command or through a command that enters a different configuration mode.

The `abort` command discards all changes not previously applied.

Access Control List (ACL) and Multiple Spanning Tree (MST) configuration modes are examples of group-change modes.

**1.1.6 Managing Switch Configuration Settings****1.1.6.1 Verifying Settings for the Current Mode**

To display only the lines of *running-config* that affect the current mode, use the `active` option of the `show (various configuration modes)` command. This command option is available in all configuration modes except global configuration.

## Example

Type **show active** to display the content of *running-config* that affects the current mode. To include default settings in the display, type **show active all**.

```
switch(config-router-ospf3)#show active all
ipv6 router ospf 9
  router-id 0.0.0.0
  default-metric 10
  distance ospf intra-area 10
  area 0.0.0.200 default-cost 10
  area 0.0.0.200
  no log-adjacency-changes
  timers spf 5
switch(config-router-ospf3)#
```

To display any comments associated with the current mode, use the **comment** option of the [show \(various configuration modes\)](#) command.

## Example

Type **show comment** to display any comments attached to the current mode.

```
switch(config-router-ospf3)#show comment
Comment for router-ospf3:
  Consult Thomas Morton before making changes to the OSPF configuration
.
switch(config-router-ospf3)#
```

### 1.1.6.2 Verifying the Running Configuration Settings

The **running-config** command is the virtual file that stores the operating configuration. The **show running-config** command displays the *running-config*. The command is supported in Privileged EXEC mode.

## Example

- Type **show running-config** in Privileged EXEC mode. The response in the example is truncated to display only the ip route configured.

```
switch#show running-config
! Command: show running-config

!
ip route 0.0.0.0/0 192.0.2.1
!

end
switch#
```

### 1.1.6.3 Adding a Comment to a Configuration Mode

To add a comment to most switch configuration modes, use the [comment \(various configuration modes\)](#) command. Comments cannot be modified, but can be replaced by entering the **comment** command again and entering new text. Comments cannot be added to global configuration mode

To append to an existing comment, enter `!!` followed by additional comment text. To display comments for the active mode, use the `show comment` command. The `no comment` and `default comment` commands remove the comment from `running-config` .

### Examples

- These commands enter a comment in Router OSPF3 Mode.

```
switch(config-router-ospf3)#comment
Enter TEXT message. Type 'EOF' on its own line to end.
Consult Thomas Morton before making changes to the OSPF configuration.
EOF
switch(config-router-ospf3)#
```

- These commands append additional information to the comment entered above.

```
switch(config-router-ospf3)#!! x2735
switch(config-router-ospf3)#show comment
Comment for router-ospf3:
    Consult Thomas Morton before making changes to the OSPF
    configuration.
    x2735
switch(config-router-ospf3)#
```

#### 1.1.6.4 Saving the Running Configuration Settings

`startup-config` is the file, stored in internal flash memory, that the switch loads when it boots. Configuration changes that are not saved to `startup-config` are lost the next time the switch is booted.

The `write` and `copy running-config startup-config` commands store the operating configuration to `startup-config`. Both commands are supported in Privileged EXEC mode.

#### Example

These equivalent commands save the current operating configure to the startup-config file.

```
switch#write

switch#copy running-config startup-config
```

The `show startup-config` command displays the startup configuration file. The command is supported in Privileged EXEC mode.

#### Example

Type `show startup-config` to display the startup configuration file. The response in the example is truncated to display only the ip route configured in Admin Username.

```
switch#show startup-config
! Command: show startup-config
! Startup-config last modified at Wed Feb 19 08:34:31 2014 by admin
!

!
ip route 0.0.0.0/0 192.0.2.1
!

end
switch#
```

---

## 1.1.7 Other Command-Line Interfaces

EOS can access other CLIs that provide switch commands, files, and services. .

- [About Command-Line Interface](#) describes the boot-loader CLI
- [Bash Shell](#) describes the Bash shell CLI.

### 1.1.7.1 About Command-Line Interface

About is the switch boot loader. It reads a configuration file from the internal flash or a USB flash drive and attempts to boot a software image.

The switch opens an About shell if the switch does not find a software image, the configuration is corrupted, or the user terminates the boot process. The About shell provides a CLI for manually booting a software image, recovering the internal flash to its default factory state, running hardware diagnostics, and managing files.

### 1.1.7.2 Bash Shell

The switch provides a Linux Bash shell for accessing the underlying Linux operating system and extensions. The Bash shell is accessible in all command modes except EXEC. [Mode Types](#) describes EOC command modes.

- To enter the Bash, type **bash** at the prompt.

```
switch#bash
Arista Networks EOS shell
[admin@Switch ~]$
```

- To exit the Bash, type **logout**, **exit**, or **Ctrl-D** at the Bash prompt.

```
[admin@Switch ~]$ logout
switch#
```

## 1.1.8 Directory Structure

EOS operates from a flash drive root mounted as the **/mnt/flash** directory on the switch. The EOS CLI supports these file and directory commands:

- **delete**: Delete a file or directory tree.
- **copy**: Copy a file.
- **more**: Display the file contents.
- **diff**: Compares the contents of files located at specified URLs.
- **rename**: Rename a file
- **cd**: Change the current working directory.
- **dir**: Lists directory contents, including files and subdirectories.
- **mkdir**: Create a directory.
- **rmdir**: Remove a directory.
- **pwd**: Display the current working directory.

Verify flash memory space before copying a file. When a file is copied to flash, it is first written to a temporary file and then renamed to the destination rather than directly overwriting the destination file. This protects the integrity of the existing file if the **copy** command is interrupted, but requires more free space to complete the process.

Switch directory files are accessible through the Bash shell and About. When entering the Bash shell from the switch, the working directory is located in **/home** and has the name of the user name from which Bash was entered.

### Example

- These commands were entered from the user name john:

```
switch#bash
[john@switch ~]$ pwd
/home/john
[john@switch ~]$
```

In this instance, the working directory is **/home/john**

When a flash drive is inserted in the USB flash port, flash drive contents are accessible through **/mnt/usb1**.

When entering About, the working directory is the root directory of the boot.

---

## 1.1.9 Command-Line Interface Commands

### Mode Navigation Commands

- `alias`
- `bash`
- `configure` (configure terminal)
- `configure network`
- `copy running-config`
- `daemon`
- `disable`
- `enable`
- `end`
- `exit`

### File Transfer Commands

- `ip ftp client source-interface`
- `ip http client local-interface`
- `ip ssh client source-interface`
- `ip tftp client source-interface`

### File Management Commands

- `configure checkpoint`
- `configure network`
- `copy running-config`
- `dir`
- `pwd`

### Modular Switch Platform Commands

- `platform arad lag mode`
- `platform sand fabric mode` (7500 and 7500E Series)
- `platform sand forwarding mode` (7500 and 7500E Series)
- `platform sand lag hardware-only`
- `show platform sand compatibility`
- `show platform sand lag hardware-only`

### CLI Scheduling Commands

- `schedule`
- `schedule config`
- `show schedule`

### Event Handler Commands

- `action bash`
- `delay`
- `event-handler`
- `event-handler DropCountersHandler`
- `show event-handler`
- `show event-handler DropCountersHandler`

- [trigger](#)

#### **Terminal Parameter Commands**

- [terminal length](#)
- [terminal monitor](#)

#### **Display and Comment Commands**

- [comment \(various configuration modes\)](#)
- [show \(various configuration modes\)](#)
- [show module](#)
- [show version](#)

---

### 1.1.9.1 action bash

The **action bash** command specifies a Bash shell command to be run when an event handler is triggered. When an event handler is triggered, execution of the associated shell command is delayed by a configurable period set by the **delay** command. Only a single Bash command may be configured for an event handler, but the command may have multiple arguments. If more than one Bash command must be executed in response to a trigger, create a script containing the desired commands and enter the file path to the script as the argument of the **action bash** command.

To specify the event that will trigger the action, use the **trigger** command.

If the event handler uses an **on-intf** trigger, the following environment variables are passed to the action and can be used as arguments to the Bash command:

- **\$INTF** interface name.
  - **\$OPERSTATE** current operational status of the specified interface.
  - **\$IP-PRIMARY** current primary IP address of the specified interface.

#### Event-Handler Configuration

##### Command Syntax

`action bash command`

##### Parameters

- *command* Bash shell command to be executed when the event handler is triggered.

##### Examples

- This command configures the event handler “onStartup” to run a script on the flash drive.

```
switch(config-handler-onStartup) #action bash /mnt/flash/myScript1
switch(config-handler-onStartup) #
```

- This command configures the event handler “eth\_4” to send email to the specified address when there is a change in the operational status of *Ethernet interface 4*.

```
switch(config-event-eth_4) #action bash email x@yz.com -s "Et4
$OPERSTATE"
switch(config-event-eth_4) #
```

The above action uses the **\$OPERSTATE** variable to include the current operational state (“linkup” or “linkdown”) in the subject of the email. Note that the action will only function if email has been configured on the switch.

### 1.1.9.2 alias

The **alias** command creates an alias for a CLI command. Entering the alias in the CLI executes the corresponding command. Once created, an alias is accessible in all modes and all user sessions, but is subject to all the restrictions of the original command.

When using a command alias, no tokens may precede the alias except the **no** and **default** keywords. However, an alias can incorporate positional parameters.

In online help, aliases are preceded by an asterisk (\*) in this format:

```
*alias_name=command_name
```

The **no alias** and **default alias** commands remove the specified alias.

#### Command Mode

Global Configuration

#### Command Syntax

```
alias alias_name command_name
```

```
no alias alias_name
```

```
default alias alias_name
```

#### Parameters

- *alias\_name* the string which is to be substituted for the original command. The string can include letters, numbers, and punctuation, but no spaces. If the *alias\_name* string is identical to an existing command, the alias will supercede the original command.
- *command\_name* the command which is to be executed when the alias is entered in the CLI. If the original command requires additional parameters, they must be included in the *command\_name* string in the following manner:

Positional parameters are of the form “%n” and must be whitespace-delimited. The first parameter is represented by “%1” and any additional parameters must be numbered sequentially. When executing the alias a value must be entered for each parameter or the CLI will display the error “% incomplete command”.

#### Examples

- This command makes **e** an alias for the command **enable**.

```
switch(config)#alias e enable
```

- This command makes **srie** an alias for the command **show running-config interface ethernet 1-6**.

```
switch(config)#alias srie show running-config interface ethernet 1-6
```

- These commands make **ss** an alias for the command **show interfaces ethernet <range> status** with a positional parameter for the port range, then use the alias to display the status of ports 4/1-4/5.

```
switch(config)#alias ss show interfaces ethernet %1 status
switch(config)#ss 4/1-4/5
Port      Name      Status      Vlan      Duplex  Speed  Type
Et4/1    connected in Po1     full    10000  10GBASE-SRL
Et4/2    notconnect in Po1     full    10000  10GBASE-SRL
Et4/3    notconnect 1          full    10000  10GBASE-SRL
Et4/4    notconnect 1          full    10000  10GBASE-SRL
Et4/5    notconnect 1          full    10000  10GBASE-SRL
```

---

### 1.1.9.3 bash

The **bash** command starts the Linux Bash shell. The Bash shell gives you access to the underlying Linux operating system and system extensions.

To exit the Bash, type **logout**, **exit**, or **Ctrl-D** at the Bash prompt.

#### Command Mode

Privileged EXEC

#### Command Syntax

bash

#### Examples

- This command starts the Bash shell.

```
switch#bash
Arista Networks EOS shell
[admin@switch ~]$
```

- This command, executed within Bash, exits the Bash shell.

```
[admin@switch ~]$ logout
switch#
```

### 1.1.9.4 comment (various configuration modes)

The **comment** command adds a comment for the active configuration mode to **running-config**. Comments cannot be modified, but can be replaced by entering the **comment** command again and entering new text. To append to an existing comment, enter **!!** followed by additional comment text. To display comments, use the **comment** option of the [show \(various configuration modes\)](#) command.

The **no comment** and **default comment** commands remove the comment from **running-config**.

Comments cannot be added to the global configuration mode through the EOS.

#### Command Mode

All configuration modes except Global Configuration

#### Command Syntax

```
comment comment_text EOF
no comment
default comment !! comment_text
```

#### Parameters

- *comment\_text* To create a comment, enter a message when prompted. The message may span multiple lines.
- EOF To end a comment, type EOF on its own line (case sensitive) and press **enter**.

#### Example

- This command adds a comment to the active configuration mode.

```
switch(config-sg-radius-RAD-SV1)#comment
Enter TEXT message. Type 'EOF' on its own line to end.
Consult Thomas Morton before making changes to the RADIUS configuration
.
EOF
switch(config-sg-radius-RAD-SV1)#
```

- This command appends a line to the comment for the active configuration mode.

```
switch(config-sg-radius-RAD-SV1)#!! x3452
switch(config-sg-radius-RAD-SV1)#
```

---

### 1.1.9.5 **configure (configure terminal)**

The **configure** command places the switch in the Global Configuration mode to configure features at the system level. You can move to Interface Configuration mode and protocol-specific mode from the Global Configuration mode. The command may also be entered as `configure terminal`.

#### **Command Mode**

Privileged EXEC

#### **Command Syntax**

```
configure [terminal]
```

#### **Example**

- This command places the switch in the Global Configuration mode.

```
switch>enable  
switch#configure  
switch(config)#
```

### 1.1.9.6 configure checkpoint

The **configure checkpoint** command saves the running configuration to a checkpoint file. This checkpoint file can be used for restoring the current running configuration in future, if required.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
configure checkpoint {restore checkpoint_name | save [checkpoint_name]}
```

#### Parameters

- *restore checkpoint\_name* restores the running configuration from the specified checkpoint file.
- *save checkpoint\_name* saves running configuration to the specified checkpoint file.

#### Guidelines

If the filename already exists, EOS overwrites the filename. If the command is entered without a checkpoint name, the switch automatically saves the checkpoint under the name ckp-date-number where date is the date in YYYYMMDD format and number increments by one for each automatically named checkpoint file.

#### Examples

- This command saves **running-config** to the *ca\_test* checkpoint file.

```
switch#configure checkpoint save ca_test
```

- This command restores the **running-config** from the *ca\_test* checkpoint file.

```
switch#configure checkpoint restore ca_test
! Preserving static routes. Use 'no ip routing delete-static-routes' to
clear
them.
```

- This command saves **running-config** to the *13Aug2018* checkpoint file. The *dir* command shows the contents of the checkpoint directory.

```
switch#configure checkpoint save
switch#dir checkpoint:
Directory of checkpoint:/
-rw-          7426          Aug 13 12:00  ckp-20180813-17
-rw-          7588          Aug 13 12:10  ckp-20180813-18
-rw-          8499          Aug 13 12:13  ckp-20180813-19
-rw-          8499          Aug 13 12:13  ckp-20180813-20
```

---

### 1.1.9.7 **configure convert**

The **configure convert** command converts the current configuration syntax to the specified syntax.

#### **Command Mode**

Privileged EXEC

#### **Command Syntax**

```
configure convert new-syntax
```

#### **Parameter**

new-syntax converts **running-config** to the current version of EOS.

#### **Example:**

This command converts running-config to the current version of EOS.

```
switch#configure convert new-syntax

WARNING!
Converting existing configuration to new syntax will lose backward
compatibility.
Make sure you won't downgrade to releases that only support the old
syntaxes.

Proceed [ y/n ]
```

### 1.1.9.8 **configure network**

The **configure network** command is deprecated. Use the **copy <url> running-config** command to configure the switch from a local file or network location.

---

### 1.1.9.9 copy running-config

The current operating configuration of the switch is stored in a virtual file called running-config. The copy running-config command saves the contents of the running-config virtual file to a new location.

#### Command Mode

Privileged EXEC

#### Command Syntax

**copy running-config DESTINATION**

#### Parameters

- **DESTINATION** destination for the contents of the running-config file. Values include:
  - **startup-config** the configuration file that the switch loads when it boots.

The **copy running-config**, **startup-config**, and **write** commands are equivalent.

- **file:** a file in the switch file directory.
- **flash:** a file in flash memory.
- **url** any valid URL.

The **copy running-config url** and **write network url** commands are equivalent.

#### Examples

- This command copies running-config to the startup-config file.

```
switch#copy running-config startup-config
switch#
```

- This command copies running-config to a file called *rc20110617* in the dev subdirectory of the switch directory.

```
switch#copy running-config file:dev/rc20110617
switch#
```

### 1.1.9.10 daemon

The **daemon** command accesses daemon configuration mode for adding or removing external daemons and scripts, which are then managed by ProcMgr.

The **no daemon** and **default daemon** commands delete the daemon by removing the corresponding **daemon** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
daemon daemon_name
```

```
no daemon daemon_name
```

```
default daemon daemon_name
```

#### Parameters

- *daemon\_name* label that references the daemon configuration mode.

#### Example

These commands enters daemon configuration mode and initiates the daemon script.

```
switch(config)#daemon process1
switch(config-daemon-process1)#command process-script -i -m
switch(config-daemon-process1)#
```

---

### 1.1.9.11 **delay**

The **delay** command specifies the time in seconds the system will delay between a triggering event and the execution of an event handler action. The default delay is 20 seconds.

#### **Command Mode**

Event-Handler Configuration

#### **Command Syntax**

`delay seconds`

#### **Parameters**

*seconds* number of seconds to delay before executing the action. The default is 20.

#### **Example**

This command configures the event handler Eth5 to delay 10 seconds before executing.

```
switch(config-handler-Eth5)#delay 10
switch(config-handler-Eth5)#
```

### 1.1.9.12 dir

The `dir` command displays a list of files on a file system.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
dir [SCOPE][FILE TYPE]
```

#### Parameters

- **SCOPE** the files to display. Options include
  - `<no parameter>` lists normal files in current directory.
  - `/all` list all files, including hidden files.
  - `/recursive` list files recursively.
- **FILE TYPE** The options include:
  - `<no parameter>` lists undeleted files.
  - `all_filesystems` list files on all filesystems including deleted files, undeleted files, and files with errors.
  - `extensions` directory or file name.
  - `file` directory or file name.
  - `flash` directory or file name.
  - `supervisor-peer` directory or file name.
  - `system` directory or file name.
  - `usb1` directory or file name.

#### Example

This command displays the flash directory.

```
switch# dir flash:
Directory of flash:/

-rwx  293409892      Oct 23 08:55  EOS-4.11.0.swi
-rwx  221274543      Sep  6 13:37  EOS-4.7.5.swi
-rwx  271453650      Sep  4 19:13  EOS_4.10.1-SSO.swi
-rwx   135168        Dec 31  1979  FSCK0000.REC
-rwx         26      Oct 23 13:51  boot-config
-rwx   8570          Sep 10 12:22  cfg_sso_mst
-rwx   5642          Sep 20 10:35  config.reset
drwx   4096          Oct 23 13:59  debug
-rwx    12          Oct 23 13:56  kernel-params
drwx   4096          Oct 23 14:59  persist
drwx   4096          Sep  6 14:50  schedule
-rwx   5970          Oct 23 13:53  startup-config

switch#
```

---

### 1.1.9.13 **disable**

The **disable** command exchanges the session's current command mode with the specified privilege level.

#### **Command Mode**

Privileged EXEC

#### **Command Syntax**

```
disable [PRIVILEGE_LEVEL]
```

#### **Parameters**

**PRIVILEGE\_LEVEL** Session's new privilege level. Value ranges from 0 to 15. Levels 2 through 15 place the switch in Privileged EXEC mode. Values of 0 or 1 leave the switch in EXEC mode.

- *<no parameter>* Session is assigned default level of 1.
- *<0 to 15>* Specifies session level.

#### **Restrictions**

New privilege level must be less than the session's current level.

#### **Example**

This command exits Privileged EXEC mode level of 15 to enter EXEC mode level 1.

```
switch# disable  
switch>
```

### 1.1.9.14 enable

The **enable** command places the switch in Privileged EXEC mode. If an **enable** password is set, the CLI displays a password prompt when a user enters the **enable** command. If the user enters an incorrect password three times, the CLI displays the EXEC mode prompt.

To set a local **enable** password, use the **enable password** command.

#### Command Mode

EXEC

#### Command Syntax

```
enable [PRIVILEGE_LEVEL]
```

#### Parameters

- **PRIVILEGE\_LEVEL** Session's privilege level. Values range from 0 to 15. Values of 0 or 1 places the switch in EXEC mode. Any level above 1 leaves the switch in Privileged EXEC mode.
  - *<no parameter>* Session is assigned default level of 15.
  - **<0 to 15>** Specifies session level.

#### Example

This command places the switch in Privileged EXEC mode with the default privilege level of 15.

```
switch>enable  
switch#
```

---

### 1.1.9.15 end

The **end** command exits to Privileged Exec mode from any Configuration mode. If the switch is in a group-change mode (such as ACL-Configuration mode or MST-Configuration mode), the **end** command also saves all pending changes made in that mode to **running-config**.

#### Command Mode

All configuration modes

#### Command Syntax

```
end
```

#### Example

This command exits to Privileged Exec mode.

```
switch(config-if-Et25) #end  
switch#
```

### 1.1.9.16 event-handler DropCountersHandler

The **event-handler DropCountersHandler** command enables the adverse drop counters monitor with event handlers. The DropCountersHandler event handler is enabled by default, and can be customized for duration of time window and threshold levels.

The **no event-handler DropCountersHandler** command disables the adverse drop counters monitor with event handlers. The **default event-handler DropCountersHandler** command resets the DropCountersHandler event handler to the system default.

#### Command Mode

Global Configuration

#### Command Syntax

```
event-handler DropCountersHandler
no event-handler DropCountersHandler
default event-handler DropCountersHandler
```

#### Examples

- These commands customize the delay, polling interval, and condition for width (-w), violation count (-c), and threshold (-t) of this event handler. Each parameter may be customized separately, with all other parameters remaining unchanged.

```
switch(config)#event-handler DropCountersHandler
switch(config-DropCountersHandler)#action bash DropCounterLog.py -l
switch(config-DropCountersHandler)#delay 0
switch(config-DropCountersHandler)#trigger on-counters
switch(config-DropCountersHandler-counters)#poll interval 60
switch(config-DropCountersHandler-counters)#condition
bashCmd."DropCounterMonitor.py" -w 800" > 0
switch(config-DropCountersHandler-counters)#condition
bashCmd."DropCounterMonitor.py" -c 5" > 0
switch(config-DropCountersHandler-counters)#condition
bashCmd."DropCounterMonitor.py" -t 200" > 0
switch(config-DropCountersHandler-counters)#
```

- This command disables this event handler.

```
switch(config)#no event-handler DropCountersHandler
switch(config)#
```

---

### 1.1.9.17 event-handler

An event handler executes a Linux Bash shell command in response to a specific system event. An event handler consists of a Bash command, a trigger and a delay; when the trigger event occurs, the action is scheduled to run after *delay* seconds.

The **event-handler** command places the switch in event-handler configuration mode for the specified event handler. If the named event handler does not already exist, this command creates it. Event-handler configuration mode is a group change mode that configures event handlers.

Changes made in a group change mode are saved by leaving the mode through the **exit** command or by entering another configuration mode.

These commands are available in event-handler configuration mode:

- [action bash](#)
- [delay](#)
- [trigger](#)

The **no event-handler** and **default event-handler** commands delete the specified event handler by removing it from *running config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
event-handler name
```

```
no event-handler name
```

```
default event-handler name
```

#### Parameters

*name* name of the event handler to be configured. If the named event handler does not already exist, this command will create it.

#### Example

This command places the switch in event-handler configuration mode for an event handler called “*Eth\_5*”.

```
switch(config)#event-handler Eth_5
switch(config-handler-Eth_5)#
```

### 1.1.9.18 exit

The exit command places the switch in the parent of the command mode from which the exit command was entered.

- When used in Global configuration, the switch enters Privileged EXEC mode.
- When used in EXEC or Privileged EXEC mode, the `exit` command terminates the user session.
- When the command is used in a group-change mode (such as ACL-Configuration mode or MST-Configuration mode), the `exit` command also applies all pending changes made in that mode.

#### Command Mode

All modes

#### Command Syntax

```
exit
```

#### Examples

- This command exits Global Configuration mode to Privileged EXEC mode.

```
switch(config)#exit  
switch#
```

- This command terminates the user session.

```
switch#exit
```

---

### 1.1.9.19 ip ftp client source-interface

By default, the FTP (File Transfer Protocol) source IP address is selected by the switch (the IP address of the source interface if one is assigned). The `ip ftp client source-interface` command allows the user to override the default FTP source address.

The `ip ftp client source-interface` and `ip ftp source-interface` commands are functionally equivalent. In each case, `ip ftp client source-interface` is stored in *running-config*.

The `no ip ftp client source-interface` and `default ip ftp client source-interface` commands restore default behavior by removing the `ip ftp client source-interface` statement from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip ftp [client] source-interface INTERFACE [vrf vrf_name]  
no ip ftp [client] source-interface  
default ip ftp [client] source-interface
```

#### Parameters

- *client* Parameter has no functional effect.
- INTERFACE Interface providing the IP address. Options include:
  - ethernet *e\_num* Ethernet interface specified by *e\_num*.
  - loopback *l\_num* Loopback interface specified by *l\_num*.
  - management *m\_num* Management interface specified by *m\_num*.
  - port-channel *p\_num* Port-channel interface specified by *p\_num*.
  - tunnel *t\_num* Tunnel interface specified by *t\_num*.
  - vlan *v\_num* VLAN interface specified by *v\_num*.
- *vrf vrf\_name* Uses the specified user-defined VRF.

#### Examples

- These commands configure the `10.10.121.15` as the source IP address the switch uses when communicating with FTP servers.

```
switch(config)#interface ethernet 17  
switch(config-if-Et17)#ip address 10.10.121.15/24  
switch(config-if-Et17)#ip ftp client source-interface ethernet 17  
switch(config)#
```

- This command configures the switch to use `interface tunnel 45` and `vrf vrf01` when communicating with FTP servers.

```
switch(config)#ip ftp client source-interface tunnel 45 vrf vrf01  
switch(config)#
```

### 1.1.9.20 ip http client local-interface

The `ip http client local-interface` command specifies the source IP address for hypertext transfer protocol (HTTP) connections. By default, the source IP address is selected by the switch when this command is not configured or when the specified interface is not assigned an IP address.

The `no ip http client local-interface` and `default ip http client local-interface` commands restore default behavior by removing the `ip http client local-interface` statement from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip http client local-interface INTERFACE [vrf vrf_name]
```

```
no ip http client local-interface
```

```
default ip http client local-interface
```

#### Parameters

- **INTERFACE** Interface providing the IP address. Options include:
  - ethernet *e\_num* Ethernet interface specified by *e\_num*.
  - loopback *l\_num* Loopback interface specified by *l\_num*.
  - management *m\_num* Management interface specified by *m\_num*.
  - port-channel *p\_num* Port-channel interface specified by *p\_num*.
  - vlan *v\_num* VLAN interface specified by *v\_num*.
- vrf *vrf\_name* Uses the specified user-defined VRF.

#### Examples

- These commands configure the *10.15.17.9* as the source IP address the switch uses when communicating with HTTP servers.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip address 10.15.17.9/24
switch(config-if-Vl10)#ip http client local-interface vlan 10
switch(config)#
```

- This command configures the switch to use *interface tunnel 45* and *vrf vrf01* when communicating with HTTP servers.

```
switch(config)#ip http client local-interface tunnel 45 vrf vrf01
switch(config)#
```

---

### 1.1.9.21 ip ssh client source-interface

The `ip ssh client source-interface` command specifies the source IP address for secure shell (SSH) connections. By default, the source IP address is selected by the switch when this command is not configured or when the specified interface is not assigned an IP address.

The `ip ssh client source-interface` and `ip ssh source-interface` commands are functionally equivalent. In each case, `ip ssh client source-interface` is stored in *running-config*.

The `no ip ssh client source-interface` and `default ip ssh client source-interface` commands restore default behavior by removing the `ip ssh client source-interface` statement from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip ssh [client] source-interface INTERFACE [vrf vrf_name]
```

```
no ip ssh [client] source-interface
```

```
default ip ssh [client] source-interface
```

#### Parameters

- `client` Parameter has no functional effect.
- `INTERFACE` Interface providing the IP address. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
- `vrf vrf_name` Uses the specified user-defined VRF.

#### Examples

- These commands configure the `10.17.17.9` as the source IP address the switch uses when communicating with SSH servers.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip address 10.17.17.9/24
switch(config-if-Vl10)#ip ssh client source-interface vlan 10
switch(config)#
```

- This command configures the switch to use `interface tunnel 45` and `vrf vrf01` when communicating with SSH servers.

```
switch(config)#ip ssh client source-interface tunnel 45 vrf vrf01
switch(config)#
```

### 1.1.9.22 ip tftp client source-interface

The `ip tftp client source-interface` command specifies the source IP address for Trivial File Transfer Protocol (TFTP) connections. By default, the source IP address is selected by the switch when this command is not configured or when the specified interface is not assigned an IP address.

The `ip tftp client source-interface` and `ip tftp source-interface` commands are functionally equivalent. In each case, `ip tftp client source-interface` is stored in *running-config*.

The `no ip tftp client source-interface` and `default ip tftp client source-interface` commands restore default behavior by removing the `ip tftp client source-interface` statement from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip tftp [client] source-interface INTERFACE [vrf vrf_name]
no ip tftp [client] source-interface
default ip tftp [client] source-interface
```

#### Parameters

- `client` Parameter has no functional effect.
- `INTERFACE` Interface providing the IP address. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
- `vrf vrf_name` Uses the specified user-defined VRF.

#### Examples

- These commands configure the `10.15.17.9` as the source IP address the switch uses when communicating with TFTP servers.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip address 10.15.17.9/24
switch(config-if-Vl10)#ip tftp client source-interface vlan 10
switch(config)#
```

- This command configures the switch to use `interface tunnel 45` and `vrf vrf01` when communicating with TFTP servers.

```
switch(config)#ip tftp client source-interface tunnel 45 vrf vrf01
switch(config)#
```

---

### 1.1.9.23 platform arad lag mode

The **platform arad lag mode** command allows configuration of LAGs with more than 16 members.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform arad lag mode [1024x16 | 256x64 | 512x32]
```

#### Examples

- This command configures 1024 LAGs with 16 members each.

```
switch(config)#platform arad lag mode 1024x16  
! Change will take effect only after switch reboot.  
switch(config)#
```

- This command configures 256 LAGs with 64 members each.

```
switch(config)#platform arad lag mode 256x64  
! Change will take effect only after switch reboot.  
switch(config)#
```

- This command configures 512 LAGs with 32 members each.

```
switch(config)#platform arad lag mode 512x32  
! Change will take effect only after switch reboot.  
switch(config)#
```

### 1.1.9.24 platform sand fabric mode (7500 and 7500E Series)

The `platform sand fabric mode` command specifies the fabric mode under which the switch operates after the next system reload. The command has no operational effect until the switch reloads.

The fabric mode determines the modular switch's fabric performance capabilities and must be compatible with the installed fabric modules. Fabric mode settings include:

- fe600: Supports first-generation fabric modules.
- fe1600: Supports E-Series fabric modules.

 **Note:** Switches that reload in **petraA** forwarding compatibility mode ([platform sand forwarding mode \(7500 and 7500E Series\)](#)) also reload in fe600 fabric mode regardless of the presence of a `platform sand fabric mode` statement in *running-config*.

The switch's fabric mode setting must match the capabilities of its installed fabric modules. Reloading the switch in a different mode may be required after exchanging fabric modules for a different module type. The `show module` command displays the fabric modules in the switch.

Each fabric module is categorized as first-generation or E-Series:

- First-generation fabric modules support all basic switch functions.
- E-Series fabric modules support faster fabric link speeds, greater internal table capacities, and advanced encoding formatting.

E-series fabric modules can operate in **fe600** mode, but are limited to first-generation fabric performance. First-generation modules cannot operate in **fe600** mode. Switches containing both types of modules must be set to **fe600** mode. Best practice is to avoid switch configurations with mixed fabric modules.

When a switch reloads, fabric mode is determined by the following (in order of precedence):

1. Switches reloading in **petraA** forwarding compability mode also reload in **fe600** fabric mode .
2. As specified by the `platform sand fabric mode` statement in *running-config*.
3. The first fabric module that becomes operational as the switch reloads.

In switches with a homogeneous module set, the fabric mode matches its fabric modules. Switches with a mixed set of modules are typically reloaded in **fe600** mode because first generation modules are usually operational before E-Series modules. However, the fabric mode in mixed module switches that are reloading cannot be guaranteed in the absence of the first two conditions.

The `no platform sand fabric mode` and `default platform sand fabric mode` commands remove the `platform sand fabric mode` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform sand fabric mode [MODE_SETTING]
```

```
no platform sand fabric mode
```

```
default platform sand fabric mode
```

#### Parameters

- **MODE\_SETTING** Specifies the switch's fabric mode. Options include:
  - **fe16000** E-Series fabric mode.
  - **fe600** First-generation fabric mode.

#### Example

---

This command configures the switch to reload in fe1600 fabric mode to support E-series fabric modules. After issuing this command, the switch should be reset only after exchanging all switch fabric modules to E-series modules.

```
switch(config)#platform sand fabric mode fe1600
switch(config)#exit
switch#show platform sand compatibility
Configuration      Status
Forwarding mode    None               Arad
Fabric mode        Fe1600            Fe600
switch#
```

### 1.1.9.25 platform sand forwarding mode (7500 and 7500E Series)

The **platform sand forwarding mode** command specifies the forwarding compatibility mode under which the switch operates after the next system reload. The command has no operational effect until the switch reloads.

Forwarding compatibility mode specifies switch forwarding capabilities and configures performance capacity of installed linecards. Forwarding compatibility modes settings include:

- **petraA**: Supports first-generation fabric modules.
- **arad**: Supports E-Series fabric modules.

 **Note:** Switches that reload in **petraA** forwarding compatibility mode also reload in **fe600** fabric mode regardless of the presence of a [platform sand fabric mode \(7500 and 7500E Series\)](#) statement in *running-config*.

This command may be required after exchanging a linecard for a different module type or in switches containing first-generation and E-series linecards. The [show module](#) command displays the linecard modules in the switch.

Each modular switch linecard module is categorized as first-generation or E-Series:

- First-generation linecards support all basic switch functions.
- E-Series linecards support provide faster data processing, greater internal table capacities, and advanced encoding formatting.

The forwarding compatibility mode determines the operational capacity of installed linecards. The following table lists the affect of the forwarding compatibility mode on all linecard module types.

**Table 3: Linecard Module and Forwarding Mode Performance**

Linecard Module Type	Forwarding Software Mode	Linecard Operating Capacity
First-generation	petraA	Linecard performs at first-generation performance capacity.
First-generation	arad	Linecard is powered-down.
E-Series	petraA	Linecard performs at first-generation performance capacity.
E-Series	arad	Linecard performs at E-series performance capacity.

 **Note:** Linecards operate at E-Series performance capacities only on switches that contain E-Series fabric modules and have a fabric mode setting of **fe1600** fabric mode (platform sand fabric mode (7500 and 7500E Series)).

Without a [platform sand fabric mode \(7500 and 7500E Series\)](#) command, forward compatibility mode is determined by the first linecard that becomes operational after reloading the switch. In a switch that is reloaded with a homogeneous module set, forwarding compatibility mode matches its linecards. Switches with a mixed set of modules are typically reloaded in **petraA** mode because first generation modules are usually operational before E-Series modules. However, forwarding compatibility mode in mixed module switches that are reloading is not guaranteed without a **platform sand forwarding mode** command.

The **no platform sand forwarding mode** and **default platform sand forwarding mode** commands restore the **platform sand forwarding mode** command from *running-config*.

#### Command Mode

Global Configuration

---

## Command Syntax

```
platform sand forwarding mode [MODE_SETTING]
no platform sand forwarding mode
default platform sand forwarding mode
```

## Parameters

- **MODE\_SETTING** Specifies the switch's software forwarding mode. Options include:
  - **arad** the switch supports E-Series linecard capabilities.
  - **petraA** the switch supports first-generation linecard capabilities.

## Example

This command changes the forwarding software mode to support E-series linecard modules. This command should be run only after exchanging all linecards to E-series modules.

```
switch(config)#platform sand forwarding mode arad
switch(config)#
```

### 1.1.9.26 platform sand lag hardware-only

The **platform sand lag hardware-only** command specifies that all LAGs will use hardware resources including single member LAGs. Hardware resource allocation and deallocation traffic disruption occurs on the first member addition or deletion, rather than the second member addition or deletion.

The **no platform sand lag hardware-only** and **default platform sand lag hardware-only** commands specify that LAGs are not required to be implemented in hardware, and therefore some LAGs may be implemented in software. Permitting both hardware and software LAGs may increase the total number of port-channels because we have no resource limit on the number of software LAGs.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform sand lag hardware-only
no platform sand lag hardware-only
default platform sand lag hardware-only
```

#### Examples

- This command configures all LAGs to use hardware resources. All existing one member LAGs will be allocated hardware resources, when available.

```
switch(config)#platform sand lag hardware-only
switch(config)#
```

- This command allows certain LAGs (single member LAGs) to not consume hardware resources. All existing one member LAGs will release their hardware resources.

```
switch(config)#no platform sand lag hardware-only
switch(config)#
```

---

### 1.1.9.27 pwd

The **pwd** command displays the working directory.

#### **Command Mode**

Privileged EXEC

#### **Command Syntax**

pwd

#### **Example**

This command shows that the working is Flash.

```
switch# pwd
flash:/
switch#
```

### 1.1.9.28 schedule config

The `schedule config` command sets configuration parameters to the CLI scheduler.

The `no schedule config max-concurrent-jobs` and `default schedule config max-concurrent-jobs` commands reset the limit of maximum concurrent jobs to the default value of 1 by removing the corresponding `schedule config max-concurrent-jobs` statement from `running-config`.

The `no schedule config prepend-hostname-logfile` and `default schedule config prepend-hostname-logfile` commands reset the log filenames to the default state.

#### Command Mode

Global Configuration

#### Command Syntax

```
schedule config{max-concurrent-jobs limit | prepend-hostname-logfile}
```

```
no schedule config {max-concurrent-jobs limit | prepend-hostname-logfile}
```

```
default schedule config {max-concurrent-jobs limit | prepend-hostname-logfile}
```

#### Parameters

- `max-concurrent-jobs limit` specifies the maximum number of concurrent commands that can run on the switch. The maximum concurrent jobs ranges from 1 to 4. The default value is 1.
- `prepend-hostname-logfile` enables prepending hostnames to log filenames. By default, this option is enabled.

#### Examples

- This command configures to concurrently run a maximum of three commands on the switch.

```
switch(config)#schedule config max-concurrent-jobs 3
switch(config)#show schedule summary
Maximum concurrent jobs 3
Prepend host name to logfile: No
Name          At time      Last      Interval  Timeout  Max      Logfile Location
Status
                time      (mins)    (mins)    log
                files
-----
tech-support   now          00:29     60         30        100     flash:schedule/tech-support/
Success
thelp         12:02:00    00:02     60         40        100     flash:schedule/thelp/
Fail
06/05/2018
switch(config)#
```

- This command enables prepending the hostname to log filenames.

```
switch(config)#schedule config prepend-hostname-logfile
switch(config)#show schedule summary
Maximum concurrent jobs 3
Prepend host name to logfile: Yes
Name          At time      Last      Interval  Timeout  Max      Logfile Location
Status
                time      (mins)    (mins)    log
                files
-----
tech-support   now          00:29     60         30        100     flash:schedule/tech-support/
Success
thelp         12:02:00    00:02     60         40        100     flash:schedule/thelp/
Fail
06/05/2018
switch(config)#
```

---

### 1.1.9.29 schedule

The `schedule` command facilitates the periodic execution of a specified CLI command. Command parameters configure the start time of periodic execution, the interval between consecutive execution instances, the maximum time allotted for command execution, and the maximum number of log files that can be created.

The `no schedule` and `default schedule` commands disable execution of the specified command.

#### Command Mode

Global Configuration

#### Command Syntax

```
schedule schedule_name PERIOD {max-log-files count | timeout timeout_interval}{command cmd | logging verbose | loglocation flash;}  
no schedule schedule_name
```

```
no schedule schedule_name
```

```
default schedule schedule_name
```

#### Parameters

- *schedule\_name* Label associated with the scheduled command.
- PERIOD Start time for execution and interval between consecutive execution instances. The interval ranges from 2 to 1440 minutes. The default interval while scheduling the `show tech-support` command is 60 minutes. Options include:
  - at Start time for execution. Options include:
    - *hh:mm:ss interval interval* The command execution starts at the specified time and repeats at the specified interval.
    - *hh:mm:ss mm/dd/yyyy interval interval* The command execution starts at the specified time on the specified day and repeats at the specified interval.
    - *hh:mm:ss once* The command execution starts at the specified time and does not repeat.
    - *hh:mm:ss mm/dd/yyyy once* The command execution starts at the specified time on the specified day and does not repeat.
    - *hh:mm:ss yyyy-mm-dd interval interval* The command execution starts at the specified time on the specified day and repeats at the specified interval.
    - *hh:mm:ss yyyy-mm-dd once* The command execution starts at the specified time on the specified day and does not repeat.
  - interval *interval* The command execution starts immediately and repeats at the specified interval.
  - now interval *interval* The command execution starts immediately and repeats at the specified interval.
- max-log-files *count* Maximum number of log files command generates for command output. The count of maximum log files ranges from 1 to 10000. The default count of maximum log files while scheduling the `show tech-support` command is 100.
- timeout *timeout\_interval* Maximum time allotted for the script execution. The timeout interval ranges from 1 to 480 minutes. The default timeout is 30 minutes.
  - 📌 **Note:** The command execution is terminated if it exceeds the specified timeout interval. The timeout allotted for the scheduled command must not be greater than the corresponding interval.
- command *cmd* The command that needs to be executed.
- logging verbose Sets the logging level to “verbose.” A syslog entry is added after the execution of the scheduled command, regardless of whether the scheduled command has succeeded or failed. In the absence of **logging verbose**, the syslog entry is added only if the execution of the scheduled command fails with an error.
- loglocation *destination* The flash destination for scheduled command output files.

## Guidelines

Log files created by the command are stored in the **flash:/schedule/ *scheduled\_name* /** directory. Empty log files are created for commands that do not generate any output.

## Examples

- This command saves the running configuration contents to the log file every hour with immediate effect and creates a maximum of 24 log files.

```
switch(config)#schedule backup-test interval 60 max-log-files 24
command show running-config
```

- This command starts the script execution at 12:00:00 and repeats every 720 minutes. The script execution is terminated if it exceeds 20 minutes. It generates a maximum of one log file because the specified bash command does not have an output.

```
switch(config)#schedule ms1 at 12:00:00 interval 720 timeout 20 max-
log-files 1 command bash /mnt/flash/myscript.sh
```

- The [show schedule](#) command lists the commands currently scheduled for periodic execution and displays the summary of the specified scheduled command.

```
switch#show schedule summary
Maximum concurrent jobs 1
Prepend host name to logfile: Yes

Name At time Last Interval Timeout Max Logfile Location Status
-----
ms1 now 23:03 720 20 1 flash:/schedule/ms1 Success

switch#
```

---

### 1.1.9.30 show (various configuration modes)

The **show** command, when executed within a configuration mode, can display data in *running-config* for the active configuration mode.

#### Command Mode

All configuration modes except Global Configuration

#### Command Syntax

```
show [DATA_TYPE]
```

#### Parameters

- **DATA\_TYPE** Specifies display contents. Values include:
  - **active** Displays running-config settings for the configuration mode.
  - **active all** Displays running-config plus defaults for the configuration mode.
  - **active all detail** Displays running-config plus defaults for the configuration mode.
  - **comment** Displays comment entered for the configuration mode.

#### Related Commands

The **show** commands in ACL-configuration mode and MST-configuration mode include the **active** and **comment** options along with additional mode-specific options.

#### Example

This command shows the server-group-TACACS+ configuration commands in *running-config*.

```
switch(config-sg-tacacs+-TAC-GR) #show active
  server TAC-1
  server 10.1.4.14
switch(config-sg-tacacs+-TAC-GR) #
```

### 1.1.9.31 show event-handler DropCountersHandler

The show event-handler command displays details of the DropCountersHandler event handler.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show event-handler DropCountersHandler
```

#### Example

This command displays details of this event handler.

```
switch(config)#show event-handler DropCountersHandler
Event-handler DropCountersHandler (BUILT-IN)
Trigger: on-counters delay 0 seconds
  Polling Interval: 60 seconds
  Condition: bashCmd."DropCounterMonitor.py" > 0
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: DropCounterLog.py -l
Action expected to finish in less than 20 seconds
Total Polls: 39
Last Trigger Detection Time: 38 minutes 22 seconds ago
Total Trigger Detections: 1
Last Trigger Activation Time: 38 minutes 22 seconds ago
Total Trigger Activations: 1
Last Action Time: Never
Total Actions: 1

switch(config)#
```

---

### 1.1.9.32 show event-handler

The show event-handler command displays the contents and activation history of a specified event handler or all event handlers.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show event-handler [handler_name]
```

#### Parameters

- *handler\_name* optional name of an event handler to display. If no parameter is entered, the command displays information for all event handlers configured on the system.

#### Example

This command displays information about an event handler called “*eth\_5*”.

```
switch#show event-handler Eth_5
Event-handler Eth_5
Trigger: on-intf Ethernet5 on ip delay 20 seconds
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: :
Device-health Action: None
Action expected to finish in less than 10 seconds
Last Trigger Detection Time: 15 days 2 hours 19 minutes ago
Total Trigger Detections: 1
Last Trigger Activation Time: 15 days 2 hours 19 minutes ago
Total Trigger Activations: 1
Last Action Time: 15 days 2 hours 19 minutes ago
Total Actions: 1
switch#
```

### 1.1.9.33 show module

The **show module** command displays information that identifies the supervisor, fabric, and linecard modules in a modular switch, including model number, serial number, hardware version number, software version (supervisors only), MAC address (supervisors and linecards), and operational status.

#### Command Mode

EXEC

#### Command Syntax

```
show module [MODULE_NAME]
```

#### Parameters

- **MODULE\_NAME** Specifies modules for which data is displayed. Options include:
  - *<no parameter>* All modules (identical to **all** option).
  - *fabric fab\_num* Specified fabric module. Number range varies with switch model.
  - *linecard line\_num* Linecard module. Number range varies with switch model.
  - *supervisor super\_num* Supervisor module. Number range varies with switch model.
  - *mod\_num* Supervisor (1 to 2) or linecard (3 to 18) module.
  - *all* All modules.

#### Related Commands

- [show version](#) displays model and serial numbers of modular system components.

#### Example

- This command displays information about all installed modules on a DCS-7504 switch.

```
switch#show module
Module   Ports Card Type                               Model                               Serial No.
-----
1        2      DCS-7500 Series Supervisor Module    7500-SUP                            JSH11440327
2        1      Standby supervisor                    Unknown                              Unknown
3        48     48-port SFP+ 10GigE Linecard        7548S-LC                             JSH10315938

### 1.1.9.34 show platform sand compatibility

The **show sand platform compatibility** command displays the fabric and forwarding modes. These modes determine switch forwarding capabilities and programs performance capacity of installed linecards

Information that identifies the supervisor, fabric, and linecard modules in the modular switch, including model number, serial number, hardware version number, software version (supervisors only), MAC address (supervisors and linecards), and operational status.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show platform sand compatibility
```

#### Related Commands

- [platform sand fabric mode \(7500 and 7500E Series\)](#) specifies the fabric software mode.
- [platform sand forwarding mode \(7500 and 7500E Series\)](#) specifies the forwarding software mode.

#### Example

This command indicates that the switch is in Fe600 fabric mode and PetraA forwarding mode.

```
switch#show platform sand compatibility
Configuration      Status
Forwarding mode   None             PetraA
Fabric mode       None             Fe600
switch#
```

---

### 1.1.9.35 show platform sand lag hardware-only

The `show platform sand lag hardware-only` command displays whether or not LAGs are hardware-only.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show platform sand lag hardware-only
```

#### Examples

- This command indicates that LAGs are hardware-only.

```
switch(config)#platform sand lag hardware-only
switch(config)#exit
switch#show platform sand lag hardware-only
Hardware resources are used for all LAGs: True
switch#
```

- This command indicates that LAGs are not hardware-only.

```
switch(config)#no platform sand lag hardware-only
switch(config)#exit
switch#show platform sand lag hardware-only
Hardware resources are used for all LAGs: False
switch#
```

### 1.1.9.36 show schedule

The **show schedule** command displays logging output on the terminal during the current terminal session. This command affects only the local monitor. The **no terminal monitor** command disables direct monitor display of logging output for the current terminal session.

The **show schedule** command displays the list of active scheduled commands and the summary of specified scheduled command.

#### Command Mode

Global Configuration

#### Command Syntax

```
show schedule {schedule_name | summary}
```

#### Parameters

- *schedule\_name* displays the summary of the specified scheduled command
- **summary** displays the list of active scheduled commands

#### Examples

- This command displays the summary of the “thelp” schedule.

```
switch(config)#show schedule thelp
The last CLI command failed with exit status 1
CLI command "show THelp" is scheduled next at "02:02:35 06/19/2018", interval is
60 minutes
Timeout is 40 minutes
Maximum of 100 log files will be stored
Verbose logging is off
100 log files currently stored in flash:/schedule/thelp

Start time          Size          Filename
-----
Jun 19 2018 01:02   60.0 bytes   ro301_thelp_2018-06-19.0102.log.gz

Jun 18 2018 23:02   60.0 bytes   ro301_thelp_2018-06-18.2302.log.gz
Jun 18 2018 22:02   60.0 bytes   ro301_thelp_2018-06-18.2202.log.gz
Jun 18 2018 21:02   60.0 bytes   ro301_thelp_2018-06-18.2102.log.gz

switch(config)#
```

- This command displays the summary of scheduled commands.

```
switch(config)#show schedule summary
Maximum concurrent jobs 1
Prepend host name to logfile: Yes
Name          At time      Last      Interval  Timeout    Max      Logfile Location
Status
              time        (mins)    (mins)    log
              files
-----
tech-support   now         00:29     60        30        100     flash:schedule/tech-support/
Success
thelp         12:02:00   00:02     60        40        100     flash:schedule/thelp/
Fail
06/05/2018
switch(config)#
```

---

### 1.1.9.37 show version

The **show version** command displays information that identifies the switch, including its model number, serial number, and system MAC address. The command also provides hardware and software manufacturing information, along with the available memory and elapsed time from the most recent reload procedure.

#### Command Mode

EXEC

#### Command Syntax

```
show version [INFO_LEVEL]
```

#### Parameters

- **INFO\_LEVEL** Specifies information the command displays. Options include
  - *<no parameter>* Model and serial numbers, manufacturing data, uptime, and memory.
  - **detail** Data listed *<no parameter>* option plus version numbers of internal components.

#### Related Command

[show module](#) displays model and serial numbers of modular system components.

#### Example

This command displays the switch's model number, serial number, hardware and software manufacturing information, uptime, and memory capacity.

```
switch>show version
Arista DCS-7150S-64-CL-F
Hardware version:    01.01
Serial number:      JPE13120819
System MAC address: 001c.7326.fd0c

Software image version: 4.13.2F
Architecture:         i386
Internal build version: 4.13.2F-1649184.4132F.2
Internal build ID:    eeb3c212-b4bd-4c19-ba34-1b0aa36e43f1

Uptime:              1 hour and 36 minutes
Total memory:        4017088 kB
Free memory:         1473280 kB

switch>
```

### 1.1.9.38 terminal length

The terminal length command overrides automatic pagination and sets pagination length for all show commands on a terminal. If the output of a show command is longer than the configured terminal length, the output will be paused after each screenful of output, prompting the user to continue.

To disable pagination for an SSH session, set terminal length to 0. By default, all console sessions have pagination disabled.

The no terminal length and **default terminal length** commands restore automatic pagination by removing the terminal length command from *running-config*.

The pagination setting is persistent if configured from Global Configuration mode. If configured from EXEC mode, the setting applies only to the current CLI session. Pagination settings may also be overridden when you adjust the size of the SSH terminal window, but can be reconfigured by running the terminal length command again.

#### Command Mode

EXEC

#### Command Syntax

```
terminal length lines
```

```
no terminal length
```

```
default terminal length
```

#### Parameters

*lines* number of lines to be displayed at a time. Values range from 0 through 32767. A value of 0 disables pagination.

#### Examples

- This command sets the pagination length for the current terminal session to 10 lines.

```
switch#terminal length 10  
Pagination set to 10 lines.
```

- This command configures the switch to paginate terminal output automatically based on screen size for the current terminal session.

```
switch#no terminal length
```

- These commands disable pagination globally.

```
switch#configure  
switch(config)#terminal length 0  
Pagination disabled.
```

---

### 1.1.9.39 terminal monitor

The terminal monitor command enables the display of logging output on the terminal during the current terminal session. This command affects only the local monitor. The no terminal monitor command disables direct monitor display of logging output for the current terminal session.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
terminal monitor
```

```
no terminal monitor
```

```
default terminal monitor
```

#### Example

This command enables the display of logging to the local monitor during the current terminal session.

```
switch#terminal monitor  
switch#
```

### 1.1.9.40 trigger

The **trigger** command specifies what event will trigger the event handler. Handlers can be triggered either by the system booting or by a change in a specified interface's IP address or operational status.

To specify the action to be taken when the handler is triggered, use the [action bash](#) command.

#### Command Mode

Event-Handler Configuration

#### Command Syntax

```
trigger EVENT
```

#### Parameters

- **EVENT** event which will trigger the configuration mode event handler. Values include:
  - **onboot** triggers when the system reboots, or when you exit event-handler configuration mode. This option takes no further arguments, and passes no environment variables to the action triggered.
    - **on-intf INTERFACE CHANGE** triggers when a change is made to the specified interface.
    - **on-startup-config** triggers when a change is made to the **startup-config** file.
    - **vm-tracer vm** triggers when a virtual machine monitored by VM Tracer changes state.
- **INTERFACE** the triggering interface. Values include:
  - **ethernet number** Ethernet interface specified by *number*.
  - **loopback number** loopback interface specified by *number*.
  - **management number** management interface specified by *number*.
  - **port-channel number** channel group interface specified by *number*.
  - **vlan number** VLAN interface specified by *number*.
- **CHANGE** the change being watched for in the triggering interface. Values include:
  - **ip** triggers when the IPv4 address of the specified interface is changed.
  - **ip6** triggers when the IPv6 address of the specified interface is changed.
  - **operstatus** triggers when the operational status of the specified interface changes.

#### Examples

- This command configures the event handler “*Eth5*” to be triggered when there is a change in the operational status or IP address of *Ethernet interface 5*.

```
switch(config-handler-Eth5)#trigger on-intf Ethernet 5 operstatus ip
switch(config-handler-Eth5)#
```

- This command configures the event handler “onStartup” to be triggered when the system boots, or on exiting event-handler configuration mode.

```
switch(config-handler-onStartup)#trigger onboot
switch(config-handler-onStartup)#
```

## Booting the Switch

---

This chapter describes the switch boot process, describes configuration options, and lists the components it requires, including the boot loader, the boot loader shell, and other configuration files.

This chapter includes the following sections:

- [Boot Loader About](#)
- [Configuration Files](#)
- [Supervisor Redundancy](#)
- [System Reset](#)
- [Aboot Shell](#)
- [Aboot Configuration Commands](#)
- [Switch Booting Commands](#)

### 2.1 Boot Loader About

Aboot is the boot loader for Arista switches. In addition to booting the switch EOS, Aboot provides a shell for changing boot parameters, restoring default switch settings, diagnosing hardware problems, and managing switch files. [Aboot Shell](#) describes the Aboot shell.

The boot process loads an EOS image file, initiates switch processes, performs self tests, restores interface settings, and configures other network parameters. The replacement image file can be in the switch's flash or on a device in the flash drive port. Configuration files stored in flash memory specify boot parameters.

Aboot supports most available USB flash drive models. The flash drive must be formatted with the FAT or VFAT file system. Windows NT File System (NTFS) is not supported.

Aboot initiates a system reboot upon a `reLoad` command or by restoring power to the switch. Before loading the EOS image file, Aboot provides an option to enter the Aboot shell. The user can either enter the shell to modify boot parameters or allow the switch to boot.

The boot process can be monitored through a terminal connected to the console port. The console port is configured to interact with the terminal by configuration file settings.

### 2.2 Configuration Files

Three files define boot and running configuration parameters.

- ***boot-config***: contains the location and name of the image to be loaded.
- ***running-config***: contains the current switch configuration.
- ***startup-config***: contains the switch configuration that is loaded when the switch boots.

The ***running-config*** and ***startup-config*** are different from one another when configuration changes have not been saved since the last boot.

#### 2.2.1 boot-config

The ***boot-config*** file is an ASCII file that Aboot uses to configure console communication settings, locate the EOS flash image, and specify initial network configuration settings.

---

About attempts to boot the EOS flash software image (with the extension `.swi`) referenced by **boot-config** if the user does not interrupt the boot process. See [About Shell](#) describes how About uses **boot-config**.

You can view and edit the **boot-config** file contents. Viewing and editing options include:

- View **boot-config** file contents with the `more boot-config` command:

```
switch(config)#more boot-config
SWI=flash:/EOS.swi
CONSOLESPPEED=2400
About password (encrypted): $1$A8dZ3GLZ$knKrBpTyg5dhmtGdCdwNM.
switch(config)#
```

- View **boot-config** settings with the `show boot-config` command:

```
switch(config)#show boot-config
Software image: flash:/EOS.swi
Console speed: 2400
About password (encrypted): $1$A8dZ3GLZ$knKrBpTyg5dhmtGdCdwNM.
Memory test iterations: (not set)
switch(config)#
```

- Modify file settings from the command line with EOS `boot` commands.

See [Programming boot-config from the CLI](#) for a list of `boot` commands.

- Edit the file directly by using `vi` from the Bash shell.

See [boot-config Command Line Content](#) for a list of **boot-config** parameters.

### 2.2.1.1 boot-config File Structure

Each line in the **boot-config** file specifies a configuration setting and has this format:

NAME=VALUE

- NAME is the parameter label.
- VALUE indicates the parameter's bootup setting.

The NAME and VALUE fields cannot contain spaces.

About ignores blank lines and lines that begin with a `#` character.

### 2.2.1.2 boot-config Command Line Content

About configuration commands that **boot-config** files can contain include:

- **SWI** specifies the location and file name of the EOS image file that About loads when booting, using the same format as the boot command to designate a local or network path.

#### Example

```
SWI=flash:EOS.swi           <---flash drive location
SWI=usb1:/EOS1.swi         <---USB drive location
SWI=file:/tmp/EOSexp.swi   <---switch directory location
SWI=/mnt/flash/EOS.swi
SWI=http://foo.com/images/EOS.swi
SWI=ftp://foo.com/images/EOS.swi
SWI=tftp://foo.com/EOS.swi
SWI=nfs://foo.com/images/EOS.swi
```

- **CONSOLE SPEED** specifies the console baud rate. To communicate with the switch, the connected terminal must match the specified rate. Baud rates options include 1200, 2400, 4800, 9600, 19200, 38400, 57600, and 115200. The default baud rate is 9600.

#### Example

```
CONSOLE SPEED=19200
```

- **PASSWORD (ABOOT)** specifies the Aboot password, as described in [Accessing the Aboot Shell](#). If **boot-config** does not contain a **PASSWORD** command, the Aboot shell does not require a password.

#### Example

```
PASSWORD=$1$CdWp5wfe$PzNtE3ujBoFEL8vjCq7jo/
```

- **NET commands** are used by Aboot during switch booting to configure the network interface that will be used for switch configuration. These commands can also be entered manually in Aboot.

**NETDEV** indicates which network interface is being configured. If **boot-config** does not contain a **NETDEV** command, the booting process does not attempt to configure a network interface. Other **NET** commands specify settings that Aboot uses to configure the interface.

#### Examples

This **NETDEV** command specifies management port 1 as the network interface to be configured by **boot-config**:

```
NETDEV=ma1
```

This **NETAUTO** command instructs the switch to configure the network interface through a DHCP server, ignoring other **NET** settings:

```
NETAUTO=dhcp
```

These **NET** commands configure the network interface:

```
NETIP=10.12.15.10
NETMASK=255.255.255.0
NETGW=10.12.15.24
NETDOMAIN=mycompany.com
NETDNS=10.12.15.13
```

### 2.2.1.3 Programming boot-config from the CLI

The switch CLI provides **boot** commands for editing **boot-config** contents. The **boot** commands are not accessible from a console port CLI. Parameters not configurable from a **boot** command can be modified by directly editing the **boot-config** file.

Commands that configure boot parameters include **boot system**, **boot secret**, and **boot console**.

#### boot system

The **boot system** command provides the EOS image file location to Aboot.

#### Examples

- This command specifies EOS1.swi on USB flash memory as the software image load file.

```
switch(config)#boot system usb1:EOS1.swi
switch(config)#
```

---

The **boot system** command above adds this line to **boot-config**.

```
SWI=usb1:/EOS1.swi
```

- This command designates EOS.swi, on the switch flash, as the EOS software image load file.

```
switch(config)#boot system flash:EOS.swi  
switch(config)#
```

The **boot system** command above adds this line to **boot-config**:

```
SWI=flash:/EOS.swi
```

## boot secret

The **boot secret** command sets the Aboot password.

### Examples

- These equivalent commands set the Aboot password to xr19v.

```
switch(config)#boot secret xr19v  
switch(config)#
```

```
switch(config)#boot secret 0 xr19v  
switch(config)#
```

- This command shows the password that has been set.

```
switch(config)#show boot-config  
Software image: flash:/EOS.swi  
Console speed: (not set)  
Aboot password (encrypted): $1$k9YHFW8D$cgM8DSN.e/yY0p3k3RUvk.  
switch(config)#
```

The **boot secret** commands above add this line to **boot-config**:

```
PASSWORD=$1$k9YHFW8D$cgM8DSN.e/yY0p3k3RUvk.
```

The user must enter xr19v at the login prompt to access the Aboot shell.

- This command sets the Aboot password to xr123. The encrypted string was previously generated with xr123 as the clear-text seed.

```
switch(config)#boot secret 5 $1$QfbYkVWb$PIXG0udEquW0wOSiZBN3D/  
switch(config)#
```

- This command shows the password that has been set.

```
switch(config)#show boot-config  
Software image: flash:/EOS.swi  
Console speed: (not set)  
Aboot password (encrypted): $1$QfbYkVWb$PIXG0udEquW0wOSiZBN3D/  
switch(config)#
```

The **boot secret** command above adds this line to **boot-config**:

```
PASSWORD=$1$QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
```

The user must enter xr123 at the login prompt to access the Aboot shell.

- This command removes the About password; subsequent About access is not authenticated.

```
switch(config)#no boot secret
switch(config)#
```

This command shows that there is now no About password.

```
switch(config)#show boot-config
Software image: flash:/EOS.swi
Console speed: (not set)
About password (encrypted): (not set)
switch(config)#
```

### boot console

The `boot console` command sets console settings for attaching devices.

#### Examples

- This command sets the console speed to 4800 baud:

```
switch(config)#boot console speed 4800
switch(config)#
```

This command shows the console speed.

```
switch(config)#show boot-config
Software image: flash:/EOS.swi
Console speed: 4800
About password (encrypted): (not set)
switch(config)#
```

The `boot console` command above adds this line to *boot-config*:

```
CONSOLESPPEED=4800
```

## 2.2.2 running-config

The *running-config* is a virtual file that contains the system's operating configuration, formatted as a command sequence. Commands entered from the CLI modify *running-config*, and copying a file to *running-config* updates the operating configuration by executing the commands in the copied file.

Commands for viewing and copying *running-config* include:

- `show running-config` displays the contents of *running-config*.
- `copy running-config startup-config` copies *running-config* contents to *startup-config*.
- `write` copies *running-config* contents to *startup-config*.

## 2.2.3 startup-config

The *startup-config* file is stored in flash memory and contains the configuration that the switch loads when booting. During a switch boot, *running-config* is replaced by *startup-config*. Changes to *running-config* that are not copied to *startup-config* are lost when the system reboots.

Commands affecting *startup-config* include:

- `show startup-config` displays the contents of *startup-config*.
- `copy file_name startup-config` copies contents of the specified file to *startup-config*.
- `delete startup-config` deletes the *startup-config* file.

---

## 2.3 Supervisor Redundancy

On modular switches with redundant supervisor modules, control of the switch can be transferred to the standby supervisor to minimize downtime and data loss in the case of a reset, reload, or failure of the active supervisor. How the switchover takes place is determined by the redundancy protocol configured on the active supervisor.

To display the state and the current redundancy protocol of both supervisors, use the `show redundancy status` command. To display the state of configuration file synchronization between the supervisors, use the `show redundancy file-replication` command.

### 2.3.1 Redundancy Supervisor Protocols

There are three available supervisor redundancy protocols.

#### Route Processor Redundancy (RPR)

The default redundancy protocol is Route Processor Redundancy (RPR), which synchronizes **startup-config** files between the supervisor modules and partially boots the standby supervisor to a standby warm state, but does not synchronize **running-config**. If the active supervisor fails, or a manual switchover is initiated with the `redundancy manual switchover` command, the standby supervisor will become active. Running state, including spanning tree, is lost, and all links are temporarily brought down.

Under RPR, the CLI of the standby supervisor can be accessed by SSH or through the console port, but the available command set is limited. Any configuration changes made to the standby supervisor will be lost when the supervisor reboots.

#### Stateful Switchover (SSO)

In Stateful Switchover (SSO) protocol, the switch synchronizes both **startup-config** and **running-config** files between the supervisor modules and fully boots the standby module to a standby hot state to speed the switchover process and minimize packet loss. If the active supervisor fails, or a manual switchover is initiated, the standby supervisor immediately becomes active, and L2 running state is maintained. An SSO switchover is largely transparent from the outside, but because L3 state is not synchronized the switchover can result in traffic loss for traffic forwarded on routes learned by a dynamic routing protocol. Enabling nonstop forwarding can eliminate most packet loss for BGP and OSPF.

Under SSO, the CLI of the standby supervisor can be accessed only through the console port, and the command set is limited. Any configuration changes made on the standby supervisor will be lost when the supervisor reboots.

**Note:** When upgrading the EOS on a dual-supervisor switch to an SSO-capable version (4.11.0 or higher) from a version that does not support SSO, both supervisors will reset simultaneously, causing several seconds of system downtime.

#### Simplex

When the switch is set to simplex protocol, the standby supervisor is disabled and switchover will not occur even if the active supervisor fails. Reloading the active supervisor results in system downtime while the supervisor reboots, and the standby supervisor remains disabled. To transfer control of the switch to the standby supervisor, the redundancy protocol must be changed to RPR or SSO.

Under simplex protocol, the CLI of the disabled supervisor can be accessed only through the console port, and the command set is limited. Any configuration changes made on the standby supervisor will be lost when the supervisor reboots.

## 2.3.2 Configuring Supervisor Redundancy

The supervisor redundancy protocol is configured using the `protocol` command in redundancy configuration mode (accessed with the `redundancy` command).

Changing the redundancy protocol on the active supervisor resets the standby supervisor regardless of redundancy protocol, and executing the `write` command on the active supervisor synchronizes the *startup-config* files between supervisors in RPR and SSO modes.

### Examples

- These commands display the current redundancy state of the switch and the most recent file synchronization information.

```
switch#show redundancy state
  my state = ACTIVE
  peer state = STANDBY WARM
    Unit = Primary
    Unit ID = 1

Redundancy Protocol (Operational) = Route Processor Redundancy
Redundancy Protocol (Configured) = Route Processor Redundancy
Communications = Up
Ready for switchover

  Last switchover time = 7:23:56 ago
  Last switchover reason = Supervisor has control of the active
  supervisor lock
switch#show redundancy file-replication
0 files unsynchronized, 2 files synchronized, 0 files failed, 2 files
total.
```

File	Status	Last Synchronized
file:persist/sys	Synchronized	0:10:04 ago
flash:startup-config	Synchronized	0:10:04 ago

```
switch#
```

- These commands set the redundancy protocol for the active supervisor to stateful switchover (SSO).

```
switch#config
switch(config)#redundancy
switch(config-redundancy)#protocol sso
Peer supervisor will be restarted.
switch(config-redundancy)#
```

## 2.4 System Reset

When a reset condition exists, Aboot can either reset the switch without user intervention or facilitate a manual reset through the Aboot shell. A reset operation clears the switch, including memory states and other hardware logic

- **Fixed systems:** the power supply remains powered up through the reset. Power is removed from all other switch components for two to five seconds.
- **Modular systems:** the power supply on the active supervisor remains powered up through the reset. Power is removed from all other supervisor components for at least one second. In Stateful Switchover (SSO) and Route Processor Redundancy (RPR) modes, resetting the standby supervisor has no effect on the active supervisor, but resetting the active supervisor causes the

---

standby supervisor to immediately become active. After the supervisor becomes functional, it manages the power-cycling of all line cards.

The `reload` command initiates an immediate reset, terminating all CLI instances not running through the console port. The console port CLI displays messages that the switch generates during a reset. On modular switches with redundant supervisors, CLI sessions on the standby supervisor are not terminated.

The `reload (scheduled)` command schedules a reset operation to initiate at a specific time or after a specified period.

## 2.4.1 Typical Reset Sequence

The `reload` command power cycles the switch, then resets it under Aboot control. The hard reset clears the switch, including memory states and other hardware logic.

By default, the `reload` command triggers a request to store unsaved *running-config* commands and an option to open the Aboot shell before starting the reboot when accessing the CLI through the console port. The switch then begins the reboot process controlled by Aboot.

The following procedure is an example of a typical restart.

1. Begin the reboot process by typing the `reload` command:

```
switch#reload
```

The switch sends a message to confirm the reload request:

```
Proceed with reload? [confirm]
```

2. Press **enter** or type **y** to confirm the requested reload. Pressing any other key terminates the reload operation.

The switch sends a series of messages, including a notification that a message was broadcast to all open CLI instances, informing them that the system is being rebooted. The reload pauses when the CLI displays the Aboot shell notification line.

```
Broadcast message from root@mainStopping sshd: [ OK ]
SysRq : Remount R/O
Restarting system

Aboot 1.9.0-52504.EOS2.0

Press Control-C now to enter Aboot shell
```

3. To continue the reload process, do nothing. Typing **Ctrl-C** opens the Aboot shell; see [Aboot Commands](#) for Aboot editing instructions.

The switch continues the reset process, displaying messages to indicate the completion of individual tasks. The reboot is complete when the CLI displays a login prompt.

```
Booting flash:/EOS.swi
Unpacking new kernel
Starting new kernel
Switching to rooWelcome to Arista Networks EOS 4.4.0

Starting isshd: [ OK ]
Starting sshd: [ OK ]
Starting xinetd: [ OK ]
[ OK ] crond: [ OK ]

switch login:

```

4. Log in to the switch to resume configuration tasks.

## 2.4.2 Switch Recovery

About can automatically erase the internal flash and copy the contents of a USB drive that has been inserted before powering up or rebooting the switch. This recovery method does not require access to the switch console or About password entry, even if the **boot-config** file lists one.

About invokes the recovery mechanism only if each of these two conditions is met:

- The USB drive must contain a file called “fullrecover.”  
The file’s contents are ignored; an empty text file is sufficient.
- If the USB drive contains a **boot-config** file, its timestamp must differ from the timestamp of the **boot-config** file on the internal flash.

This prevents About from invoking the recovery mechanism again on every boot if you leave the flash key inserted.

To use this recovery mechanism, set up a USB drive with the files to be installed on the internal flash for example, a current EOS software image, and a customized or empty **boot-config** plus an empty file named “fullrecover.”

Check that the timestamp of **boot-config** is current to ensure that the above conditions are met.

## 2.4.3 Display Reload Cause

The `show reload cause` command displays the cause of the most recent system reset and lists recommended actions, if any exist, to avoid future spontaneous resets or resolve other issues that may have caused the reset.

### Example

To display the reset cause, type `show reload cause` at the prompt.

```

switch#show reload cause
Reload Cause 1:
-----
Reload requested by the user.

Recommended Action:
-----
No action necessary.

Debugging Information:
-----
None available.
switch#

```

---

## 2.4.4 Configuring Zero Touch Provisioning

Zero Touch Provisioning (ZTP) is a switch configuration method that uses files referenced by a DHCP server to initially provision the switch without user intervention. A switch enters ZTP mode when it is reloaded if flash memory does not contain a **startup-config**.

Canceling ZTP boots the switch without using a **startup-config** file. When ZTP mode is canceled, a **startup-config** file is not stored to flash memory. Until a **startup-config** file is stored to flash, the switch returns to ZTP mode on subsequent reboots. This section describes steps required to implement, monitor, and cancel ZTP.

### 2.4.4.1 Configuring the Network for ZTP

A switch performs the following after booting in ZTP mode:

- Configures each physical interface to no switchport mode.
- Sends a DHCP query packet on all Ethernet and management interfaces.

After the switch receives a DHCP offer, it responds with a DHCP request for Option 66 (TFTP server name), Option 67 (bootfile name), and dynamic network configuration settings. When the switch receives a valid DHCP response, it configures the network settings, then fetches the file from the location listed in Option 67. If Option 67 returns a network URL (`http://` or `ftp://`), the switch obtains the file from the network. If Option 67 returns a file name, the switch retrieves the file from the TFTP server listed in Option 66.

The Option 67 file can be a **startup-config** file or a boot script. The switch distinguishes between a **startup-config** file and a boot script by examining the first line in the file:

- The first line of a boot file must consist of the `#!` characters followed by the interpreter path. The switch executes the code in the script, then reboots. The boot script may fetch an EOS software image or perform required customization tasks.

The following boot file fetches an EOS software image and stores a startup configuration file to flash.

```
#!/usr/bin/Cli -p2
copy http://company.com/startup-config flash:startup-config
copy http://company.com/EOS-2.swi flash:EOS-2.swi
config
boot system flash:EOS-2.swi
```

- The switch identifies any other file as a **startup-config** file. The switch copies the **startup-config** file into flash as `mnt/flash/startup-config`, then reboots.

The switch uses its system MAC address as the DHCP client identifier and Arista as the Vendor Class Identifier (Option 60). When the switch receives an http URL through Option 67, it sends the following HTTP headers in the GET request:

```
X-Arista-SystemMAC:
X-Arista-HardwareVersion:
X-Arista-SKU:
X-Arista-Serial:
X-Arista-Architecture:
```

### 2.4.4.2 Monitoring ZTP Progress

A switch displays the following message after rebooting when it does not contain a **startup-config** file:

```
No startup-config was found.
```

```
The device is in Zero Touch Provisioning mode and is attempting to
```

```
download the startup-config from a remote system. The device will not
be fully functional until either a valid startup-config is downloaded
from a remote system or Zero Touch Provisioning is cancelled. To cancel
Zero Touch Provisioning, login as admin and type 'zerotouch cancel'
at the CLI.
```

```
switch login:
```

The switch displays a **CONFIG\_DOWNLOAD\_SUCCESS** message after it successfully downloads a **startup-config** file, then continues the reload process as described in [Typical Reset Sequence](#).

```
=====
=====

Successful download
-----

Apr 15 21:36:46 switch ZeroTouch: %ZTP-5-DHCP_QUERY: Sending DHCP request

About 1.9.0-52504.EOS2.0

Press Control-C now to enter About shell
```

#### 2.4.4.3 ZTP Failure Notification

The switch displays a **DHCP\_QUERY\_FAIL** message when it does not receive a valid DHCP response within 30 seconds of sending the query. The switch then sends a new DHCP query and waits for a response. The switch continues sending queries until it receives a valid response or until ZTP mode is canceled.

```
switch login: admin

Management1, Management2 ]
```

#### 2.4.4.4 Canceling ZTP Mode

To boot the switch without a **startup-config** file, log into the console, then cancel ZTP mode. After the switch boots, it uses all factory default settings. A **startup-config** file must be saved to flash memory to prevent the switch from entering ZTP mode on subsequent boots.

#### 2.4.5 Configuring the Networks

If the **boot-config** file contains a NETDEV statement, Aboot attempts to configure the network interface, as specified by Network configuration commands. See [boot-config Command Line Content](#) for a list of commands that define the network configuration.

### 2.5 About Shell

The Aboot shell is an interactive command-line interface used to manually boot a switch, restore the internal flash to its factory-default state, run hardware diagnostics, and manage files. The Aboot shell is similar to the Linux Bourne Again Shell (Bash).

The Aboot shell provides commands for restoring the state of the internal flash to factory defaults or a customized default state. You can use these recovery methods to:

- restore the factory-default flash contents before transferring the switch to another owner.
- restore Aboot shell access if the Aboot password is lost or forgotten.
- restore console access if baud rate or other settings are incompatible with the terminal.
- replace the internal flash contents with configuration or image files stored on a USB flash drive.

#### 2.5.1 Aboot Shell Operation

When the switch is powered on or rebooted, Aboot reads its configuration from **boot-config** on the internal flash and attempts to boot an EOS software image (with the extension .swi) automatically if one is configured.

You can monitor the automatic boot process or enter the Aboot shell only from the console port. You can connect a PC or terminal directly to the port and run a terminal emulator to interact with the serial port or access it through a serial concentrator device.

Console settings are stored in **boot-config**; the factory-default settings for Arista switches are 9600 baud, no parity, 8 character bits, and 1 stop bit. If you do not know the current settings, perform a full flash recovery to restore the factory-default settings. When the console port is connected and the

terminal settings are configured properly, the terminal displays a message similar to the following a few seconds after powering up the switch:

```
About 1.0.0

Press Control-C now to enter the Aboot shell
```

To abort the automatic boot process and enter the Aboot shell, press **Ctrl-C** (ASCII 3 in the terminal emulator) after the *Press Control-C now to enter Aboot shell* message appears. Pressing **Ctrl-C** can interrupt the boot process up through the starting of the new kernel.

If the **boot-config** file does not contain a password command, the Aboot shell starts immediately. Otherwise, you must enter the correct password at the password prompt to start the shell. If you enter the wrong password three times, Aboot displays this message:

```
Type "fullrecover" and press Enter to revert /mnt/flash to factory
  default

state, or just press Enter to reboot:
```

- Pressing **Enter** continues a normal soft reset without entering the Aboot shell.
- Typing **fullrecover** and pressing **Enter** performs a full flash recovery to restore the factory-default settings, removing all previous contents of the flash drive.

The Aboot shell starts by printing:

```
Welcome to Aboot.
```

Aboot then displays the Aboot# prompt.

Aboot reads its configuration from **boot-config** on the internal flash.

## 2.5.2 Accessing the Aboot Shell

This procedure accesses the Aboot Shell.

1. Reload the switch and press **enter** or type **y** when prompted, as described in [Typical Reset Sequence](#).

The command line displays this Aboot entry prompt.

```
Press Control-C now to enter Aboot shell
```

2. Type **Ctrl-C**.

If the **boot-config** file does not contain a PASSWORD command, the CLI displays an Aboot welcome banner and prompt.

```
^CWelcome to Aboot.
Aboot#
```

If the **boot-config** file contains a PASSWORD command, the CLI displays a password prompt. In this case, proceed to step 3. Otherwise, the CLI displays the Aboot prompt.

3. If prompted, enter the Aboot password.

```
Press Control-C now to enter Aboot shell
^CAboot password:
Welcome to Aboot.
Aboot#
```

---

About allows three attempts to enter the correct password. After the third attempt, the CLI prompts the user to either continue the reboot process without entering the About shell or to restore the flash drive to the factory default state.

```
Press Control-C now to enter About shell
^CAboot password:
incorrect password
About password:
incorrect password
About password:
incorrect password
Type "fullrecover" and press Enter to revert /mnt/flash to factory
default
state, or just press Enter to reboot: fullrecover
All data on /mnt/flash will be erased; type "yes" and press Enter to
proceed,
or just press Enter to cancel:
```

The `fullrecover` operation replaces the flash contents with a factory default configuration. The CLI displays text similar to the following when performing a `fullrecover`, finishing with another entry option into the About shell.

**Note:** For hardware that is purchased after June 2017, the factory default partition will not have the backup EOS software image. This is done to increase the flash size on smaller flash size disks, and other options are available in the `fullrecover` command functionality to restore factory default EOS image. This is applicable to both fixed system and modular system hardware.

```
Erasing /mnt/flash
Writing recovery data to /mnt/flash
boot-config
startup-config
EOS.swi
210770 blocks
Restarting system.

About 1.9.0-52504.EOS2.0

Press Control-C now to enter About shell
```

### 2.5.3 About File Structure

When you enter the About CLI, the current working directory is the root directory on the switch. Switch image and configuration files are at `/mnt/flash`. When exiting the About shell, only the contents of `/mnt/flash` are preserved. The `/mnt` directory contains the file systems of storage devices. About mounts the internal flash device at `/mnt/flash`.

When a USB flash drive is inserted in one of the flash ports, About mounts its file system on `/mnt/usb1`. The file system is unmounted when the USB flash drive is removed from the port. Most USB drives contain an LED that flashes when the system is accessing it; do not remove the drive from the flash port until the LED stops flashing.

### 2.5.4 Booting From the About Shell

About attempts to boot the EOS software image (with the extension `.swi`) configured in `boot-config` automatically if you take no action during the boot process. If the boot process fails for any reason, such as an incorrectly configured software image, About enters the shell, allowing you to correct

the configuration or boot a software image manually. The `boot` command loads and boots an EOS software image file.

The `boot` command syntax is

**boot** *SWI*

where *SWI* lists the location of the EOS image that the command loads. **SWI** options include:

- `device:path` loads the image file from the specified storage device. The default `device` value is `flash`; other values include `file` and `usb1`.
- `/PATH` loads the image file from the specified path in the switch directory.
- `http://server/path` loads the image file from the HTTP server on the host server.
- `ftp://server/path` loads the image file from the FTP server on the host server.
- `tftp://server/path` loads the image file from the TFTP server on the host server.
- `nfs://server/path` mounts the path's parent directory from the host server and loads the image file from the loaded directory.

The accepts the same commands as the `SWI` variable in the `boot-config` file. See [boot-config Command Line Content](#) for a list of boot command formats.

If an image file is not specified in **`boot-config`**, or if booting the image results in an error condition (for example, an incorrect path or unavailable HTTP server), `boot` halts the boot process and drops into the shell.

### Example

To boot `EOS.swi` from internal flash, enter one of these commands on the `boot` command line:

```
boot flash:EOS.swi
```

```
boot /mnt/flash/EOS.swi
```

## 2.5.5 About Commands

To list the contents of the internal flash, enter `ls /mnt/flash` at the `boot#` prompt.

### Example

```
boot#ls /mnt/flash
EOS.swi boot-config startup-config
```

Commonly used commands include:

- `ls` prints a list of the files in the current working directory.
- `cd` changes the current working directory.
- `cp` copies a file.
- `more` prints the contents of a file one page at a time.
- `vi` edits a text file.
- `boot` boots a software image file.
- `swiinfo` prints information about a software image.
- `recover` recovers the factory-default configuration.
- `reboot` reboots the switch.
- `udhcp` configures a network interface automatically via DHCP.
- `ifconfig` prints or alters network interface settings.
- `wget` downloads a file from an HTTP or FTP server.

---

Many Aboot shell commands are provided by Busybox, an open-source implementation of UNIX utilities. Busybox command help is found at <http://www.busybox.net/downloads/BusyBox.html>. Aboot provides access to only a subset of the documented commands.

Aboot can access networks through the Ethernet management ports. Aboot provides network interfaces `mgmt1` and `mgmt2`. These ports are unconfigured by default; you can configure management port settings using Aboot shell commands like `ifconfig` and `udhcpd`. When a management interface is configured, use `wget` to transfer files from an HTTP or FTP server, `tftp` to transfer files from a TFTP server, or `mount` to mount an NFS filesystem.

## 2.6 About Configuration Commands

This section describes the About configuration commands that a *boot-config* file can contain.

- [CONSOLE SPEED](#)
- [NET commands](#)
- [PASSWORD \(ABOOT\)](#)
- [SWI](#)

---

## 2.6.1 CONSOLESPEED

The `CONSOLESPEED` command in the *boot-config* file specifies the console baud rate when the switch is booted. To communicate with the switch, the connected terminal must match the specified rate. Baud rate options include 1200, 2400, 4800, 9600, 19200, 38400, 57600, and 115200.

The default baud rate is 9600.

### Command Syntax

```
CONSOLESPEED= baud_rate
```

### Parameters

- *baud\_rate* specifies the console speed. Values include **1200**, **2400**, **4800**, **9600**, **19200**, **38400**, **57600**, and **115200**.

### Examples

- This command in a *boot-config* file sets the baud rate to 2400 when the switch boots.

```
CONSOLESPEED=2400
```

## 2.6.2 NET Commands

NET commands in the *boot-config* file are used by Aboot during switch booting to configure the network interface that will be used for switch configuration. These commands can also be entered manually in Aboot.

NETDEV indicates which network interface is being configured. If *boot-config* does not contain a NETDEV command, the booting process does not attempt to configure a network interface. Other NET commands specify settings that Aboot uses to configure the interface.

### Command Syntax

NETDEV=*device\_interface*

NETAUTO=*auto\_setting*

NETIP=*interface\_address*

NETMASK=*interface\_mask*

NETGW=*gateway\_address*

NETDOMAIN=*domain\_name*

NETDNS=*dns\_address*

### Parameters

- *device\_interface* the network interface. Options include:
  - ma1 management port 1.
  - ma2 management port 2.
- *auto\_setting* the configuration method. Options include:
  - dhcp interface is configured through a DHCP server; other NET commands are ignored.
  - if the NETAUTO command is omitted, the interface is configured with other NET commands.
- *interface\_address* interface IP address, in dotted-decimal notation.
- *interface\_mask* interface subnet mask, in dotted-decimal notation.
- *gateway\_address* default gateway IP address, in dotted decimal notation.
- *domain\_name* interface domain name.
- *dns\_address* IP address of the Domain Name Server, in dotted decimal notation.

### Example

- This command specifies management port 1 as the network interface to be configured for management traffic.

```
NETDEV=ma1
```

- This command instructs the switch to configure the network interface through a DHCP server, ignoring any other NET commands.

```
NETAUTO=dhcp
```

- These NET commands configure the network interface.

```
NETIP=10.12.15.10
NETMASK=255.255.255.0
NETGW=10.12.15.24
NETDOMAIN=mycompany.com
NETDNS=10.12.15.13
```

---

### 2.6.3 PASSWORD (ABOOT)

PASSWORD specifies the Aboot password, as described in [Accessing the Aboot Shell](#). If **boot-config** does not contain a `PASSWORD` command, the Aboot shell does not require a password.

The **boot-config** file stores the password as an MD5-encrypted string as generated from a clear-text seed by the UNIX `passwd` program or the `crypt` library function. When entering the Aboot password, the user types the clear-text seed.

There is no method of recovering the password from the encrypted string. If the clear-text password is lost, delete the corresponding `PASSWORD` command line from the **boot-config** file.

**Note:** The EOS `boot secret` command is the recommended method for adding or modifying the `PASSWORD` configuration line.

#### Command Syntax

```
PASSWORD = encrypted_string
```

#### Parameters

- *encrypted\_string* the encrypted string that corresponds to the clear-text Aboot password.

#### Example

- This line is a `PASSWORD` command example in which the encrypted string corresponds to the clear-text password “abcde.”

```
PASSWORD=$1$CdWp5wfe$pzNtE3ujBoFEL8vjCq7jo/
```

## 2.6.4 SWI

SWI specifies the location and file name of the EOS image file that Aboot loads when booting, using the same format as **boot-config** to designate a local or network path.

### Command Syntax

SWI = **SWI\_PATH**

### Parameters

- **SWI\_PATH** specifies the location of the EOS image file. Options include:
  - *file\_path* specifies a file location on the internal flash drive.
  - *file:file\_path* specifies a file location in the switch directory.
  - *usb1:file\_path* specifies a file location on the USB drive.
  - *http:file\_path* specifies an HTTP path to the image file.
  - *ftp:file\_path* specifies an FTP path to the image file.
  - *tftp:file\_path* specifies a TFTP path to the image file.
  - *nfs:file\_path* specifies an NFS path to the image file.

### Examples

- This SWI command in **boot-config** causes Aboot to boot the switch from the file “EOS.swi” on the switch’s internal flash drive.

```
SWI=flash:EOS.swi
```

- This SWI command in **boot-config** causes Aboot to boot the switch from the file “EOS.swi” at the specified location on foo.com.

```
SWI=http://foo.com/images/EOS.swi
```

---

## 2.7 Switch Booting Commands

- [boot console](#)
- [boot secret](#)
- [boot system](#)
- [delete startup-config](#)
- [protocol](#)
- [redundancy](#)
- [redundancy manual switchover](#)
- [reload](#)
- [reload \(scheduled\)](#)
- [show redundancy file-replication](#)
- [show redundancy status](#)
- [show redundancy switchover sso](#)
- [show reload](#)
- [show reload cause](#)

## 2.7.1 boot console

The `boot console` command configures terminal settings for serial devices connecting to the console port. At this time, the only console setting that can be specified from *boot-config* is speed.

Factory-default console settings are 9600 baud, no parity, 8 character bits, and 1 stop bit. If you do not know the current settings, restore the factory-default settings as described in [Restoring the Factory Default EOS Image and Startup Configuration](#).

The `no boot console` and `default boot console` commands restore the factory default settings on the switch and remove the corresponding `CONSOLESPPEED` command from the *boot-config* file.

### Command Mode

Global Configuration

### Command Syntax

```
boot console speed baud_rate
```

### Parameters

- *baud\_rate* console baud rate. Options include 1200, 2400, 4800, 9600, 19200, 38400, 57600, and 115200.

### Example

- This command sets the console speed to 57600 baud.

```
switch(config)#boot console speed 57600
switch(config)#
```

This command displays the result of the console-speed change.

```
switch(config)#show boot-config
Software image: flash:/EOS.swi
Console speed: 57600
Aboot password (encrypted): (not set)
switch(config)#
```

The above `boot console` command adds the following line to boot-config.

```
CONSOLESPPEED=57600
```

---

## 2.7.2 boot secret

The `boot secret` command creates or edits the Aboot shell password and stores the encrypted string in the `PASSWORD` command line of the *boot-config* file.

The `no boot secret` and `default boot secret` commands remove the Aboot password from the *boot-config* file. When the Aboot password does not exist, no password is required to enter the Aboot shell.

### Command Mode

Global Configuration

### Command Syntax

```
boot secret [ENCRYPT_TYPE] password
```

```
no boot secret
```

```
default boot secret
```

### Parameters

- **ENCRYPT\_TYPE** indicates the encryption level of the password parameter. Settings include:
  - <no parameter> the *password* is clear text.
  - 0 the *password* is clear text. Equivalent to the <no parameter> case.
  - 5 the *password* is an MD5-encrypted string.
  - sha512 the password is entered as an sha512 encrypted string.
- *password* specifies the boot password.
  - *password* must be in clear text if **ENCRYPT\_TYPE** specifies clear text.
  - *password* must be an appropriately encrypted string if **ENCRYPT\_TYPE** specifies encryption.

### Restrictions

The sha512 encryption option is not available on Trident platform switches.

### Examples

- These equivalent commands set the Aboot password to xr19v.

```
switch(config)#boot secret xr19v
switch(config)#
```

```
switch(config)#boot secret 0 xr19v
switch(config)#
```

This command displays the result:

```
switch(config)#show boot-config
Software image: flash:/EOS.swi
Console speed: (not set)
Aboot password (encrypted): $1$k9YHFW8D$cgM8DSN.e/yY0p3k3RUvk.
switch(config)#
```

The `boot secret` commands above add this line to *boot-config*:

```
PASSWORD=$1$k9YHFW8D$cgM8DSN.e/yY0p3k3RUvk.
```

The user must enter xr19v at the login prompt to access the Aboot shell.

- These commands set the Aboot password to xr123, then display the resulting **boot-config** code. The encrypted string was previously generated with xr123 as the clear-text seed.

```
switch(config)#boot secret 5 $1$QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
switch(config)#show boot-config
Software image: flash:/EOS.swi
Console speed: (not set)
Aboot password (encrypted): $1$QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
switch(config)#
```

The **boot secret** command above adds this line to **boot-config**:

```
PASSWORD=$1$QfbYkVWb$PIXG0udEquW0wOSiZBN3D/
```

The user must enter xr123 at the login prompt to access the Aboot shell.

- This command removes the Aboot password, allowing access to the Aboot shell without a password.

```
switch(config)#no boot secret
switch(config)#
```

---

## 2.7.3 boot system

The `boot system` command specifies the location of the EOS software image that Aboot loads when the switch boots. The command can refer to files on flash or on a module in the USB flash port.

### Command Mode

Global Configuration

### Command Syntax

```
boot system DEVICE file_path
```

### Parameters

- **DEVICE** location of the image file. Options include
  - file: file is located in the switch file directory.
  - flash: file is located in flash memory.
  - usb1: file is located on a drive inserted in the USB flash port. Available if a drive is in the port.
- *file\_path* path and name of the file.

### Examples

- This command designates EOS1.swi, on USB flash memory, as the EOS software image load file.

```
switch(config)#boot system usb1:EOS1.swi
switch(config)#
```

The `boot system` command above adds this line to *boot-config*.

```
SWI=usb1:/EOS1.swi
```

- This command designates EOS.swi, on the switch flash, as the EOS software image load file.

```
switch(config)#boot system flash:EOS.swi
switch(config)#
```

The `boot system` command above adds this line to *boot-config*.

```
s
```

## 2.7.4 delete startup-config

The `delete startup-config` command erases or deletes the **startup-config** file.

### Command Mode

Privileged EXEC

### Command Syntax

```
delete startup-config [CONFIRMATION]
```

### Parameters

- **CONFIRMATION** confirmation for immediate erasure. Options include:
  - `<no parameter>` the switch requires a confirmation before starting the erasure.
  - `now` the erasure begins immediately without prompting the user to confirm the request.

### Examples

- This command deletes the startup configuration from the switch. When the `delete startup-config` command is entered, the switch sends a message prompting the user to confirm the request.

```
switch#delete startup-config  
Proceed with erasing startup configuration? [confirm]y  
switch#
```

- This command deletes the startup configuration from the switch immediately without prompting.

```
switch#delete startup-config now  
switch#
```

---

## 2.7.5 protocol

The `protocol` command configures how the supervisors on a modular switch will handle switchover events. By default, the switch is set to **route processor redundancy (RPR)**, which synchronizes **startup-config** files between the supervisor modules and partially boots the standby supervisor. The mode can also be set to **simplex** (manual switchover only) or to **stateful switchover (SSO)** which synchronizes both **startup-config** and **running-config** files between the supervisor modules and fully boots the standby module to speed the switchover process and minimize packet loss. Note that SSO synchronizes L2 state between the supervisors, but that L3 state is not synchronized. This can result in traffic loss for traffic forwarded on routes learned by a dynamic routing protocol. Enabling nonstop forwarding can eliminate most packet loss for BGP and OSPF.

The `no protocol` and `default protocol` commands set the redundancy protocol to the default value (`rpr`) by removing the `protocol` command from **running-config**.

### Command Mode

Redundancy Configuration

### Command Syntax

```
protocol {rpr | simplex | sso}
no protocol
default protocol
```

### Parameters

- `rpr` route processor redundancy protocol (RPR, the default).
- `simplex` no redundancy. Switchover must be initiated manually.
- `sso` stateful switchover (SSO).

### Related Commands

- [redundancy](#) places switch in redundancy configuration mode.

### Example

- These commands enter redundancy configuration mode and set the redundancy protocol to SSO.

```
switch(config)#redundancy
switch(config-redundancy)#protocol sso
switch(config-redundancy)#
```

## 2.7.6 redundancy

The **redundancy** command places the switch in redundancy configuration mode.

### Command Mode

Global Configuration

### Command Syntax

```
redundancy
```

### Commands Available in Redundancy Configuration Mode

- `protocol`

### Related Commands

- `redundancy manual switchover` manually initiates a switchover.

### Example

- These commands enter redundancy configuration mode and set the redundancy protocol to stateful switchover.

```
switch(config)#redundancy  
switch(config-redundancy)#protocol sso  
switch(config-redundancy)#
```

---

## 2.7.7 redundancy manual switchover

The **redundancy manual switchover** command immediately switches control of the switch to the standby supervisor. If the redundancy mode is set to simplex or the standby supervisor is unavailable for any other reason, this command will not function.

### Command Mode

Privileged EXEC

### Command Syntax

```
redundancy manual switchover
```

### Related Commands

- [redundancy](#) places the switch in redundancy configuration mode.

### Example

- This command forces a switchover to the standby supervisor. The switchover is executed immediately without further confirmation from the user.

```
switch#redundancy manual switchover  
This supervisor will be restarted.  
switch#
```

## 2.7.8 reload

The `reload` command power cycles the switch, then resets it under About control. The hard reset clears the switch, including memory states and other hardware logic.

**Note:** The `reload` commands are used to initiate Accelerated Switch Update (ASU) and Smart Switch Update (SSU); for descriptions of these features and the appropriate command syntax, please refer to the [Accelerated Software Upgrade \(ASU\)](#) and [Leaf Smart System Upgrade \(Leaf SSU\)](#) sections.

The command behaves differently in fixed and modular systems.

- **Fixed 1-RU systems:** the power supply remains powered up through the reset. Power is removed from all other switch components for two to five seconds.
- **Modular systems:** the power supply on the active supervisor remains powered up through the reset. Power is removed from all other supervisor components for at least one second. After the supervisor becomes functional, it manages the power-cycling of all line cards.

### Command Mode

Privileged EXEC

### Command Syntax

```
reload [TARGET] [CONFIRMATION]
```

### Parameters

- **TARGET** specifies which supervisor(s) will be reset. Some options are available only on dual-supervisor switches. Options include:
  - `<no parameter>` the active supervisor is reset.
  - `all` both supervisors are reset.
  - `peer` the peer supervisor is reset.
  - `power` the active supervisor is reset.
- **CONFIRMATION** confirmation for immediate reset. Options include:
  - `<no parameter>` the switch requires a confirmation before starting the reset.
  - `now` the reset begins immediately without prompting the user to confirm the request.

### Related Commands

- `reload (scheduled)` schedules a pending reload operation.
- `show reload cause` displays cause of most recent reload.

### Example

- Begin the reboot process by typing the `reload` command:

```
switch#reload
switch#
```

When the `reload` command is entered, the switch sends a message prompting the user to save the configuration if it contains unsaved modifications, then asks the user to confirm the reload request. In this example, the user does not save modifications to the system before reloading.

```
System configuration has been modified. Save? [yes/no/cancel/diff]:n
Proceed with reload? [confirm]y
```

The switch responds by broadcasting a series of messages, including a notification that the system is being rebooted, to all open CLI instances. The reload pauses to provide an option for the user to

---

enter About shell; the About shell supports commands that restore the state of the internal flash to factory defaults or create a customized default state.

```
Broadcast message from root@mainStopping sshd: [ OK ]
SysRq : Remount R/O
Restarting system

About 1.9.0-52504.EOS2.0

Press Control-C now to enter About shell
```

No action is required to continue the reset process. The switch displays messages to indicate the completion of individual tasks. The reboot is complete when the CLI displays a login prompt.

```
Booting flash:/EOS.swi
Unpacking new kernel
Starting new kernel
Switching to rootWelcome to Arista Networks EOS 4.4.0

switch login:
```

## 2.7.9 reload (scheduled)

The **reload (scheduled)** command configures the switch to reset at a specified time or after a specified interval. Refer to [reload](#) for the functional details of the reset operation.

The switch prompts to save the configuration and confirm the reload request. Once the request is confirmed, the switch resumes normal operation until the reload initiates.

The **reload cancel**, **no reload**, and **default reload** commands cancel the pending reload operation.

### Command Mode

Privileged EXEC

### Command Syntax

```
reload [all | power | peer] {at hh:mm [month | day] | in hh:mm} [force | reason]
```

```
reload cancel
```

```
no reload
```

```
default reload
```

### Parameters

- all reloads all supervisors.
- power resets the active supervisor.
- peer resets the peer supervisor.
- at performs reload at specified times.
  - *hh:mm* specifies reload time in hours (0 to 23) and minutes (0 to 59). If no month and day are specified, reload occurs at the specified time on the day the command is issued.
    - *month* optionally specifies month of the year (Jan, Feb, etc.)
      - *day* day of the month. Values range from 1 to 31.
- in performs the reload after a specified delay.
  - *hh:mm* specifies delay before reload in hours (0 to 23) and minutes (0 to 59).
- force performs action immediately without prompting.
- reason enter text to display explaining the purpose of the reload.
- cancel cancels any existing reload request.

### Related Commands

- [reload](#) initiates an immediate reload operation.
- [show reload](#) displays time and reason of any pending reload operation.

### Examples

- This command schedules a switch reset to begin in 12 hours.

```
switch#reload in 12:00
System configuration has been modified. Save? [yes/no/cancel/diff]:y
Proceed with reload? [confirm]
Reload scheduled for Tue Mar 27 05:57:25 2012 (in 11 hours 59 minutes)
switch#
```

- This command cancels a scheduled reset.

```
switch#no reload
Scheduled reload has been cancelled
switch#
```

- 
- This command schedules a reload of the active supervisor to begin in 12 hours.

```
switch#reload power in 12:00  
Reload scheduled for Thu Feb 13 18:56:01 2020 (in 11 hours 59 minutes)  
switch#
```

## 2.7.10 show redundancy file-replication

The `show redundancy file-replication` command displays the status and last synchronization date of file replication between the supervisors on the switch.

### Command Mode

EXEC

### Command Syntax

```
show redundancy file-replication
```

### Related Commands

- `show redundancy status` displays status and redundancy protocol of supervisors.
- `show redundancy switchover sso` displays stateful switchover information since last reload.

### Example

- This command displays the current file replication status of the supervisors.

```
switch#show redundancy file-replication
0 files unsynchronized, 2 files synchronized, 0 files failed, 2 files
total.

File                               Status                               Last Synchronized
-----
file:persist/sys                   Synchronized                         25 days, 19:48:26 ago
flash:startup-config              Synchronized                         25 days, 19:48:26 ago
switch#
```

---

## 2.7.11 show redundancy status

The `show redundancy status` command displays the current status (active or standby) and the configured redundancy protocol of both supervisors, as well as summary information about the latest switchover event.

### Command Mode

EXEC

### Command Syntax

```
show redundancy status
```

### Related Commands

- `show redundancy file-replication` displays status of file replication between supervisors.
- `show redundancy switchover sso` displays stateful switchover information since last reload.

### Example

- This command displays redundancy information for both supervisors and a summary of the latest switchover.

```
switch#show redundancy status
  my state = ACTIVE
 peer state = STANDBY HOT
      Unit = Primary
      Unit ID = 1

Redundancy Protocol (Operational) = Stateful Switchover
Redundancy Protocol (Configured) = Stateful Switchover
Communications = Up
switchover completion timeout = 720.0 seconds (default)
Ready for switchover

  Last switchover time = 0:32:15 ago
Last switchover reason = Supervisor has control of the active
supervisor lock
switch#
```

## 2.7.12 show redundancy switchover sso

The `show redundancy switchover sso` command displays the number of stateful switchovers since the last reload and a log of the events in the latest stateful switchover.

### Command Mode

EXEC

### Command Syntax

```
show redundancy switchover sso
```

### Related Commands

- `show redundancy file-replication` displays status of file replication between supervisors.
- `show redundancy status` displays status and redundancy protocol of supervisors.

### Example

- This command displays stateful switchover information.

```
switch#show redundancy switchover sso
Total number of Stateful Switchover completed since reload: 4
```

```
Latest Stateful Switchover occurred 29 days, 12:48:22 ago @ 2012-06-09
19:47:50
(completed)
0.000000: switchover started

---

## 2.7.13 show reload

The `show reload` command displays the time and reason of any pending reload operation. The `reload (scheduled)` command schedules a reload operation and can be used to cancel a pending reload.

### Command Mode

EXEC

### Command Syntax

```
show reload
```

### Related Commands

- `reload (scheduled)` schedules a pending reload operation.
- `show reload cause` displays cause of most recent reload.

### Example

- These commands schedule a reload for 2:45 pm, display the time of the pending reload, then cancel the scheduled reload.

```
switch#reload at 14:45
Proceed with reload? [confirm]
Reload scheduled for Tue Mar 27 14:45:00 2012 ( in 4 hours 11 minutes )
switch#show reload
Reload scheduled for Tue Mar 27 14:45:00 2012 ( in 4 hours 11 minutes )
switch#reload cancel
Scheduled reload has been cancelled
switch#
```

## 2.7.14 show reload cause

The `show reload cause` command displays the reason of the most recent reload operation. The command displays recommended actions and debug information related to the executed reload.

### Command Mode

EXEC

### Command Syntax

```
show reload cause
```

### Related Commands

- `reload` initiates an immediate reload operation.
- `show reload` displays time and reason of all pending reload operations.

### Example

- This command displays the cause of the most recent reload operation.

```
switch#show reload cause
Reload Cause 1:
-----
Reload requested by the user.

Recommended Action:
-----
No action necessary.

Debugging Information:
-----
None available.
switch#
```

## Initial Configuration and Recovery

---

This chapter describes initial configuration and recovery tasks. Subsequent chapters provide details about features introduced in this chapter.

This chapter contains these sections:

- [Initial Switch Access](#)
- [Connection Management](#)
- [configure session](#)
- [Recovery Procedures](#)
- [Session Management Commands](#)

### 3.1 Initial Switch Access

Arista network switches provide two initial configuration methods:

- Zero Touch Provisioning (ZTP) configures the switch without user interaction ( [Zero Touch Provisioning](#)).
- Manual provisioning configures the switch through commands entered by a user through the CLI ( [Manual Provisioning](#)).

#### 3.1.1 Zero Touch Provisioning

Zero Touch Provisioning (ZTP) configures a switch without user intervention by downloading a startup configuration file (**startup-config**) or a boot script from a location specified by a DHCP server. [Configuring the Network for ZTP](#) describes network tasks required to set up ZTP.

The switch enters ZTP mode when it boots if flash memory does not contain **startup-config**. It remains in ZTP mode until a user cancels ZTP mode, or until the switch retrieves a **startup-config** or a boot script. After downloading a file through ZTP, the switch reboots again, using the retrieved file.

##### Security Considerations

The ZTP process cannot distinguish an approved DHCP server from a rogue DHCP server. For secure provisioning, you must ensure that only approved DHCP servers are able to communicate with the switch until after the ZTP process is complete. Arista also recommends validating the EOS image on your ZTP server by confirming that its MD5 checksum matches the MD5 checksum that can be found on the EOS download page of the Arista website.

On a UNIX server, the **md5sum** command calculates this checksum:

```
% md5sum EOS.swi
3bac45b96bc820eb1d10c9ee33108a25  EOS.swi
```

This command is also available on Arista switches from the CLI or from within the Bash shell.

```
switch#bash md5sum /mnt/flash/EOS-4.18.0F.swi
73435f0db3af785011f88743f4c01abd /mnt/flash/EOS-4.18.0F.swi

switch#[admin@switch ~]$ md5sum /mnt/flash/EOS-4.18.0F.swi
73435f0db3af785011f88743f4c01abd /mnt/flash/EOS-4.18.0F.swi
```

```
[admin@switch ~]$
```

To provision the switch through Zero Touch Provisioning:

1. Mount the switch in its permanent location.
2. Connect at least one management or Ethernet port to a network that can access the DHCP server and the configuration file.
3. Provide power to the switch.

ZTP provisioning progress can be monitored through the console port. [Console Port](#) provides information for setting up the console port. [Canceling Zero Touch Provisioning](#) provides information for monitoring ZTP progress and canceling ZTP mode.

### 3.1.2 Manual Provisioning

Initial manual switch provisioning requires the cancellation of ZTP mode, the assignment of an IP address to a network port, and the establishment of an IP route to a gateway. Initial provisioning is performed through the serial console and Ethernet management ports.

- The console port is used for serial access to the switch. These conditions may require serial access:
  - management ports are not assigned IP addresses
  - the network is inoperable
  - the password for the users log on is not available
  - the password to access the enable mode is not available
- The Ethernet management ports are used for out-of-band network management tasks. Before using a management port for the first time, an IP address must be assigned to that port.

#### 3.1.2.1 Console Port

The console port is a serial port located on the front of the switch. [Figure 2: Switch Ports](#) shows the console port on the DCS-7050T-64 switch. Use a serial or RS-232 cable to connect to the console port. The accessory kit also includes an RJ-45 to DB-9 adapter cable for connecting to the switch.

**Figure 2: Switch Ports**

#### Port Settings

Use these settings when connecting the console port:

- 9600 baud
- no flow control
- 1 stop bit

- no parity bits
- 8 data bits

### Admin Username

The initial configuration provides one username, **admin**, that is not assigned a password. When using the **admin** username without a password, you can only log into the switch through the console port. After a password is assigned to the **admin** username, it can log into the switch through any port.

The `username` command modifies a specified username, and can be used to create or delete usernames, including **admin**.

### Example

- This command assigns the password **pxq123** to the **admin** username:

```
switch(config)#username admin secret pxq123
switch(config)#
```

New and altered passwords must be saved to the startup configuration file or they will be lost when the switch is rebooted.

**Note:** if the configuration is saved with all usernames deleted, it will be necessary to access the Aboot shell through the console port in order to log in to the switch.

### 3.1.2.2 Canceling Zero Touch Provisioning

Zero Touch Provisioning (ZTP) installs a **startup-config** file from a network location if flash memory does not contain a **startup-config** when the switch reboots. Canceling ZTP is required if the switch cannot download a **startup-config** or boot script file.

When the switch boots without a **startup-config** file, it displays the following message through the console port:

```
No startup-config was found.
```

```
The device is in Zero Touch Provisioning mode and is attempting to
download the startup-config from a remote system. The device will not
be fully functional until either a valid startup-config is downloaded
from a remote system or Zero Touch Provisioning is cancelled. To cancel
Zero Touch Provisioning, login as admin and type 'zerotouch cancel'
at the CLI.
```

```
localhost login:
```

To cancel ZTP mode, log into the switch with the **admin** password, then enter the **zerotouch cancel** command. The switch immediately boots without installing a **startup-config** file.

```
localhost login: admin
admin
localhost>Apr 15 21:28:21 localhost ZeroTouch: %ZTP-5-DHCP_QUERY: Sending
DHCP

Press Control-C now to enter About shell

```

To avoid entering ZTP mode on subsequent reboots, create a **startup-config** file as described in Step 8 of [Ethernet Management Port](#).

### 3.1.2.3 Ethernet Management Port

Arista switches provide one or more Ethernet management ports for configuring the switch and managing the network out of band. [Figure 2: Switch Ports](#) shows the location of the Ethernet management ports on a DCS-7050T-64 switch. Only one port is required to manage the switch.

You can access the Ethernet management port(s) remotely over a common network or locally through a directly connected PC. Before you can access the switch through a remote connection, an IP address and a static route to the default gateway are required. On a modular switch with dual supervisors, a virtual IP address can also be configured to access the management port on whichever supervisor is active.

#### Assigning a Virtual IP Address to Access the Active Ethernet Management Port

On modular switches with dual supervisors, this procedure assigns a virtual IP address which will connect to the Ethernet management port of the active supervisor. (To assign a physical IP address to an individual Ethernet management port, see the following section.)

1. Connect a PC or terminal server to the console port. Use the settings listed in [Console Port](#) under [Port Settings](#).
2. Type **admin** at the login prompt to log into the switch. Initial login through the console port does not require a password.

```

Arista EOS
switch login:admin
Last login: Fri Apr 9 14:22:18 on Console
switch>

```

3. Type **enable** at the command prompt to enter Privileged EXEC mode.

```

switch>enable
switch#

```

4. Type **configure terminal** (or **config**) to enter global configuration mode.

```

switch#configure terminal
switch(config)#

```

5. Type **interface management 0** to enter interface configuration mode for the virtual interface which accesses management port 1 on the currently active supervisor.

```
switch(config)#interface management 0
switch(config-if-Ma0)#
```

6. Type **ip address**, followed by the desired address, to assign a virtual IP address for access to the active management port. This command assigns IP address 10.0.2.5 to management port 0

```
switch(config-if-Ma0)#ip address 10.0.2.5/24
```

7. Type **exit** at both the interface configuration and global configuration prompts to return to Privileged EXEC mode.

```
switch(config-if-Ma0)#exit
switch(config)#exit
switch#
```

8. Type **write** (or **copy running-config startup-config**) to save the new configuration to the **startup-config** file.

```
switch# write
switch#
```

### Assigning an IP Address to a Specific Ethernet Management Port

This procedure assigns an IP address to a specific Ethernet management port:

1. Connect a PC or terminal server to the console port. Use the settings listed in [Console Port](#) under [Port Settings](#).
2. Type **admin** at the login prompt to log into the switch. The initial login does not require a password.

```
Arista EOS
switch login:admin
Last login: Fri Apr 9 14:22:18 on Console
switch>
```

3. Type **enable** at the command prompt to enter Privileged EXEC mode.

```
switch>enable
switch#
```

4. Type **configure terminal** (or **config**) to enter global configuration mode.

```
switch#configure terminal
```

5. Type **interface management 1** to enter interface configuration mode. (Any available management port can be used in place of management port 1.)

```
switch(config)#interface management 1
switch(config-if-Ma1)#
```

6. Type **ip address**, followed by the desired address, to assign an IP address to the port. This command assigns the IP address 10.0.2.8 to management port 1.

```
switch(config-if-Ma1)#ip address 10.0.2.8/24
```

7. Type **exit** at both the interface configuration and global configuration prompts to return to Privileged EXEC mode.

```
switch(config-if-Ma1)#exit
```

```
switch(config)#exit  
switch#
```

8. Type **write** (or **copy running-config startup-config**) to save the new configuration to the **startup-config** file.

```
switch# write  
switch#
```

### Configuring a Default Route to the Gateway

This procedure configures a default route to a gateway located at 10.0.2.1.

1. Enter global configuration mode.

```
switch>enable  
switch#configure terminal
```

2. Create a static route to the gateway with the IP route command.

```
switch(config)#ip route 0.0.0.0/0 10.0.2.1
```

3. Save the new configuration.

```
switch#write  
switch#
```

## 3.2 Connection Management

The switch supports three connection methods:

- console
- SSH
- Telnet

The switch always enables console and SSH. Telnet is disabled by default.

**Management** commands place the switch in a configuration mode for changing session connection parameters.

### Examples

- The **management console** command places the switch in console management mode:

```
switch(config)#management console  
switch(config-mgmt-console)#
```

- The **management ssh** command places the switch in SSH management mode:

```
switch(config)#management ssh  
switch(config-mgmt-ssh)#
```

- The **management telnet** command places the switch in Telnet management mode:

```
switch(config)#management telnet  
switch(config-mgmt-telnet)#
```

- The **exit** command returns the switch to global configuration mode:

```
switch(config-mgmt-ssh)#exit
```

```
switch(config)#
```

The **idle-timeout** commands shown below configure the idle-timeout period for the connection type being configured. The idle timeout is the interval that the connection waits after a users most recent command before shutting down the connection. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

### Examples

- This **idle-timeout (SSH Management)** command configures an SSH idle-timeout period of three hours.

```
switch(config)#management ssh
switch(config-mgmt-ssh)#idle-timeout 180
```

- This **idle-timeout (Telnet Management)** command disables automatic connection timeout for telnet connections.

```
switch(config)#management telnet
switch(config-mgmt-telnet)#idle-timeout 0
```

The **shutdown (Telnet Management)** command enables and disables Telnet on the switch.

### Examples

- These commands enable Telnet.

```
switch(config)#management telnet
switch(config-mgmt-telnet)#no shutdown
```

- These commands disable Telnet.

```
switch(config)#management telnet
switch(config-mgmt-telnet)#shutdown
```

## 3.3 Configure Session

The command **configure session** creates a configuration session in which CLI commands can be issued that do not take effect until the session is committed . Each **configure session** is saved with a unique name. A session can be entered, modified and exited at any time without impacting the currently running system configuration.

When a session is committed, the configuration that was modified during the session is copied into **running-config**, overwriting any other configuration changes made since the session was created. A session can be aborted or removed, thereby removing the session completely and freeing up memory used by the session. The user must explicitly request that the changes in a deferred session be applied to the configuration of the router by entering a **commit** command and exiting the mode. Alternately, the user may abandon the changes by entering an **abort** command. An uncommitted configuration session will be discarded if the switch reboots and will time out after 24 hours.

Configuration sessions are used to make sets of changes, after verifying that there are no CLI errors. Configuration sessions allow the administrator to pre-provision a group of CLI commands in a named session, then execute each configuration session at specified times.

---

### 3.3.1 Configuration Session

The `configure session` command allows users to make a series of configuration changes in a temporary location and commit them to *running-config* at once by issuing the `commit` command.

- `configure session <name of session>` and *running-config*: The user enters a session (versus `configure terminal` in the case where configuration sessions are not used). If a session name is not specified, a system named session is created. A snapshot of the current *running-config* is copied into the session's data structure as the basis of further configuration changes.
- CLI configuration commands: User can run any configuration commands inside the session.
- `rollback clean-config`: User can run `rollback` command to revert the sessions configuration to the factory-default configuration (or clean configuration).
- `show session-config`: User can run `show session-config` to show the sessions configuration, which will be the future *running-config* once committed.
- `commit`: User issues `commit` to commit the changes, which will replace the current *running-config*.
- `abort`: To abort the session and throw away all changes.
- `exit`: User can `exit` from the session, and later return to the same session by running `configure session <name>` again.
- For named session: More than one CLI instance can enter the same session and make changes to the session configuration. Once the session is committed in any of the CLIs, no other CLI can commit or make any other changes in that session.

**Note:** committing a configuration session replaces *running-config* with the session configuration, which consists of the running configuration at the time the session was initiated plus the commands that were entered as part of the session. Any changes that were made to *running-config* since the session was initiated will be overwritten when the session is committed.

### 3.3.2 Configure Replace

The command `configure replace <URL>` replaces the current *running-config* with the configuration saved in `<URL>`. By default, `configure replace <URL>` will replace *running-config* only if the configuration in `<URL>` loads without errors. The command `configure replace <URL> ignore-errors` forces the operation even if there are errors.

**Note:** The command `copy <URL> running-config` was typically used to apply a saved configuration file to the system, and append that configuration to the current *running-config* (in lieu of replacing it). However, Arista recommends using the CLI command `configure replace <URL>` to streamline the process of deterministically restoring the system back to a known good configuration.

The normal workflow internally uses a configuration session to perform the replace.

### 3.3.3 Configuration CLI

In the CLI, execute the following configuration steps to create a configuration session.

#### 1. `configure session [ name of session ]`

Create or enter a session. If a name is not specified, it is automatically generated. The user is put in the session configuration mode and the prompt will change to show the first six characters of the session name. Designating the name of a session is optional. When *name of session* is not specified, a unique name is assigned.

```
no configure session name of session
```

Delete the specified configuration session. Designating the name of a session is required.

**2. commit**

Commit the changes made in the session. This command must be issued from within the session configuration mode.

```
abort
```

Abort the session, which is the same as deleting it. This command must be issued from within the session configuration mode.

**3. rollback clean-config**

Revert configuration in the session to the clean, factory-default configuration. This command must be issued from within the session configuration mode.

**4. service configuration session max completed *number***

Set a limit on the maximum number of committed sessions that are saved.

**5. service configuration session max pending *number***

Set a limit on the maximum number of uncommitted sessions that can be outstanding.

## 3.4 Recovery Procedures

These sections describe switch recovery procedures:

- [Removing the Enable Password from the Startup Configuration](#)
- [Reverting the Switch to the Factory Default Startup Configuration](#)
- [Restoring the Factory Default EOS Image and Startup Configuration](#)
- [Restoring the Configuration and Image from a USB Flash Drive](#)

The first three procedures require About Shell access through the console port. If the console port is not accessible, use the last procedure in the list to replace the configuration file through the USB Flash Drive.

1 describes the switch booting process and includes descriptions of the About shell, About boot loader, and required configuration files.

### 3.4.1 Removing the Enable Password from the Startup Configuration

The **enable password** controls access to Privileged EXEC mode. To prevent unauthorized disclosure, the switch stores the **enable password** as an encrypted string that it generates from the clear-text password. When the switch authentication mode is local and an **enable password** is configured, the CLI prompts the user to enter the clear-text password after the user types enable at the EXEC prompt.

The **startup-config** file stores the encrypted **enable password** to ensure that the switch loads it when rebooting. If the text version of the **enable password** is lost or forgotten, access to enable mode is restored by removing the encrypted **enable password** from the startup configuration file.

**Note:** During the recovery process, in a system containing more than one supervisor, the secondary supervisor must be physically removed from the system. This ensures the previous configuration is not recovered from the secondary supervisor upon reboot during the recovery process.

This procedure restores access to enable mode without changing any other configuration settings.

1. Access the About shell:
  - a. Power cycle the switch by successively removing and restoring access to its power source.
  - b. Type **Ctrl-C** when prompted, early in the boot process.

- c. Enter the Aboot password, if prompted. If the Aboot password is unknown, refer to [Restoring the Factory Default EOS Image and Startup Configuration](#) for instructions on reverting all flash directory contents to the factory default, including the startup configuration and EOS image.
2. Change the active directory to /mnt/flash directory.

```
About#cd /mnt/flash
```

3. Open the startup-config file in vi.

```
About#vi startup-config
```

4. Remove the enable password line.

This is an example of an enable password line:

```
enable password 5 $1$dBXo2KpF$Pd4XYLpI0ap1ZaU7g1G1w/
```

5. Save the changes and exit vi.
6. Exit Aboot. This boots the switch.

```
About#exit
```

### 3.4.2 Reverting the Switch to the Factory Default Startup Configuration

The *startup-config* file contains configuration parameters that the switch uses during a boot. Parameters that do not appear in *startup-config* are set to their factory defaults when the switch reloads. The process requires the Aboot password if Aboot is password protected.

This procedure reverts EOS configuration settings to the default state through bypassing the *startup-config* file during a switch boot.

1. Access the Aboot shell through the console port:
  - a. Type [reload](#) at the Privileged EXEC prompt.
  - b. Type **Ctrl-C** when prompted, early in the boot process.
  - c. Enter the Aboot password, if prompted. If the Aboot password is unknown, refer to [Restoring the Factory Default EOS Image and Startup Configuration](#) for instructions on reverting all flash directory contents to the factory default, including *startup-config* and EOS image.

2. Change the active directory to /mnt/flash directory.

```
About#cd /mnt/flash
```

3. Rename the startup configuration file.

```
About#mv startup-config startup-config.old
```

4. Exit Aboot. This boots the switch

```
About#exit
```

5. Cancel Zero Touch Provisioning (ZTP). Refer to [Canceling Zero Touch Provisioning](#) for instructions. If ZTP is not canceled, the switch either:
  - boots, using the *startup-config* file or boot script that it obtains from the network, or
  - remains in ZTP mode if the switch is unable to download a *startup-config* file or boot script.
6. Configure the **admin** and **enable** passwords.

```
switch>enable  
switch#configure terminal  
switch(config)#enable password xyz1
```

```
switch(config)#username admin secret abc41
```

7. Save the new **running-config** to the startup configuration file.

```
switch#write
```

8. (Optional) Delete the old startup configuration file.

```
switch#delete startup-config.old
```

After ZTP is canceled, the switch reboots, using the factory default settings. To avoid entering ZTP mode on subsequent reboots, create a **startup-config** file before the next switch reboot.

### 3.4.3 Restoring the Factory Default EOS Image and Startup Configuration

A **fullrecover** command removes all internal flash contents (including configuration files, EOS image files, and user files), then restores the factory default EOS image and **startup-config**. A subsequent installation of the current EOS image may be required if the default image is outdated. This process requires Aboot shell access through the console port.

**Note:** For hardware that is purchased after June 2017, the factory default partition will not have the backup EOS software image. This is done to increase the flash size on smaller flash size disks and also since other options are available in the **fullrecover** command functionality to restore factory default EOS image. This is applicable to both fixed system and modular system hardware.

This procedure restores the factory default EOS image and startup configuration.

1. Access the Aboot shell through the console port:
  - a. Type **reload** at the Privileged EXEC prompt.
  - b. Type **Ctrl-C** when prompted, early in the boot process.
  - c. Enter the Aboot password, if prompted. If the Aboot password is not known, enter an empty password three times, after which the CLI displays:

```
Type "fullrecover" and press Enter to revert /mnt/flash to factory
default state, or just press Enter to reboot:
```

- d. Type **fullrecover** and go to 4 .
2. Type **fullrecover** at the Aboot prompt.

```
Aboot#fullrecover
```

Aboot displays this warning:

```
All data on /mnt/flash will be erased; type "yes" and press Enter to
proceed, or just press Enter to cancel:
```

3. Type **yes** and press **Enter**.

The switch performs these actions:

- erases the contents of /mnt/flash
- writes new boot-config, startup-config, and EOS.swi files to /mnt/flash
- returns to the Aboot prompt

4. Exit Aboot. This boots the switch.

```
Aboot#exit
```

The serial console settings are restored to their default values (9600/N/8/1/N).

5. Reconfigure the console port if non-default settings are required.

- 
6. Cancel Zero Touch Provisioning (ZTP). Refer to [Canceling Zero Touch Provisioning](#) for instructions. If ZTP is not canceled, the switch either:
    - boots, using the **startup-config** file or boot script that it obtains from the network, or
    - remains in ZTP mode if the switch is unable to download a **startup-config** file or boot script.

After ZTP is canceled, the switch reboots, using the factory default settings. To avoid entering ZTP mode on subsequent reboots, create a **startup-config** file before the next switch reboot.

### 3.4.4 Restoring the Configuration and Image from a USB Flash Drive

The USB flash drive port can be used to restore an original configuration when you cannot establish a connection to the console port. This process removes the contents of the internal flash drive, restores the factory default configuration, and installs a new EOS image from the USB flash drive.

This procedure restores the factory default configuration and installs an EOS image stored on a USB flash drive.

1. Prepare the USB flash drive:
  - a. Verify the drive is formatted with MS-DOS or FAT file system. Most USB drives are pre-formatted with a compatible file system.
  - b. Create a text file named **fullrecover** on the USB flash drive. The filename does not have an extension. The file may be empty.
  - c. Create a text file named **boot-config**. The last modified timestamp of the **boot-config** file on the USB flash must differ from the timestamp of the **boot-config** file on the switch.
  - d. Enter this line in the new **boot-config** file on the USB flash:

```
SWI=flash:EOS.swi
```

- e. Copy an EOS image file to the flash drive. Rename it **EOS.swi** if it has a different file name. For best results, the flash drive should contain only these three files, because the procedure copies all files and directories on the USB flash drive to the switch.
  - fullrecover
  - boot-config
  - EOS.swi
2. Insert the USB flash drive into the USB flash port on the switch, as shown in [Figure 2: Switch Ports](#).
3. Connect a terminal to the console port and configure it with the default terminal settings (9600/N/8/1) to monitor progress messages on the console.
4. Power up or **reload** the switch.

The switch erases internal flash contents and copies the files from the USB flash drive to internal flash. The switch then boots automatically.
5. Cancel Zero Touch Provisioning (ZTP). Refer to [Canceling Zero Touch Provisioning](#) for instructions. If ZTP is not canceled, the switch either:
  - boots, using the startup-config file or boot script that it obtains from the network, or
  - remains in ZTP mode if the switch is unable to download a **startup-config** file or boot script.

After ZTP is canceled, the switch reboots using the factory default settings. To avoid entering ZTP mode on subsequent reboots, create a **startup-config** file before the next switch reboot.

## 3.5 Session Management Commands

### Global Configuration Commands

- `configure replace`
- `configure session`
- `management api http-commands`
- `management console`
- `management ssh`
- `management telnet`
- `management xmpp`

### Management Configuration Commands

- `domain` (XMPP Management)
- `idle-timeout` (Console Management)
- `idle-timeout` (SSH Management)
- `idle-timeout` (Telnet Management)
- `protocol http` (API Management)
- `protocol https` (API Management)
- `protocol https certificate` (API Management)
- `server` (XMPP Management)
- `session privilege` (XMPP Management)
- `shutdown` (API Management)
- `shutdown` (Telnet Management)
- `shutdown` (XMPP Management)
- `switch-group` (XMPP Management)
- `username` (XMPP Management)
- `vrf` (API Management)
- `vrf` (XMPP Management)
- `xmpp send`
- `xmpp session`

### Display Commands

- `show inventory`
- `show xmpp neighbors`
- `show xmpp status`
- `show xmpp switch-group`

---

### 3.5.1 configure replace

The **configure replace** command replaces the current configuration with the new configuration from the specified source.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
configure replace {source_file_path:source_file_name | boot-extensions | clean-config |  
installed-extensions | running-config | startup-config}[ignore-errors] [md5 md5sum] [skip-checkpoint]
```

#### Parameter

- **source\_file\_path:source\_file\_name** replaces current configuration with the configuration from the specified source file.
- **boot-extensions** replaces current configuration with the boot extensions configuration.
- **clean-config** replaces current configuration with clean and default configurations.
- **installed-extensions** replaces current configuration with the installed extensions configuration.
- **running-config** obsolete.
- **starup-config** replaces current configuration with the startup configuration.
- **ignore-errors** ignores errors while loading the new configuration.
- **md5 md5sum** performs a checksum to validate data integrity with the specified MD5 hashing algorithm.
- **skip-checkpoint** skips creating the checkpoint file of *running-config*.

#### Example

- This command replaces the current configuration state with the startup configuration.

```
switch(config)#configure replace start-config  
! Preserving static routes. Use 'no ip routing delete-static-  
routes' to clear  
them.  
switch#
```

## 3.5.2 configure session

The `configure session` command allows a series of configuration changes to be made in a temporary location, then committed to *running-config* later by issuing the `commit` command. An uncommitted configuration session will be discarded if the switch reboots and will time out after 24 hours.

**Note:** committing a configuration session replaces *running-config* with the session configuration, which consists of the running configuration at the time the session was initiated plus the commands that were entered as part of the session. Any changes that were made to *running-config* since the session was initiated will be overwritten when the session is committed.

The `no configure session session_name` and `default configure session session_name` commands delete the specified configuration session.

### Command Mode

Privileged EXEC

### Command Syntax

```
configure session [session_name]
no configure session session_name
default configure session session_name
```

### Parameter

- *session\_name* session name

### Guidelines

- If a session name is not specified, a session is created with a name generated by the systems.
- The switch permits up to five uncommitted sessions.
- Any uncommitted sessions are discarded when the switch reboots.
- Uncommitted sessions time out after 24 hours.

### Example

- This command creates a session (automatically named "sess-1") and adds commands to it. Issuing the `commit` command would cause all of the commands to be executed and would overwrite any configuration performed since the session was created.

```
switch(config)#configure session
switch(config-s-sess-1)#no username kevin
switch(config-s-sess-1)#aaa authentication dot1x default group
radius
switch(config-s-sess-1)#dot1x system-auth-control
switch(config-s-sess-1)#copy running-config startup-config
switch(config-s-sess-1)#reload all now
switch(config-s-sess-1)#
```

---

### 3.5.3 domain (XMPP Management)

The `domain` command configures the switch's XMPP domain name. Only messages using a domain matching the locally configured one are accepted by the XMPP client. The switch's domain name is used if none is specified.

Management over XMPP is disabled by default. To enable it, you must provide the location of the server along with the domain, username and password for the switch.

Arista recommends configuring the XMPP domain before the username, because it will provide shortcuts for the `switch-group` and `username` so they can be configured without the domain attached to it (e.g., `USERNAME` instead of `USERNAME@DOMAIN`).

The `no domain` and `default domain` commands delete the domain name by removing the `domain` command from *running-config*.

#### Command Mode

Mgmt-xmpp Configuration

#### Command Syntax

`domain` *string*

`no domain`

`default domain`

#### Parameters

- *string* domain name (text string)

#### Examples:

- This command configures `test.aristanetworks.com` as the switch's domain name.

```
switch(config)#management xmpp
test1(config-mgmt-xmpp)#server arista-xmpp
test1(config-mgmt-xmpp)#domain test.aristanetworks.com
test1(config-mgmt-xmpp)#username test1@test.aristanetworks.com
password 0 arista
test1(config-mgmt-xmpp)#no shutdown
```

- This command removes the domain name from the XMPP *configuration*.

```
switch(config-mgmt-xmpp)#no domain
switch(config-mgmt-xmpp)#
```

### 3.5.4 idle-timeout (Console Management)

The `idle-timeout (Console Management)` command configures the idle-timeout period for console connection sessions. The idle timeout is the interval that the connection waits after a users most recent command before shutting down the connection. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

The `no idle-timeout` and `default idle-timeout` commands disables the automatic connection timeout by removing the `idle-timeout` statement from *running-config*.

#### Command Mode

Mgmt-console

#### Command Syntax

```
idle-timeout idle_period
```

```
no idle-timeout
```

```
default idle-timeout
```

#### Parameters

- ***idle\_period*** session idle-timeout length. Options include:
  - **0** Automatic connection timeout is disabled
  - **<1 to 86400>** Automatic timeout period (minutes).

#### Example

- These commands configure a console idle-timeout period of three hours, then return the switch to global configuration mode.

```
switch(config)#management console
switch(config-mgmt-console)#idle-timeout 180
switch(config-mgmt-console)#exit
switch(config)#
```

- These commands disable automatic connection timeout.

```
switch(config)#management console
switch(config-mgmt-console)#idle-timeout 0
switch(config-mgmt-console)#
```

---

### 3.5.5 idle-timeout (SSH Management)

The `idle-timeout (SSH Management)` command configures the idle-timeout period for SSH connection sessions. The idle timeout is the interval that the connection waits after a users most recent command before shutting down the connection. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

The `no idle-timeout` and `default idle-timeout` commands disables the automatic connection timeout by removing the `idle-timeout` statement from *running-config*.

#### Command Mode

Mgmt-ssh Configuration

#### Command Syntax

```
idle-timeout idle_period
```

```
no idle-timeout
```

```
default idle-timeout
```

#### Parameters

- ***idle\_period*** session idle-timeout length. Options include:
  - **0** Automatic connection timeout is disabled
  - **<1 to 86400>** Automatic timeout period (minutes).

#### Example

- These commands configure an ssh idle-timeout period of three hours, then return the switch to global configuration mode.

```
switch(config)#management ssh  
switch(config-mgmt-ssh)#idle-timeout 180  
switch(config-mgmt-ssh)#exit  
switch(config)#
```

- These commands disable automatic connection timeout.

```
switch(config)#management ssh  
switch(config-mgmt-ssh)#idle-timeout 0  
switch(config-mgmt-ssh)#
```

### 3.5.6 idle-timeout (Telnet Management)

The `idle-timeout (Telnet Management)` command configures the idle-timeout period for Telnet connection sessions. The idle timeout is the interval that the connection waits after a users most recent command before shutting down the connection. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

The `no idle-timeout` and `default idle-timeout` commands disables the automatic connection timeout by removing the `idle-timeout` statement from *running-config*.

#### Command Mode

Mgmt-telnet

#### Command Syntax

```
idle-timeout idle_period
```

```
no idle-timeout
```

```
default idle-timeout
```

#### Parameters

- ***idle\_period*** session idle-timeout length. Options include:
  - **0** Automatic connection timeout is disabled
  - **<1 to 86400>** Automatic timeout period (minutes).

#### Example

- These commands configure a telnet idle-timeout period of three hours, then return the switch to global configuration mode.

```
switch(config)#management telnet
switch(config-mgmt-telnet)#idle-timeout 180
switch(config-mgmt-telnet)#exit
switch(config)#
```

- These commands disable automatic connection timeout.

```
switch(config)#management telnet
switch(config-mgmt-telnet)#idle-timeout 0
switch(config-mgmt-telnet)#
```

---

### 3.5.7 management api http-commands

The `management api http-commands` command places the switch in mgmt-API configuration mode.

The `no management api http-commands` and `default management api http-commands` commands delete mgmt-api-http-command configuration mode statements from *running-config*.

Mgmt-api-http-cmds configuration mode is not a group change mode; *running-config* is changed immediately upon entering commands. Exiting mgmt-api-http-cmds configuration mode does not affect *running-config*. The `exit` command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
management api http-commands
```

```
no management api http-commands
```

```
default management api http-commands
```

#### Commands Available in Mgmt-API Configuration Mode

- [protocol http \(API Management\)](#)
- [protocol https \(API Management\)](#)
- [protocol https certificate \(API Management\)](#)
- [shutdown \(API Management\)](#)
- [vrf \(API Management\)](#)

#### Example

- This command places the switch in mgmt-api-http-cmds configuration mode.

```
switch(config)#management api http-commands  
switch(config-mgmt-api-http-cmds)#
```

- This command returns the switch to global management mode.

```
switch(config-mgmt-api-http-cmds)#exit  
switch(config)#
```

### 3.5.8 management console

The **management console** command places the switch in mgmt-console configuration mode to adjust the idle-timeout period for console connection sessions. The idle-timeout period determines the inactivity interval that terminates a connection session.

The **no management console** and **default management console** commands delete mgmt-console configuration mode statements from *running-config*.

Mgmt-console configuration mode is not a group change mode; *running-config* is changed immediately upon entering commands. Exiting mgmt-console configuration mode does not affect *running-config*. The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
management console
```

```
no management console
```

```
default management console
```

#### Commands Available in mgmt-console Configuration Mode

- [idle-timeout \(Console Management\)](#)

#### Example

- This command places the switch in mgmt-console configuration mode:

```
switch(config)#management console  
switch(config-mgmt-console)#
```

- This command returns the switch to global management mode:

```
switch(config-mgmt-console)#exit  
switch(config)#
```

---

### 3.5.9 management ssh

The **management ssh** command places the switch in mgmt-ssh configuration mode to adjust SSH session connection parameters.

The **no management ssh** and **default management ssh** commands delete the mgmt-ssh configuration mode statements from *running-config*.

Mgmt-ssh configuration mode is not a group change mode; *running-config* is changed immediately upon entering commands. Exiting mgmt-ssh configuration mode does not affect *running-config*. The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
management ssh
```

```
no management ssh
```

```
default management ssh
```

#### Commands Available in Mgmt-ssh Configuration Mode

- authentication mode (Management-SSH)
- cipher (Management-SSH)
- fips restrictions (Management-SSH)
- hostkey (Management-SSH)
- idle-timeout (Management-SSH)
- ip access group (Management-SSH)
- ipv6 access group (Management-SSH)
- key-exchange (Management-SSH)
- login timeout (Management-SSH)
- mac hmac (Management-SSH)
- server-port (Management-SSH)
- shutdown (Management-SSH)
- vrf (Management-SSH)

#### Example

- This command places the switch in mgmt-ssh configuration mode:

```
switch(config)#management ssh  
switch(config-mgmt-ssh)#
```

- This command returns the switch to global management mode:

```
switch(config-mgmt-ssh)#exit  
switch(config)#
```

### 3.5.10 management telnet

The `management telnet` command places the switch in mgmt-telnet configuration mode to adjust telnet session connection parameters.

The `no management telnet` and `default management telnet` commands delete the mgmt-telnet configuration mode statements from *running-config*.

Mgmt-telnet configuration mode is not a group change mode; *running-config* is changed immediately upon entering commands. Exiting mgmt-telnet configuration mode does not affect *running-config*. The `exit` command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
management telnet
```

```
no management telnet
```

```
default management telnet
```

#### Commands Available in mgmt-telnet Configuration Mode

- idle-timeout (Management-Telnet)
- ip access group (Management-Telnet)
- ipv6 access group (Management-Telnet)
- shutdown (Management-Telnet)
- vrf (Management-Telnet)

#### Example

- This command places the switch in mgmt-telnet configuration mode:

```
switch(config)#management telnet  
switch(config-mgmt-telnet)#
```

- This command returns the switch to global management mode:

```
switch(config-mgmt-telnet)#exit  
switch(config)#
```

---

### 3.5.11 management xmpp

The **management xmpp** command places the switch in mgmt-xmpp configuration mode. Management over XMPP is disabled by default. To enable XMPP, you must provide the location of the XMPP server along with the username and password for the switch.

The **no management xmpp** and **default management xmpp** commands delete the mgmt-xmpp configuration mode statements from *running-config*.

Mgmt-xmpp configuration mode is not a group change mode; *running-config* is changed immediately upon entering commands. Exiting mgmt-xmpp configuration mode does not affect *running-config*. The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
management xmpp
```

```
no management xmpp
```

```
default management xmpp
```

#### Commands Available in Mgmt-xmpp Configuration Mode

- domain (Management-xmpp)
- server (Management-xmpp)
- session (Management-xmpp)
- shutdown (Management-xmpp)
- switch-group (Management-xmpp)
- username (Management-xmpp)
- vrf (Management-xmpp)

#### Example

- This command places the switch in mgmt-xmpp configuration mode:

```
switch(config)#management xmpp  
switch(config-mgmt-xmpp)#
```

- This command returns the switch to global management mode:

```
switch(config-mgmt-xmpp)#exit  
switch(config-mgmt-xmpp)#
```

### 3.5.12 protocol http (API Management)

The `protocol http` command enables the hypertext transfer protocol (HTTP) server.

The `no protocol http` and `default protocol http` commands disable the HTTP server by removing the `protocol http` statement from *running-config*.

#### Command Mode

Mgmt-API Configuration

#### Command Syntax

```
protocol http [TCP_PORT ]
```

```
no protocol http
```

```
default protocol http
```

#### Parameters

- **TCP\_PORT** Port number to be used for the HTTP server. Options include:
  - **<no parameter>** Specifies default port number 80.
  - **port <1 to 65535>** Specifies HTTP server port number. Value ranges from **1** to **65535**.
- **localhost** The name of the server bound on the localhost.
- **port** The number of the TCP port to serve on.

#### Related Commands

- [management api http-commands](#) places the switch in mgmt-api configuration mode.

#### Examples

- These commands enable the management API for the HTTP server.

```
switch(config)#management api http-commands  
switch(config-mgmt-api-http-cmds)#
```

### 3.5.13 protocol https (API Management)

The `protocol https` command enables the HTTP secure server. The HTTP secure server is active by default.

The `default protocol https` command restores the default setting by removing the `no protocol https` statement from *running-config*. The `no protocol https` command disables the HTTP secure server.

#### Command Mode

Mgmt-API Configuration

#### Command Syntax

```
protocol https [TCP_PORT ]
```

```
no protocol https
```

```
default protocol https
```

#### Parameters

- **TCP\_PORT** Port number to be used for the HTTPS server. Options include:
  - **<no parameter>** Specifies default port number 443.
  - **port <1 to 65535>** Specifies HTTP server port number. Value ranges from 1 to 65535.
- **certificate** The HTTPS key and certificate to use.
- **cipher** Exclusive list of cryptographic ciphers.
- **key-exchange** Exclusive list of key-exchange algorithms.
- **mac** Exclusive list of MAC algorithms.
- **port** The number of the TCP port to serve on.
- **ssl** Configure SSL options.

#### Related Commands

- [management api http-commands](#) places the switch in mgmt-api configuration mode.

#### Examples

- These commands enables service to the HTTP server. The `no shutdown` command allows access to the service.

```
switch(config)#management api http-commands
switch(config-mgmt-api-http-cmds)#protocol https
switch(config-mgmt-api-http-cmds)# no shutdown
```

- These commands specifies the port number that should be used for the HTTPS server. The `no shutdown` command allows access to the service.

```
switch(config)#management api http-commands
switch(config-mgmt-api-http-cmds)#protocol https port 52
switch(config-mgmt-api-http-cmds)#no shutdown
```

### 3.5.14 protocol https certificate (API Management)

The `protocol https certificate` command configures the HTTP secure server to request an X.509 certificate from the client. The client then authenticates the certificate with a public key.

The `no protocol https certificate` and `default protocol https certificate` commands restore default behavior by removing the `protocol https certificate` statement from *running-config*.

#### Command Mode

Mgmt-API Configuration

#### Command Syntax

```
protocol https certificate
no protocol https certificate
default protocol https certificate
```

#### Related Commands

- [management api http-commands](#) places the switch in mgmt-api configuration mode.

#### Examples

- These commands configure the HTTP secure server to request an X.509 certificate from the client for authentication.

```
switch(config)#management api http-commands
switch(config-mgmt-api-http-cmds)#protocol https certificate
switch(config-mgmt-api-http-cmds)#
```

---

### 3.5.15 server (XMPP Management)

The **server** command adds a XMPP server to *running-config*. Multiple XMPP servers can be set up for redundancy. For redundant configurations, the XMPP server location should be a DNS name and not a raw IP address. The DNS server is responsible for returning the list of available XMPP servers, which the client can go through until an accessible server is found.

User authentication is provided by the XMPP server. Command authorization can be provided by EOS local configuration or TACACS+. The XMPP server should use the same authentication source as the switches. RADIUS is not supported as an XMPP authorization mechanism.

The **no server** and **default server** commands remove the specified XMPP server from *running-config*.

#### Command Mode

Mgmt-xmpp Configuration

#### Command Syntax

```
server SERVER_NAME [SERVER_PORT]
```

```
no server
```

```
default server
```

#### Parameters

- **SERVER\_NAME** XMPP server location. Options include:
  - **IP address** in dotted decimal notation.
  - a host name for the XMPP server.
- **SERVER\_PORT** Server port. Options include:
  - **port <1 to 65535 >** where *number* ranges from 1 to 65535. If no port is specified, the default port 5222 is used.

#### Examples

- This command configures the server hostname **arista-xmpp** to server port 1.

```
switch(config)#management xmpp
switch(config-mgmt-xmpp)#server arista-xmpp port 1
```

- This command removes the XMPP server.

```
switch(config-mgmt-xmpp)# no server
```

### 3.5.16 session privilege (XMPP Management)

The `session privilege` command will place the user in EXEC mode. The initial privilege level is meaningless by default. However, with the configuration of roles, users can add meaning to the different privilege levels. By default, XMPP does not limit access to any command.

Level 1-15: Commands accessible from EXEC Mode.

If AAA is not configured and the switch is configured to connect to the XMPP client, any message received is executed with privilege level 1 by default.

The `no session privilege` and `default session privilege` commands revert the list contents to **none** for the specified privilege levels.

#### Command Mode

Mgmt-xmpp Configuration

#### Command Syntax

```
session privilege PRIV_LEVEL
```

```
no session privilege
```

```
default session privilege
```

#### Parameters

- **PRIV\_LEVEL** Privilege levels of the commands. Value ranges from **0** and **15**.

#### Examples

- These commands authorizes configuration commands (privilege level config 5) for XMPP.

```
switch(config)#(config)#management xmpp
switch(config-mgmt-xmpp)#session privilege 5
switch(config-mgmt-xmpp)#
```

- This command removes the privilege levels set for the XMPP session.

```
switch(config)#management xmpp
switch(config-mgmt-xmpp)#no session privilege
```

### 3.5.17 show inventory

The `show inventory` command displays the hardware components installed in the switch. Serial numbers and a description is also provided for each component.

#### Command Mode

EXEC

#### Command Syntax

```
show inventory
```

#### Examples

- This command displays the hardware installed in a DCS-7150S-52 switch.

```
switch>show inventory
System information
  Model                               Description
  -----
DCS-7150S-52-CL                       52-port SFP+ 10GigE 1RU + Clock

52   Arista Networks  SFP-10G-SR                          XCW1225FD753  0002

switch>
```

### 3.5.18 show xmpp neighbors

The `show xmpp neighbors` command displays all neighbors and their connection status. The XMPP server keeps track of all relationships between its users.

#### Command Mode

EXEC

#### Command Syntax

```
show xmpp neighbors
```

#### Example

- This command displays all the XMPP neighbors and their connection status.

```
switch#show xmpp neighbors
Neighbor                               State           Last Seen Login Time
-----                               -
admin@test.aristanetworks.com         present         0:01:40 ago
test1@test.aristanetworks.com        present         20:29:39 ago

Neighbor                               Status Message
-----                               -
admin@test.aristanetworks.com
test1@test.aristanetworks.com        Arista Networks DCS-7048T-4S
switch#
```

---

### 3.5.19 show xmpp status

The `show xmpp status` command displays the current XMPP connection status to the server.

The XMPP server keeps track of all relationships between its users. In order for two users to directly communicate, this relationship must first be established and confirmed by the other party.

Switches automatically confirm requests from outside parties as long as they are a user from the same domain name, for example when you chat with your switch from your own XMPP chat client.

#### Command Mode

EXEC

#### Command Syntax

```
show xmpp status
```

#### Example

- This command displays the current XMPP connection status to the server.

```
switch#show xmpp status
XMPP Server:  port 5222
Client username: test@test.aristanetworks.com
Default domain: test.aristanetworks.com
Connection status: connected
switch#
```

### 3.5.20 show xmpp switch-group

The `show xmpp switch-group` command displays the configured and active switch groups for the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show xmpp switch-group
```

#### Example

- This command displays the configured and active switch groups.

```
switch#show xmpp switch-group
testroom@conference.test.aristanetworks.com
switch#
```

---

### 3.5.21 shutdown (API Management)

The **shutdown** command, in mgmt-api configuration mode, disables management over API on the switch. API is disabled by default.

The **no shutdown** command, in mgmt-api configuration mode, enables the management API access.

The **default shutdown** command, in mgmt-api configuration mode, disables the management API access.

#### Command Mode

Mgmt-API Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

#### Related Commands

- [management api http-commands](#) places the switch in mgmt-api configuration mode.

#### Example

- These commands disables API access to the HTTP server.

```
switch(config)#management api http-commands  
switch(config-mgmt-api-http-cmds)# shutdown  
switch(config-mgmt-api-http-cmds)#
```

- These commands enables API access to the HTTP server.

```
switch(config)#management api http-commands  
switch(config-mgmt-api-http-cmds)# no shutdown  
switch(config-mgmt-api-http-cmds)#
```

### 3.5.22 shutdown (Telnet Management)

The **shutdown** command, in management-telnet mode, disables or enables Telnet on the switch. Telnet is disabled by default. The **management telnet** command places the switch in management-telnet mode.

- To enable Telnet, enter **no shutdown** at the management-telnet prompt.
- To disable Telnet, enter **shutdown** at the management-telnet prompt.

#### Command Mode

Management-Telnet Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

#### Example

- These commands enable Telnet, then return the switch to global configuration mode.

```
switch(config)#management telnet  
switch(config-mgmt-telnet)#no shutdown  
switch(config-mgmt-telnet)#exit  
switch(config)#
```

- This command disables Telnet.

```
switch(config-mgmt-telnet)#shutdown
```

---

### 3.5.23 shutdown (XMPP Management)

The **shutdown** command, in `mgmt-xmpp` mode, disables or enables management over XMPP on the switch. XMPP is disabled by default.

The `no shutdown` and `default shutdown` commands re-enable XMPP by removing the **shutdown** command from *running-config*.

#### Command Mode

Mgmt-xmpp Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

#### Example

- These commands enable management over XMPP, then return the switch to global configuration mode.

```
switch(config-mgmt-xmpp) #no shutdown
switch(config-mgmt-xmpp) #exit
switch(config) #
```

- This command disables management over XMPP.

```
switch(config-mgmt-xmpp) #shutdown
switch(config-mgmt-xmpp) #
```

### 3.5.24 switch-group (XMPP Management)

The `switch-group` command allows you to configure each switch to join specified chat rooms on startup. In order for the switch to participate in a chat group, the switch has to be configured to belong to the specified chat room.

The `no switch-group` and `default switch-group` commands delete the specified switch-group configuration (or all switch-group configurations if no name is specified) by removing the corresponding `switch-group` statement from *running-config*.

#### Command Mode

Mgmt-xmpp Configuration

#### Command Syntax

```
switch-group name SECURITY
```

```
no switch-group
```

```
default switch-group
```

#### Parameters

- ***name*** Group name text that the user enters at the login prompt to access the CLI. To enter multiple names in a single command, separate them with spaces.

Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:

```
@ # $ % ^ & * - _ = + ; < > , . ~ |
```

- **SECURITY** password assignment.
  - **password *pwd\_txt*** *name* is protected by specified password. *pwd\_txt* is a clear-text string.
  - **password 0** *pwd\_txt* *name* is protected by specified password. *pwd\_txt* is a clear-text string.
  - **password 7** *pwd\_txt* *name* is protected by specified password. *pwd\_txt* is encrypted string.

#### Guidelines

- A switch group is an arbitrary grouping of switches within the network which belong to one chat group.
- In order to belong to one or more switch groups, the switch has to be manually assigned to it.
- Switch groups are defined dynamically based on the configuration of all of the switches in the network.
- As per the multi-user chat XMPP standard (XEP-0045), switch groups have a full name of `GROUPNAME@conference.DOMAIN`
- All CLI commands allow either the full group name or the short name, which are appended the `@conference.DOMAIN`
- If the switch belongs to multiple chat rooms, you must configure each group with a separate command.

#### Examples

- These commands configure the switch-group to be part of the chat room.

```
switch(config)#management xmpp
switch(config-mgmt-xmpp)# switch-group
testroom@conference.test.aristanetworks.com password 0 arista
```

- Use the `show xmpp switch-group` to verify the active switch-group for the switch.

```
switch# show xmpp switch-group
```

---

testroom@conference.test.aristanetworks.com

### 3.5.25 username (XMPP Management)

The **username** command configures the switch's username and password on the XMPP server.

The **no username** and **default username** commands delete the specified username by removing the corresponding **username** statement from *running-config*.

#### Command Mode

Mgmt-xmpp Configuration

#### Command Syntax

```
username name SECURITY
```

```
no username
```

```
default username
```

#### Parameters

- **name** username text that defines the XMPP username and password.

Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:

```
@ # $ % ^ & * ( ) - _ = + { } [ ] ; < > , . ~ |
```

- **SECURITY** password assignment.
  - **password** *pwd\_txt name* specifies and unencrypted shared key. *pwd\_txt* is a clear-text string.
  - **password 0** *pwd\_txt name* specifies and unencrypted key. *pwd\_txt* is a clear-text string.
  - **password 7** *pwd\_txt name* specifies a hidden key. *pwd\_txt* is encrypted string.

#### Guidelines

Encrypted strings entered through this parameter are generated elsewhere. The **password 7** option (**SECURITY**) is typically used to enter a list of username-passwords from a script.

#### Examples

- These commands create the username and assigns it a password. The password is entered in clear text because the parameter is set to 0.

```
switch(config)#management xmpp
switch(config-mgmt-xmpp)#server arista-xmpp
switch(config-mgmt-xmpp)#domain test.aristanetworks.com
switch(config-mgmt-xmpp)#username test1@test.aristanetworks.
com password 0
arista
switch(config-mgmt-xmpp)#no shutdown
```

- This command removes all usernames from the XMPP server.

```
switch(config-mgmt-xmpp)#no username
switch(config-mgmt-xmpp)#
```

---

### 3.5.26 vrf (API Management)

The `vrf` command places the switch in VRF configuration mode for the server. If the named VRF does not already exist, this command creates it.

#### Command Mode

Mgmt-API Configuration

#### Command Syntax

```
vrf VRF_INSTANCE
```

#### Parameters

- **VRF\_INSTANCE** specifies the VRF instance.
  - **default** Instance is created in the default VRF.
  - **vrf\_name** Instance is created in the specified user-defined VRF.

#### Related Commands

- [management api http-commands](#) places the switch in mgmt-api configuration mode.

#### Example

- This command creates a VRF named management-vrf and places the switch in VRF configuration mode for the new VRF.

```
switch(config)#management api http-commands  
switch(config-mgmt-api-http-cmds)#vrf management-vrf  
switch(config-mgmt-api-http-cmds-vrf-management-vrf)#
```

### 3.5.27 vrf (XMPP Management)

The `vrf` command places the switch in VRF configuration mode for the XMPP server. If the named VRF does not already exist, this command creates it.

The VRF configuration for the client is for the entire XMPP service, rather than per server. All servers resolving on a particular hostname must be reachable in the same VRF.

#### Command Mode

Mgmt-xmpp Configuration

#### Command Syntax

```
vrf [VRF_INSTANCE]
```

#### Parameters

- **VRF\_INSTANCE** specifies the VRF instance.
  - **default** Instance is created in the default VRF.
  - **vrf\_name** Instance is created in the specified user-defined VRF.

#### Example

- This command creates a VRF named `management-vrf` and places the switch in VRF configuration mode for the server.

```
switch(config)#management xmpp
switch(config-mgmt-xmpp)#vrf management-vrf
switch(config-mgmt-xmpp)
```

### 3.5.28 xmpp send

The `xmpp send` command can be used to connect to the XMPP server and send messages to switches or switch groups within the network.

Before switches can send messages to each other, they must friend each other. An easy way to have them auto friend each other is to have them join the same chat room. The friendship between switches can be verified by using the `show xmpp neighbor` command.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
xmpp send to neighbor XMIT_TYPE content
```

#### Parameters

- **neighbor** Options include switches or switch groups within the network that are connected as friends in a chat room.
- **XMIT\_TYPE** Transmission type. Valid options include:
  - **command** Sends an XMPP command.
  - **message** Sends an XMPP message.
- **content** The command you want the friends within the chat room to display or execute.

#### Configuration Restrictions

- Only enable-mode commands are allowed within the multi-switch CLI.
- Changing into a different CLI mode and running several commands in that mode is not supported (e.g., into configuration mode)
- An external XMPP client (for example Adium) can be used to send multiple lines within a single message. By sending multiple lines, it is possible to change into another CLI mode. After the message is processed, the switch automatically return to the enable mode.
- Commands that prompt for a response (like reload) are not supported.
- Long commands, such as image file copies, may cause the switch XMPP client to momentarily stop responding and disconnect. The switch should reconnect and the long command should complete.
- Many command outputs display in a specific table format. To achieve the same visual feel as through a terminal, use a monospaced font, such as Courier, for the incoming messages.

#### Example

- This command sends the switch in the chat room the request to execute the show version command.

```
switch# xmpp send test2 command show version
message from user: test2@test.aristanetworks.com
-----
Hardware version:      04.40
Serial number:        JFL08432083
System MAC address:   001c.7301.7d69
Software image version: 4.12.3
Architecture:         i386
Internal build version: 4.12.3
Internal build ID:    f5ab5f57-9c26-4fe4-aaa-fb60fa55d01d
Uptime:               2 hours and 38 minutes
Total memory:         1197548 kB
Free memory:          182452 kB
```

### 3.5.29 xmpp session

The `xmpp session` command is similar to running SSH from the switch. The user is required to input their username (default is to `USER@DEFAULTDOMAIN`) and password in order to connect to the XMPP server. This command allows you to interact in the enable mode with a switch or switch group over XMPP using the standard CLI, with access to help and tab completion. All commands are then executed remotely and only the non-empty results are displayed on the screen.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
xmpp session switchgroup
```

#### Parameters

- ***switchgroup*** The option includes the switch group within the network that is connected as friends in a chat room.

#### Configuration Restrictions

- Only enable-mode commands are allowed within the multi-switch CLI.
- Changing into a different CLI mode and running several commands in that mode is not supported (e.g., into configuration mode)
- An external XMPP client (for example Adium) can be used to send multiple lines within a single message. By sending multiple lines, it is possible to change into another CLI mode. After the message is processed, the switch automatically return to the enable mode.
- Commands that prompt for a response (like reload) are not supported.
- Long commands, such as image file copies, may cause the switch XMPP client to momentarily stop responding and disconnect. The switch should reconnect and the long command should complete.
- Many command outputs display in a specific table format. To achieve the same visual feel as through a terminal, use a monospaced font, such as Courier, for the incoming messages.

#### Example

- This command displays the status of Ethernet 3 from test1, which is a member of the switch group chat room.

```
switch# xmpp session all@test.aristanetworks.com
xmpp-all# show int Eth3 status

response from: test1@test.aristanetworks.com

-----

Port  Name  Status      Vlan    Duplex  Speed  Type
Et3   bs3   connected   in Po3  a-full  a-1000 10GBASE-SR
switch#
```

## Administering the Switch

---

This chapter describes administrative tasks that are typically performed only after initially configuring the switch or after recovery procedures.

This chapter includes these sections:

- [Managing the Switch Name](#)
- [System Clock and Time Protocols](#)
- [Managing Display Attributes](#)
- [Logging of Event Notifications](#)
- [Event Monitor](#)
- [Managing EOS Extensions](#)
- [Switch Administration Commands](#)

### 4.1 Managing the Switch Name

These sections describe how to configure the switchs domain and host name.

- [Assigning a Name to the Switch](#) describes the assigning of an FQDN to the switch.
- [Specifying DNS Addresses](#) describes the adding of name servers to the configuration.

#### 4.1.1 Assigning a Name to the Switch

A fully qualified domain name (FQDN) labels the switch and defines its organization ID in the Domain Name System hierarchy. The switchs FQDN consists of a host name and domain name.

The host name is uniquely associated with one device within an IP-domain. The default host name is localhost. You can configure the prompt to display the host name, as described in [prompt](#).

- To assign a host name to the switch, use the `hostname` command. To return the switchs host name to the default value of localhost, use the `no hostname` command.
- To specify the domain location of the switch, use the `dns domain` command.

#### Example

- This command assigns the string *main-host* as the switchs host name.

```
switch(config)#hostname main-host
main-host(config)#
```

- This command configures *aristanetworks.com* as the switchs domain name.

```
switch(config)#dns domain aristanetworks.com
switch(config)#
```

- This procedure configures *sales1.samplecorp.org* as the switchs FQDN.

```
switch(config)#dns domain samplecorp.org
switch(config)#
```

- This *running-config* extract contains the switch's host name and IP-domain name.

```
switch#show running-config
! Command: show running-config
! device: switch (DCS-7150S-64-CL, EOS-4.13.2F)
!

vlan 3-4
!
username john secret 5 $1$a7Hjept9$TIKRX6ytkg8o.ENja.na50
!
hostname sales1
ip name-server vrf default 172.17.0.22
dns domain samplecorp.org
!

end
switch#
```

## 4.1.2 Specifying DNS Addresses

The Domain Name Server (DNS) maps FQDN labels to IP addresses and provides addresses for network devices. Each network requires at least one server to resolve addresses. The configuration file can list a maximum of three server addresses.

To add name servers to the configuration, use the `ip name-server` command. Each command can add one to three servers. The switch disregards any attempt to add a fourth server to the configuration. All server addresses must be in a single VRF. If servers have been previously configured in a different VRF they must be removed before adding a new server to the configuration.

### Example

- This code performs these actions:
  - adds three names servers to the configuration in the default VRF
  - attempts to add a fourth server, resulting in an error message
  - displays the configuration file.

```
switch(config)#ip name-server 10.1.1.24 10.1.1.25 172.17.0.22
switch(config)#ip name-server 10.15.3.28
% Maximum number of nameservers reached. '10.15.3.28' not added
switch(config)#show running-config
! device: Switch (EOS-4.11.2-1056939.EOS4112)
!
username david secret 5 $1$a7Hjept9$TIKRX6ytkg8o.ENja.na50
!
hostname Switch
ip name-server 10.1.1.24
ip name-server 10.1.1.25
ip name-server 172.17.0.22
dns domain aristanetworks.com
```

The switch assigns source IP addresses to outgoing DNS requests. To force the switch to use a single, user-defined source interface for all requests, use the `ip domain lookup` command.

**Example**

- This command forces the switch to use VLAN 5 as the source interface for DNS requests originating from the default VRF.

```
switch(config)#ip domain lookup source-interface Vlan5
switch(config)#
```

- This command forces the switch to use VLAN 10 as the source interface for DNS requests originating from VRF purple.

```
switch(config)#ip domain lookup vrf purple source-interface Vlan10
switch(config)#
```

## 4.2 System Clock and Time Protocols

The switch uses the system clock for displaying the time and for time-stamping messages. The system clock is set to Coordinated Universal Time (UTC); the switch calculates local time based on the time zone setting. Time-stamps and time displays are in local time. The system clock can be set either manually or via Network Time Protocol (NTP); any NTP servers properly configured on the switch override time that is manually entered.

The following sections deal with the configuration of the system clock and the use of NTP and PTP.

- [Configuring the Time Zone](#)
- [Setting the System Clock Manually](#)
- [Displaying the Time](#)
- [Network Time Protocol \(NTP\)](#)

### 4.2.1 Configuring the Time Zone

The time zone setting is used by the switch to convert the system time (UTC) to local time. To specify the time zone, use the `clock timezone` command.

**Examples**

- These commands configure the switch for the United States Central Time Zone.

```
switch(config)#clock timezone US/Central
switch(config)#show clock
Mon Jan 14 18:42:49 2013
timezone is US/Central
switch(config)#
```

- To view the predefined time zone labels, enter `clock timezone` with a question mark.

```
switch(config)#clock timezone ?
Africa/Abidjan          Africa/Accra
WET                    WET timezone
Zulu                   Zulu timezone

switch(config)#clock timezone
```

- This command displays all time zone labels that start with **America**.

```
switch(config)#clock timezone AMERICA?
America/Adak           America/Anchorage
America/Yellowknife
```

```
switch(config)#clock timezone AMERICA
```

## 4.2.2 Setting the System Clock Manually

The `clock set` command manually configures the system clock time and date, in local time. Any NTP servers properly configured on the switch override time that is manually entered.

### Example

This command manually sets the switch time.

```
switch#clock set 08:15:24 14 Jan 2013
Mon Jan 14 08:15:25 2013
timezone is US/Central
```

## 4.2.3 Displaying the Time

To display the local time and configured time zone, enter the `show clock` command.

### Example

- This command displays the switch time.

```
switch(config)#show clock
Mon Jan 14 16:32:46 2013
timezone is America/Los_Angeles
```

## 4.2.4 Network Time Protocol (NTP)

Network Time Protocol (NTP) is enabled on the switch by default, and time settings from any properly configured NTP server will override manual setting of the system clock.

NTP servers synchronize time settings of systems running an NTP client. The switch supports NTP versions 1 through 4. The default is version 4. After configuring the switch to synchronize with an NTP server, it may take up to ten minutes for the switch to set its clock. The *running-config* lists NTP servers that the switch is configured to use.

The following NTP sections deal with NTP on the switch:

- [Configuring the NTP Server](#)
- [Configuring the NTP Source](#)
- [Configuring the Switch as an NTP Server](#)
- [Configuring NTP Authentication](#)
- [Viewing NTP Settings and Status](#)

### 4.2.4.1 Configuring the NTP Server

The `ntp server` command adds a server to the list or modifies the parameters of a previously listed address. When the system contains multiple NTP servers, the `prefer` keyword can be used to specify a preferred NTP server, which will be used as the NTP server if not discarded by NTP.

Note that all NTP servers must be in the same VRF, and that they are added in the default VRF if no VRF is specified.

The system clock will be set via NTP if NTP is enabled and there is at least one NTP server properly configured on the switch, and NTP overrides manual setting of the system clock. NTP is enabled by default. To disable NTP, use the `no ntp` command.

**Example**

- These commands add three NTP servers, designating the second server as preferred.

```
switch(config)#ntp server local-NTP
switch(config)#ntp server 172.16.0.23 Prefer
switch(config)#ntp server 172.16.0.25
```

**4.2.4.2 Configuring the NTP Source**

The `ntp local-interface` command configures an interface as the source of NTP packets. That interface's IP address is then used as the source address for all NTP packets unless a server-specific source is configured using the `source` option of the `ntp server` command. For an `ntp local-interface` command to take effect, the specified interface and the NTP server must both belong to the same VRF.

**Example**

- This command configures VLAN interface 25 as the source of NTP update packets.

```
switch(config)#ntp local-interface vlan 25
switch(config)#
```

**4.2.4.3 Configuring the Switch as an NTP Server**

To configure the switch to accept NTP requests on all interfaces, use the `ntp serve all` command to enable NTP server mode globally on the switch. To configure an individual interface to accept or deny NTP requests, use the `ntp serve` command. Interface level settings override the global settings, and changing the settings at either the global or interface level also causes the switch to re-synchronize with its upstream NTP server. NTP server mode is disabled by default.

**Example**

- This command configures the switch to act as an NTP server, accepting NTP requests.

```
switch(config)#ntp serve all
switch(config)#
```

- These commands configure Ethernet interface 5 to accept NTP requests regardless of global settings.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#ntp serve
switch(config-if-Et5)#
```

**4.2.4.4 Configuring NTP Authentication**

The switch can be configured to accept NTP packets only from an authenticated server or client. NTP authentication is disabled by default.

To configure the switch to authenticate NTP packets, create one or more authentication keys using the `ntp authentication-key` command, specify which keys are trusted by using the `ntp trusted-key` command, use the `ntp authenticate` command to enable NTP authentication, and specify to use the trusted-key for a specific server. The NTP server must be configured to use the same authentication key and key ID number.

**Note:** When NTP authentication is enabled on a switch, all NTP servers upstream of the switch, as well as all NTP clients of the switch, should have matching keys configured, and clients must have NTP authentication enabled.

**Example:**

These commands configure the switch to authenticate NTP packets using key 328 with the plaintext password timeSync.

```
switch(config)#ntp authentication-key 328 md5 timeSync
switch(config)#ntp trusted key 328
switch(config)#ntp authenticate
switch(config)#
```

#### 4.2.4.5 Viewing NTP Settings and Status

To display the status of Network Time Protocol (NTP) on the switch, use the `show ntp status` command. To display the status of connections to NTP servers, use the `show ntp associations` command.

**Note:** In the output for `show ntp associations`, the reference ID (which identifies the time source of the NTP server) is either the IPv4 address of the time source or, if that source has an IPv6 address, the first four octets of the MD5 hash of that IPv6 address. In EOS releases prior to 4.23.2, `show ntp status` identified the system peer by its reference ID as described above, but in later releases it shows the IP address (whether IPv4 or IPv6).

**Example**

- This command displays the status of the switch’s NTP connection.

```
switch#show ntp status
synchronised to NTP server (192.168.78.62) at stratum 3
  time correct to within 66 ms
  polling server every 1024 s
switch #
```

- This command displays data about the NTP servers in the configuration.

```
switch#show ntp associations
  remote          refid          st t when  poll reach  delay  offset
  jitter
=====
+1.ntp.arista.co 125.157.10.11  2 u  539  1024  377  121.748  -0.345
  0.893
-3.ntp.arista.co 127.31.152.34  2 u  868  1024  377  101.671  2.434
  1.529
+2.ntp.arista.co 176.131.12.185 2 u  676  1024  377  116.505   0.03
  0.768
*4.ntp.arista.co 120.181.192.192 2 u  696  1024  377   48.431 -0.416
  0.15
switch#
```

## 4.3 Managing Display Attributes

Display commands control the content of the banner and the command line prompt.

### 4.3.1 Banners

The switch can display two banners:

- **Login banner:** The login banner precedes the login prompt. One common use for a login banner is to warn against unauthorized network access attempts.
- **motd banner:** The message of the day (motd) banner is displayed after a user logs into the switch.

This output displays both banners in bold:

```
This is a login banner
switch login: john
Password:
Last login: Mon Jan 14 09:24:36 2013 from adobe-wrks.aristanetworks.com
This is an motd banner
switch>
```

These commands create the login and motd banner shown earlier in this section.

```
switch(config)#banner login
Enter TEXT message. Type 'EOF' on its own line to end.
This is a login banner
EOF
switch(config)#banner motd
Enter TEXT message. Type 'EOF' on its own line to end.
This is an motd banner

EOF
switch(config)#
```

To create a banner:

1. Enter global configuration mode.

```
switch#config
switch(config)#
```

2. Enter banner edit mode by typing the desired command:

- To create a login banner, type **banner login**.
- To create a motd banner, type **banner motd**.

The switch responds with instructions on entering the banner text.

```
switch(config)#banner login
Enter TEXT message. Type 'EOF' on its own line to end.
```

3. Enter the banner text.

```
This is the first line of banner text.
This is the second line of banner text.
```

4. Press **Enter** to place the cursor on a blank line after completing the banner text.
5. Exit banner edit mode by typing EOF.

```
EOF
switch(config)#
```

### 4.3.2 Configuring prompt

The prompt provides an entry point for EOS commands. The `prompt` command configures the contents of the prompt. The `no prompt` command returns the prompt to the default of %H%P.

---

Characters allowed in the prompt include A-Z, a-z, 0-9, and these punctuation marks:

! @ # \$ % ^ & \* ( ) - = + f g [ ] ; : < > , . ? / ~ n

The prompt supports these control sequences:

- %s “ space character
- %t “ tab character
- %% “ percent character
- %H “ host name
- %D “ time and date
- %D{*f\_char*} “ time and date, format specified by the BSD **strftime** (*f\_char*) time conversion function.
- %h “ host name up to the first."
- %P “ extended command mode
- %p “ command mode
- %r “ redundancy status on modular systems (has no effect on a fixed system)
- %R “ extended redundancy status on modular systems â “ includes status and slot number (has no effect on a fixed system)

### Example

- This command creates a prompt that displays **system 1** and the command mode.

```
host-name.dut103(config)#prompt system%s1%P
system 1(config) #
```

- This command creates a prompt that displays the command mode.

```
host-name.dut103(config)#prompt %p
(config) #
```

- These equivalent commands create the default prompt.

```
% prompt %H%P
host-name.dut103(config)#
% no prompt
host-name.dut103(config)#
```

## 4.4 Logging of Event Notifications

Arista switches log event notifications using the Syslog protocol. By default, event notifications are logged internally to `/var/log/messages`, but they can also be displayed on the console or logged to an external server. Severity levels and log message destinations can be configured via the CLI, and individual processes and protocols can also be configured to adjust or limit the messages that they log. Details of the current logging configuration may be viewed using the `show logging` command.

For a full list of Syslog messages, visit the Arista website.

### 4.4.1 Managing TCAM Capacity Warnings

Strata chipsets (Helix, Trident, Trident2, and Tomahawk) provide event logging for the hardware capacity of TCAM tables on a per-slice basis, triggering a capacity warning by default whenever any slice exceeds 90% capacity. As a result, default TCAM logging can generate high levels of syslog messages on Strata platforms. If this presents a problem, the **hardware capacity alert table** command can be used to adjust the capacity levels at which warnings occur to above the 90% default; this adjustment can be made per TCAM resource and per slice. The command can also be used to

disable TCAM hardware capacity messages of level Warning and below entirely for a given slice by setting the threshold to 0 or using the **no** version of the command.

To determine the chipset of your device, enter `show platform ?` in the CLI.

### Examples

- This command reduces hardware capacity Syslog warnings by increasing the capacity threshold to 99% for EFP table monitoring in slice 2.

```
switch(config)#hardware capacity alert table EFP feature Slice-2
threshold 99
```

- This command reduces messages by disabling hardware capacity Syslog warnings entirely for the IFP table in slice 5.

```
switch(config)#hardware capacity alert table IFP feature Slice-5
threshold 0
```

- This command reduces messages by disabling hardware capacity Syslog warnings entirely for the VFP table in all slices.

```
switch(config)#no hardware capacity alert table VFP
```

## 4.5 Event Monitor

The event monitor writes system event records to local files for access by SQLite database commands.

### Note:

Beginning with release EOS-4.20.5F, **event-monitor** is not enabled by default. Use the `config#event-monitor` command to explicitly enable event-monitor.

### 4.5.1 Description

The event monitor receives notifications for important events or changes to the enabled event monitor tables. These changes are logged to a fixed-size circular buffer. The size of this buffer is configurable, but it does not grow dynamically. Buffer contents can be stored to permanent files to increase the event monitor effective capacity. The permanent file size and the number of permanent files is configurable. The buffer is stored at a fixed location on the switch.

Specific event monitor queries are available through CLI commands. For queries not available through specific commands, manual queries are supported through other CLI commands. When the user issues a query command, the relevant events from the circular buffer and permanent files are written to and accessed from a temporary SQLite database file. The database keeps a separate table for each logging type (such as MAC, ARP, route, and others). When the monitor receives notification of a new event, the database file is deleted, then recreated.

### 4.5.2 Configuring the Event Monitor

#### Enabling the Event Monitor

The `event-monitor` command enables the event monitor and specifies the types of events that are logged. The event monitor is an event logging service that records system events to a local database. The event monitor records these events:

- all changes to all events.
- ARP changes to the ARP table (IPv4 address to MAC address mappings).

- Neighbor changes to the neighbor table (IPv6 address to MAC address mappings)
- backup backed up log files.
- buffer changes to the local buffer settings.
- IGMP snooping changes to the IGMP snooping table.
- LACP changes to the LACP table events.
- MAC changes to the MAC address table (MAC address to port mappings).
- mroute changes to the IP multicast routing table.
- neighbor changes to the neighbor routing table.
- route changes to the IPv4 routing table.
- route6 changes to the IPv6 routing table.
- stpunstable events that cause STP instability.

Beginning with release EOS-4.20.5F, **event-monitor** is not enabled by default. Use the **event-monitor** command to explicitly enable event-monitor. The **no event-monitor all** disables the event monitor. The **no event-monitor** command, followed by a log type parameter, disables event recording for the specified type.

### Example

- This command disables the event monitor for all types of events.

```
switch(config)#no event-monitor all
```

- This command enables the event monitor for routing table changes.

```
switch(config)#event-monitor route
```

The **event-monitor clear** command removes the contents of the event monitor buffer. If event monitor backup is enabled, this command removes the contents from all event monitor backup files.

### Example

- This command clears the contents of the event monitor buffer.

```
switch#event-monitor clear
switch(config)#
```

### Configuring the Buffer

The **event-monitor buffer max-size** command specifies the size of the event monitor buffer. The event monitor buffer is a fixed-size circular data structure that receives event records from the event monitor. When event monitor backup is enabled, the buffer is copied to a backup file before each rollover. Buffer size ranges from 6 Kb to 50 Kb. The default size is 32 Kb.

### Example

- This command configures a buffer size of 48 Kb.

```
switch(config)#event-monitor buffer max-size 48
switch(config)#
```

### Configuring Permanent Files

The **event-monitor backup path** command enables storage of the event monitor buffer to permanent switch files and specifies the path/name of these files. The command references file

location either from the flash drive root directory where the CLI operates (/mnt/flash) or from the switch root directory (/).

The event monitor buffer is circular after the buffer is filled, new data replaces older data at the beginning of the buffer. The buffer is copied into a new backup file after each buffer writing cycle before the switch starts re-writing the buffer.

### Example

- These commands configure the switch to store the event monitor buffer in sw-event.log, then display the new file in the flash directory.

```
switch(config)#event-monitor backup path eventmon_backup_dir/event.log
switch(config)#
bash-4.3# ls /mnt/flash/eventmon_backup_dir/

arpevent.log.1 lacpevent.log.1 neighborevent.log.1 routeevent.log.1
igmpsnoopingevent.log.1 macevent.log.1 route6event.log.1
stpunstaleevent.log.1
```

The `event-monitor backup max-size` command specifies the quantity of event monitor backup files the switch maintains. The switch appends an extension number to the file name when it creates a new file. After every 500 events, the switch deletes the oldest backup file if the file limit is exceeded.

### Example

- These commands configure the switch to back up the event buffer to a series of files named sw-event.log. The switch can store a maximum of four files.

```
switch(config)#event-monitor backup path sw-event.log
switch(config)#event-monitor backup max-size 4
switch(config)#
```

The first five files that the switch creates to store event monitor buffer contents are:

```
sw-event.log.0
sw-event.log.1
sw-event.log.2
sw-event.log.3
sw-event.log.4
```

The switch deletes `sw-event.log.0` the first time it verifies the number of existing backup files after the creation of `sw-event.log.4`.

## 4.5.3 Querying the Event Monitor

These CLI commands perform SQL-style queries on the event monitor database:

- The `show event-monitor arp` command displays ARP table events.
- The `show event-monitor mac` command displays MAC address table events.
- The `show event-monitor route` command displays routing table events.

### Example

- This command displays all events triggered by MAC address table events.

```
switch#show event-monitor mac
% Writing 0 Arp, 0 Route, 1 Mac events to the database
```

```

added|0
```

For other database queries, the `show event-monitor sqlite` command performs an SQL-style query on the database, using the statement specified in the command.

### Example

- This command displays all entries from the route table.

```
switch#show event-monitor sqlite select * from route;
2019-09-30 14:01:21.659428|16.16.16.255/32|default|receiveBcast|0|0|

## 4.5.4 Accessing Event Monitor Database Records

The `event-monitor interact` command replaces the CLI prompt with an SQLite prompt. The event monitor buffer and all backup logs are synchronized into a single SQLite file and loaded for access from the prompt.

- To access help from the SQLite prompt, enter `.help`
- To exit SQLite and return to the CLI prompt, enter `.quit` or `.exit`

The `event-monitor sync` command combines the event monitor buffer and all backup logs and synchronizes them into a single SQLite file. The data can be accessed through SQLite or by using the `show event-monitor` commands described above.

### Examples

- This command replaces the EOS CLI prompt with an SQLite prompt.

```
switch#event-monitor interact
sqlite>
```

- This command exits SQLite and returns to the EOS CLI prompt.

```
sqlite> .quit
switch#
```

- This command synchronizes the buffer and backup logs into a single SQLite file.

```
switch(config)#event-monitor sync
```

```
switch(config)#
```

## 4.6 Managing EOS Extensions

The most simple and efficient way to make the most of the extensibility on which EOS is built is through the use of extensions. An extension is a pre-packaged optional feature or a set of scripts in an RPM Package Manager (RPM) or Software image extension (SWIX) format. A variety of extensions are available from the EOS Central page at <https://www.arista.com/en/>.

These sections describe basic EOS extension tasks:

- [Managing EOS Extensions](#)
- [Installing EOS Extensions on a Dual-Supervisor Switch](#)
- [Verifying EOS Extensions Installation](#)
- [Uninstalling an EOS Extension](#)

### 4.6.1 Installing EOS Extensions

Complete the following steps to install an EOS extension.

1. Download the desired extension and copy it onto the devices flash storage.

```
switch#dir
Directory of flash:/
-rwx 479183792 Jun 23 09:46 EOS-4.13.3F.swi
-rwx 21280296 Feb 6 16:48 arista-splunk-extension.swix
-rwx 27 Jun 23 10:08 boot-config drwx 4096 Sep 26 2012 schedule
-rwx 1481 Jun 27 05:54 startup-config
```

2. Copy the file from the flash storage to the extensions partition.

```
switch#copy flash:arista-splunk-extension.swix extension:
Copy completed successfully.
```

3. Install the EOS extension.

```
switch#extension arista-splunk-extension.swix
If this extension modifies the behavior of the Cli, any running Cli
sessions will
need to be reset in order for the Cli modifications to take effect.
```

4. If extension persistence across reboots is required, the extension should also be copied into the boot-extensions partition.

```
switch#copy installed-extensions boot-extensions
```

5. Run the extension. As the CloudVision extension adds additional CLI commands to EOS, the CLI session must be restarted so that the additional commands are available. To achieve this, close the SSH or the telnet session and open a new session.

### 4.6.2 Installing EOS Extensions on a Dual-Supervisor Switch

Complete the following steps to install an EOS extension on a dual-supervisor switch.

1. Copy the extension from the primary supervisor to the standby supervisors flash directory.

```
switch(s1)#copy flash:<filename>.swixsupervisor-peer://mnt/flash/
```

2. Establish a session to the standby supervisor from the primary.

```
switch(s1)#session peer-supervisor
Warning: Permanently added '[127.1.0.2]:3601' (RSA) to the list of
known hosts.
Last login: Mon Aug 27 17:32:00 2018 from supervisor1
```

```
WARNING - you are currently logged in to the standby supervisor.
Not all cli commands are available or supported. Any configuration
done from this cli will not be reflected in the active supervisor's
running config and will be lost when the active supervisor writes
its startup config.
switch(s2)#
```

3. Repeat the steps listed in the [Installing EOS Extensions](#) to install the EOS extension.
4. Repeat the steps listed in the [Verifying EOS Extensions Installation](#) to verify the extension installation.
5. Exit standby supervisor.

```
switch(s2)#exit
Connection to 127.1.0.1 closed.
switch(s1)#
```

### 4.6.3 Verifying EOS Extensions Installation

Complete the steps to verify that the EOS extensions are installed correctly.

1. Run the **show extensions** command to verify that the EOS extensions are available and installed correctly.

```
switch#show extensions
Name Version/Release Status Extension
-----
-----
EosSdk-1.2.1-fl.boca-1943435.i686.rpm 1.2.1/1943435.flbocaeossd A, NI
1
arista-splunk-extension.swix 0.95/1498976.20131tdsplun A, I 2
fping-2.4b2-10.fc12.i686.rpm 2.4b2/10.fc12 A, I 1
gnuplot.swix 1.10.0/1.fc14 A, I 16
splunkforwarder-5.0.9-213964.i386.rpm 5.0.9/213964 A, NI 1
```

```
A: available | NA: not available | I: installed | NI: not installed |
F: forced
```

2. Run the **show boot-extensions** command to verify that the EOS extensions are enabled for boot persistence.

```
switch#show boot-extensions
arista-splunk-extension.swix
fping-2.4b2-10.fc12.i686.rpm
gnuplot.swix
```

### 4.6.4 Uninstalling an EOS Extension

Complete the following steps to uninstall an EOS extension.

1. Uninstall the existing EOS extension using the **no extension** command.

```
switch#no extension fping-2.4b2-10.fc12.i686.rpm
switch#show extensions
```

Name	Version/Release	Status	extension
EosSdk-1.2.1-fl.boca-1943435.i686.rpm	1.2.1/1943435.flbocaeossd A,	NI	1
arista-splunk-extension.swix	0.95/1498976.2013ltdsplun A,	I	2
fping-2.4b2-10.fc12.i686.rpm	2.4b2/10.fc12 A,	NI	1
gnuplot.swix	1.10.0/1.fc14 A,	I	16
splunkforwarder-5.0.9-213964.i386.rpm	5.0.9/213964 A,	NI	1

A: available | NA: not available | I: installed | NI: not installed |  
F: forced

2. Remove the extension from the boot-extension using the **copy installed-extensions boot-extensions** command.

```
switch#copy installed-extensions boot-extensions
```

**Note:** If your system is a Dual-Supervisor Switch, connect to the secondary supervisor using the session peer-supervisor command, repeat steps 1 and 2, and finally exit from the secondary supervisor.

---

## 4.7 Switch Administration Commands

### Switch Name Configuration Commands

- `dns domain`
- `hostname`
- `ip domain-list`
- `ip domain lookup`
- `ip host`
- `ip name-server`
- `ipv6 host`
- `show hostname`
- `show hosts`
- `show ip domain-name`
- `show ip name-server`

### Banner Configuration Commands

- `banner login`
- `banner motd`
- `show banner`

### Prompt Configuration Command

- `prompt`

### Event Manager Commands

- `event-monitor`
- `event-monitor backup max-size`
- `event-monitor backup path`
- `event-monitor buffer max-size`
- `event-monitor clear`
- `event-monitor interact`
- `event-monitor sync`
- `no event-monitor`
- `show event-monitor arp`
- `show event-monitor igmpsnooping`
- `show event-monitor mac`
- `show event-monitor mroute`
- `show event-monitor neighbor`
- `show event-monitor route6`
- `show event-monitor route`
- `show event-monitor sqlite`
- `show event-monitor stpunstable`

### Email Configuration Command

- `email`

**System Clock Commands**

- `clock set`
- `clock timezone`
- `show clock`

**NTP Commands**

- `ntp authenticate`
- `ntp authentication-key`
- `ntp local-interface`
- `ntp serve`
- `ntp serve all`
- `ntp server`
- `ntp trusted-key`
- `show ntp associations`
- `show ntp status`

**Syslog Configuration Commands**

- `logging format sequence-numbers`
- `logging repeat-messages`

---

## 4.7.1 banner login

The `banner login` command configures a message that the switch displays before login and password prompts. The login banner is available on console, telnet, and ssh connections.

The `no banner login` and `default banner login` commands delete the login banner.

### Command Mode

Global Configuration

### Command Syntax

`banner login`

`no banner login`

`default banner login`

### Parameters

- *banner\_text* To configure the banner, enter a message when prompted. The message may span multiple lines. Banner text supports the following keywords:
  - `$(hostname)` displays the switch's host name.
  - `EOF` To end the banner editing session, type EOF on its own line and press **enter**.

### Examples

- These commands create a two-line login banner.

```
switch(config)#banner login
Enter TEXT message. Type 'EOF' on its own line to end.
This is a login banner for $(hostname).
Enter your login name at the prompt.
EOF
switch(config)#
```

This output displays the login banner.

```
This is a login banner for switch.
Enter your login name at the prompt.
switch login:john
Password:
Last login: Mon Jan 14 09:05:23 2013 from adobe-wrks.aristanetworks.com
switch>
```

## 4.7.2 banner motd

The `banner motd` command configures a message of the day (motd) that the switch displays after a user logs in. The motd banner is available on console, telnet, and ssh connections.

The `no banner motd` and `default banner motd` commands delete the motd banner.

### Command Mode

Global Configuration

### Command Syntax

```
banner motd
```

```
no banner motd
```

```
default banner motd
```

### Parameters

- *banner\_text* To configure the banner, enter a message when prompted. The message may span multiple lines. Banner text supports this keyword:
  - **\$(hostname)** displays the switch's host name.
- **EOF** To end the banner editing session, type EOF on its own line and press **enter**.

### Examples

- These commands create an motd banner.

```
switch(config)#banner motd
Enter TEXT message. Type 'EOF' on its own line to end.
This is an motd banner for $(hostname)
EOF
switch(config)#
```

This output displays the motd banner.

```
switch login:john
Password:
Last login: Mon Jan 14 09:17:09 2013 from adobe-wrks.aristanetworks.com
This is an motd banner for Switch
switch>
```

---

### 4.7.3 clear ptp interface counters

The `clear ptp interface counters` command resets the Precision Time Protocol (PTP) packet counters.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ptp interface [INTERFACE_NAME] counters
```

#### Parameters

- `INTERFACE_NAME` Interface type and numbers. Options include:
  - `<no parameter>` Display information for all interfaces.
  - **ethernet** `e_range` Ethernet interface range specified by `e_range`.
  - **loopback** `l_range` Loopback interface specified by `l_range`.
  - **management** `m_range` Management interface range specified by `m_range`.
  - **port-channel** `p_range` Port-Channel Interface range specified by `p_range`.
  - **vlan** `v_range` VLAN interface range specified by `v_range`.
  - **vxlan** `vx_range` VXLAN interface range specified by `vx_range`.

Valid parameter formats include number, number range, or comma-delimited list of numbers and ranges.

#### Example

- This command clears all PTP counters.

```
switch#clear ptp counters
switch#
```

## 4.7.4 clock set

The `clock set` command sets the system clock time and date. If the switch is configured with an NTP server, NTP time synchronizations override manually entered time settings.

Time entered by this command is local, as configured by the `clock timezone` command.

### Command Mode

Privileged EXEC

### Command Syntax

```
clock set hh:mm:ss date
```

### Parameters

- *hh:mm:ss* is the current time (24-hour notation).
- *date* is the current date. Date formats include:

**mm/dd/yy** example: 05/15/2012

**Monthdayyear** example: May 15 2012

**daymonthyear** example: 15 May 2012

### Example

- This command manually sets the switch time.

```
switch#clock set 08:15:24 14 Jan 2013
Mon Jan 14 08:15:25 2013
timezone is US/Central
```

---

## 4.7.5 clock timezone

The `clock timezone` command specifies the UTC offset that converts system time to local time. The switch uses local time for time displays and to time-stamp system logs and messages.

The `no clock timezone` and `default clock timezone` commands delete the `timezone` statement from *running-config*, setting local time to UTC.

### Command Mode

Global Configuration

### Command Syntax

```
clock timezone zone_name
```

```
no clock timezone
```

```
default clock timezone
```

### Parameters

- `zone_name` the time zone. Settings include a list of predefined time zone labels.

### Examples

- This command configures the switch for the United States Central Time Zone.

```
switch(config)#clock timezone US/Central
switch(config)#show clock
Fri Jan 11 18:42:49 2013
timezone is US/Central
switch(config)#
```

- To view the predefined time zone labels, enter `clock timezone` with a question mark.

```
switch(config)#clock timezone ?
Africa/Abidjan          Africa/Accra
Africa/Addis_Ababa     Africa/Algiers
Africa/Asmara          Africa/Asmera
Africa/Bamako           Africa/Bangui

W-SU                    W-SU timezone
WET                     WET timezone
Zulu                    Zulu timezone

switch(config)#clock timezone
```

- This command displays all time zone labels that start with **America**.

```
switch(config)#clock timezone AMERICA?
America/Adak            America/Anchorage
America/Anguilla        America/Antigua
America/Araguaina       America/Argentina/Buenos_Aires

America/Virgin          America/Whitehorse
America/Winnipeg        America/Yakutat
America/Yellowknife

switch(config)#clock timezone AMERICA
```

## 4.7.6 dns domain

The `dns domain` command configures the switch's domain name. The switch uses this name to complete unqualified host names.

The `no dns domain` and `default dns domain` commands delete the domain name by removing the `dns domain` command from *running-config*.

### Command Mode

Global Configuration

### Command Syntax

```
dns domain string
```

```
no dns domain
```

```
default dns domain
```

### Parameters

- *string* domain name (text string)

### Example

- This command configures *aristanetworks.com* as the switch's domain name.

```
switch(config)#dns domain aristanetworks.com
switch(config)#
```

---

## 4.7.7 email

The `email` command places the switch in email client configuration mode. If you configure a from-user and an outgoing SMTP server on the switch, you can then use an email address as an output modifier to a `show` command and receive the output as email.

### Command Mode

Global Configuration

### Command Syntax

`email`

### Example

- This command places the switch in email client configuration mode.

```
switch(config)#email
switch(config)#
```

## 4.7.8 event-monitor backup max-size

The `event-monitor backup max-size` command specifies the quantity of event monitor backup files the switch maintains. Values range from 1 to 200 files with a default of ten files.

The `event-monitor backup path` command specifies the path/name of these files. The switch appends an extension to the file name that tracks the creation order of backup files. When the quantity of files exceeds the configured limit, the switch deletes the oldest file.

The `no event-monitor backup max-size` and `default event-monitor backup max-size` command restores the default maximum number of backup files the switch can store to ten by removing the corresponding `event-monitor backup max-size` command from *running-config*.

### Command Mode

Global Configuration

### Command Syntax

```
event-monitor backup max-size file_quantity
```

```
no event-monitor backup max-size
```

```
default event-monitor backup max-size
```

### Parameters

- *file\_quantity* maximum number of backup files. Value ranges from 1 to 200. Default is 10.

### Examples

- These commands configure the switch to back up the event buffer to a series of files named `sw-event.log`. The switch can store a maximum of four files.

```
switch(config)#event-monitor backup path sw-event.log
switch(config)#event-monitor backup max-size 4
switch(config)#
```

The first five files that the switch creates to store event monitor buffer contents are:

`sw-event.log.0`

`sw-event.log.1`

`sw-event.log.2`

`sw-event.log.3`

`sw-event.log.4`

The switch deletes `sw-event.log.0` the first time it verifies the number of existing backup files after the creation of `sw-event.log.4`.

---

## 4.7.9 event-monitor backup path

The `event-monitor backup path` command enables the storage of the event monitor buffer to switch files and specifies the path/name of these files. The command references the file location either from the flash drive root directory (`/mnt/flash`) where the CLI operates or from the switch root directory (`/`).

The event monitor buffer is circular after the buffer is filled, new data is written to the beginning of the buffer, replacing old data. At the conclusion of each buffer writing cycle, it is copied into a new backup file before the switch starts re-writing the buffer. The switch appends a extension number to the file name when it creates a new file. After every 500 events, the switch deletes the oldest backup file if the file limit specified by the `event-monitor backup max-size` command is exceeded.

`running-config` can contain a maximum of one `event-monitor backup path` statement. Subsequent `event-monitor backup path` commands replace the existing statement in `running-config`, changing the name of the file where event monitor backup files are stored.

The `no event-monitor backup path` and `default event-monitor backup path` commands disable the storage of the event monitor buffer to switch files by deleting the `event-monitor backup path` command from `running-config`.

### Command Mode

Global Configuration

### Command Syntax

```
event-monitor backup path URL_FILE
```

```
no event-monitor backup path
```

```
default event-monitor backup path
```

### Parameters

- **URL\_FILE** path and file name of the backup file
  - **path\_string** specified path is appended to `/mnt/flash/`
  - **file:** **path\_string** specified path is appended to `/`
  - **flash:** **path\_string** specified path is appended to `/mnt/flash/`

### Example

These commands configure the switch to store the event monitor buffer in `sw-event.log`, then display the new file in the flash directory.

```
switch(config)#event-monitor backup path eventmon_backup_dir/event.log
switch(config)#
bash-4.3# ls /mnt/flash/eventmon_backup_dir/

arpevent.log.1  lacpevent.log.1  neighborevent.log.1  routeevent.log.1
igmpsnoopingevent.log.1  macevent.log.1  route6event.log.1
stpunstabilevent.log.1
```

## 4.7.10 event-monitor buffer max-size

The `event-monitor buffer max-size` command specifies the size of the event monitor buffer. The event monitor buffer is a fixed-size circular data structure that receives event records from the event monitor. When event monitor backup is enabled (`event-monitor backup path`), the buffer is copied to a backup file before each rollover.

Buffer size ranges from 6 Kb to 50 Kb. The default size is 32 Kb.

The `no event-monitor buffer max-size` and `default event-monitor buffer max-size` commands restore the default buffer size of 32 Kb by removing the `event-monitor buffer max-size` command from *running-config*.

### Command Mode

Global Configuration

### Command Syntax

```
event-monitor buffer max-size buffer_size
```

```
no event-monitor buffer max-size
```

```
default event-monitor buffer max-size
```

### Parameters

- *buffer\_size* buffer capacity (Kb). Values range from 6 to 50. Default value is 32.

### Example

- This command configures a buffer size of 48 Kb.

```
switch(config)#event-monitor buffer max-size 48  
switch(config)#
```

---

## 4.7.11 event-monitor clear

The `event-monitor clear` command removes the contents of the event monitor buffer. If event monitor backup is enabled, this command removes the contents from all event monitor backup files.

### Command Mode

Privileged EXEC

### Command Syntax

```
event-monitor clear
```

### Example

- This command clears the contents of the event monitor buffer.

```
switch#event-monitor clear  
switch#
```

## 4.7.12 event-monitor interact

The `event-monitor interact` command replaces the CLI prompt with an SQLite prompt. The event monitor buffer and all backup logs are synchronized into a single SQLite file and loaded for access from the prompt.

- To access help from the SQLite prompt, enter `.help`
- To exit SQLite and return to the CLI prompt, enter `.quit` or `.exit`

### Command Mode

Privileged EXEC

### Command Syntax

```
event-monitor interact
```

### Examples

- This command replaces the EOS CLI prompt with an SQLite prompt.

```
switch#event-monitor interact
sqlite>
```

- This command exits SQLite and returns to the EOS CLI prompt.

```
sqlite> .quit
switch#
```

---

### 4.7.13 event-monitor sync

The `event-monitor buffer sync` command combines the event monitor buffer and all backup logs and synchronizes them into a single SQLite file, which is stored at `/var/log/eventMon.db`

#### Command Mode

Privileged EXEC

#### Command Syntax

```
event-monitor sync
```

#### Example

- This command synchronizes the buffer and backup logs into a single SQLite file.

```
switch(config)#event-monitor sync  
switch(config)#
```

## 4.7.14 event-monitor

The **event-monitor** command enables the event monitor and specifies the types of events that are logged. The event monitor is an event logging service that records system events to a local database.

The database maintains a separate table for each event type.

Beginning with release EOS-4.20.5F, **event-monitor** is not enabled by default. Use the **event-monitor** command to explicitly enable event-monitor.

- The **no event-monitor all** command disables the event monitor.
- The **no event-monitor** command, followed by a log type parameter, disables event recording for the specified type.
- The **event-monitor** and **default event-monitor** commands enable the specified event logging type by removing the corresponding **no event-monitor** command from *running-config*.

The **no event-monitor** and **default event-monitor** commands, without a LOG\_TYPE parameter, restore the default event monitor settings by deleting all event monitor related commands from *running-config*.

### Command Mode

Global Configuration

### Command Syntax

```
event-monitor LOG_TYPE
```

```
no event-monitor LOG_TYPE
```

```
default event-monitor LOG_TYPE
```

### Parameters

- LOG\_TYPE specifies the event logging type. Options include:
  - **all** all event logging types.
  - **arp** changes to ARP table.
  - **backup** backed up log files.
  - **buffer** changes to the local buffer settings.
  - **igmpsnooping** changes to IGMP snooping table.
  - **lACP** changes to the LACP table events.
  - **mac** changes to MAC address table.
  - **mroute** changes to multicast routing table.
  - **neighbor** changes to the neighbor routing table.
  - **route** changes to IP routing table.
  - **route6** changes to IP route6 table.
  - **stpunable** events that cause STP instability.

### Related Commands

- **no event-monitor**

### Examples

- This command disables the event monitor for all types of events.

```
switch(config)#no event-monitor all
switch(config)#
```

- This command enables the event monitor for routing table changes.

```
switch(config)#event-monitor route
```

---

```
switch(config)#
```

## 4.7.15 hostname

The `hostname` command assigns a text string as the switch's host name. The default host name is *localhost*.

The prompt displays the host name when appropriately configured through the `prompt` command.

The `no hostname` and `default hostname` commands return the switch's host name to the default value of *localhost*.

### Command Mode

Global Configuration

### Command Syntax

```
hostname string
```

```
no hostname
```

```
default hostname
```

### Parameters

- *string* host name assigned to the switch.

### Example

- This command assigns the string *main-host* as the switch's host name.

```
switch(config)#hostname main-host  
main-host(config)#
```

The prompt was previously configured to display the host name.

---

## 4.7.16 ip domain lookup

The `ip domain lookup` command specifies the source interface for all DNS requests sent from the specified VRF.

The `no ip domain lookup` and `default ip domain lookup` commands return the switch to its default state, in which the switch selects source IP addresses for each DNS request from the specified VRF.

### Command Mode

Global Configuration

### Command Syntax

```
ip domain lookup [VRF_INSTANCE] source-interface INTF_NAME
```

```
no ip domain lookup [VRF_INSTANCE] source-interface
```

```
default ip domain lookup [VRF_INSTANCE] source-interface
```

### Parameters

- VRF\_INSTANCE specifies the VRF instance being modified.
  - <no parameter> changes are made to the default VRF.
  - **vrf** *vrf\_name* changes are made to the specified VRF.
- INTF\_NAME name of source interface to be used for DNS requests. Options include:
  - **ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **loopback** *l\_num* Loopback interface specified by *l\_num*.
  - **management** *m\_num* Management interface specified by *m\_num*.
  - **port-channel** *p\_num* Port-channel interface specified by *p\_num*.
  - **vlan** *v\_num* VLAN interface specified by *v\_num*.

### Examples

- This command specifies VLAN 5 as the source interface for DNS requests originating from the default VRF.

```
switch(config)#ip domain lookup source-interface Vlan5
switch(config)#
```

- This command specifies VLAN 10 as the source interface for DNS requests originating from VRF purple.

```
switch(config)#ip domain lookup vrf purple source-interface Vlan10
switch(config)#
```

## 4.7.17 ip domain-list

The `ip domain-list` command specifies a domain name to add to the IP domain list.

The `no ip domain-list` and `default ip domain-list` commands return the IP domain list to its default state, in which the switch selects source IP addresses for each DNS request from the specified VRF.

### Command Mode

Global Configuration

### Command Syntax

```
ip domain-list [IP_DOMAIN_NAME]
```

```
no ip domain-list [IP_DOMAIN_NAME]
```

```
default ip domain-list [IP_DOMAIN_NAME]
```

### Parameters

- IP\_DOMAIN\_NAME specifies the IP domain name.

### Examples

- This command specifies `foo.com` as the IP domain name to add to the IP domain list.

```
switch(config)#ip domain-list foo.com
switch(config)#
```

- This command removes `foo.com` and returns the IP domain list to its default state.

```
switch(config)#no ip domain-list foo.com
switch(config)#
```

---

## 4.7.18 ip host

The `ip host` command associates a hostname to an IPv4 address. This command supports local hostname resolution based on local hostname-IP address maps. Multiple hostnames can be mapped to an IP address. IPv4 and IPv6 addresses can be mapped to the same hostname (to map an IPv6 address to a hostname, use the `ipv6 host` command). The `show hosts` command displays the local hostname-IP address mappings.

The `no ip host` and `default ip host` commands removes hostname-IP address maps by deleting the corresponding `ip host` command from *running-config*, as specified by command parameters:

- no parameters: command removes all hostname-IP address maps.
- hostname parameter: command removes all IP address maps for the specified hostname.
- hostname and IP address parameters: command removes specified hostname-IP address maps.

### Command Mode

Global Configuration

### Command Syntax

```
ip host hostname hostadd_1 [hostadd_2] ...[hostadd_X]
```

```
no ip host [hostname] [hostadd_1 [hostadd_2] [hostadd_X]
```

```
default ip host [hostname] [hostadd_1 [hostadd_2] [hostadd_X]
```

### Parameters

- *hostname* hostname (text).
- *hostadd\_N* IPv4 address associated with hostname (dotted decimal notation).

### Related Commands

- `ipv6 host`
- `show hosts`

### Examples

- This command associates the hostname `test_lab` with the IP addresses `10.24.18.5` and `10.24.16.3`.

```
switch(config)#ip host test_lab 10.24.18.5 10.24.16.3
```

- This command removes all IP address maps for the hostname `production_lab`.

```
switch(config)#no ip host production_lab
switch(config)#
```

## 4.7.19 ip name-server

The `ip name-server` command adds name server addresses to *running-config*. The switch uses name servers for name and address resolution. The switch can be configured with up to three name servers. Although a command can specify multiple name server addresses, *running-config* stores each address in a separate statement. Name server addresses can be IPv4 and IPv6; each command can specify both address types.

Attempts to add a fourth server generate an error message. All name server addresses must be configured in the same VRF. When name servers were previously configured in a VRF, they must all be removed before adding new name server entries.

The `no ip name-server` and `default ip name-server` commands remove specified name servers from *running-config*. Commands that do not list an address remove all name servers.

### Command Mode

Global Configuration

### Command Syntax

```
ip name-server [VRF_INSTANCE] [SERVER_1] [SERVER_2] [SERVER_3]
```

```
no ip name-server [VRF_INSTANCE] [SERVER_1] [SERVER_2] [SERVER_3]
```

```
default ip name-server [VRF_INSTANCE] [SERVER_1] [SERVER_2] [SERVER_3]
```

### Parameters

- VRF\_INSTANCE specifies the VRF instance containing the addresses.
  - <no parameter> default VRF.
  - `vrf vrf_name` a user-defined VRF.
- SERVER\_X IP address of the name server (dotted decimal notation). Options include:
  - `ipv4_addr` (A.B.C.D)
  - `ipv6_addr` (A:B:C:D:E:F:G:H)

A command can contain both (IPv4 and IPv6) address types.

### Guidelines

All configured name server addresses must come from the same VRF. To use a user defined VRF for connection to a name server, first remove any name servers configured in the default VRF.

### Examples

- This command adds two name servers to the configuration.

```
switch(config)#ip name-server 172.0.14.21 3:4F21:1902::
switch(config)#
```

- This command attempts to add a name server when the configuration already lists three servers.

```
switch(config)#ip name-server 172.1.10.22
% Maximum number of nameservers reached. '172.1.10.22' not added
switch(config)#
```

---

## 4.7.20 ipv6 host

The `ipv6 host` command associates a hostname to an IPv6 address. This command supports local hostname resolution based on local hostname-IP address maps. Multiple hostnames can be mapped to an IPv6 address. IPv4 and IPv6 addresses can be mapped to the same hostname (to map IPv4 addresses to a hostname, use the `ip host` command). The `show hosts` command displays the local hostname-IP address mappings.

The `no ipv6 host` and `default ipv6 host` commands remove hostname-IP address maps by deleting the corresponding `ipv6 host` command from *running-config*, as specified by command parameters:

- **<no parameters>**: command removes all hostname-IPv6 address maps.
- **hostname** parameter: command removes all IPv6 address maps for the specified hostname.
- **hostname** and **IP address** parameters: command removes specified hostname-IP address maps.

### Command Mode

Global Configuration

### Command Syntax

```
ipv6 host hostname hostadd_1 [hostadd_2] ...[hostadd_X]
no ipv6 host [hostname] [hostadd_1] [hostadd_2] [hostadd_X]
default ipv6 host [hostname] [hostadd_1] [hostadd_2] [hostadd_X]
```

### Parameters

- *hostname* hostname (text).
- *hostadd\_N* IPv6 addresses associated with hostname (dotted decimal notation).

### Related Commands

- `ip host`
- `show hosts`

### Example

This command associates the hostname *support\_lab* with the IPv6 address 2001:0DB8:73:ff:ff:26:fd:90.

```
switch(config)#ipv6 host support_lab 2001:0DB8:73:ff:ff:26:fd:90
switch(config)#
```

## 4.7.21 logging format sequence-numbers

The `logging format sequence-numbers` command causes the sequence numbers of syslog messages to be visible when the messages are displayed.

The `no logging format sequence-numbers` and `default logging format sequence-numbers` commands remove the `logging format sequence-numbers` command from *running-config*.

### Command Mode

Global Configuration

### Command Syntax

```
logging format sequence-numbers
```

```
no logging format sequence-numbers
```

```
default logging format sequence-numbers
```

### Examples

- This command enables sequence numbering that can be seen when syslog messages are displayed.

```
switch(config)#logging format sequence-numbers
switch(config)#
```

- To display the sequence numbers, issue the show logging command.

```
switch#show logging
Syslog logging: enabled
  Buffer logging: level debugging
  Console logging: level informational
  Synchronous logging: disabled
  Trap logging: level informational
  Sequence numbers: enabled
  Syslog facility: local4
  Hostname format: Hostname only
  Repeat logging interval: disabled

Log Buffer:

Nov 12 14:03:34 switch1 SuperServer: 1: %SYS-7-CLI_SCHEDULER_LOG_STORED: Logfile for

switch#
```

---

## 4.7.22 logging repeat-messages

The `logging repeat-messages` command configures repetition of syslog messages instead of summarizing the count of repeats.

The `no logging repeat-messages` and `default logging repeat-messages` commands disable the functionality to repeat logging messages in *running-config*.

### Command Mode

Global Configuration

### Command Syntax

`logging repeat-messages`

`no logging repeat-messages`

`default logging repeat-messages`

### Examples

- This command repeats syslog messages instead of summarizing the count of repeats.

```
switch(config)#logging repeat-messages
switch(config)#
```

- This command displays the status of logging repeat messages command.

```
switch(config)#show logging
Syslog logging: enabled
  Buffer logging: level debugging
  Console logging: level debugging
  Monitor logging: level debugging
  Synchronous logging: disabled
  Trap logging: level informational
  Sequence numbers: disabled
  Syslog facility: local4
  Hostname format: Hostname only
  Repeat logging interval: disabled
  Repeat messages: enabled
```

Facility	Severity	Effective Severity
-----	-----	-----
aaa	debugging	debugging
accounting	debugging	debugging

```
switch(config)#
```

## 4.7.23 no event-monitor

The `no event-monitor` and `default event-monitor` commands remove the specified **event-monitor** configuration statements from *running-config*, returning the switch to the specified default state.

- **no event-monitor** <with no parameters> restores all default setting states:
  - event monitor is enabled.
  - buffer backup is disabled.
- **no event-monitor backup** disables the backup.

To disable the event monitor, enter the `no event-monitor all` command ([event-monitor](#)).

### Command Mode

Global Configuration

### Command Syntax

```
no event-monitor [PARAMETER]
```

```
default event-monitor [PARAMETER]
```

### Parameters

- **PARAMETER** the event monitor property that is returned to the default state.
  - <no parameter> all event monitor properties.
  - **backup** event monitor buffer backup is disabled.

### Example

- This command removes all event monitor configuration statements from *running-config*.

```
switch(config)#no event-monitor
switch(config)#
```

---

## 4.7.24 ntp authenticate

The `ntp authenticate` command enables the authentication of incoming NTP packets. When authentication is enabled, NTP packets will be used to synchronize time on the switch only if they include a trusted authentication key. Authentication keys are created on the switch using the `ntp authentication-key` command, and the `ntp trusted-key` command is used to specify which keys are trusted. NTP authentication is disabled by default.

The `no ntp authenticate` and `default ntp authenticate` commands disable NTP authentication on the switch by removing the corresponding `ntp authenticate` command from *running-config*.

### Command Mode

Global Configuration

### Command Syntax

```
ntp authenticate
```

```
no ntp authenticate
```

```
default ntp authenticate
```

### Examples

- This command enables NTP authentication on the switch.

```
switch(config)#ntp authenticate
switch(config)#
```

- This command disables NTP authentication on the switch.

```
switch(config)#no ntp authenticate
switch(config)#
```

## 4.7.25 ntp authentication-key

The `ntp authentication-key` command creates an authentication key for use in authenticating incoming NTP packets. For the key to be used in authentication:

- It must be configured as a trusted key using the `ntp trusted-key` command.
- NTP authentication must be enabled on the switch using the `ntp authenticate` command.
- The same key must be configured on the NTP server.

The `no ntp authentication-key` and `default ntp authentication-key` commands remove the specified authentication key by removing the corresponding `ntp authentication-key` command from *running-config*.

### Command Mode

Global Configuration

### Command Syntax

```
ntp authentication-key key_id ENCRYPT_TYPE password_text
```

```
no ntp authentication-key key_id
```

```
default ntp authentication-key key_id
```

### Parameters

- `key_id` key ID number. Value ranges from 1 to 65534.
- `ENCRYPT_TYPE` encryption method. Values include:
  - `md5` `key_text` is MD5 encrypted.
  - `sha1` `key_text` is SHA-1 encrypted.
- `password_text` the authentication-key password.

### Example

- This command creates an NTP authentication key with ID 234 and password `timeSync` using MD5 encryption.

```
switch(config)#ntp authentication-key 234 md5 timeSync
```

*Running-config* stores the password as plain text.

- This command removes NTP authentication key 234.

```
switch(config)#no ntp authentication-key 234
```

---

## 4.7.26 ntp local-interface

The `ntp local-interface` command configures an interface as the source of NTP updates. That interface's IP address is then used as the source address for all NTP packets sent to all destinations unless a server-specific source interface has been specified using the `source` option of the `ntp server` command.

The `no ntp local-interface` and `default ntp local-interface` commands remove the `ntp local-interface` command from *running-config*.

### Command Mode

Global Configuration

### Command Syntax

```
ntp local-interface [VRF_INSTANCE] INT_PORT
```

```
no ntp local-interface
```

```
default ntp local-interface
```

### Parameters

- `VRF_INSTANCE` the VRF instance to be used for connection to the specified server.
  - `<no parameter>` connects using the default VRF.
  - `vrf vrf_name` connects using the specified user-defined VRF.
- `INT_PORT` the interface port that specifies the NTP local interface. Settings include:
  - `ethernet e_range` Ethernet interface list.
  - `loopback l_range` loopback interface list.
  - `management m_range` management interface list.
  - `port-channel c_range` port channel interface list.
  - `vlan v_range` VLAN interface list.

### Examples

- This command configures VLAN interface 25 as the source of NTP update packets.

```
switch(config)#ntp local-interface vlan 25
switch(config)#
```

- This command removes the `ntp local-interface` command from the configuration.

```
switch(config)#no ntp local-interface
switch(config)#
```

## 4.7.27 ntp serve all

The `ntp serve all` command configures the switch to act as an NTP server by accepting incoming NTP requests.

Using this command also causes the switch to re-synchronize with its upstream NTP server.

Individual interfaces can be configured separately to accept or deny NTP requests by using the `ntp serve` command, and these settings override the global setting.

### Command Mode

Global Configuration

### Command Syntax

```
ntp serve all
```

```
no ntp serve all
```

```
default ntp serve all
```

### Example

- This command configures the switch to accept incoming NTP requests.

```
switch(config)#ntp serve all
switch(config)#
```

- This command configures the switch to deny incoming NTP requests.

```
switch(config)#no ntp serve all
switch(config)#
```

---

## 4.7.28 ntp serve

The **ntp serve** command configures the command mode interface to accept incoming NTP requests regardless of the global setting.

The **no ntp serve** command configures the command mode interface to refuse incoming NTP requests regardless of the global setting. The **default ntp serve** command configures the command mode interface to follow the global setting.

Using this command also causes the switch to re-synchronize with its upstream NTP server.

### Command Modes

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Interface-VXLAN Configuration

### Command Syntax

**ntp serve**

**no ntp serve**

**default ntp serve**

### Example

- These commands configure Ethernet interface 5 to accept incoming NTP requests regardless of global settings.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#ntp serve
switch(config-if-Et5)#
```

- These commands configure Ethernet interface 5 to deny incoming NTP requests regardless of global settings.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no ntp serve
switch(config-if-Et5)#
```

- These commands configure Ethernet interface 5 to use global settings in responding to incoming NTP requests.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#default ntp serve
switch(config-if-Et5)#
```

## 4.7.29 ntp server

The `ntp server` command adds a Network Time Protocol (NTP) server to *running-config*. If the command specifies a server that already exists in *running-config*, it will modify the server settings. The switch synchronizes the system clock with an NTP server when *running-config* contains at least one valid NTP server.

The switch supports NTP versions 1 through 4. The default is version 4.

The `prefer` option specifies a preferred NTP server, which will be used as the NTP server if not discarded by NTP.

The `no ntp server` and `default ntp server` commands remove the specified NTP server from *running-config*. To remove an NTP server configured in a user-defined VRF, include the VRF name in the `no ntp server` command.

### Command Mode

Global Configuration

### Command Syntax

```
ntp server [VRF_INSTANCE] SERVER_NAME [PREFERENCE] [NTP_VERSION] [IP_SOURCE]
[burst] [iburst] [AUTH_KEY][MAX_POLL_INT][MIN_POLL_INT]
```

```
no ntp server [VRF_INSTANCE] SERVER_NAME
```

```
default ntp server [VRF_INSTANCE] SERVER_NAME
```

All parameters except **VRF\_INSTANCE** and **SERVER\_NAME** can be placed in any order.

### Parameters

- **VRF\_INSTANCE** the VRF instance to be used for connection to the specified server.
  - <no parameter> connects using the default VRF.
  - `vrf vrf_name` connects using the specified user-defined VRF.
- **SERVER\_NAME** NTP server location. Options include:
  - *IP address* in dotted decimal notation
  - an FQDN host name
- **PREFERENCE** indicates priority of this server when the switch selects a synchronizing server.
  - <no parameter> server has no special priority.
  - `prefer` server has priority when the switch selects a synchronizing server.
- **NTP\_VERSION** specifies the NTP version. Settings include:
  - <no parameter> sets NTP version to 4 (default).
  - `version number`, where *number* ranges from 1 to 4.
- **IP\_SOURCE** specifies the source interface for NTP updates for the specified NTP server. This option overrides global settings created by the `ntp local-interface` command. Options include:
  - <no parameter> sets the source interface to the global default.
  - `source ethernet e_num` Ethernet interface specified by *e\_num*.
  - `source loopback l_num` loopback interface specified by *l\_num*.
  - `source management m_num` management interface specified by *m\_num*.
  - `source port-channel p_num` port-channel interface specified by *p\_num*.
  - `source vlan v_num` VLAN interface specified by *v\_num*.
- **burst** indicates that when the NTP server is reached, the switch sends packets to the server in bursts of eight instead of the usual one. Recommended only for local servers. Off by default.

- **iburst** indicates that the switch sends packets to the server in bursts of eight instead of the usual one until the server is reached. Recommended for general use to speed synchronization. Off by default.
- **AUTH\_KEY** the authentication key to use in authenticating NTP packets from the server.
  - `<no parameter>` no authentication key is specified.
  - **key <1 to 65534>** switch will use the specified key to authenticate NTP packets from the server.
- **MAX\_POLL\_INT** specifies the maximum polling interval for the server (as the base-2 logarithm of the interval in seconds). Settings include:
  - `<no parameter>` sets the maximum polling interval to 10 (1,024 seconds, the default).
  - **maxpoll number**, where *number* is the base-2 logarithm of the interval in seconds. Values range from 3 (8 seconds) to 17 (131,072 seconds, approximately 36 hours).
- **MIN\_POLL\_INT** specifies the minimum polling interval for the server (as the base-2 logarithm of the interval in seconds). Settings include:
  - `<no parameter>` sets the minimum polling interval to 6 (64 seconds, the default).
  - **minpoll number**, where *number* is the base-2 logarithm of the interval in seconds. Values range from 3 (8 seconds) to 17 (131,072 seconds, approximately 36 hours).

### Guidelines

To configure multiple parameters for a single server, include them all in a single **ntp server** command. Using the command again for the same server overwrites parameters previously configured in **running-config**.

All NTP servers must use the same VRF. If no VRF is specified, the server is configured in the default VRF. To use a user-defined VRF for connection to an NTP server, first use the **no ntp server** command to remove any NTP servers configured in the default VRF.

When specifying a source interface, choose an interface in the same VRF as the server. If the source interface is not in the same VRF, the source data will be included in **running-config** but will not be added to NTP packets.

An NTP server may be configured using an invalid or inactive VRF, but the status of the NTP server will remain inactive until the VRF is active.

### Examples

- This command configures the switch to update its time with the NTP server at address 172.16.0.23 and designates it as a preferred NTP server.

```
switch(config)#ntp server 172.16.0.23 prefer
```

- This command configures the switch to update its time through an NTP server named *local-nettime*.

```
switch(config)#ntp server local-nettime
```

- This command configures the switch to update its time through a version 3 NTP server.

```
switch(config)#ntp server 171.18.1.22 version 3
```

- These commands reconfigure the switch to access the above NTP servers through VRF magenta.

```
switch(config)#no ntp server 172.16.0.23
switch(config)#no ntp server local-nettime
switch(config)#no ntp server 171.18.1.22
switch(config)#ntp server vrf magenta 172.16.0.23 prefer
switch(config)#ntp server vrf magenta local-nettime
switch(config)#ntp server vrf magenta 171.18.1.22 version 3
switch(config)#
```

### 4.7.30 ntp trusted-key

The `ntp trusted-key` command specifies which authentication keys will be trusted for authentication of NTP packets. A packet with a trusted key will be used to update the local time if authenticated.

The `no ntp trusted-key` and `default ntp trusted-key` commands remove the specified authentication keys from the trusted key list by removing the corresponding `ntp trusted-key` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ntp trusted-key key_list
```

```
no ntp trusted-key
```

```
default ntp trusted-key
```

#### Parameters

- **key\_list** specified one or more keys. Formats include a number (1 to 65534), number range, or comma-delimited list of numbers and ranges.

#### Example

- This command configures the switch to trust authentication keys 234 and 237 for authentication of NTP packets.

```
switch(config)#ntp trusted-key 234,237
switch(config)#
```

## 4.7.31 prompt

The **prompt** command specifies the contents of the CLI prompt. Characters allowed in the prompt include A-Z, a-z, 0-9, and these punctuation marks:

! @ # \$ % # & \* ( ) - = + f g [ ] ; : < > , . ? / # n

The prompt supports these control sequences:

- %s – space character
- %t – tab character
- %% – percent character
- %D – time and date
- %D{*f\_char*} – time and date, format specified by the BSD **strftime** (*f\_char*) time conversion function.
- %H – host name
- %h – host name up to the first ‘.’
- %P – extended command mode
- %p – command mode
- %r<sup>1</sup> – redundancy status on modular systems
- %R<sup>2</sup> – extended redundancy status on modular systems – includes status and slot number

[Table 4: Command Mode Prompt Examples](#) displays Command Mode and Extended Command Mode prompts for various modes.

**Table 4: Command Mode Prompt Examples**

Command Mode	Command Mode Prompt	Extended Command Mode Prompt
Exec	>	>
Privileged Exec	#	#
Global Configuration	(config)#	(config)#
Ethernet Interface Configuration	(config-if)#	(config-if-ET15)#
VLAN Interface Configuration	(config-if)#	(config-if-VI24)#
Port Channel Interface Configuration	(config-if)#	(config-if-Po4)#
Management Interface Configuration	(config-if)#	(config-if-Ma1)
Access List Configuration	(config-acl)#	(config-acl-listname)#
OSPF Configuration	(config-router)#	(config-router-ospf)#
BGP Configuration	(config-router)#	(config-router-bgp)#

The **no prompt** and **default prompt** commands return the prompt to the default of %H%R%P.

<sup>1</sup> When logged into a fixed system or a supervisor on a modular system, this option has no effect.

<sup>2</sup> When logged into a fixed system, this option has no effect.

## Command Mode

Global Configuration

## Command Syntax

**prompt** *p\_string*

**no prompt**

**default prompt**

## Parameters

- *p\_string* prompt text (character string). Elements include letters, numbers, and control sequences.

## Examples

- This command creates a prompt that displays **system 1** and the command mode.

```
host-name.dut103(config)#prompt system%s1%P
system 1(config) #
```

- This command creates a prompt that displays the command mode.

```
host-name.dut103(config)#prompt %p
(config) #
```

- These equivalent commands create the default prompt.

```
% prompt %H%P
host-name.dut103(config) #
```

```
% no prompt
host-name.dut103(config) #
```

---

## 4.7.32 show banner

The `show banner` command displays the specified banner.

### Command Mode

Privileged EXEC

### Command Syntax

```
show banner BANNER_TYPE
```

### Parameters

- BANNER\_TYPE banner that the command displays. Options include
  - **login** command displays login banner.
  - **motd** command displays message of the day banner.

### Example

- These commands configure and display the message of the day banner.

```
switch(config)#banner motd  
Enter TEXT message. Type 'EOF' on its own line to end.  
This is an motd banner for $(hostname)  
EOF  
switch(config)#show banner motd  
This is an motd banner for $(hostname)  
switch(config)#
```

### 4.7.33 show clock

The `show clock` command displays the current system clock time and configured time zone. The switch uses the system clock for system log messages and debugging traces.

#### Command Mode

EXEC

#### Command Syntax

```
show clock
```

#### Example

- This command displays the current system clock time and configured time zone.

```
switch>show clock
Wed Nov  2 10:29:32 2011
timezone is America/Los_Angeles
switch>
```

---

## 4.7.34 show event-monitor arp

The `show event-monitor arp` command performs an SQL-style query on the event monitor database and displays ARP table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

### Command Mode

Privileged EXEC

### Command Syntax

```
show event-monitor arp [GROUP] [MESSAGES] [INTERFACE] [IP] [MAC] [TIME] [VRF]
```

Optional parameters can be placed in any order.

### Parameters

- GROUP used with aggregate functions to group results. Analogous to SQL group by command.
  - <no parameter> results are not grouped.
  - **group-by** *interface* results are grouped by interface.
  - **group-by** *ip* results are grouped by IP address.
  - **group-by** *mac* results are grouped by MAC address.
  - **group-by** *vrf* results are grouped by VRF.
- MESSAGES number of messages returned from query. Analogous to SQL limit command.
  - <no parameter> result-set size is not limited.
  - **limit** *msg\_quantity* number of results that are displayed. Values range from 1 to 15,000.
- INTERFACE restricts result-set to events that include specified interface (SQL Like command).
  - <no parameter> result-set not restricted by interface.
  - **match-interface ethernet** *e\_range* Ethernet interface list.
  - **match-interface loopback** *l\_range* loopback interface list.
  - **match-interface management** *m\_range* management interface list.
  - **match-interface port-channel** *c\_range* port channel interface list.
  - **match-interface tunnel** *t\_range* tunnel interface list.
  - **match-interface vxlan** *vx\_range* VXLAN interface list.
  - **match-interface port-channel** *c\_range* port channel interface list.
- IP restricts result-set to events that include specified IP address (SQL Like command).
  - <no parameter> result-set not restricted to specific IP addresses.
  - **match-ip** *ip\_address\_rex* IP address, as represented by regular expression.
- MAC restricts result-set to events that include specified MAC address (SQL Like command).
  - <no parameter> result-set not restricted to specific MAC addresses.
  - **match-mac** *mac\_address\_rex* MAC address, as represented by regular expression.
- TIME restricts result-set to events generated during specified period.
  - <no parameter> result-set not restricted by time of event.
  - **match-time last-minute** includes events generated during last minute.
  - **match-time last-day** includes events generated during last day.
  - **match-time last-hour** includes events generated during last hour.
  - **match-time last-week** includes events generated during last week.
- VRF restricts result-set to events that include a specific VRF.
  - <no parameter> result-set not restricted by time of event.
  - **match-vrf** *vrf\_name* the VRF name.

### Example

- This command displays ARP table events listed in the event monitor database.

```
switch#show event-monitor arp
% Writing 220017 Arp, 234204 Route, 1732559 Mac events to the database
2012-11-06 12:36:10|10.33.6.159|Vlan1417|0000.00dc.cc0d|0|added|2186271

## 4.7.35 show event-monitor igmpsnooping

The `show event-monitor igmpsnooping` command performs an SQL-style query on the event-monitor database, using the statement specified in the command.

### Command Mode

Privileged EXEC

### Command Syntax

```
show event-monitor igmpsnooping [GROUP] [MESSAGES] [MAC] [INTERFACE] [VLAN] [TIME]
```

### Parameters

- GROUP used with aggregate functions to group results. Analogous to SQL group by command.
  - <no parameter> results are not grouped.
  - **group-by** *interface* results are grouped by interface.
  - **group-by** *mac* results are grouped by MAC address.
  - **group-by** *vlan* results are grouped by VLAN.
- MESSAGES number of messages returned from query. Analogous to SQL limit command.
  - <no parameter> result-set size is not limited.
  - **limit** *msg\_quantity* number of results that are displayed. Values range from 1 to 15,000.
- MAC restricts result-set to events that include specified MAC address (SQL Like command).
  - <no parameter> result-set not restricted to specific MAC addresses.
  - **match-mac** *mac\_address\_rex* MAC address, as represented by regular expression.
- INTERFACE restricts result-set to events that include specified interface (SQL Like command).
  - <no parameter> result-set not restricted by interface.
  - **match-interface ethernet** *e\_range* Ethernet interface list.
  - **match-interface loopback** *l\_range* loopback interface list.
  - **match-interface management** *m\_range* management interface list.
  - **match-interface port-channel** *c\_range* port channel interface list.
  - **match-interface vlan** *v\_range* VLAN interface list.
  - **match-interface tunnel** *t\_range* tunnel interface list.
  - **match-interface vxlan** *vx\_range* VXLAN interface list.
- TIME restricts result-set to events with specified period.
  - <no parameter> result-set not restricted by time of event.
  - **match-time last-minute** includes events generated during last minute.
  - **match-time last-day** includes events generated during last day.
  - **match-time last-hour** includes events generated during last hour.
  - **match-time last-week** includes events generated during last week.
- VLAN restricts result-set to events that include a specific VLAN (SQL Like command).
  - <no parameter> result-set not restricted by time of event.
  - **match-vlan** *vlan* VLAN interface number.

### Examples

```
switch#show event-monitor igmpsnooping
switch#
```

## 4.7.36 show event-monitor mac

The `show event-monitor mac` command performs an SQL-style query on the event monitor database and displays MAC address table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

### Command Mode

Privileged EXEC

### Command Syntax

```
show event-monitor mac [GROUP] [MESSAGES] [INTERFACE] [MAC] [TIME]
```

Optional parameters can be placed in any order.

### Parameters

- GROUP used with aggregate functions to group results. Analogous to SQL group by command.
  - <no parameter> results are not grouped.
  - **group-by interface** results are grouped by interface.
  - **group-by mac** results are grouped by MAC address.
- MESSAGES number of messages returned from query. Analogous to SQL limit command.
  - <no parameter> result-set size is not limited.
  - **limit msg\_quantity** number of results that are displayed. Values range from 1 to 15,000.
- INTERFACE restricts result-set to events that include specified interface (SQL Like command).
  - <no parameter> result-set not restricted by interface.
  - **match-interface ethernet e\_range** Ethernet interface list.
  - **match-interface loopback l\_range** loopback interface list.
  - **match-interface management m\_range** management interface list.
  - **match-interface port-channel c\_range** port channel interface list.
  - **match-interface vlan v\_range** VLAN interface list.
  - **match-interface tunnel t\_range** tunnel interface list.
  - **match-interface vxlan vx\_range** VXLAN interface list.
- MAC restricts result-set to events that include specified MAC address (SQL Like command).
  - <no parameter> result-set not restricted to specific MAC addresses.
  - **match-mac mac\_address\_rex** MAC address, as represented by regular expression.
- TIME restricts result-set to events with specified period.
  - <no parameter> result-set not restricted by time of event.
  - **match-time last-minute** includes events generated during last minute.
  - **match-time last-day** includes events generated during last day.
  - **match-time last-hour** includes events generated during last hour.
  - **match-time last-week** includes events generated during last week.

### Examples

- This command displays all events triggered by MAC address table events.

```
switch#show event-monitor mac
% Writing 0 Arp, 0 Route, 1 Mac events to the database
2012-01-19 13:57:55|1|0808.0808.0808|Ethernet1|configuredStaticMac|
added|0
```

- This command displays events triggered by MAC address table changes.

```
switch#show event-monitor mac match-mac 08:08:08:%
```

---

```
2012-01-19 13:57:55|1|0808.0808.0808|Ethernet1|configuredStaticMac|  
added|0
```

### 4.7.37 show event-monitor mroute

The `show event-monitor mroute` command performs an SQL-style query on the event-monitor database, using the statement specified in the command.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show event-monitor mroute [GROUP] [MESSAGES] [IP] [INTERFACE] [SRC_IP] [TIME]
```

Optional parameters can be placed in any order.

#### Parameters

- GROUP used with aggregate functions to group results. Analogous to SQL group by command.
  - <no parameter> results are not grouped.
  - **group-by interface** results are grouped by interface.
  - **group-by ip6** results are grouped by IPv6 address.
  - **group-by mac** results are grouped by MAC address.
  - **group-by vrf** results are grouped by VRF.
- MESSAGES number of messages returned from query. Analogous to SQL limit command.
  - <no parameter> result-set size is not limited.
  - **limit msg\_quantity** number of results that are displayed. Values range from 1 to 15,000.
- IP restricts result-set to events that include specified IP address (SQL Like command).
  - <no parameter> result-set not restricted to specific IP addresses.
  - **match-ipv6 ip\_address\_rex** IP address, as represented by regular expression.
- INTERFACE restricts result-set to events that include specified interface (SQL Like command).
  - <no parameter> result-set not restricted by interface.
  - **match-interface ethernet e\_range** Ethernet interface list.
  - **match-interface loopback l\_range** loopback interface list.
  - **match-interface management m\_range** management interface list.
  - **match-interface port-channel c\_range** port channel interface list.
  - **match-interface vlan v\_range** VLAN interface list.
  - **match-interface tunnel t\_range** tunnel interface list.
  - **match-interface vxlan vx\_range** VXLAN interface list.
- SRC\_IP restricts result-set to events that include specified Source IP address (SQL Like command).
  - <no parameter> result-set not restricted to specific IP addresses.
  - **match-ip ip\_address\_rex** IP address, as represented by regular expression.
- TIME restricts result-set to events with specified period.
  - <no parameter> result-set not restricted by time of event.
  - **match-time last-minute** includes events generated during last minute.
  - **match-time last-day** includes events generated during last day.
  - **match-time last-hour** includes events generated during last hour.
  - **match-time last-week** includes events generated during last week.

#### Examples

- This command displays neighbor table events listed in the event monitor database.

```
switch#show event-monitor mroute
2011-07-28 12:33:28|default|16.17.18.19/32|225.0.0.1/32|||added|30
```

---

```
2011-07-28 12:33:28|default|16.17.18.19/32|225.0.0.1/32|Vlan2|iif|join|
31
2011-07-28 12:33:28|default|16.17.18.19/32|225.0.0.1/32|Vlan3|oif|join|

```

### 4.7.38 show event-monitor neighbor

The `show event-monitor neighbor` command performs an SQL-style query on the event monitor database and displays neighbor table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show event-monitor neighbor [GROUP] [MESSAGES] [INTERFACE] [IP6] [MAC] [TIME] [VRF]
```

Optional parameters can be placed in any order.

#### Parameters

- GROUP used with aggregate functions to group results. Analogous to SQL group by command.
  - <no parameter> results are not grouped.
  - **group-by** *interface* results are grouped by interface.
  - **group-by** *ip6* results are grouped by IPv6 address.
  - **group-by** *mac* results are grouped by MAC address.
  - **group-by** *vrf* results are grouped by VRF.
- MESSAGES number of messages returned from query. Analogous to SQL limit command.
  - <no parameter> result-set size is not limited.
  - **limit** *msg\_quantity* number of results that are displayed. Values range from 1 to 15,000.
- INTERFACE restricts result-set to events that include specified interface (SQL Like command).
  - <no parameter> result-set not restricted by interface.
  - **match-interface ethernet** *e\_range* Ethernet interface list.
  - **match-interface loopback** *l\_range* loopback interface list.
  - **match-interface management** *m\_range* management interface list.
  - **match-interface port-channel** *c\_range* port channel interface list.
  - **match-interface vlan** *v\_range* VLAN interface list.
  - **match-interface tunnel** *t\_range* tunnel interface list.
  - **match-interface vxlan** *vx\_range* VXLAN interface list.
- IP6 restricts result-set to events that include specified IP address (SQL Like command).
  - <no parameter> result-set not restricted to specific IP addresses.
  - **match-ipv6** *ip6\_address\_rex* IPv6 address, as represented by regular expression.
- MAC restricts result-set to events that include specified MAC address (SQL Like command).
  - <no parameter> result-set not restricted to specific MAC addresses.
  - **match-mac** *mac\_address\_rex* MAC address, as represented by regular expression.
- TIME restricts result-set to events with specified period.
  - <no parameter> result-set not restricted by time of event.
  - **match-time last-minute** includes events generated during last minute.
  - **match-time last-day** includes events generated during last day.
  - **match-time last-hour** includes events generated during last hour.
  - **match-time last-week** includes events generated during last week.
- VRF restricts result-set to events that include a specific VRF (SQL Like command).
  - <no parameter> result-set not restricted by time of event.
  - **match-vrf** *vrf\_name* VRF name, as represented by a regular expression.

#### Examples

- 
- This command displays neighbor table events listed in the event monitor database.

```
switch#show event-monitor neighbor

```

### 4.7.39 show event-monitor route6

The `show event-monitor route6` command performs an SQL-style query on the event monitor database and displays routing6 table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show event-monitor route6 [GROUP] [MESSAGES] [IP6] [TIME]
```

Optional parameters can be placed in any order.

#### Parameters

- GROUP used with aggregate functions to group results. Analogous to SQL group by command.
  - <no parameter> results are not grouped.
  - **group-by** *interface* results are grouped by interface.
  - **group-by** *ip6* results are grouped by IPv6 address.
  - **group-by** *mac* results are grouped by MAC address.
  - **group-by** *vrf* results are grouped by VRF.
- MESSAGES number of messages returned from query. Analogous to SQL limit command.
  - <no parameter> result-set size is not limited.
  - **limit** *msg\_quantity* number of results that are displayed. Values range from 1 to 15,000.
- IP6 restricts result-set to events that include specified IP address (SQL Like command).
  - <no parameter> result-set not restricted to specific IP addresses.
  - **match-ipv6** *ip6\_address\_rex* IPv6 address, as represented by regular expression.
- TIME restricts result-set to events with specified period.
  - <no parameter> result-set not restricted by time of event.
  - **match-time last-minute** includes events generated during last minute.
  - **match-time last-day** includes events generated during last day.
  - **match-time last-hour** includes events generated during last hour.
  - **match-time last-week** includes events generated during last week.

#### Examples

- This command displays neighbor table events listed in the event monitor database.

```
switch#show event-monitor route6

## 4.7.40 show event-monitor route

The `show event-monitor route` command performs an SQL-style query on the event monitor database and displays routing table events as specified by command parameters. The event monitor buffer and all backup logs are synchronized into a single SQLite file.

### Command Mode

Privileged EXEC

### Command Syntax

```
show event-monitor route [GROUP] [MESSAGES] [IP] [TIME]
```

Optional parameters can be placed in any order.

### Parameters

- GROUP used with aggregate functions to group results. Analogous to SQL group by command.
  - <no parameter> results are not grouped.
  - **group-by ip** results are grouped by IPv4 address.
- MESSAGES number of messages returned from query. Analogous to SQL limit command.
  - <no parameter> result-set size is not limited.
  - **limit msg\_quantity** number of results that are displayed. Values range from 1 to 15,000.
- IP restricts result-set to events that include specified IP address (SQL Like command).
  - <no parameter> result-set not restricted to specific IP addresses.
  - **match-ip ip\_address\_rex** IP address, as represented by regular expression.
- TIME restricts result-set to events with specified period.
  - <no parameter> result-set not restricted by time of event.
  - **match-time last-minute** includes events generated during last minute.
  - **match-time last-day** includes events generated during last day.
  - **match-time last-hour** includes events generated during last hour.
  - **match-time last-week** includes events generated during last week.

### Example

- This command displays 10 routing table events listed in the event monitor database.

```
switch#show event-monitor route limit 10

## 4.7.41 show event-monitor sqlite

The `show event-monitor sqlite` command performs an SQL-style query on the event monitor database, using the statement specified in the command.

### Command Mode

Privileged EXEC

### Command Syntax

```
show event-monitor sqlite statement
```

### Parameters

- *statement* SQLite statement.

### Example

- This command displays all entries from the route table.

```
switch#show event-monitor sqlite select * from route;
2019-09-30 14:01:21.659428|16.16.16.255/32|default|receiveBcast|0|0|

## 4.7.42 show event-monitor stpunstable

The `show event-monitor stpunstable` command performs an SQL-style query on the event-monitor database, using the statement specified in the command.

### Command Mode

Privileged EXEC

### Command Syntax

```
show event-monitor stpunstable [MESSAGES] [TIME]
```

Optional parameters can be placed in any order.

### Parameters

- MESSAGES number of messages returned from query. Analogous to SQL limit command.
  - <no parameter> result-set size is not limited.
  - **limit** *msg\_quantity* number of results that are displayed. Values range from 1 to 15,000.
- TIME restricts result-set to events with specified period.
  - <no parameter> result-set not restricted by time of event.
  - **match-time last-minute** includes events generated during last minute.
  - **match-time last-day** includes events generated during last day.
  - **match-time last-hour** includes events generated during last hour.
  - **match-time last-week** includes events generated during last week.

### Example

```
switch#show event-monitor stpunstable limit 5
2019-02-07 07:22:10.286164|Cist|Ethernet5|forward-delay-while|1
2019-02-07 07:22:10.286651|Cist|Ethernet6|forward-delay-while|2
2019-02-07 07:22:10.286844|Cist|Ethernet8|forward-delay-while|3
2019-02-07 07:22:10.287030|Cist|Ethernet14|forward-delay-while|4
2019-02-07 07:22:10.287215|Cist|Ethernet21|forward-delay-while|5
switch#
```

## 4.7.43 show hostname

The `show hostname` command displays the hostname and the fully qualified domain name (FQDN) of the switch.

### Command Mode

EXEC

### Command Syntax

```
show hostname
```

### Example

- This command displays the hostname and FQDN of the switch.

```
switch>show hostname
Hostname: switch_1
FQDN:    switch_1.aristanetworks.com

switch>
```

---

## 4.7.44 show hosts

The `show hosts` command displays the default domain name, name lookup service style, a list of name server hosts, and the static hostname-IP address maps.

### Command Mode

EXEC

### Command Syntax

`show hosts`

### Example

- This command displays the switches IP domain name:

```
switch>show hosts

Default domain is: aristanetworks.com
Name/address lookup uses domain service
Name servers are: 172.22.22.40, 172.22.22.10
Static Mappings:

Hostname                IP      Addresses
TEST_LAB                IPV410.24.18.6
PRODUCTION_LAB          IPV410.24.18.7
SUPPORT_LAB             IPV62001:0DB8:73:ff:ff:26:fd:90
switch>
```

## 4.7.45 show ip domain-name

The `show ip domain-name` command displays the switch's IP domain name that is configured with the `ip domain-name` command.

### Command Mode

EXEC

### Command Syntax

```
show ip domain-name
```

### Example

- This command displays the switch's IP domain name:

```
switch>show ip domain-name
aristanetworks.com
switch>
```

---

## 4.7.46 show ip name-server

The `ip name-server` command displays the ip addresses of name-servers in *running-config*. The name servers are configured by the `ip name-server` command.

### Command Mode

EXEC

### Command Syntax

```
show ip name-server
```

### Example

- This command displays the IP address of name servers that the switch is configured to access.

```
switch>show ip name-server
172.22.22.10
172.22.22.40
switch>
```

## 4.7.47 show local-clock time-properties

The `show local-clock time-properties` command displays the Precision Time Protocol (PTP) clock properties.

### Command Mode

Privileged EXEC

### Command Syntax

```
show local-clock time-properties
```

### Examples

- This command shows the PTP clock properties.

```
switch#show local-clock time-properties
Current UTC offset valid: False
Current UTC offset: 0
Leap 59: False
Leap 61: False
Time Traceable: False
Frequency Traceable: False
PTP Timescale: False
Time Source: 0x0
switch#
```

## 4.7.48 show ntp associations

The `show ntp associations` command displays the status of connections to NTP servers.

### Command Mode

EXEC

### Command Syntax

```
show ntp associations
```

### Display Values

- **refid (reference ID):** the reference ID of the configured NTP server's time source. The reference ID is either the IPv4 address of the source or (if the source has an IPv6 address) the first four octets of the MD5 hash of the IPv6 address.
- **st (stratum):** number of steps between the switch and the reference clock.
- **t (transmission type):** u unicast; b broadcast; l local.
- **when:** interval since reception of last packet (seconds unless unit is provided).
- **poll:** interval between NTP poll packets. Maximum (1024) reached as server and client syncs.
- **reach:** octal number that displays status of last eight NTP messages (377 - all messages received).
- **delay:** round-trip delay of packets to the NTP server.
- **offset:** difference between local clock and the server's clock.
- **jitter:** nominal offset estimation error.

### Example

- This command displays the status of the switch's NTP associations.

```
switch>show ntp associations
      remote          refid      st t when  poll reach  delay  offset
 jitter
=====
=====
+1.ntp.arista.co 125.157.10.11  2 u  539  1024  377  121.748  -0.345
 0.893
-3.ntp.arista.co 127.31.152.34  2 u  868  1024  377  101.671   2.434

+2.ntp.arista.co 176.131.12.185 2 u  676  1024  377  116.505   0.03
 0.768
*4.ntp.arista.co 120.181.192.192 2 u  696  1024  377   48.431  -0.416
 0.15
switch#
```

## 4.7.49 show ntp status

The `show ntp status` command displays the status of NTP on the switch. If the switch clock is not synchronized to an NTP server, the status reads “unsynchronised” and shows the server polling interval. If the clock is synchronized to an NTP server, the status shows the IP address and stratum of the server, the precision of the synchronization, and the polling interval.

### Note:

In EOS releases prior to 4.23.2, this command identified system peers with IPv6 addresses by their reference IDs (the first four octets of the MD5 hash of the IPv6 address). In later releases, this command always shows the IP address of the system peer (whether IPv4 or IPv6).

### Command Mode

EXEC

### Command Syntax

```
show ntp status
```

### Example

- This command displays the switch’s NTP status.

```
switch>show ntp status
synchronised to NTP server (192.168.78.62) at stratum 3
  time correct to within 66 ms
  polling server every 1024 s
switch>
```

## Timing Protocols

---

The Precision Time Protocol (PTP) provides a greater degree of clock accuracy for networked devices, allowing clocks to be synchronized locally in increments of less than a microsecond. PTP uses a master-slave hierarchy similar to that used by NTP. The most precise clock available is referred to as the master clock, and slave devices use the signal from the master to synchronize their own clocks.

The master clock sends out a **sync** message (referred to as an **announce** message in IEEE 1588-2008) at a regular interval. The slave clock responds with a time-stamped delay request message in order to measure and compensate for packet delays between the devices. The slave then receives a message from the master specifying when the delay message was received, which allows the slave to calculate final values for clock synchronization. Synchronization is maintained by the regular exchange of PTP packets between master and slave.

**Note:** Arista switches do not support setting of the system clock using PTP. System clock synchronization is best supported by the NTP service on the PTP grandmaster.

PTP is disabled globally by default. The following steps are required to enable PTP on an interface:

- [Setting the PTP Mode](#)
- [Enabling PTP on an Interface](#)

The following PTP global configurations are optional:

- [Configuring the PTP Domain](#)
- [Configuring the Offset Hold Time](#)
- [Setting the PTP Priority](#)
- [Configuring the Source IP](#)
- [Configuring the TTL for PTP Packets](#)
- [Configuring PTP Monitoring](#)

The following PTP interface-level configurations are optional:

- [Setting the PTP Announce Interval](#)
- [Setting the PTP Timeout Interval](#)
- [Configuring the PTP Delay Mechanism](#)
- [Setting the Delay Request Interval](#)
- [Setting the Peer Delay Request Interval](#)
- [Setting the Peer Link Propagation Threshold](#)
- [Setting the Interval for Sending Synchronization Messages](#)
- [Setting the PTP Transport Type](#)
- [Viewing PTP Settings and Status](#)
- [Precision Time Protocol \(PTP\) Commands](#)

### 5.1 Setting the PTP Mode

To allow PTP to be used on switch interfaces, first set the PTP mode using the `ptp mode` command. PTP mode options include:

- **boundary** The device acts as a boundary clock, and both runs and participates in the best master clock algorithm.
- **disabled** PTP is disabled, and the device forwards all PTP packets as normal traffic.

- **end-to-end transparent** The device acts as an end-to-end transparent clock, synchronizing all ports to a connected master clock and updating the time interval field of forwarded PTP packets using switch residence time.
- **peer-to-peer transparent** The device acts as a peer-to-peer transparent clock, synchronizing all ports to a connected master clock and updating the time interval field of forwarded PTP packets using switch residence time and inbound path delays.
- **generalized Precision Time Protocol (gPTP)** The device runs generalized Precision Time Protocol (gPTP), participating in the best master clock algorithm but also updating the interval field of forwarded PTP packets using switch residence time and inbound path delays.

To disable PTP globally on the switch, use the **no** or **default** forms of the **ptp mode** command.

**Example:**

This command configures the device as a PTP boundary clock.

```
switch(config)#ptp mode boundary
switch(config)#
```

## 5.2 Enabling PTP on an Interface

To enable PTP on a specific interface on the device, use the **ptp enable** command.

**Example**

- This command enables PTP on Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#ptp enable
```

## 5.3 Configuring the PTP Domain

To set the domain number to use for the clock, use the **ptp domain** command.

- This command configures the domain 1 to use with a clock.

```
switch(config)#ptp domain 1
switch(config)#
```

## 5.4 Configuring the Offset Hold Time

To set the PTP offset hold time, use the **ptp hold-ptp-time** command.

- This command configures the PTP offset hold time to 600 seconds.

```
switch(config)#ptp hold-ptp-time 600
switch(config)#
```

## 5.5 Setting the PTP Priority

To set the priority 1 value, use the `ptp priority1` command. Lower values take precedence. This command configures the priority 1 value of 120 to use when advertising the clock.

```
switch(config)#ptp priority1 120
switch(config)#
```

To set the priority 2 value for the clock, use the `ptp priority2` command. This command configures the priority 2 value of 128.

```
switch(config)#ptp priority2 128
switch(config)#
```

## 5.6 Configuring the Source IP

To set the source IP address for all PTP packets, use the `ptp source ip` command.

- This command configures the source IP address of 10.0.2.1 for all PTP packets.

```
switch(config)#ptp source ip 10.0.2.1
switch(config)#
```

## 5.7 Configuring the TTL for PTP Packets

To set the time to live (TTL) of PTP packets, use the `ptp ttl` command. TTL is the maximum number of hops that a PTP packet may make.

- This command configures a TTL of 64 hops for PTP packets.

```
switch(config)#ptp ttl 64
switch(config)#
```

## 5.8 Configuring PTP Monitoring

PTP monitoring records PTP information including offset from master, mean path delay, and skew values, which can then be viewed using a `show` command. When this feature is enabled, PTP Syslog messages will also be generated for those metrics for which threshold values have been configured on the switch. PTP monitoring is enabled by default.

### Enabling and Disabling PTP Monitoring

Use the `ptp monitor` command to enable PTP monitoring on the device (it is enabled by default). The `no` form of the command disables PTP monitoring and clears all the recorded PTP data.

### Example

- This command disables PTP monitoring and clears all recorded PTP data from the switch.

```
switch(config)#no ptp monitor
```

---

### Configuring the Offset-from-master Threshold

The offset is the difference in nanoseconds between master and slave time. Use the `ptp monitor threshold offset-from-master` command to specify the offset-from-master threshold in nanoseconds. A Syslog message is generated if the most recently calculated time offset from the PTP master is outside of the range ( $-\langle\text{threshold}\rangle, \langle\text{threshold}\rangle$ ). The maximum offset threshold is one second. The no form of the command clears the threshold value and prevents further Syslog messages from being generated for this parameter.

#### Example

- This command sets an offset-from-master threshold value of 500 nanoseconds.

```
switch(config)#ptp monitor threshold offset-from-master 500
```

### Configuring the Mean-path-delay Threshold

Mean path delay is the mean time in nanoseconds that PTP packets take to travel between master and slave. Use the `ptp monitor threshold mean-path-delay` command to specify the mean-path-delay threshold in nanoseconds. A Syslog message is generated if the value of the most recently calculated mean path delay is greater than or equal to this threshold. The maximum mean-path-delay threshold is one second. The no form of the command clears the threshold value and prevents further Syslog messages from being generated for this parameter.

#### Note:

Mean path delay is always non-negative.

#### Example

- This command sets a mean-path-delay threshold value of 2000 nanoseconds.

```
switch(config)#ptp monitor threshold mean-path-delay 2000
```

### Configuring the Skew Threshold

PTP skew is the clock frequency difference between master and slave. Use the `ptp monitor threshold skew` command to configure the value of the skew-threshold percentage. A Syslog message is generated if the value of the most recently calculated skew is not in the range ( $1/(1+\langle\text{threshold}\rangle), 1*(1+\langle\text{threshold}\rangle)$ ). Skew threshold percentage is represented a double precision (16 digit) real number ranging from 0 (0%) to 10 (1000%). The no form of the command clears the threshold value and prevents further Syslog messages from being generated for this parameter.

#### Example

- This command sets a skew threshold value of 5 (500%).

```
switch(config)#ptp monitor threshold skew 5
```

## 5.9 Setting the PTP Announce Interval

To set the interval at which an interface sends PTP **announce** messages, use the `ptp announce interval` command. The interval is measured in log seconds. This value also affects the timeout interval.

This command configures the interval between PTP announcement messages on Ethernet interface 5 to 4 seconds.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#ptp announce interval 2
switch(config-if-Et5)#
```

## 5.10 Setting the PTP Timeout Interval

To set the timeout multiplier for an interface, use the `ptp announce timeout` command. The timeout multiplier is the number of announcement intervals that the interface will wait without receiving a PTP announcement before a timeout occurs; values range from 2 to 255. The default multiplier is 3, which results in a 6-second timeout interval when the announcement interval is set to the default of 2 seconds.

This command sets timeout multiplier for the interface to 5; since the announcement interval has just been set to 2 (4 seconds), this means the interface will time out if it doesn't receive a PTP announcement for 20 seconds.

```
switch(config-if-Et5)#ptp announce timeout 5
switch(config-if-Et5)#
```

## 5.11 Configuring the PTP Delay Mechanism

To set the delay mechanism used in boundary-mode, use the `ptp delay-mechanism` command.

- This command sets the delay mechanism in boundary clock mode for the interface to peer-to-peer.

```
switch(config-if-Et5)#ptp delay-mechanism p2p
switch(config-if-Et5)#
```

## 5.12 Setting the Delay Request Interval

To set the time for the slave devices to send delay request messages, use the `ptp delay-request interval` command.

- This command sets the time the slave devices to send delay request messages to the master state to 3 for the interface.

```
switch(config-if-Et5)#ptp delay-request interval 3
switch(config-if-Et5)#
```

## 5.13 Setting the Peer Delay Request Interval

To set the minimum interval between the PTP peer delay-request messages, use the `ptp pdelay-request interval` command.

This command sets the interval between PTP peer delay-request messages on the interface to 3.

```
switch(config-if-Et5)#ptp pdelay-request interval 3
switch(config-if-Et5)#
```

---

## 5.14 Setting the Peer Link Propagation Threshold

To set the delay threshold for which the peer will be considered unable to run generalized Precision Time Protocol (gPTP), use the `ptp pdelay-neighbor-threshold` command.

- This command sets the link propagation delay threshold on the interface to 200000 nanoseconds..

```
switch(config-if-Et5)#ptp pdelay-neighbor-threshold 200000
switch(config-if-Et5)#
```

## 5.15 Setting the Interval for Sending Synchronization Messages

To set the interval (in log seconds) for sending synchronization messages, use the `ptp sync-message interval` command. Value ranges and defaults vary based on the PTP mode of the switch.

- This command configures the interval for sending synchronization messages on the interface to 3 (8 seconds).

```
switch(config-if-Et5)#ptp sync-message interval 3
switch(config-if-Et5)#
```

## 5.16 Setting the PTP Transport Type

To set the PTP transport type, use the `ptp transport` command.

- This command configures the PTP transport type for the interface to IPv4.

```
switch(config-if-Et5)#ptp transport ipv4
switch(config-if-Et5)#
```

## 5.17 Viewing PTP Settings and Status

The following commands display the status of the switch PTP server connections:

- [Displaying General PTP Information](#)
- [Displaying PTP Local Clock and Offset](#)
- [Displaying PTP Masters Information](#)
- [Displaying PTP Clock Properties](#)
- [Displaying PTP Information for all Interfaces](#)
- [Displaying PTP Interface Counters](#)
- [Displaying PTP Foreign Master](#)
- [Displaying PTP Source IP](#)
- [Displaying PTP Monitoring Information](#)

### 5.17.1 Displaying General PTP Information

To display general Precision Time Protocol (PTP) information, use the `show ptp` command.

```
switch#show ptp
PTP Mode: gptp - Generalized PTP Clock
Clock Identity: 2001:0DB8:73:ff:ff:26:fd:90
```

```

Grandmaster Clock Identity: 2001:0DB8:96:ff:fe:6c:ed:02
Number of slave ports: 1
Number of master ports: 6
Slave port: Ethernet33
Mean Path Delay (nanoseconds): 718
Steps Removed: 1
Neighbor Rate Ratio: 1.00000007883
Rate Ratio: 1.00000007883
Interface StateASTime Since LastNeighborMean PathResidence

Et4Disabled NoNever1.000
Et5Disabled NoNever1.000
Et6Disabled NoNever1.000
Et7MasterYes0:21:081.000000094200

```

### 5.17.2 Displaying PTP Clock Properties

To display PTP clock properties, use the [Displaying PTP Clock Properties](#) command.

```

switch#show local-clock time-properties
Current UTC offset valid: False
Current UTC offset: 0
Leap 59: False
Leap 61: False
Time Traceable: False
Frequency Traceable: False
PTP Timescale: False
Time Source: 0x0
switch#

```

### 5.17.3 Displaying PTP Foreign Master

To display information about foreign masters (PTP sources not designated as the switchs master from which the switch has received sync packets), use the [show ptp foreign-master-record](#) command.

```

switch#show ptp foreign-master-record
No Foreign Master Records
switch#

```

### 5.17.4 Displaying PTP Information for all Interfaces

To display PTP information for specified interfaces, use the [show ptp interface](#) command.

```

switch#show ptp interface
Interface Ethernet1
PTP: Disabled
Port state: Disabled
Sync interval: 1.0 seconds
Announce interval: 2.0 seconds
Announce interval timeout multiplier: 3
Delay mechanism: end to end
Delay request message interval: 32.0 seconds
Transport mode: ipv4

```

```
Interface Ethernet5
PTP: Disabled
Port state: Disabled
Sync interval: 8.0 seconds
Announce interval: 2.0 seconds
Announce interval timeout multiplier: 5
Delay mechanism: peer to peer
Peer delay request message interval: 8.0 seconds
Peer Mean Path Delay: 0
Transport mode: ipv4

switch#
```

### 5.17.5 Displaying PTP Interface Counters

To display PTP interface counters for specified interfaces, use the `show ptp interface counters` command.

```
switch#show ptp interface ethernet 5 counters
Interface Ethernet5
Announce messages sent: 0
Announce messages received: 0
Sync messages sent: 0
Sync messages received: 0
Follow up messages sent: 0
Follow up messages received: 0
Delay request messages sent: 0
Delay request messages received: 0
Delay response messages sent: 0
Delay response messages received: 0
Peer delay request messages sent: 0
Peer delay request messages received: 0
Peer delay response messages sent: 0
Peer delay response messages received: 0
Peer delay response follow up messages sent: 0
Peer delay response follow up messages received: 0
switch#
```

### 5.17.6 Displaying PTP Local Clock and Offset

To display the local PTP clock and offset, use the `show ptp local-clock` command.

```
switch#show ptp local-clock
PTP Mode: Boundary Clock
Clock Identity: 0x00:1c:73:ff:ff:1e:83:24
Clock Domain: 1
Number of PTP ports: 24
Priority1: 128
Priority2: 128
Clock Quality:
  Class: 248
  Accuracy: 0x30
  OffsetScaledLogVariance: 0xffff
Offset From Master: 0
Mean Path Delay: 0
Steps Removed: 0
switch#
```

## 5.17.7 Displaying PTP Masters Information

To display the PTP clocks master and grandmaster identity and configuration, use the `show ptp masters` command.

```
switch#show ptp masters
Parent Clock:
Parent Clock Identity: 0x00:1c:73:ff:ff:00:72:40
Parent Port Number: 0
Parent IP Address: N/A
Observed Parent Offset (log variance): N/A
Observed Parent Clock Phase Change Rate: N/A

Grandmaster Clock:
Grandmaster Clock Identity: 0x00:1c:73:ff:ff:00:72:40
Grandmaster Clock Quality:
  Class: 248
  Accuracy: 0x30
  OffsetScaledLogVariance: 0xffff
  Priority1: 128
  Priority2: 128
switch#
```

## 5.17.8 Displaying PTP Monitoring Information

To display the list of up to 100 recorded entries of offset from master, mean path delay and skew values, the current PTP mode, whether or not the feature is enabled, the number of entries displayed, and the configured thresholds for each metric, use the `show ptp monitor` command. Entries are sorted by the system time at which the value was calculated, starting with the most recent data at the top.

```
Switch#show ptp monitor
PTP Mode: Boundary Clock
Ptp monitoring: enabled
Number of entries: 5
Offset from master threshold: 1500
Mean path delay threshold: not configured
Skew threshold: 0.5
Interface Time                               Offset from Master (ns)  Mean Path Delay (ns)  Skew
-----

## 5.17.9 Displaying PTP Source IP

To display PTP IP source information, use the `show ptp source ip` command.

```
switch#show ptp source ip
PTP source IP: 10.0.2.1
```

---

```
switch#
```

## 5.18 Precision Time Protocol (PTP) Commands

### PTP Commands

- `ptp announce interval`
- `ptp announce timeout`
- `ptp delay-mechanism`
- `ptp delay-req interval`
- `ptp domain`
- `ptp enable`
- `ptp forward-v1`
- `ptp hold-ptp-time`
- `ptp mode`
- `ptp monitor`
- `ptp monitor threshold mean-path-delay`
- `ptp monitor threshold offset-from-master`
- `ptp monitor threshold skew`
- `ptp pdelay-neighbor-threshold`
- `ptp pdelay-req interval`
- `ptp priority1`
- `ptp priority2`
- `ptp role`
- `ptp source ip`
- `ptp sync timeout`
- `ptp sync-message interval`
- `ptp transport`
- `ptp ttl`

### PTP Show Commands

- `show ptp foreign-master-record`
- `show ptp interface`
- `show ptp interface counters`
- `show ptp local-clock`
- `show ptp masters`
- `show ptp monitor`
- `show ptp source ip`
- `show ptp`

---

## 5.18.1 ptp announce interval

The `ptp announce interval` command configures the interval at which the configuration mode interface sends PTP **announce** messages. The `no ptp announce interval` command resets the announce interval to its default of 1 (2 seconds).

### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

### Command Syntax

```
ptp announce interval log_interval
```

```
no ptp announce interval
```

```
default ptp announce interval
```

### Parameters

- *log\_interval* The number of log seconds between PTP **announce** messages (base 2 log (seconds)). Value ranges from -3 (1/8 second) to 4 (16 seconds); default value is 1 (2 seconds).

### Examples

- These commands set the interval between PTP **announce** messages sent by Ethernet interface 5 to 4 seconds.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#ptp announce interval 2  
switch(config-if-Et5)#
```

- These commands reset the PTP **announce** interval on Ethernet interface 5 to the default value of 1 (2 seconds).

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#no ptp announce interval  
switch(config-if-Et5)#
```

## 5.18.2 ptp announce timeout

The `ptp announce timeout` sets the timeout multiplier for the configuration-mode interface. The timeout multiplier is the number of announcement intervals that the interface will wait without receiving a PTP **announce** message before a timeout occurs; the range is from 2 to 255. The default multiplier is 3, which results in a 6-second timeout interval when the announce interval is set to the default of 2 seconds. To configure the announce interval, use the `ptp announce interval` command.

### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

### Command Syntax

```
ptp announce timeout multiplier
```

```
no ptp announce timeout
```

```
default ptp announce timeout
```

### Parameters

- *multiplier* Number of announce intervals after which the interface will time out if it does not receive a PTP **announce** message. The range is from 2 to 255; default value is 3.

### Examples

- This command sets the timeout multiplier for Ethernet interface 5 to 5. This means that the interface will time out if it doesn't receive a PTP **announce** message within five announce intervals.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#ptp announce timeout 5  
switch(config-if-Et5)#
```

- These commands reset the PTP timeout interval on interface Ethernet 5 to the default value of 3.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#no ptp announce timeout  
switch(config-if-Et5)#
```

---

### 5.18.3 ptp delay-mechanism

The `ptp delay-mechanism` command configures the delay mechanism in boundary clock mode. The `no ptp delay-mechanism` command disables the feature.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
ptp delay-mechanism mech_type
```

```
no ptp delay-mechanism
```

```
default ptp delay-mechanism
```

#### Parameters

- *mech\_type* The delay mechanism. Options include:
  - **e2e** end-to-end delay mechanism
  - **p2p** peer-to-peer mechanism

#### Examples

- This command sets the delay mechanism to peer-to-peer in the boundary clock mode.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#ptp delay-mechanism p2p  
switch(config-if-Et5)#
```

- This command sets the delay mechanism to end-to-end in the boundary clock mode.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#ptp delay-mechanism e2e  
switch(config-if-Et5)#
```

- This command removes the delay mechanism configuration from Ethernet 5.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#no ptp delay-mechanism e2e  
switch(config-if-Et5)#
```

## 5.18.4 ptp delay-req interval

The **ptp delay-req interval** command specifies the time in log seconds recommended to the slave devices to send delay request messages. You must enable PTP on the switch first and configure the source IP address for PTP communication. The **no ptp delay-req interval** command resets the interval to its default of 5 (32 seconds).

### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

### Command Syntax

```
ptp delay-req interval log_interval
```

```
no ptp delay-req interval
```

```
default ptp delay-req interval
```

### Parameters

- *log\_interval* The range is -1 to 8 log seconds (base 2 log (seconds)). The default is 5 (32 seconds).

### Examples

- These commands set the minimum interval allowed between PTP delay request messages on Ethernet interface 5 to 3 (8 seconds).

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)# ptp delay-request interval 3  
switch(config-if-Et5)#
```

- These commands reset the minimum interval allowed between PTP delay-request messages to the default of 5 (32 seconds).

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#no ptp delay-request interval  
switch(config-if-Et5)#
```

---

## 5.18.5 ptp domain

The `ptp domain` command sets the domain number to use for the clock. The `no ptp domain` command disables the feature.

### Command Mode

Global Configuration

### Command Syntax

```
ptp domain domain_number
```

```
no ptp domain
```

```
default ptp domain
```

### Parameters

- *domain\_number* Value ranges from 0 to 255.

### Examples

- This command shows how to configure domain 1 for use with a clock.

```
switch(config)#ptp domain 1  
switch(config)#
```

- This command removes the configured domain 1 for use with a clock.

```
switch(config)#no ptp domain 1  
switch(config)#
```

## 5.18.6 ptp enable

The `ptp enable` command enables PTP on the interface. The `no ptp enable` command disables PTP on the interface.

### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

### Command Syntax

`ptp enable`

`no ptp enable`

`default ptp enable`

### Examples:

- This command enables PTP on Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#ptp enable
```

- This command disables PTP on Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no ptp enable
```

---

## 5.18.7 ptp forward-v1

The `ptp forward-v1` command configures the switch to forward Precision Time Protocol version packets as regular multicast traffic. By default, PTP v1 packets are trapped by the CPU, logged and discarded.

The `no ptp forward-v1` and `default ptp forward-v1` commands restore the default forwarding behavior by removing the corresponding `ptp forward-v1` command from *running-config*.

### Command Mode

Global Configuration

### Command Syntax

```
ptp forward-v1
```

```
no ptp forward-v1
```

```
default ptp forward-v1
```

### Examples

- This command configures the switch to forward PTP v1 packets as regular multicast traffic.

```
switch(config)#ptp forward-v1
switch(config)#
```

- This command configures the switch to log and discard PTP v1 packets.

```
switch(config)#no ptp forward-v1
switch(config)#
```

### 5.18.8 ptp hold-ptp-time

The `ptp hold-ptp-time` command configures the PTP offset hold time in seconds. The `no ptp hold-ptp-time` command disables the feature.

#### Command Mode

Global Configuration

#### Command Syntax

```
ptp hold-ptp-time offset
```

```
no ptp hold-ptp-time
```

```
default ptp hold-ptp-time
```

#### Parameters

- *offset* Value ranges from 0 to 86400.

#### Examples

- This command shows how to configure the PTP offset hold time.

```
switch(config)#ptp hold-ptp-time 600  
switch(config)#
```

- This command removes the configured PTP offset hold time.

```
switch(config)#no ptp hold-ptp-time  
switch(config)#
```

---

## 5.18.9 ptp mode

The `ptp mode` command configures the Precision Time Protocol (PTP) packet forwarding mode for the switch. By default, PTP is disabled globally; the mode must be changed to use PTP on switch interfaces.

The `no ptp mode` and `default ptp mode` commands return the forwarding mode to **disabled** by removing the `ptp mode` command from *running-config*.

### Command Mode

Global Configuration

### Command Syntax

```
ptp mode mode_name
```

```
no ptp mode
```

```
default ptp mode
```

### Parameters

- *mode\_name* Default mode is **disabled**. Options include:
  - **boundary** The device acts as a boundary clock, and both runs and participates in the best master clock algorithm.
    - **disabled** The default mode. PTP is disabled, and the device forwards all PTP packets as normal traffic.
    - **e2transparent** The device acts as an end-to-end transparent clock, synchronizing all ports to a connected master clock and updating the time interval field of forwarded PTP packets using switch residence time.
    - **p2transparent** The device acts as a peer-to-peer transparent clock, synchronizing all ports to a connected master clock and updating the time interval field of forwarded PTP packets using switch residence time and inbound path delays.
    - **gptp** The device runs generalized Precision Time Protocol (gPTP), participating in the best master clock algorithm but also updating the interval field of forwarded PTP packets using switch residence time and inbound path delays.

### Examples

- This command configures the switch to act as a PTP boundary clock.

```
switch(config)#ptp mode boundary
switch(config)#
```

- This command restores PTP to disabled mode.

```
switch(config)#no ptp mode
switch(config)#
```

### 5.18.10 ptp monitor threshold mean-path-delay

Mean path delay is the mean time in nanoseconds that PTP packets take to travel between PTP master and slave. The `ptp monitor threshold mean-path-delay` command configures the mean-path-delay threshold in nanoseconds. When this threshold is configured, a Syslog message is generated if the value of the most recently calculated mean path delay is greater than or equal to this value.

The `no ptp monitor threshold mean-path-delay` and `default ptp monitor threshold mean-path-delay` commands clear the threshold value and prevent further Syslog messages from being generated for this parameter.

#### Command Mode

Global Configuration

#### Command Syntax

```
ptp monitor threshold mean-path-delay threshold  
no ptp monitor threshold mean-path-delay  
default ptp monitor threshold mean-path-delay
```

#### Parameter

- *threshold* threshold in nanoseconds. Values range from 0 to 1000000000 (1 second).

#### Example

- This command sets a mean-path-delay threshold value of 2000 nanoseconds.

```
switch(config)#ptp monitor threshold mean-path-delay 2000
```

---

### 5.18.11 ptp monitor threshold offset-from-master

PTP offset is the difference in nanoseconds between master and slave time. The `ptp monitor threshold offset-from-master` command configures the offset-from-master threshold in nanoseconds. A Syslog message is generated if the most recently calculated time offset from the PTP master is outside of the range (-<threshold>, <threshold>). The maximum offset threshold is one second.

The `no ptp monitor threshold offset-from-master` and `no ptp monitor threshold offset-from-master` commands clear the threshold value and prevents further Syslog messages from being generated for this parameter.

#### Command Mode

Global Configuration

#### Command Syntax

```
ptp monitor threshold offset-from-master threshold  
no ptp monitor threshold offset-from-master  
default ptp monitor threshold offset-from-master
```

#### Parameter

- *threshold* Offset threshold value in nanoseconds. Values range from 0 to 1000000000.

#### Example

- This command sets an offset-from-master threshold value of 500 nanoseconds.

```
switch(config) #ptp monitor threshold offset-from-master 500  
switch(config) #
```

## 5.18.12 ptp monitor threshold skew

PTP skew is the clock frequency difference between master and slave. The `ptp monitor threshold skew` command configures the value of the skew-threshold percentage. A Syslog message is generated if the value of the most recently calculated skew is not in the range  $(1/(1+threshold), 1*(1+threshold))$ .

The `no ptp monitor threshold skew` and `default ptp monitor threshold skew` commands clear the threshold value and prevent further Syslog messages from being generated for this parameter.

### Command Mode

Global Configuration

### Command Syntax

```
ptp monitor threshold skew threshold
```

```
no ptp monitor threshold skew
```

```
default ptp monitor threshold skew
```

### Parameters

- *threshold* skew percentage threshold represented as a double precision (16 digit) real number ranging from 0 (0%) to 10 (1000%).

### Example

- This command sets a skew threshold value of 5 (500%).

```
switch(config)#ptp monitor threshold skew 5
switch(config)#
```

---

### 5.18.13 ptp monitor

The `ptp monitor` command enables and disables PTP monitoring on the switch. When PTP monitoring is enabled, the switch records PTP status and configuration information (which can be viewed using the `show ptp monitor` command) and generates Syslog messages for metrics whose threshold values have been configured. PTP monitoring is enabled by default.

The `no ptp monitor` command disables the PTP monitoring and clears all the recorded data from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ptp monitor
```

```
no ptp monitor
```

#### Related Commands

- `ptp monitor threshold mean-path-delay`
- `ptp monitor threshold offset-from-master`
- `ptp monitor threshold skew`
- `show ptp monitor`

#### Example

- This command disables ptp monitor PTP monitoring on the switch and clears all the recorded data.

```
switch(config)#ptp monitor  
switch(config)#
```

### 5.18.14 ptp pdelay-neighbor-threshold

The `ptp pdelay-neighbor-threshold` command configures the propagation delay threshold above which the switch will consider the neighbor connected to this port to be incapable of participating in generalized Precision Time Protocol (gPTP).

The `no ptp pdelay-neighbor-threshold` and `default ptp pdelay-neighbor-threshold` commands restore the threshold to 100000 nanoseconds by removing the corresponding `ptp pdelay-neighbor-threshold` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
ptp pdelay-neighbor-threshold link_prop
```

```
no ptp pdelay-neighbor-threshold
```

```
default ptp pdelay-neighbor-threshold
```

#### Parameters

- *link\_prop* Threshold in nanoseconds. Value ranges from 0 to 10000000000 (ten billion). Default is 100000.

#### Examples

- These commands set the link propagation delay threshold on Ethernet interface 5 to 200000 nanoseconds.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#ptp pdelay-neighbor-threshold 200000
switch(config-if-Et5)#
```

- These commands restore the link propagation delay threshold on Ethernet interface 5 to its default value of 100000 nanoseconds.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)# no ptp pdelay-neighbor-threshold
switch(config-if-Et5)#
```

---

### 5.18.15 ptp pdelay-req interval

The `ptp pdelay-req interval` command configures the interval between Precision Time Protocol peer delay-request messages. The `no ptp pdelay-req interval` command removes the configuration.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
ptp pdelay-req interval log_interval
```

```
no ptp pdelay-req interval
```

```
default ptp pdelay-req interval
```

#### Parameters

- *log\_interval* The log interval in seconds (base 2 log (seconds)). Value ranges from 0 to 5.

#### Examples

- This command shows how to configure the interval allowed between PTP peer delay request messages on interface Ethernet 5.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)# ptp pdelay-request interval 3  
switch(config-if-Et5)#
```

- This command removes the configure the interval allowed between PTP peer delay request messages on interface Ethernet 5.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#no ptp pdelay-request interval  
switch(config-if-Et5)#
```

## 5.18.16 ptp priority1

The `ptp priority1` command configures the priority 1 value for advertising the switches PTP clock. Priority 1 is the most significant of the six factors used by devices in the selection of a master clock. Lower values indicate higher priority.

The `no ptp priority1` and `default ptp priority1` commands restore the priority 1 default setting of 128.

### Command Mode

Global Configuration

### Command Syntax

```
ptp priority1 priority_rate
```

```
no ptp priority1
```

```
default ptp priority1
```

### Parameters

- *priority\_rate* Value ranges from 0 to 255. Default is 128.

### Examples

- This command sets the priority 1 level for the switches PTP clock to 120.

```
switch(config)#ptp priority1 120
switch(config)#
```

- This command restores the default priority 1 level of 128.

```
switch(config)#no ptp priority1
switch(config)#
```

---

## 5.18.17 ptp priority2

The `ptp priority2` command sets the priority 2 value for the clock. The range is from 0 to 255. Priority 2 is the fifth most significant of the six factors used by devices in the selection of a master clock. Lower values indicate higher priority.

The `no ptp priority2` and `default ptp priority2` commands restore the priority 2 default setting of 128.

### Command Mode

Global Configuration

### Command Syntax

```
ptp priority2 priority_rate
```

```
no ptp priority2
```

```
default ptp priority2
```

### Parameters

- *priority\_rate* Specifies the priority 2 level for the PTP clock. Value ranges from 0 to 255; default value is 128.

### Examples

- This command sets the priority 2 level for the switches PTP clock to 120.

```
switch(config)#ptp priority2 120  
switch(config)#
```

- This command restores the default priority 2 level of 128.

```
switch(config)#no ptp priority2  
switch(config)#
```

## 5.18.18 ptp role

The `ptp role` command configures a port to operate either in the master mode or the dynamic mode when it is executed in the interface configuration mode.

The `no ptp role` command removes the master or dynamic mode if it was previously configured on an interface.

### Command Mode

Interface-Ethernet Configuration

### Command Syntax

```
ptp role [dynamic | master]
```

```
no ptp role
```

```
default ptp role
```

### Related Commands

- [ptp enable](#)
- [ptp enable](#)
- [show ptp interface](#)

### Parameters

- `dynamic` the dynamic mode.
- `master` the master clock mode that has the most precise time.

### Examples

- This command configures a port to operate in the master mode for Ethernet interface 1.

```
switch(config)#interface ethernet 1  
switch(config-if-Et1)#ptp role master
```

- This command configures a port to operate in the dynamic mode for Ethernet interface 1.

```
switch(config)#interface ethernet 1  
switch(config-if-Et1)#ptp role dynamic
```

---

## 5.18.19 ptp source ip

The `ptp source ip` command configures the source IP address for all PTP packets. The IP address can be in IPv4 format. The `no ptp source ip` command removes this configuration.

### Command Mode

Global Configuration

### Command Syntax

```
ptp source ip ipv4_addr
```

```
no ptp source ip
```

```
default ptp source ip
```

### Parameters

- *ipv4\_addr* IPv4 address

### Examples

- This command configures the source IP address **10.0.2.1** for all PTP packets.

```
switch(config)#ptp source ip 10.0.2.1  
switch(config)#
```

- This command removes the source IP address **10.0.2.1** for all PTP packets.

```
switch(config)#no ptp source ip  
switch(config)#
```

## 5.18.20 ptp sync timeout

A PTP synchronization timeout occurs if a sync message is not received for a specified period of time, calculated as a multiple of the PTP sync-message interval. The `ptp sync timeout` command configures the sync timeout multiplier. The range is 2 to 255, with a default of 20 (20 times the sync interval). To configure the sync interval, use the `ptp sync-message interval` command.

The `no ptp sync timeout` and `default ptp sync timeout` commands restore the PTP sync timeout multiplier to its default value of 20.

### Command Mode

Interface-Ethernet Configuration

### Command Syntax

```
ptp sync timeout interval_multiplier
```

```
no ptp sync timeout
```

```
default ptp sync timeout
```

### Parameters

- *interval\_multiplier* The number of sync intervals that must pass without the configuration mode interface receiving a PTP sync message before a timeout occurs. Value ranges from 2 to 255. Default value is 20.

### Example

- These commands configure the sync timeout on Ethernet interface 5 to ten times the configured sync interval.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#ptp sync timeout 10
switch(config-if-Et5)#
```

---

## 5.18.21 ptp sync-message interval

The `ptp sync-message interval` command configures the time for sending synchronization messages by specifying its log2 value. Default values and ranges depend on the PTP mode, which is set using the `ptp mode` command.

The `no ptp sync-message interval` and `default ptp sync-message interval` commands restore the sync interval to its default (1 second in **boundary** mode, 1/8 second in **gptp** mode) by removing the corresponding `ptp sync-message interval` command from *running-config*.

### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

### Command Syntax

```
ptp sync-message interval log_interval
```

```
no ptp sync-message interval
```

```
default ptp sync-message interval
```

### Parameters

- *log\_interval* The interval between PTP synchronization messages sent from the master to the slave (base 2 log(seconds)). Values vary according to PTP mode: in **boundary** mode, the range is from -7 (1/128 second) to 3 (8 seconds) and the default value is 0 (1 second). In **gptp** mode, the range is from -3 (1/8 second) to 17 (131072 seconds, approximately 36 hours) with a default of -3.

### Examples

- These commands set the interval for PTP synchronization messages on Ethernet interface 5 to 3 (8 seconds).

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#ptp sync-message interval 3
switch(config-if-Et5)#
```

- In **boundary** mode, these commands restore the interval for PTP synchronization messages on Ethernet interface 5 to its default of 0 (1 second).

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no ptp sync-message interval
switch(config-if-Et5)#
```

## 5.18.22 ptp transport

The `ptp transport` command configures the PTP transport type for a specific interface. Any values set in interface PTP configuration mode override the settings in the PTP configuration profile associated with the interface. The `no ptp transport` command removes the setting from the *running-config*.

### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

### Command Syntax

```
ptp transport TRANSPORT_TYPE
```

```
no ptp transport
```

```
default ptp transport
```

### Parameters

- `TRANSPORT_TYPE` The transport mode in boundary clock mode. Options include:
  - `ipv4` The IPv4 address used as the transport type on the interface.
  - `layer2` The Layer 2 protocol used as the transport type on the interface.

### Examples

- This command overrides the transport type in the profile and sets it to be IPv4 for the interface.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#ptp transport ipv4  
switch(config-if-Et5)#
```

- This command removes the interval for PTP synchronization messages on interface Ethernet 5.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#no ptp transport  
switch(config-if-Et5)#
```

---

### 5.18.23 ptp ttl

The `ptp ttl` command configures the Time To Live (TTL) value of the PTP packets. The `no ptp ttl` resets the TTL value to the default value of 1 hop by removing the `ptp ttl` command from the *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ptp ttl hop_count
```

```
no ptp ttl
```

```
default ptp ttl
```

#### Parameters

- *hop\_count* The TTL value measured in hops. Value ranges from 1 to 255, default is 1.

#### Example

- This command sets the time to live of the PTP packets to 60 hops.

```
switch(config)#ptp ttl 60  
switch(config)#
```

- This command resets the time to live of the PTP packets to the default value of 1 hop.

```
switch(config)#no ptp ttl  
switch(config)#
```

## 5.18.24 show ptp foreign-master-record

The `show ptp foreign-master-record` command displays information about foreign masters (PTP sources not designated as the switch's master from which the switch has received sync packets).

### Command Mode

EXEC

### Command Syntax

```
show ptp foreign-master-record
```

### Examples

- This command displays information about PTP foreign masters.

```
switch#show ptp foreign-master-record
No Foreign Master Records
switch#
```

---

## 5.18.25 show ptp interface counters

The `show ptp interface counters` command displays PTP interface counters for all interfaces.

### Command Mode

EXEC

### Command Syntax

```
show ptp [INTERFACE_NAME] counters
```

### Parameters

- `INTERFACE_NAME` Interface type and numbers. Options include:
  - `<no parameter>` Display information for all interfaces.
  - **ethernet** `e_range` Ethernet interface range specified by `e_range`.
  - **loopback** `l_range` Loopback interface specified by `l_range`.
  - **management** `m_range` Management interface range specified by `m_range`.
  - **port-channel** `p_range` Port-Channel Interface range specified by `p_range`.
  - **vlan** `v_range` VLAN interface range specified by `v_range`.
  - **vxlan** `vx_range` VXLAN interface range specified by `vx_range`.

Valid range formats include number, number range, or comma-delimited list of numbers and ranges.

### Examples

- This command displays the PTP interface counters.

```
switch#show ptp interface ethernet 5 counters
Interface Ethernet5
Announce messages sent: 0
Announce messages received: 0
Sync messages sent: 0
Sync messages received: 0
Follow up messages sent: 0
Follow up messages received: 0
Delay request messages sent: 0
Delay request messages received: 0
Delay response messages sent: 0
Delay response messages received: 0
Peer delay request messages sent: 0
Peer delay request messages received: 0
Peer delay response messages sent: 0
Peer delay response messages received: 0
Peer delay response follow up messages sent: 0
Peer delay response follow up messages received: 0
switch#
```

## 5.18.26 show ptp interface

The `show ptp interface` command displays PTP information for all the interfaces on the device.

### Command Mode

EXEC

### Command Syntax

```
show ptp [INTERFACE_NAME][STATUS_FILTER]
```

### Parameters

- **INTERFACE\_NAME** Interface type and numbers. Options include:
  - `<no parameter>` Display information for all interfaces.
  - **ethernet** *e\_range* Ethernet interface range specified by *e\_range*.
  - **loopback** *l\_range* Loopback interface specified by *l\_range*.
  - **management** *m\_range* Management interface range specified by *m\_range*.
  - **port-channel** *p\_range* Port-Channel Interface range specified by *p\_range*.
  - **vlan** *v\_range* VLAN interface range specified by *v\_range*.

Valid range formats include number, number range, or comma-delimited list of numbers and ranges.

- **STATUS\_FILTER** Filters interfaces by their configuration status. Options include:
  - `<no parameter>` all interfaces.
  - **enabled** PTP configured interfaces.

### Examples

This command displays PTP information for all the interfaces on the device.

```
switch#show ptp interface
Interface Ethernet1
PTP: Disabled
Port state: Disabled
Sync interval: 1.0 seconds
Announce interval: 2.0 seconds
Announce interval timeout multiplier: 3
Delay mechanism: end to end
Delay request message interval: 32.0 seconds
Transport mode: ipv4

Interface Ethernet5
PTP: Disabled
Port state: Disabled
Sync interval: 8.0 seconds
Announce interval: 2.0 seconds
Announce interval timeout multiplier: 5
Delay mechanism: peer to peer
Peer delay request message interval: 8.0 seconds
Peer Mean Path Delay: 0
Transport mode: ipv4

switch#
```

---

## 5.18.27 show ptp local-clock

The `show ptp local-clock` command displays the Precision Time Protocol (PTP) clock information.

### Command Mode

EXEC

### Command Syntax

```
show ptp local-clock
```

### Example

- This command shows how to display the PTP local clock and offset.

```
switch#show ptp local-clock
PTP Mode: Boundary Clock
Clock Identity: 0x00:1c:73:ff:ff:1e:83:24
Clock Domain: 1
Number of PTP ports: 24
Priority1: 128
Priority2: 128
Clock Quality:
  Class: 248
  Accuracy: 0x30
  OffsetScaledLogVariance: 0xffff
Offset From Master: 0
Mean Path Delay: 0
Steps Removed: 0
switch#
```

## 5.18.28 show ptp masters

The `show ptp masters` command displays information about the switches PTP master and grand master clocks.

### Command Mode

Privileged EXEC

### Command Syntax

```
show ptp masters
```

### Examples

- This command displays information about the switches PTP master and grand master clocks.

```
switch#show ptp masters
Parent Clock:
Parent Clock Identity: 0x00:1c:73:ff:ff:00:72:40
Parent Port Number: 0
Parent IP Address: N/A
Observed Parent Offset (log variance): N/A
Observed Parent Clock Phase Change Rate: N/A

Grandmaster Clock:
Grandmaster Clock Identity: 0x00:1c:73:ff:ff:00:72:40
Grandmaster Clock Quality:
  Class: 248
  Accuracy: 0x30
  OffsetScaledLogVariance: 0xffff
  Priority1: 128
  Priority2: 128
switch#
```

---

## 5.18.29 show ptp monitor

The `show ptp monitor` command displays the list of up to 100 recorded entries of offset from master, mean path delay and skew values, along with current PTP mode, whether or not the feature is enabled, number of entries displayed and the configured thresholds for each metric. Entries are sorted by the system time at which the value was calculated, starting with the most recent data at the top.

### Command Mode

EXEC

### Command Syntax

`show ptp monitor`

### Example

- This command displays the information recorded by PTP monitoring.

```
Switch#show ptp monitor
PTP Mode: Boundary Clock
Ptp monitoring: enabled
Number of entries: 5
Offset from master threshold: 1500
Mean path delay threshold: not configured
Skew threshold: 0.5
InterfaceTimeOffset fromMean PathSkew
Master (ns)Delay (ns)
-----
-----
Et821:23:12.901 UTC Feb 22 20187158491.003159918
Et121:23:12.901 UTC Feb 22 201811336721.004990621
Et221:23:12.901 UTC Feb 22 201870677991.002744199
Et121:23:12.901 UTC Feb 22 201880358611.003432049
Et121:23:12.901 UTC Feb 22 201861034150.998974658
```

### 5.18.30 show ptp source ip

The `show ptp source ip` command displays the PTP source IP for the device.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show ptp source ip
```

#### Examples

- This command shows the PTP source IP to be 10.0.2.1.

```
switch#show ptp source ip
PTP source IP: 10.0.2.1
switch#
```

## 5.18.31 show ptp

The `show ptp` command displays summary Precision Time Protocol (PTP) information and PTP status of switch ports.

### Command Mode

EXEC

### Command Syntax

```
show ptp
```

### Example

- This command displays summary PTP information.

```
switch#show ptp
PTP Mode: gptp - Generalized PTP Clock
Clock Identity: 2001:0DB8:73:ff:ff:26:fd:90
Grandmaster Clock Identity: 2001:0DB8:96:ff:fe:6c:ed:02
Number of slave ports: 1
Number of master ports: 6
Slave port: Ethernet33
Mean Path Delay (nanoseconds): 718
Steps Removed: 1
Neighbor Rate Ratio: 1.00000007883
Rate Ratio: 1.00000007883
Interface StateASTime Since LastNeighborMean PathResidence

Et6 Disabled No Never 1.0 00
Et7 Master Yes 0:21:08 1.000000094200
```

## Switch Environment Control

---

The following sections describe the commands that display temperature, fan, and power supply status:

- [Environment Control Introduction](#)
- [Environment Control Overview](#)
- [Configuring and Viewing Environment Settings](#)
- [Environment Commands](#)

The switch chassis, fans, power supplies, line cards, and supervisors also provide LEDs that signal status and conditions that require attention. The Quick Start Guide for the individual switches provides information about their LEDs.

### 6.1 Environment Control Introduction

Arista Networks switching platforms are designed to work reliably in common data center environments.

To ensure their reliable operation and to monitor or diagnose the switch's health, Arista provides a set of monitoring capabilities available through the CLI or SNMP entity MIBs to monitor and diagnose potential problems with the switching platform.

### 6.2 Environment Control Overview

This section contains the following topics:

- [Temperature](#)
- [Fans](#)
- [Power](#)

#### 6.2.1 Temperature

Arista switches include internal temperature sensors. The number and location of the sensors vary with each switch model. Each sensor is assigned temperature thresholds that denote alert and critical conditions. Temperatures that exceed the threshold trigger the following:

- **Alert Threshold:** All fans run at maximum speed and a warning message is logged.
- **Critical Threshold:** The component is shut down immediately and its Status LED flashes orange.

In modular systems, cards are shut down when their temperatures exceed the critical threshold. The switch is shut down if the temperature remains above the critical threshold for three minutes.

#### 6.2.2 Fans

Arista switches include fan modules that maintain internal components at proper operating temperatures. The number and type of fans vary with switch chassis type:

- **Fixed configuration switches** contain hot-swappable independent fans. Fan models with different airflow directions are available. All fans within a switch must have the same airflow direction.
- **Modular switches** contain independent fans that circulate air from front-to-rear panel. Power supplies for modular switches also include fans that cool the power supply and supervisors.

---

The switch operates normally when one fan is not operating. Non-functioning modules should not be removed from the switch unless they are immediately replaced; adequate switch cooling requires the installation of all components, including a non-functional fan.

Two non-operational fans trigger an **insufficient fan shutdown** condition. Under normal operations, this condition initiates a switch power down procedure.

Fans are accessible from the rear panel.

### 6.2.3 Power

Arista switches contain power supplies which provide power to internal components.

- **Fixed configuration switches** contain two power supplies, providing 1+1 redundancy.
- **Modular switches** contain four power supplies, providing a minimum of 2+2 redundancy.

Power supply LED indicators are visible from the rear panel.

## 6.3 Configuring and Viewing Environment Settings

This section contain the following topics:

- [Overriding Automatic Shutdown](#)
- [Viewing Environment Status](#)
- [Locating Components on the Switch](#)

### 6.3.1 Overriding Automatic Shutdown

This section contains the following topics:

- [Overheating](#)
- [Insufficient Fans](#)
- [Fan Speed](#)

#### 6.3.1.1 Overheating

The switch can be configured to continue operating during temperature shutdown conditions. Ignoring a temperature shutdown condition is strongly discouraged because operating at high temperatures can damage the switch and void the warranty.

Temperature shutdown condition actions are specified by the [environment overheat action](#) command. The switch displays this warning when configured to ignore shutdown temperature conditions.

```
Switch(config)#environment overheat action ignore
=====
WARNING: Overriding the system shutdown behavior when the system
is overheating is unsupported and should only be done under
the direction of an Arista Networks engineer. You risk damaging
hardware by not shutting down the system in this situation, and doing
so without direction from Arista Networks can be grounds for voiding
your warranty. To re-enable the shutdown-on-overheat behavior, use
the 'environment overheat action shutdown' command.
=====
Switch(config)#
```

The **running-config** contains the **environment overheat action** command when it is set to **ignore**. When the command is not in **running-config**, the switch shuts down when an overheating condition exists.

The following *running-config* file lists the `environment overhear action` command.

```
switch#show running-config
! Command: show running-config
! device: switch (DCS-7150S-64-CL, EOS-4.13.2F)

ip route 0.0.0.0/0 10.255.255.1
!
environment overhear action ignore
!
!
end
switch#
```

### 6.3.1.2 Insufficient Fans

The switch can be configured to ignore the *insufficient fan shutdown* condition. This is strongly discouraged because continued operation without sufficient cooling may lead to a critical temperature condition that can damage the switch and void the warranty.

Insufficient-fans shutdown override is configured by the `environment insufficient-fans action` command. The switch displays this warning when configured to ignore insufficient-fan conditions.

```
switch(config)#environment insufficient-fans action ignore
=====
WARNING: Overriding the system shutdown behavior when the system
has insufficient fans inserted is unsupported and should only be done
under
the direction of an Arista Networks engineer. You risk damaging
hardware by not shutting down the system in this situation, and doing
so without direction from Arista Networks can be grounds for voiding
your warranty. To re-enable the shutdown-on-overheat behavior, use
the 'environment insufficient-fans action shutdown' command.
=====
switch(config)#
```

The *running-config* contains the `environment insufficient-fans action` command when it is set to *ignore*. When *running-config* does not contain this command, the switch shuts down when it detects an insufficient-fans condition.

### 6.3.1.3 Fan Speed

The switch can be configured to override the automatic fan speed. The switch normally controls the fan speed to maintain optimal operating temperatures. The fans can be configured to operate at a constant speed regardless of the switch temperature conditions.

Fan speed override is configured by the `environment fan-speed` command. The switch displays this warning when its control of fan speed is overridden.

```
switch(config)#environment fan-speed override 50
=====
WARNING: Overriding the system fan speed is unsupported and should only
be done under the direction of an Arista Networks engineer.
You can risk damaging hardware by setting the fan speed too low
and doing so without direction from Arista Networks can be grounds
for voiding your warranty.
To set the fan speed back to automatic mode, use the
'environment fan-speed auto' command
=====
switch(config)#
```

The *running-config* contains the `environment fan-speed override` command if it is set to override. When *running-config* does not contain this command, the switch controls the fan speed.

## 6.3.2 Viewing Environment Status

This section contains the following topics:

- [Power Status](#)
- [Temperature Status](#)
- [Fan Status](#)
- [System Status](#)

### 6.3.2.1 Power Status

The `show environment power` command displays the status of the power supplies.

#### Example

This command displays the status of the power supplies.

```
switch>show environment power
Power Input Output Output
Supply Model Capacity Current Current Power Status
-----
1 PWR-650AC 650W 0.44A 10.50A 124.0W Ok
Switch>
```

### 6.3.2.2 Temperature Status

To display internal temperature sensor status, enter `show environment temperature`.

```
switch>show environment temperature
System temperature status is: Ok

Sensor Description Temperature Alert Critical
-----
1 Front-panel temp sensor 22.000C 65C 75C
2 Fan controller 1 sensor 23.000C 75C 85C
3 Fan controller 2 sensor 28.000C 75C 85C
4 Switch chip 1 sensor 40.000C 105C 115C
5 VRM 1 temp sensor 48.000C 105C 110C
switch>
```

**System temperature status** is the first line that the command displays. **System temperature status** values indicate the following:

- **Ok:** All sensors report temperatures below the alert threshold.
- **Overheating:** At least one sensor reports a temperature above its alert threshold.
- **Critical:** At least one sensor reports a temperature above its critical threshold.
- **Unknown:** The switch is initializing.
- **Sensor Failed:** At least one sensor is not functioning.

### 6.3.2.3 Fan Status

The `show system environment cooling` command displays the cooling and fan status.

#### Example

This command displays the fan and cooling status:

```
switch>show system environment cooling
System cooling status is: Ok
Ambient temperature: 22C
Airflow: port-side-intake
Fan Tray  Status          Speed
-----
1 Ok 35%
2 Ok 35%
3 Ok 35%
4 Ok 35%
5 Ok 35%
switch>
```

#### 6.3.2.4 System Status

The `show system environment all` command lists the temperature, cooling, fan, and power supply information that the individual show environment commands display, as described in [Temperature Status](#), [Fans](#), and [Power](#).

##### Example:

This command displays the temperature, cooling, fan, and power supply status:

```
switch>show system environment all
System temperature status is: Ok

Sensor  Description          Temperature  Alert   Critical
Threshold                                     Threshold
-----
1      Front-panel temp sensor  22.750C    65C    75C
2      Fan controller 1 sensor  24.000C    75C    85C
3      Fan controller 2 sensor  29.000C    75C    85C
4      Switch chip 1 sensor    41.000C    105C   115C
5      VRM 1 temp sensor      49.000C    105C   110C

System cooling status is: Ok
Ambient temperature: 22C
Airflow: port-side-intake
Fan Tray  Status          Speed
-----
1      Ok 35%
2      Ok 35%
3      Ok 35%
4      Ok 35%
5      Ok 35%

Power
Supply  Model          Capacity  Input   Output  Output
-----
1      PWR-650AC     650W     0.44A  10.50A  124.0W  Ok
```

### 6.3.3 Locating Components on the Switch

When a component requires service, the switch administrator may use the `locator-led` command to assist a technician in finding the component. The command causes the status LED on the specified

---

component to flash, and also displays a “service requested” message on the LCD panel of modular switches or lights the blue locator light on the front of fixed switches. Use the [show locator-led](#) command to display all locator LEDs currently enabled on the switch.

- This command enables the locator LED on fan tray 3:

```
switch#locator-led fantray 3  
Enabling locator led for FanTray3  
switch#
```

- This command displays all locator LEDs enabled on the switch:

```
switch#show locator-led  
There are no locator LED enabled  
switch#
```

## 6.4 Environment Commands

### Environment Control Configuration Commands

- `environment fan-speed`
- `environment insufficient-fans action`
- `environment overheat action`
- `locator-led`

### Environment Display Commands

- `show environment power`
- `show environment temperature`
- `show locator-led`
- `show system environment all`
- `show system environment cooling`

## 6.4.1 environment fan-speed

The **environment fan-speed** command determines the method of controlling the speed of the switch fans. The switch automatically controls the fan speed by default.

The switch normally controls the fan speed to maintain optimal operating temperatures. The fans can be configured to operate at a constant speed regardless of the switch temperature conditions.

The **no environment fan-speed** and **default environment fan-speed** commands restore the default action of automatic fan-speed control by removing the **environment fan-speed override** statement from *running-config*.

### Note:

Overriding the system fan speed is unsupported and should only be done under the direction of an Arista Networks engineer. You can risk damaging hardware by setting the fan speed too low. Doing so without direction from Arista Networks can be grounds for voiding your warranty.

### Command Mode

Global Configuration

### Command Syntax

```
environment fan-speed ACTION
```

```
no environment fan-speed
```

```
default environment fan-speed
```

### Parameters

- ACTION Fan speed control method. Valid settings include:
  - **auto** Fan speed is controlled by the switch.

This option restores the default setting by removing the **environment fan-speed override** command from *running-config*.

- **override percent** Fan speed is set to the specified percentage of the maximum. Valid *percent* settings range from 30 to 100.

### Examples:

- This command overrides the automatic fan speed control and configures the fans to operate at 50% of maximum speed.

```
switch(config)#environment fan-speed override 50
=====
WARNING: Overriding the system fan speed is unsupported and
should only
be done under the direction of an Arista Networks engineer.
You can risk damaging hardware by setting the fan speed too
low
and doing so without direction from Arista Networks can be
grounds
for voiding your warranty.
To set the fan speed back to automatic mode, use the
'environment fan-speed auto' command
=====
switch(config)#
```

- This command restores control of the fan speed to the switch.

```
switch(config)#environment fan-speed auto  
switch(config)#
```

## 6.4.2 environment insufficient-fans action

The `environment insufficient-fans` command controls the switch response to the insufficient fan condition. By default, the switch initiates a shutdown procedure when it senses insufficient fans.

The switch operates normally when one fan is not operating. Non-functioning modules should not be removed from the switch unless they are immediately replaced; adequate switch cooling requires the installation of all components, including a non-functional fan.

Two non-operational fans trigger an *insufficient fan shutdown* condition. This condition normally initiates a power down procedure.

The `no environment insufficient-fans` and `default environment insufficient-fans` commands restore the default shutdown response to the insufficient-fans condition by removing the `environment insufficient-fans action ignore` statement from *running-config*.

### Note:

Overriding the system shutdown behavior when the system has insufficient fans inserted is unsupported and should only be done under the direction of an Arista Networks engineer. You risk damaging hardware by not shutting down the system in this situation, and doing so without direction from Arista Networks can be grounds for voiding your warranty.

### Command Mode

Global Configuration

### Command Syntax

```
environment insufficient-fans action REMEDY
```

```
no environment insufficient-fans action
```

```
default environment insufficient-fans action
```

### Parameters

- **REMEDY** Configures action when switch senses an insufficient fan condition. Settings include:
  - **ignore** Switch continues operating when insufficient fans are operating.
  - **shutdown** Switch shuts power down when insufficient fans are operating.
  - The **shutdown** parameter restores default behavior by removing the `environment insufficient-fans` command from *running-config*.

### Examples:

- This command configures the switch to continue operating after it senses insufficient fan condition.

```
switch(config)#environment insufficient-fans action ignore
=====
=====
WARNING: Overriding the system shutdown behavior when the
system
has insufficient fans inserted is unsupported and should only
be done under
the direction of an Arista Networks engineer. You risk
damaging
hardware by not shutting down the system in this situation,
and doing
so without direction from Arista Networks can be grounds for
voiding
your warranty. To re-enable the shutdown-on-overheat behavior,
use
```

```
the 'environment insufficient-fans action shutdown' command.  
=====
```

- This command configures the switch to shut down when it senses an insufficient fan condition.

```
switch(config)#environment insufficient-fans action shutdown  
switch(config)#
```

### 6.4.3 environment overheat action

The `environment overheat` command controls the switch response to an overheating condition. By default, the switch shuts down when it senses an overheating condition.

#### Note:

Overriding the system shutdown behavior when the system is overheating is unsupported and should only be done under the direction of an Arista Networks engineer. You risk damaging hardware by not shutting down the system in this situation, and doing so without direction from Arista Networks can be grounds for voiding your warranty.

Arista switches include internal temperature sensors. The number and location of the sensors vary with each switch model. Each sensor is assigned temperature thresholds that denote alert and critical conditions. Temperatures that exceed the threshold trigger the following:

- **Alert Threshold:** All fans run at maximum speed and a warning message is logged.
- **Critical Threshold:** The component is shut down immediately and its Status LED flashes orange.

In modular systems, cards are shut down when their temperatures exceed the critical threshold. The switch normally shuts down if the temperature remains above the critical threshold for three minutes.

The `no environment overheat action` and `default environment overheat action` commands restore the default shutdown response to the environment overheating condition by removing the `environment overheat action ignore` statement from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
environment overheat action REMEDY
```

```
no environment overheat action
```

```
default environment overheat action
```

#### Parameters

- **REMEDY** Reaction to an overheating condition. Default value is **shutdown**.
  - **shutdown** Switch shuts power down by an overheating condition.
  - **ignore** Switch continues operating during an overheating condition.

#### Examples:

- This command configures the switch to continue operating after it senses an overheating condition.

```
switch(config)#environment overheat action ignore
=====
=====
WARNING: Overriding the system shutdown behavior when the
system
is overheating is unsupported and should only be done under
the direction of an Arista Networks engineer. You risk
damaging
hardware by not shutting down the system in this situation,
and doing
so without direction from Arista Networks can be grounds for
voiding
your warranty. To re-enable the shutdown-on-overheat behavior,
use
```

```
the 'environment overheat action shutdown' command.
```

```
=====
switch(config)#
```

- This command configures the switch to shut down when it senses an overheat condition.

```
switch(config)#environment overheat action shutdown
switch(config)#
```

## 6.4.4 locator-led

When a component requires service, the `locator-led` command activates a locator to assist a technician in finding the component. The command causes the status LED on the specified component to flash, and also displays a “service requested” message on the LCD panel of modular switches or lights the blue locator light on the front of fixed switches. The available locators vary by platform; to see a list of the locator LEDs available on the switch, use the `locator-led ?` command. To disable the locator LED, use the `no locator-led` command.

### Command Mode

Privileged EXEC

### Command Syntax

```
locator-led {fantray tray_num | interface interface | module module_num | powersupply  
supply_num}
```

```
no locator-led {fantray tray_num | interface interface | module module_num | powersupply  
supply_num}
```

### Parameters

- **fantray *tray\_num*** Activates locator on specified fan tray.
- **interface *interface*** Activates locator on specified interface.
- **module *module\_num*** Activates locator on specified module.
- **powersupply *supply\_num*** Activates locator on specified power supply.

### Examples:

- This command enables the locator LED on fan tray 3.

```
switch#locator-led fantray 3  
Enabling locator led for FanTray3  
switch#
```

- This command disables the locator LED on fan tray 3.

```
switch#no locator-led fantray 3  
Disabling locator led for FanTray3  
switch#
```

- This command displays the locator LEDs available on the switch.

```
switch#locator-led ?  
fantray      Fan tray LED  
interface    Interface LED  
module       Module LED  
powersupply  Power supply LED  
switch#
```

## 6.4.5 show environment power

The `show environment power` command displays the status of all power supplies in the switch.

### Command Mode

EXEC

### Command Syntax

```
show environment power [ INFO_LEVEL ]
```

### Parameters

- **INFO\_LEVEL** Specifies level of detail that the command displays. Options include:
  - `<no parameter>` Displays current and power levels for each supply.
  - **detail** Also includes status codes that can report error conditions.

### Example:

This command displays the status of power supplies on the switch.

```
switch>show environment power
Power
Supply  Model          Capacity  Input   Output   Output   Status
-----  -
1       PWR-760AC      760W     0.81A   11.00A   132.8W   Ok
2       PWR-760AC      760W     0.00A   0.00A    0.0W AC  Loss
switch>
```

## 6.4.6 show environment temperature

The `show environment temperature` command displays the operating temperature of all sensors on the switch.

### Command Mode

EXEC

### Command Syntax

```
show environment temperature [MODULE_NAME] [INFO_LEVEL]
```

### Parameters

- **MODULE\_NAME** Specifies modules for which data is displayed. This parameter is only available on modular switches. Options include:
  - **<no parameter>** All modules (identical to **all** option).
  - **fabric fab\_num** Specified fabric module. Number range varies with switch model.
  - **linecard line\_num** Line card module. Number range varies with switch model.
  - **supervisor super\_num** Supervisor module. Number range varies with switch model.
  - **mod\_num** Supervisor (1 to 2) or line card (3 to 18) module.
  - **all** All modules.
- **INFO\_LEVEL** Specifies level of detail that the command displays. Options include:
  - **<no parameter>** Displays table that lists the temperature and thresholds of each sensor.
  - **detail** Displays data block for each sensor listing the current temperature and historic data.

### Display Values

- **System temperature status** is the first line that the command displays. Values report the following:
  - **Ok** All sensors report temperatures below the alert threshold.
  - **Overheating** At least one sensor reports a temperature above its alert threshold.
  - **Critical** At least one sensor reports a temperature above its critical threshold.
  - **Unknown** The switch is initializing.
  - **Sensor Failed** At least one sensor is not functioning.

### Examples:

- This command displays a table that lists the temperature measured by each sensor.

```
switch>show environment temperature
System temperature status is: Ok

Critical
Sensor Description          Temperature  Alert
Threshold                  Threshold
-----
1      Front-panel temp sensor  30.750C    65C      75C
2      Fan controller 1 sensor   32.000C    75C      85C
3      Fan controller 2 sensor   38.000C    75C      85C
4      Switch chip 1 sensor      50.000C    105C
115C
5      VRM 1 temp sensor        60.000C    105C
110C
switch>
```

- This command lists the temperature detected by each sensor, and includes the number of previous alerts, the time of the last alert, and the time of the last temperature change.

```
switch>show environment temperature detail
TempSensor1 - Front-panel temp sensor
  Temperature      Current State  Count  Last Change
  Max Temperature  30.750C
  23:35:24 ago     35.000C      4 days,
  Alert            False         0      never

TempSensor2 - Fan controller 1 sensor
  Temperature      Current State  Count  Last Change
  Max Temperature  32.000C
  23:32:46 ago     36.000C      4 days,
  Alert            False         0      never

TempSensor3 - Fan controller 2 sensor
  Temperature      Current State  Count  Last Change
  Max Temperature  38.000C
  23:37:56 ago     41.000C      4 days,
  Alert            False         0      never

TempSensor4 - Switch chip 1 sensor
  Temperature      Current State  Count  Last Change
  Max Temperature  51.000C
  23:35:16 ago     53.000C      4 days,
  Alert            False         0      never

TempSensor5 - VRM 1 temp sensor
  Change           Current State  Count  Last
  Temperature      60.000C
  Max Temperature  62.000C
  22:54:51 ago
  Alert            False         0      never

switch>
```

---

## 6.4.7 show locator-led

The `show locator-led` command displays the status of locator LEDs enabled on the switch.

### Command Mode

Privileged EXEC

### Command Syntax

```
show locator-led
```

#### Example:

This command displays all locator LEDs enabled on the switch.

```
switch#show locator-led
There are no locator LED enabled
switch#
```

## 6.4.8 show system environment all

The `show system environment all` command displays temperature, cooling, and power supply status.

### Command Mode

EXEC

### Command Syntax

```
show system environment all
```

#### Example:

This command displays the switch's temperature, cooling, and power supply status

```
switch>show system environment all
System temperature status is: Ok
```

Sensor	Description	Temperature	Alert Threshold	Critical
1	Front-panel temp sensor	31.000C	65C	75C
2	Fan controller 1 sensor	32.000C	75C	85C
3	Fan controller 2 sensor	38.000C	75C	85C
4	Switch chip 1 sensor	50.000C	105C	115C
5	VRM 1 temp sensor	60.000C	105C	110C

```
System cooling status is: Ok
Ambient temperature: 31C
Airflow: port-side-intake
```

Fan Tray	Status	Speed
1	Ok	52%
2	Ok	52%
3	Ok	52%
4	Ok	52%
5	Ok	52%

```
Power
```

Supply	Model	Capacity	Input Current	Output Current	Output Power	Status
1	PWR-760AC	760W	0.81A	11.00A	132.6W	Ok
2	PWR-760AC	760W	0.00A	0.00A	0.0W	AC Loss

```
switch>
```

## 6.4.9 show system environment cooling

The `show system environment cooling` command displays fan status, air flow direction, and ambient temperature on the switch.

### Command Mode

EXEC

### Command Syntax

```
show system environment cooling [ INFO_LEVEL ]
```

### Parameters

- **INFO\_LEVEL** Specifies level of detail that the command displays. Options include:
  - *<no parameter>* Displays the fan status, air flow direction, and ambient switch temperature.
  - **detail** Also displays actual and configured fan speed of each fan.

### Display Values

- **System cooling status:**
  - **Ok** No more than one fan has failed or is not inserted.
  - **Insufficient fans** More than one fan has failed or is not inserted. This status is also displayed if fans with different airflow directions are installed. The switch shuts down if the error is not resolved.
  - **Ambient temperature** Temperature of the surrounding area.
  - **Airflow** Indicates the direction of the installed fans:
    - **port-side-intake** All fans flow air from the front (port side) to the rear of the chassis.
    - **port-side-exhaust** All fans flow air from the rear to the front (port side) of the chassis.
    - **incompatible fans** Fans with different airflow directions are inserted.
    - **Unknown** The switch is initializing.
- **Fan Tray Status table** Displays the status and operating speed of each fan. Status values indicate the following conditions:
  - **OK** The fan is operating normally.
  - **Failed** The fan is not operating normally.
  - **Unknown** The system is initializing.
  - **Not Inserted** The system is unable to detect the specified fan.
  - **Unsupported** The system detects a fan that the current software version does not support.

### Example:

This command displays the fan status, air flow direction, and ambient switch temperature.

```
switch>show system environment cooling
System cooling status is: Ok
Ambient temperature: 30C
Airflow: port-side-intake
Fan Tray  Status              Speed
-----  -
1         Ok                       51%
2         Ok                       51%
3         Ok                       51%
4         Ok                       51%
5         Ok                       51%
```

```
switch>
```

## Upgrades and Downgrades

---

This chapter describes the procedures for upgrading or downgrading the switch software.

This chapter contains these sections:

- [Upgrade/Downgrade Overview](#)
- [Accelerated Software Upgrade \(ASU\)](#)
- [Leaf Smart System Upgrade \(Leaf SSU\)](#)
- [Standard Upgrades and Downgrades](#)
- [Upgrade/Downgrade Commands](#)

### 7.1 Upgrade/Downgrade Overview

Upgrading or downgrading Arista switch software is accomplished by replacing the EOS image and reloading the switch. Depending on the switch model and the software change being made, there are different options for minimizing (or potentially eliminating) downtime and packet loss during the upgrade/downgrade.

[Accelerated Software Upgrade \(ASU\)](#) : ASU is available on the 7050SX-64, 7050SX-128, 7050Q-32, and 7050Q-32S and can be used on both leaf and spine switches. It significantly reduces reload time by streamlining and optimizing the reload procedure for upgrades, and continues sending LACP PDUs while the CPU is rebooting, keeping port channels operational during the reload. Downtime during the upgrade is reduced to 30 seconds. Note: ASU does not support software downgrades.

[Leaf Smart System Upgrade \(Leaf SSU\)](#) : SSU is available only on 7050X platforms (excluding 7050SX-72 and 7050SX-96), and can only be used on leaf switches. It includes the core functionality of ASU, plus additional elements that permit a hitless restart of several features. SSU does not support software downgrades, and is incompatible with VRRP.

[Standard Upgrades and Downgrades](#) : In those cases where an accelerated upgrade is not an option (such as software downgrades and unsupported platforms), performing a standard upgrade or downgrade using the steps described here will minimize downtime and packet loss.

**Note:** To upgrade the software on switches participating in an MLAG, see [Upgrading MLAG Peers](#).

### 7.2 Accelerated Software Upgrade (ASU)

The Accelerated Software Upgrade (ASU) process significantly decreases downtime and packet loss during a software upgrade in three ways:

- performing time-intensive tasks (including copying the EOS image) before rebooting the control plane
- forwarding packets in hardware (based on the last known state) while the control-plane is offline
- optimizing the boot process by performing only tasks essential for software upgrade

After the control plane has fully loaded, the data plane is restarted, causing approximately 30 seconds of downtime.

## 7.2.1 Upgrading the EOS image with Accelerated Software Upgrade

Using ASU to upgrade the active EOS image is a five-step process:

1. Prepare switch for upgrade ([Prepare the Switch](#)).
2. Transfer image file to the switch ([Transfer the Image File for ASU](#)). (Not required if desired file is on the switch).
3. Modify **boot-config** file to point to the desired image file ([Modify boot-config](#)).
4. Start the ASU process ([Start the ASU Process](#)).
5. Verify that switch is running the new image ([Verify](#)).

### 7.2.1.1 Prepare the Switch

Before upgrading the EOS image, ensure that backup copies of the currently running EOS version and the **running-config** file are available in case of corruption during the upgrade process. To copy the **running-config** file, use the **copy running-config** command. In this example, **running-config** is copied to a file in the flash drive on the switch.

```
switch#copy running-config flash:/cfg_06162014
Copy completed successfully.
switch#
```

Determine the size of the new EOS image. Then verify that there is enough space available on the flash drive for two copies of this image (use the **dir** command to check the bytes free figure).

```
switch#dir flash:
Directory of flash:/
-rwx   293168526   Nov  4   22:17   EOS4.11.0.swi
-rwx         36   Nov  8   10:24   boot-config
-rwx    37339     Jun 16   14:18   cfg_06162014
<-----OUTPUT OMITTED FROM EXAMPLE----->
606638080 bytes total (602841088 bytes free)
```

Ensure that the switch has a management interface configured with an IP addresses and default gateway. Refer the sections, [Assigning a Virtual IP Address to Access the Active Ethernet Management Port](#) and [Configuring a Default Route to the Gateway](#) (see [Assigning a Virtual IP Address to Access the Active Ethernet Management Port](#) and [Configuring a Default Route to the Gateway](#)), and confirm that it can be reached through the network by using the **show interfaces status** command and pinging the default gateway.

```
switch#show interfaces status
Port   Name      Status      Vlan      Duplex  Speed  Type
Et3/1  Name      notconnect  1         auto    auto   1000BASE-T

<-----OUTPUT OMITTED FROM EXAMPLE----->
Ma1/1  connected routed      unconf   unconf  Unknown

switch#ping 1.1.1.10
PING 172.22.26.1 (172.22.26.1) 72(100) bytes of data.
 80 bytes from 1.1.1.10: icmp_seq=1 ttl=64 time=0.180 ms
 80 bytes from 1.1.1.10: icmp_seq=2 ttl=64 time=0.076 ms
 80 bytes from 1.1.1.10: icmp_seq=3 ttl=64 time=0.084 ms
 80 bytes from 1.1.1.10: icmp_seq=4 ttl=64 time=0.073 ms
 80 bytes from 1.1.1.10: icmp_seq=5 ttl=64 time=0.071 ms
```

### 7.2.1.2 Transfer the Image File for ASU

The target image must be copied to the file system on the switch, typically onto the flash drive. After verifying that there is space for two copies of the image, use the CLI **copy** command to copy the image to the flash drive, then confirm that the new image file has been correctly transferred.

These command examples transfer an image file to the flash drive from various locations.

## USB Memory

### Command

```
copy usb1:/sourcefile flash:/destfile
```

### Example

```
Sch#copy usb1:/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

## FTP Server

### Command

```
copy ftp://ftp-source/sourcefile flash:/destfile
```

### Example

```
sch#copy ftp://user:password@10.0.0.3/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

## SCP

### Command

```
copy scp://scp-source/sourcefile flash:/destfile
```

### Example

```
sch#copy scp://user:password@10.1.1.8/user/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

## HTTP

### Command

```
copy http://http-source/sourcefile flash:/destfile
```

### Example

```
sch#copy http://10.0.0.10/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

Once the file has been transferred, verify that it is present in the directory, then confirm the MD5 checksum using the **verify** command. The MD5 checksum is available from the EOS download page of the Arista website.

```
switch#dir flash:
Directory of flash:/
-rwx      293168526   Nov  4   22:17   EOS4.14.2.swi
-rwx           36    Nov  8   10:24   boot-config
-rwx      37339     Jun 16   14:18   cfg_06162014
-rwx      394559902   May 30   02:57   EOS4.13.1.swi
```

```
606638080 bytes total (208281186 bytes free)
switch#53#verify /md5 flash:EOS-4.14.4.swi
verify /md5 (flash:EOS-4.14.4.swi) =c277a965d0ed48534de6647b12a86991
```

### 7.2.1.3 Modify boot-config

After transferring and confirming the desired image file, use the `boot system` command to update the *boot-config* file to point to the new EOS image.

This command changes the *boot-config* file to point to the image file located in flash memory at EOS-4.14.4.swi.

```
switch#configure terminal
switch(config)#boot system flash:/EOS-4.14.4.swi
```

Use the `show boot-config` command to verify that the *boot-config* file is correct:

```
switch(config)#show boot-config
Software image: flash:/EOS-4.14.4.swi
Console speed: (not set)
Aboot password (encrypted): $1$ap1QMbmz$DTqsFYeauuMSa7/Qxbi211
```

Save the configuration to the *startup-config* file with the `write` command.

```
switch#write
```

### 7.2.1.4 Start the ASU Process

After updating the *boot-config* file, start the ASU process using the `reload fast-boot` command to reload the switch and activate the new image. If *running-config* has not been saved, the CLI will prompt to save any modifications to the system configuration; failure to save modifications will abort the reload.

**Note:** Once the system configuration is saved, there is a significant delay before the user is prompted to confirm the reload.

```
switch#reload fast-boot
System configuration has been modified. Save? [yes/no/cancel/diff]:y
Proceed with reload? [confirm]y
Proceeding with reload
```

### 7.2.1.5 Verify

After the switch finishes reloading, log into the switch and use the `show version` command to confirm the correct image is loaded. The *Software image version* line displays the version of the active image file.

```
switch#show version
Arista DCS-7150S-64-CL-F
Hardware version: 01.01
Serial number: JPE13120819
System MAC address: 001c.7326.fd0c

Software image version: 4.14.4F
Architecture: i386
Internal build version: 4.14.4F-1649184.4144F.2
Internal build ID: eeb3c212-b4bd-4c19-ba34-1b0aa36e43f1
```

```

Uptime:                14 hours and 48 minutes
Total memory:          4017088 kB
Free memory:           1569760 kB

switch>

```

## 7.3 Leaf Smart System Upgrade (Leaf SSU)

The Smart System Upgrade (SSU) process includes the core functionality of Accelerated Software Upgrade, plus additional optimizations that permit a hitless restart of several features. SSU leverages protocols capable of graceful restart to minimize traffic loss during upgrade. For protocols not capable of graceful restart, SSU generates control plane messages and buffers them in hardware to be slowly released when the control plane is offline. Additionally, under SSU, the forwarding ASIC does not get reset and ports do not flap.

Features capable of hitless restart under SSU include:

- QinQ
- 802.3ad Link Aggregation/LACP
- 802.3x flow control
- BGP (BGP graceful restart must be enabled: see [Configuring BGP](#))
- MP-BGP (BGP graceful restart must be enabled: see [Configuring BGP](#))
- 128-way Equal Cost Multipath Routing (ECMP)
- VRF
- route maps
- L2 MTU
- QoS

**Note:** SSU is not compatible with VRRP. If VRRP is configured on the switch, another upgrade method must be used.

### 7.3.1 Upgrading the EOS image with Smart System Upgrade

Using SSU to upgrade the active EOS image is a five-step process:

1. Prepare switch for upgrade ( [Prepare the Switch for SSU](#)).
2. Transfer image file to the switch ([Transfer the Image File for SSU](#)). (Not required if desired file is on the switch).
3. Modify **boot-config** file to point to the desired image file ([Modify boot-config](#)).
4. Start the SSU process ([Start the SSU Process](#)).
5. Verify that the upgrade was successful ([Verify Success of the Upgrade](#)).

#### 7.3.1.1 Prepare the Switch for SSU

To prepare the switch for SSU, take the following steps:

- [Backing Up Critical Software](#)
- [Making Room on the Flash Drive](#)
- [Verifying Connectivity](#)
- [Verifying Configuration](#)
- [Configuring BGP](#)

#### Backing Up Critical Software

Before upgrading the EOS image, ensure that copies of the currently running EOS version and the **running-config** file are available in case of corruption during the upgrade process. To copy the

**running-config** file, use the `copy running-config` command. In this example, **running-config** is copied to a file in the flash drive on the switch.

```
switch#copy running-config flash:/cfg_06162014
Copy completed successfully.
switch#
```

### Making Room on the Flash Drive

Determine the size of the new EOS image. Then verify that there is enough space available on the flash drive for two copies of this image, plus a recommended 240MB (if available) for diagnostic information in case of a fatal error. Use the `dir` command to check the “bytes free” figure.

```
switch#dir flash:
Directory of flash:/
-rwx   293168526   Nov 4   22:17   EOS4.11.0.swi
-rwx         36   Nov 8   10:24   boot-config
-rwx   37339   Jun 16   14:18   cfg_06162014
606638080 bytes total (602841088 bytes free)
```

### Verifying Connectivity

Ensure that the switch has a management interface configured with an IP addresses and default gateway. Refer the sections, [Assigning a Virtual IP Address to Access the Active Ethernet Management Port](#) and [Configuring a Default Route to the Gateway](#) (see [Assigning a Virtual IP Address to Access the Active Ethernet Management Port](#) and [Configuring a Default Route to the Gateway](#)), and confirm that it can be reached through the network by using the command and pinging the default gateway.

```
switch#show interfaces status
Port    Name      Status      Vlan      Duplex  Speed  Type
Et3/1   notconnect  1          auto     auto    1000BASE-T

<-----OUTPUT OMITTED FROM EXAMPLE----->
Ma1/1   connected  routed     unconf   unconf  Unknown

switch#ping 1.1.1.10
PING 172.22.26.1 (172.22.26.1) 72(100) bytes of data.
80 bytes from 1.1.1.10: icmp_seq=1 ttl=64 time=0.180 ms
80 bytes from 1.1.1.10: icmp_seq=2 ttl=64 time=0.076 ms
80 bytes from 1.1.1.10: icmp_seq=3 ttl=64 time=0.084 ms
80 bytes from 1.1.1.10: icmp_seq=4 ttl=64 time=0.073 ms
80 bytes from 1.1.1.10: icmp_seq=5 ttl=64 time=0.071 ms
```

### Verifying Configuration

Verify that the switch configuration is valid for SSU by using the `show reload hitless` command. If parts of the configuration are blocking execution of SSU, an error message will be displayed explaining what they are. For SSU to proceed, the configuration conflicts must be corrected before issuing the `reload hitless` command.

```
switch#show reload hitless
switch#'reload hitless' cannot proceed due to the following:
Spanning-tree portfast is not enabled for one or more ports
Spanning-tree BPDU guard is not enabled for one or more ports
switch#
```

## Configuring BGP

For hitless restart of BGP and MP-BGP, BGP graceful restart must first be enabled using the **graceful-restart** command. The default restart time value (300 seconds) is appropriate for most configurations.

The BGP configuration mode in which the **graceful-restart** command is issued determines which BGP connections will restart gracefully.

- For all BGP connections, use the **graceful-restart** command in BGP configuration mode:

```
switch#config
switch(config)#router bgp 64496
switch(config-router-bgp)#graceful-restart
switch(config-router-bgp)#
```

- For all BGP connections in a specific VRF, use the **graceful-restart** command in BGP VRF configuration mode:

```
switch#config
switch(config)#router bgp 64496
switch(config-router-bgp)#vrf purple
switch(config-router-bgp-vrf-purple)#graceful-restart
switch(config-router-bgp-vrf-purple)#exit
switch(config-router-bgp)#
```

- For all BGP connections in a specific BGP address family, use the **graceful-restart** command in BGP address-family configuration mode:

```
switch#config
switch(config)#router bgp 64496
switch(config-router-bgp)#address-family ipv6
switch(config-router-bgp-af)#graceful-restart
switch(config-router-bgp-af)#exit
switch(config-router-bgp)#
```

BGP graceful restart can also be configured for a specific interface.

### 7.3.1.2 Transfer the Image File for SSU

The target image must be copied to the file system on the switch, typically onto the flash drive. After verifying that there is space for two copies of the image plus an optional 240MB for diagnostic information, use the **copy** command to copy the image to the flash drive, then confirm that the new image file has been correctly transferred.

These command examples transfer an image file to the flash drive from various locations.

#### USB Memory

##### Command

```
copy usb1:/sourcefile flash:/destfile
```

##### Example

```
Sch#copy usb1:/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

---

## FTP Server

### Command

```
copy ftp://ftp-source/sourcefile flash:/destfile
```

### Example

```
sch#copy ftp://user:password@10.0.0.3/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

## SCP

### Command

```
copy scp://scp-source/sourcefile flash:/destfile
```

### Example

```
sch#copy scp://user:password@10.1.1.8/user/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

## HTTP

### Command

```
copy http://http-source/sourcefile flash:/destfile
```

### Example

```
sch#copy http://10.0.0.10/EOS-4.14.4.swi flash:/EOS-4.14.4.swi
```

Once the file has been transferred, verify that it is present in the directory, then confirm the MD5 checksum using the **verify** command. The MD5 checksum is available from the EOS download page of the Arista website.

```
switch#dir flash:
Directory of flash:/
-rwx      293168526   Nov 4    22:17    EOS4.14.2.swi
-rwx           36    Nov 8    10:24    boot-config
-rwx      37339     Jun 16    14:18    cfg_06162014
-rwx      394559902   May 30    02:57    EOS4.13.1.swi

606638080 bytes total (208281186 bytes free)
switch#53#verify /md5 flash:EOS-4.14.4.swi
verify /md5 (flash:EOS-4.14.4.swi) =c277a965d0ed48534de6647b12a86991
```

### 7.3.1.3 Modify boot-config

After transferring and confirming the desired image file, use the **boot system** command to update the **boot-config** file to point to the new EOS image.

This command changes the **boot-config** file to point to the image file located in flash memory at EOS-4.14.4.swi.

```
switch#configure terminal
switch(config)#boot system flash:/EOS-4.14.4.swi
```

Use the `show boot-config` command to verify that the *boot-config* file is correct:

```
switch(config)#show boot-config
Software image: flash:/EOS-4.14.4.swi
Console speed: (not set)
About password (encrypted): $1$ap1QMbmz$DTqsFYeauuMSa7/Qxbi211
```

Save the configuration to the *startup-config* file with the `write` command.

```
switch#write
```

#### 7.3.1.4 Start the SSU Process

After updating the *boot-config* file, verify that your configuration supports SSU (if you have not already done so) by using the `show reload hitless` command. If parts of the configuration are blocking execution of SSU, an error message will be displayed explaining what they are.

```
switch#show reload hitless
switch#'reload hitless' cannot proceed due to the following:
Spanning-tree portfast is not enabled for one or more ports
Spanning-tree BPDU guard is not enabled for one or more ports
```

Then start the SSU process using the `reload hitless` command to reload the switch and activate the new image. The CLI will identify any changes that must be made to the configuration before starting SSU, prompt to save any modifications to the system configuration, and request confirmation before reloading.

```
switch#reload hitless
System configuration has been modified. Save? [yes/no/cancel/diff]:y
Copy completed successfully.
Proceed with reload? [confirm]y
```

#### 7.3.1.5 Verify Success of the Upgrade

Before making any configuration changes to the switch after reload, verify that the SSU process is complete using the command `show boot stages log`. If the process is complete, the last message should be `Asu Hitless boot stages complete`.

```
switch#show boot stages log
Timestamp          Delta Begin Msg
2015-03-28 15:18:30 000.000000 Asu Hitless boot stages started
2015-03-28 15:18:30 000.069732 stage CriticalAgent started
2015-03-28 15:18:30 000.069811 event CriticalAgent:SuperServer
  completed
2015-03-28 15:20:20 110.224504 stage BootSanityCheck is complete
2015-03-28 15:20:20 110.225439 Asu Hitless boot stages complete
switch#
```

Completion of the SSU process may also be verified by checking the syslog for the following message:

```
LAUNCHER-6-BOOT_STATUS: 'reload hitless' reconciliation complete
```

To verify whether the SSU upgrade was successful, use the `show reload cause` command. If a fatal error occurred during the upgrade process, the switch will have completely rebooted and the fatal error will be displayed along with the directory in which diagnostic information can be found. If the SSU upgrade succeeded, it will read `Hitless reload requested by the user`.

---

## Fatal Error Display

```
switch#show reload cause
Reload Cause 1:
-----
Reload requested by the user.

Reload Time:
-----
Reload occurred at Sat Feb 28 02:34:26 2015 PST.

Recommended Action:
-----
No action necessary.

Debugging Information:
-----
None available.

Reload Cause 2:
-----
Fatal error during 'reload hitless'. (stageMgr - LinkStatusUpdate timed
out)

Reload Time:
-----
Reload occurred at Sat Feb 28 02:33:54 2015 PST.

Recommended Action:
-----
A fatal error occurred during hitless reload.
If the problem persists, contact your customer support representative.

Debugging Information:
-----
/mnt/flash/persist/fatalError-2015-02-28_023355
switch#
```

## Successful Upgrade Display

```
switch#show reload cause
Reload Cause 1:
-----
Hitless reload requested by the user.

Reload Time:
-----
Reload occurred at Wed Mar 25 14:49:04 2015 PDT.

Recommended Action:
-----
No action necessary.

Debugging Information:
-----
None available.
switch#
```

The `show version` command will confirm whether the correct image is loaded. The **Software image version** line displays the version of the active image file.

```
switch#show version
Arista DCS-7050QX-32-F
Hardware version:    02.00
Serial number:      JPE14071098
System MAC address: 001c.7355.556f

Software image version: 4.14.5F-2353054.EOS4145F
Architecture:         i386
Internal build version: 4.14.5F-2353054.EOS4145F
Internal build ID:    e8748ea7-916d-4217-878f-4bfe2adc7122

Uptime:              4 minutes
Total memory:        3981328 kB
Free memory:         1342408 kB

switch#
```

**Note:** If a fatal error occurs during the SSU process, the new EOS image will still be loaded and booted.

## 7.4 Standard Upgrades and Downgrades

Standard software upgrades and downgrades on Arista switches are accomplished by installing a different EOS image and reloading the switch. On switches with redundant supervisors, the EOS image must be installed on both supervisors. Using the procedure described below will minimize packet loss during a standard upgrade or downgrade.

These sections describe standard switch upgrade and downgrade procedures

- [Upgrading or Downgrading the EOS on a Single-Supervisor Switch](#)
- [Upgrading or Downgrading the EOS on a Dual-Supervisor Switch](#)

### 7.4.1 Upgrading or Downgrading the EOS on a Single-Supervisor Switch

Modifying the active EOS image is a five-step process:

1. Prepare switch for upgrade ( [Prepare the Switch](#)).
2. Transfer image file to the switch ( [Transfer the Image File](#)). (Not required if desired file is on the switch).
3. Modify **boot-config** file to point to the desired image file ( [Modify boot-config for Single-Supervisor switch](#)).
4. Reload switch ([Reload](#)).
5. Verify that switch is running the new image ( [Verify](#)).

#### 7.4.1.1 Prepare the Switch

Before upgrading the EOS image, ensure that backup copies of the currently running EOS version and the **running-config** file are available in case of corruption during the upgrade process. To copy the **running-config** file, use the `copy running-config` command. In this example, **running-config** is copied to a file in the flash drive on the switch.

```
switch#copy running-config flash:/cfg_06162014
Copy completed successfully.
switch#
```

Determine the size of the new EOS image. Then verify that there is enough space available on the flash drive for two copies of this image (use the `dir` command to check the bytes free figure).

```
switch#dir flash:
Directory of flash:/
-rwx 293168526 Nov 4 22:17 EOS4.11.0.swi
-rwx 36 Nov 8 10:24 boot-config
-rwx 37339 Jun 16 14:18 cfg_06162014
<-----OUTPUT OMITTED FROM EXAMPLE----->
606638080 bytes total (602841088 bytes free)
```

Ensure that the switch has a management interface configured with an IP addresses and default gateway. Refer the sections, [Assigning a Virtual IP Address to Access the Active Ethernet Management Port](#) and [Configuring a Default Route to the Gateway](#) (see [Assigning a Virtual IP Address to Access the Active Ethernet Management Port](#) and [Configuring a Default Route to the Gateway](#)), and confirm that it can be reached through the network by using the `show interfaces status` command and pinging the default gateway.

```
switch#show interfaces status
Port Name Status Vlan Duplex Speed Type
Et3/1 notconnect 1 auto auto 1000BASE-T

<-----OUTPUT OMITTED FROM EXAMPLE----->
Ma1/1 connected routed unconf unconf Unknown

switch#ping 1.1.1.10
PING 172.22.26.1 (172.22.26.1) 72(100) bytes of data.
80 bytes from 1.1.1.10: icmp_seq=1 ttl=64 time=0.180 ms
80 bytes from 1.1.1.10: icmp_seq=2 ttl=64 time=0.076 ms
80 bytes from 1.1.1.10: icmp_seq=3 ttl=64 time=0.084 ms
80 bytes from 1.1.1.10: icmp_seq=4 ttl=64 time=0.073 ms
80 bytes from 1.1.1.10: icmp_seq=5 ttl=64 time=0.071 ms
```

### 7.4.1.2 Transfer the Image File

The target image must be copied to the file system on the switch, typically onto the flash drive. After verifying that there is space for the image, use the CLI `copy` command to copy the image to the flash drive, then confirm that the new image file has been correctly transferred.

These command examples transfer an image file to the flash drive from various locations.

#### USB Memory

##### Command

```
copy usb1:/sourcefile flash:/destfile
```

##### Example

```
Sch#copy usb1:/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

#### FTP Server

##### Command

```
copy ftp:/ftp-source/sourcefile flash:/destfile
```

**Example**

```
sch#copy ftp://user:password@10.0.0.3/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

**SCP****Command**

```
copy scp://scp-source/sourcefile flash:/destfile
```

**Example**

```
sch#copy scp://user:password@10.1.1.8/user/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

**HTTP****Command**

```
copy http://http-source/sourcefile flash:/destfile
```

**Example**

```
sch#copy http://10.0.0.10/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

Once the file has been transferred, verify that it is present in the directory, then confirm the MD5 checksum using the **verify** command. The MD5 checksum is available from the EOS download page of the Arista website.

```
switch#dir flash:
Directory of flash:/
-rwx   293168526   Nov  4   22:17   EOS4.11.0.swi
-rwx         36   Nov  8   10:24   boot-config
-rwx   37339   Jun 16   14:18   cfg_06162014
-rwx   394559902   May 30   02:57   EOS-4.12.2.swi

606638080 bytes total (208281186 bytes free)
switch#53#verify /md5 flash:EOS-4.13.2.swi
verify /md5 (flash:EOS-4.13.2.swi) =c277a965d0ed48534de6647b12a86991
```

**7.4.1.3 Modify boot-config for Single-Supervisor switch**

After transferring and confirming the desired image file, use the **boot system** command to update the **boot-config** file to point to the new EOS image.

This command changes the **boot-config** file to point to the image file located in flash memory at EOS-4.12.2.swi.

```
switch#configure terminal
switch(config)#boot system flash:/EOS-4.13.2.swi
```

Use the **show boot-config** command to verify that the **boot-config** file is correct:

```
switch(config)#show boot-config
Software image: flash:/EOS-4.13.2.swi
Console speed: (not set)
Aboot password (encrypted): $1$ap1QMbmz$DTqsFYeauuMSa7/Qxbi211
```

Save the configuration to the **startup-config** file with the **write** command.

```
switch#write
```

#### 7.4.1.4 Reload

After updating the **boot-config** file, reset the switch to activate the new image. The **reload** command resets the switch, resulting in temporary downtime and packet loss on single supervisor switches.

When reloading from the console port, all rebooting messages are displayed on the terminal. From any port except the console, the CLI displays this text:

```
switch#reload
The system is going down for reboot NOW!
```

 **Note:** The EOS boot process makes a copy of the .swi image file in the internal flash while booting, so sufficient space for **two copies** must be present when loading the new EOS image. If the switch is reloaded without adequate space on the flash drive, it will boot to the About prompt from which you can delete files from /mnt/flash to free up additional space. Exiting About will begin the boot process again.

#### 7.4.1.5 Verify the New Image for Single-Supervisor Switch

After the switch finishes reloading, log into the switch and use the **show version** command to confirm the correct image is loaded. The **Software image version** line displays the version of the active image file.

```
switch#show version
Arista DCS-7150S-64-CL-F
Hardware version:    01.01
Serial number:      JPE13120819
System MAC address: 001c.7326.fd0c

Software image version: 4.13.2F
Architecture:         i386
Internal build version: 4.13.2F-1649184.4132F.2
Internal build ID:    eeb3c212-b4bd-4c19-ba34-1b0aa36e43f1

Uptime:              14 hours and 48 minutes
Total memory:        4017088 kB
Free memory:         1569760 kB

switch>
```

## 7.4.2 Upgrading or Downgrading the EOS on a Dual-Supervisor Switch

Modifying the active EOS image is a four-step process:

1. Prepare switch for upgrade ([Prepare the switch for Dual-Supervisor Switch](#)).
2. Transfer image file to primary supervisor ( [Transfer the Image File to the Primary Supervisor](#)). (Not required if desired file is on switch)
3. Use the **install** command to install the new EOS image and update **boot-config** ( [Install the New EOS Image](#)).
4. Verify that the switch is running the new image ( [Verify the New Image](#)).

 **Note:** Due to a change in the supervisor heartbeat timeout, booting one supervisor with a post-SSO image (version 4.10.0-SSO, 4.11.X and later) while the other supervisor is running a pre-SSO image will cause the supervisor running the pre-SSO image to reload.

This will cause a disruption as both supervisors will be inactive for a short time. To minimize downtime, upgrade the images on both supervisors and reload the entire chassis using the `install` command.

### 7.4.2.1 Prepare the switch for Dual-Supervisor Switch

To prepare the switch for an EOS upgrade, take the following steps:

- Back up essential files.
- Ensure that you are logged in to the primary supervisor.
- Ensure that the primary supervisor is reachable and that the management interfaces are configured.
- Ensure that there is enough room on both supervisors for the new image file.
- Ensure that any extensions running on the active supervisor are also available on the standby.

Before upgrading the EOS image, ensure that backup copies of the currently running EOS version and the *running-config* file are available in case of corruption during the upgrade process. To copy the *running-config* file, use the `copy running-config` command. In this example, *running-config* is copied to a file called "backup2" on the flash drive.

```
switch#copy running-config backup2
Copy completed successfully.
switch#
```

Ensure that you are logged in to the primary supervisor, not the standby. Use the `show redundancy status` command, and verify that *my state* reads "ACTIVE" and not "STANDBY."

```
switch#show redundancy status
my status = Active
peer state = STANDBY HOT
Unit = Secondary
Unit ID = 1
Redundancy Protocol (Operational) = Stateful Switchover
Redundancy Protocol (Configured) = Stateful Switchover
Communications = Up
Ready for switchover
Last switchover time = 25 days, 19:51:34 ago
Last switchover reason = Other supervisor stopped sending heartbeats
```

Ensure that the switch has a management interface configured with an IP addresses and default gateway. Refer the sections, Assigning a Virtual IP Address to Access the Active Ethernet Management Port and Configuring a Default Route to the Gateway (see [Assigning a Virtual IP Address to Access the Active Ethernet Management Port](#) and [Configuring a Default Route to the Gateway](#)), and confirm that both management interfaces are in the up state and can ping the default gateway by using the `show interfaces status` command and `ping` command.

**Note:** If the management VRF interface is used, use the virtual management interface (management 0) instead of the IP address on the physical management interface.

```
switch#show interfaces status
Port      Name      Status      Vlan      Duplex  Speed  Type
Et3/1     Et3/1     notconnect  1         auto    auto   1000BASE-T

<-----OUTPUT OMITTED FROM EXAMPLE----->
Ma1/1     Ma1/1     connected  routed    unconf  unconf Unknown

switch#ping 1.1.1.10
PING 172.22.26.1 (172.22.26.1) 72(100) bytes of data.
80 bytes from 1.1.1.10: icmp_seq=1 ttl=64 time=0.180 ms
80 bytes from 1.1.1.10: icmp_seq=2 ttl=64 time=0.076 ms
```

```
80 bytes from 1.1.1.10: icmp_seq=3 ttl=64 time=0.084 ms
80 bytes from 1.1.1.10: icmp_seq=4 ttl=64 time=0.073 ms
80 bytes from 1.1.1.10: icmp_seq=5 ttl=64 time=0.071 ms
```

Determine the size of the new EOS image. Then verify that there is enough space available on the flash drive for two copies of this image (use the `dir` command to check the bytes free figure).

```
switch#dir flash:
Directory of flash:/
-rwx  293168526   Nov 4   22:17   EOS4.11.0.swi
-rwx      36     Nov 8   10:24   boot-config
-rwx   37339     Jun 16  14:18   cfg_06162014
<-----OUTPUT OMITTED FROM EXAMPLE----->
606638080 bytes total (602841088 bytes free)
Standby supervisor:
switch#dir supervisor-peer:mnt/flash/
Directory of flash:/
-rwx 293168526 Nov 4 22:17 EOS4.11.0.swi
-rwx 36 Nov 8 10:24 boot-config
-rwx 37339 Jun 16 14:18 cfg_06162014
<-----OUTPUT OMITTED FROM EXAMPLE----->
606638080 bytes total (602841088 bytes free)
```

And, finally, ensure that any extensions running on the primary supervisor are also available on the secondary supervisor.

#### 7.4.2.2 Transfer the Image File to the Primary Supervisor

Load the desired image to the file system on the primary supervisor, typically into the flash. Use the CLI `copy` command to load files to the flash on the primary supervisor, then confirm that the new image file has been correctly transferred.

These command examples transfer an image file to flash from various locations.

#### USB Memory

##### Command

```
copy usb1:/sourcefile flash:/destfile
```

##### Example

```
Sch#copy usb1:/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

#### FTP Server

##### Command

```
copy ftp:/ftp-source/sourcefile flash:/destfile
```

##### Example

```
Sch#copy ftp:/user:password@10.0.0.3/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

## SCP

### Command

```
copy scp://scp-source/sourcefile flash:/destfile
```

### Example

```
sch#copy scp://user:password@10.1.1.8/user/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

## HTTP

### Command

```
copy http://http-source/sourcefile flash:/destfile
```

### Example

```
sch#copy http://10.0.0.10/EOS-4.13.2.swi flash:/EOS-4.13.2.swi
```

Once the file has been transferred, verify that it is present in the directory, then confirm the MD5 checksum using the **verify** command. The MD5 checksum for each available image can be found on the EOS download page of the Arista website.

```
switch#dir flash:
Directory of flash:/
-rwx      293168526      Nov  4   22:17      EOS4.11.0.swi
-rwx           36       Nov  8   10:24      boot-config
-rwx      37339        Jun 16   14:18      cfg_06162014
-rwx      394559902     May 30   02:57      EOS-4.12.2.swi

<-----OUTPUT OMITTED FROM EXAMPLE----->

606638080 bytes total (208281186 bytes free)
switch#53#verify /md5 flash:EOS-4.13.2.swi
verify /md5 (flash:EOS-4.13.2.swi) =c277a965d0ed48534de6647b12a86991
```

### 7.4.2.3 Install the New EOS Image

Once the EOS image has been copied to the flash drive of the primary supervisor, use the **install** command to update the **boot-config**, copy the new image to the secondary supervisor and reload both supervisors. When upgrading to a new image, both supervisors will briefly be unavailable; using the **install** command minimizes packet loss during reload.

```
switch(config)#install source EOS-4.13.2.swi reload
Preparing new boot-config... done.
Copying new software image to standby supervisor... done.
Copying new boot-config to standby supervisor... done.
Committing changes on standby supervisor... done.
Reloading standby supervisor... done.
Committing changes on this supervisor... done.
Reloading this supervisor...
```

---

#### 7.4.2.4 Verify the New Image

After the switch finishes reloading, log into the switch and use the **show version** command to confirm the correct image is loaded. The **Software image version** line displays the version of the active image file.

```
switch#show version
Arista DCS-7504
Hardware version:    01.01
Serial number:      JPE13120819
System MAC address: 001c.7326.fd0c

Software image version: 4.13.2F
Architecture:         i386
Internal build version: 4.13.2F-1649184.4132F.2
Internal build ID:    eeb3c212-b4bd-4c19-ba34-1b0aa36e43f1

Uptime:              1 hour and 36 minutes
Total memory:        4017088 kB
Free memory:         1473280 kB

switch#
```

## 7.5 Upgrade/Downgrade Commands

- [install](#)
- [reload fast-boot](#)
- [reload hitless](#)

---

## 7.5.1 install

The `install` command copies the specified EOS image onto the switch (if the source is external), configures the `boot-config` file to point to the specified EOS image, copies the image to the standby supervisor (on dual-supervisor switches), and optionally reloads the switch to run the new EOS.

### Command Mode

Privileged EXEC

### Command Syntax

```
install source source_path [destination destination_path] [now] [reload]
```

### Parameters

- **source\_path** file path and name of EOS image. If no file path is specified, the switch will look for the image on the flash drive of the primary supervisor.
- **destination destination\_path** destination file path and name of the EOS image. If no destination or name is specified, the EOS image will be stored on the flash drive with its original file name.
- **now** command is executed immediately without further prompts.
- **reload** supervisor is reloaded after the image and updated `boot-config` file are installed. On dual-supervisor switches, reloads both supervisors, after which control is returned to the primary supervisor.

### Example

- This command updates the `boot-config` file to point to the EOS.swi file on the primary supervisors flash drive, copies the image and `boot-config` file to the secondary supervisor, and reboots both.

```
switch(config)#install source EOS.swi reload
Preparing new boot-config... done.
Copying new software image to standby supervisor... done.
Copying new boot-config to standby supervisor... done.
Committing changes on standby supervisor... done.
Reloading standby supervisor... done.
Committing changes on this supervisor... done.
Reloading this supervisor...
```

## 7.5.2 reload fast-boot

The `reload fast-boot` command starts the Accelerated Software Upgrade (ASU) process using the EOS image specified by the `boot-config` file (configured by the `boot system` command).

ASU significantly decreases downtime and packet loss during a software upgrade, but the data plane is still restarted after the control plane has loaded, resulting in approximately 30 seconds of downtime. If available, Arista recommends using Smart System Upgrade (SSU) instead.

ASU shortens downtime and minimizes packet loss during EOS upgrades in three ways:

- performing time-intensive tasks (including copying the EOS image) before rebooting the control plane
- forwarding packets in hardware (based on the last known good state) while the control-plane is offline
- optimizing the boot process by performing only tasks essential for software upgrade

### Command Mode

Privileged EXEC

### Command Syntax

```
reload fast-boot
```

### Guidelines

- ASU is supported only for upgrades (not downgrades).
- ASU is not supported if the EOS upgrade requires an FPGA upgrade.
- Enough free space must be available on the flash drive to store two copies of the target EOS image.

#### Example

- This command starts the Accelerated Software Upgrade process.

```
switch#reload fast-boot  
Proceed with reload? [confirm]
```

When the `reload fast-boot` command is entered, the switch sends a message prompting the user to save the configuration if it contains unsaved modifications, then asks the user to confirm the reload request.

### 7.5.3 reload hitless

The `reload hitless` command starts the Smart System Upgrade (SSU) process using the EOS image specified by the `boot-config` file (configured by the `boot system` command).

#### Command Mode

Privileged EXEC

#### Command Syntax

```
reload hitless
```

#### Guidelines

- SSU is supported only for upgrades (not downgrades).
- SSU is not supported if the EOS upgrade requires an FPGA upgrade.
- Enough free space must be available on the flash drive to store two copies of the target EOS image. It is also recommended that an additional 240MB be available to store diagnostic information.

#### Example

- This command starts the SSU process.

```
switch#reload hitless  
Proceed with reload? [confirm]
```

- If there are issues with the current switch configuration that will prevent SSU from being performed, the switch lists the changes that must be made before SSU can begin.

```
switch#reload hitless  
switch#'reload hitless' cannot proceed due to the following:  
Spanning-tree portfast is not enabled for one or more ports  
Spanning-tree BPDU guard is not enabled for one or more ports  
switch#
```

- When the `reload hitless` command is entered, the switch sends a message prompting the user to save the configuration if it contains unsaved modifications, then asks the user to confirm the reload request.

```
switch#reload hitless  
System configuration has been modified. Save? [yes/no/cancel/  
diff]:y  
Copy completed successfully.  
Proceed with reload? [confirm]y
```

## Security

---

The Security chapter contains the following sections:

- [User Security](#)
- [Control Plane Security](#)
- [Data Plane Security](#)

### 8.1 User Security

This section covers the following:

- [AAA Configuration](#)

#### 8.1.1 AAA Configuration

This section describes Authentication, Authorization, and Accounting (AAA), and contains these topics:

- [Authentication, Authorization, and Accounting Overview](#)
- [Configuring the Security Services](#)
- [Server Groups](#)
- [Activating Security Services](#)
- [Role-Based Authorization](#)
- [TACACS+ Configuration Examples](#)
- [AAA Commands](#)

##### 8.1.1.1 Authentication, Authorization, and Accounting Overview

This section contains the following topics:

- [Methods](#)
- [Configuration Statements](#)
- [Encryption](#)

###### 8.1.1.1.1 Methods

The switch controls access to EOS commands by authenticating user identity and verifying user authorization. Authentication, Authorization, and Accounting (AAA) activities are conducted through three data services - a local security database, TACACS+ servers, and RADIUS servers. [Configuring the Security Services](#) describes these services.

###### 8.1.1.1.2 Configuration Statements

Enabling AAA on the switch requires two steps:

1. Configure security service parameters.

The switch provides configuration commands for each security service:

- A local file supports authentication through **username** and [enable password](#) commands.
- TACACS+ servers provide security services through **tacacs-server** commands.

- RADIUS servers provide security services through `radius-server` commands.

[Configuring the Security Services](#) describes security service configuration commands.

## 2. Activate AAA services.

EOS provides `aaa authorization`, `aaa authentication`, and `aaa accounting` commands to select the primary and backup services. [Activating Security Services](#) provides information on implementing a security environment.

### 8.1.1.1.3 Encryption

The switch uses clear-text passwords and server access keys to authenticate users and communicate with security systems. To prevent accidental disclosure of passwords and keys, `running-config` stores their corresponding encrypted strings. The encryption method depends on the type of password or key.

Commands that configure passwords or keys can accept the clear-text password or an encrypted string that was generated by the specified encryption algorithm with the clear-text password as the seed.

### 8.1.1.2 Configuring the Security Services

The switch can access three security data services to authenticate users and authorize switch tasks: a local file, TACACS+ servers, and RADIUS Servers.

This section contains the following topics:

- [Local Security File](#)
- [TACACS+](#)
- [RADIUS](#)

#### 8.1.1.2.1 Local Security File

The local file uses passwords to provide these authentication services:

- authenticate users as they log into the switch
- control access to configuration commands
- control access to the switch root login

The local file contains username-password combinations to authenticate users. Passwords also authorize access to configuration commands and the switch root login.

##### 8.1.1.2.1.1 Passwords

The switch recognizes passwords as clear text and encrypted strings.

- **Clear-text** passwords are the text that a user enters to access the CLI, configuration commands, or the switch root login.
- **Encrypted strings** are MD5-encrypted strings generated with the **clear text** as the seed. The local file stores passwords in this format to avoid unauthorized disclosure. When a user enters the clear-text password, the switch generates the corresponding secure hash and compares it to the stored version.

**Note:** The switch cannot recover the clear text from which an encrypted string is generated.

Valid passwords contain the characters A-Z, a-z, 0-9 and any of these punctuation characters:

! @ # \$ % ^ & \* ( ) - \_ = + { } [ ] ; : < > , . ? / ~ \

### 8.1.1.2.1.2 Usernames

Usernames control access to the EOS and all switch commands. The switch is typically accessed through an SSH login, using a previously defined username-password combination. To create a new username or modify an existing username, use the [username](#) command.

Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:

@ # \$ % ^ & \* - \_ = + ; < > , . ~ |

The default username is **admin**, which is described in [Admin Username](#).

#### Examples

- These equivalent commands create the username “john” and assign it the password “x245.” The password is entered in clear text because the encrypt-type parameter is omitted or zero.

```
switch(config)#username john secret x245
switch(config)#username john secret 0 x245
```

- This command creates the username “john” and assigns it to the text password that corresponds to the encrypted string “\$1\$sU.7hptc\$TsJ1qslCL7ZYVbyXNG1wg1.” The string was generated by an MD5-encryption program using “x245” as the seed.

```
switch(config)# username john secret 5 $1$sU.7hptc$TsJ1qslCL7ZYVb
yXNG1wg1
```

The username is authenticated by entering “x245” when the CLI prompts for a password.

- This command creates the username “jane” without securing it with a password. It also removes a password if the “jane” username exists.

```
switch(config)# username jane nopassword
```

- This command removes the username “william” from the local file.

```
switch(config)# no username william
```

### 8.1.1.2.1.3 Logins by Unprotected Usernames

The default switch configuration allows usernames that are not password-protected to log in only from the console. The [aaa authentication policy local allow-nopassword-remote-login](#) command configures the switch to allow unprotected usernames to log in from any port. To reverse this setting to the default state, use no form of [aaa authentication policy local allow-nopassword-remote-login](#).

**Note:** Allowing remote access to accounts without passwords is a severe security risk. Arista Networks recommends assigning strong passwords to all usernames.

#### Examples

- This command configures the switch to allow unprotected usernames to log in from any port.

```
switch(config)#aaa authentication policy local allow-nopassword-remote-
login
```

- This command configures the switch to allow unprotected usernames to log in only from the console port.

```
switch(config)#no aaa authentication policy local allow-nopassword-
remote-login
```

---

#### 8.1.1.2.1.4 Enable Command Authorization

The **enable** command controls access to Privileged EXEC and all configuration command modes. The enable password authorizes users to execute the **enable** command. When the enable password is set, the CLI displays a password prompt when a user attempts to enter Privileged EXEC mode.

```
main-host> enable
Password:
main-host#
```

If an incorrect password is entered three times in a row, the CLI displays the EXEC mode prompt.

If no enable password is set, the CLI does not prompt for a password when a user attempts to enter Privileged EXEC mode.

To set the enable password, use the [enable password](#) command.

#### Examples

- These equivalent commands assign “xyrt1” as the enable password.

```
switch(config)#enable password xyrt1
switch(config)#enable password 0 xyrt1
```

- This command assigns the enable password to the clear text “12345” corresponding to the encrypted string “\$1\$8bPBrJnd\$Z8wbKLHpJEd7d4tc5Z/6h/.” The string was generated by an MD5-encryption program using “12345” as the seed.

```
switch(config)#enable password 5 $1$8bPBrJnd$Z8wbKLHpJEd7d4tc5Z/6h/
```

- This command deletes the enable password.

```
switch(config)#no enable password
```

#### 8.1.1.2.1.5 Root Account Password

The root account accesses the root directory in the underlying Linux shell. When it is not password protected, you can log into the root account only through the console port. After you assign a password to the root account, you can log into it through any port.

To set the password for the root account, use the [aaa root](#) command.

#### Examples

- These equivalent commands assign “f4980” as the root account password.

```
switch(config)#aaa root secret f4980
switch(config)#aaa root secret 0 f4980
```

- This command assigns the text “ab234” that corresponds to the encrypted string “\$1\$HW05LEY8\$QEVw6JqjD9VqDfh.O8r.b.” as the root password.

```
switch(config)#aaa root secret 5 $1$HW05LEY8$QEVw6JqjD9VqDfh.O8r.b
```

- This command removes the password from the root account.

```
switch(config)#aaa root nopassword
```

- This command disables the root login.

```
switch(config)#no aaa root
```

### 8.1.1.2.2 TACACS+

Terminal Access Controller Access-Control System Plus (TACACS+), derived from the TACACS protocol defined in RFC 1492, is a network protocol that provides centralized user validation services. TACACS+ information is maintained on a remote database. EOS support of TACACS+ services requires access to a TACACS+ server.

TACACS+ manages multiple network access points from a single server. The switch defines a TACACS+ server connection by its address and port, allowing the switch to conduct multiple data streams to a single server by addressing different ports on the server.

These sections describe steps that configure access to TACACS+ servers. Configuring TACACS+ access is most efficiently performed when TACACS+ is functioning prior to configuring switch parameters.

#### 8.1.1.2.2.1 Configuring TACACS+ Parameters

TACACS+ parameters define settings for the switch to communicate with TACACS+ servers. A set of values can be configured for individual TACACS+ servers that the switch accesses. Global parameters define settings for communicating with servers for which parameters are not individually configured.

The switch supports the following TACACS+ parameters.

#### Encryption Key

The encryption key is code that the switch and the TACACS+ server share to facilitate communications.

- The `tacacs-server host` command defines the encryption key for a specified server.
- The `tacacs-server key` command defines the global encryption key.

#### Examples

- This command configures the switch to communicate with the TACACS+ server assigned the host name "TAC\_1" using the encryption key "rp31E2v."

```
switch(config)#tacacs-server host TAC-1 key rp31E2v
```

- This command configures "cv90jr1" as the global encryption key.

```
switch(config)#tacacs-server key 0 cv90jr1
```

- This command assigns "cv90jr1" as the global key, using the corresponding encrypted string.

```
switch(config)#tacacs-server key 7 020512025B0C1D70
```

#### Session Multiplexing

The switch supports multiplexing sessions on a single TCP connection.

- The `tacacs-server host` command configures the multiplexing option for a specified server.
- There is no global multiplexing setting.

---

## Example

- This command configures the switch to communicate with the TACACS+ server at 10.12.7.9 and indicates the server supports session multiplexing on a TCP connection.

```
switch(config)#tacacs-server host 10.12.7.9 single-connection
```

## Timeout

The timeout is the period the switch waits for a successful connection to, or response from, the TACACS+ server. The default is 5 seconds.

- The [tacacs-server host](#) command defines the timeout for a specified server.
- The [tacacs-server timeout](#) command defines the global timeout.

## Examples

- This command configures the switch to communicate with the TACACS+ server assigned the host name "TAC\_1" and configures the timeout period as 20 seconds.

```
switch(config)#tacacs-server host TAC_1 timeout 20
```

- This command configures 40 seconds as the period that the server waits for a response from a TACACS+ server before issuing an error.

```
switch(config)#tacacs-server timeout 40
```

## Port

The port specifies the port number through which the switch and the servers send information. The TACACS+ default port is 49.

- The [tacacs-server host](#) command specifies the port number for an individual TACACS+ server.
- The global TACACS+ port number cannot be changed from the default value of 49.

## Example

- This command configures the switch to communicate with the TACACS+ server at 10.12.7.9 through port 54.

```
switch(config)#tacacs-server host 10.12.7.9 port 54
```

### 8.1.1.2.2.2 TACACS+ Status

To display the TACACS+ servers and their interactions with the switch, use the [show tacacs](#) command.

## Example

- This command lists the configured TACACS+ servers.

```
switch(config)#show tacacs

server1: 10.1.1.45
Connection opens: 15
Connection closes: 6
Connection disconnects: 6
Connection failures: 0
Connection timeouts: 2
Messages sent: 45
```

```

Messages received: 14
Receive errors: 2
Receive timeouts: 2
Send timeouts: 3

Last time counters were cleared: 0:07:02 ago

```

To reset the TACACS+ status counters, use the `clear aaa counters tacacs+` command.

### Example

- This command clears all TACACS+ status counters.

```
switch(config)#clear aaa counters tacacs
```

## 8.1.1.2.3 RADIUS

Remote Authentication Dial-In User Service (RADIUS) is a networking protocol that provides centralized AAA services for computers connecting to and using network resources. RADIUS is used to manage access to the Internet, internal networks, wireless networks, and integrated email services.

These sections describe steps that configure RADIUS server access. Configuring RADIUS parameters is most efficiently performed when RADIUS is functioning prior to configuring switch parameters.

### 8.1.1.2.3.1 RADIUS Vendor-Specific Attribute-Value Pairs

RADIUS servers and client companies extend basic RADIUS functionality through vendor-specific attributes. A dictionary file includes a list of RADIUS attribute-value pairs that Arista switches use to perform AAA operations through the RADIUS server.

Arista switches use the following attribute values:

- Arista Vendor number: 30065
- Attribute: Arista-AVPair 1 string

Acceptable string values for Arista-AVPair include:

- "shell:priv-lvl=<privilege level of a user, 0-15>"
- "shell:roles=<list of roles for a user>"

### Example

- This is a sample dictionary file that identifies Arista RADIUS vendor-specific attribute value pairs.

```

#
# dictionary.arista
#
VENDOR          Arista      30065
# Standard Attribute
BEGIN-VENDOR    Arista
ATTRIBUTE       Arista-AVPair  1    string
END-VENDOR      Arista

```

### 8.1.1.2.3.2 Configuring RADIUS Defaults

RADIUS policies specify settings for the switch to communicate with RADIUS servers. A set of values can be configured for individual RADIUS servers that the switch accesses. Global parameters define settings for communicating with servers for which parameters are not individually configured.

The switch defines the following RADIUS parameters.

---

## Encryption Key

The encryption key is the key shared by the switch and RADIUS servers to facilitate communications.

- The `radius-server host` command defines the encryption key for a specified server.
- The `radius-server key` command specifies the global encryption key.

## Examples

- This command configures the switch to communicate with the RADIUS server assigned the host name “RAD-1” using the encryption key “rp31E2v.”

```
switch(config)#radius-server host RAD-1 key rp31E2v
```

- This command configures “cv90jr1” as the global encryption key.

```
switch(config)#radius-server key 0 cv90jr1
```

- This command assigns cv90jr1 as the key by specifying the corresponding encrypted string.

```
switch(config)#radius-server key 7 020512025B0C1D70
```

## Timeout

The timeout is the period that the switch waits for a successful connection to, or response from, a RADIUS server. The default period is 5 seconds.

- The `radius-server host` command defines the timeout for a specified server.
- The `radius-server key` command defines the global timeout.

## Examples

- This command configures the switch to communicate with the RADIUS server assigned the host name *RAD-1* and configures the timeout period as *20 seconds*.

```
switch(config)#radius-server host RAD-1 timeout 20
```

- This command configures *50 seconds* as the period that the server waits for a response from a RADIUS server before issuing an error.

```
switch(config)#radius-server timeout 50
```

## Retransmit

Retransmit is the number of times the switch attempts to access the RADIUS server after the first server timeout expiry. The default value is 3 times.

- The `radius-server host` command defines the retransmit for a specified server.
- The `radius-server retransmit` command defines the global retransmit value.

## Examples

- This command configures the switch to communicate with the RADIUS server assigned the host name “RAD-1” and configures the retransmit value as 2.

```
switch(config)#radius-server host RAD-1 retransmit 2
```

- This command configures the switch to attempt five RADIUS server contacts after the initial timeout. If the timeout parameter is set to 50 seconds, then the total period that the switch waits for a response is  $((5+1)*50) = 300$  seconds.

```
switch(config)#radius-server retransmit 5
```

### Deadtime

Deadtime is the period when the switch ignores a non-responsive RADIUS server or a server that does not answer retransmit attempts after timeout expiry. Deadtime is disabled if a value is not specified.

- The [radius-server host](#) command defines the deadtime for a specified server.
- The [radius-server deadtime](#) command defines the global deadtime setting.

### Examples

- This command configures the switch to communicate with the RADIUS server assigned the host name “RAD-1” and configures the deadtime period as 90 minutes.

```
switch(config)#radius-server host RAD-1 deadtime 90
```

- This command programs the switch to ignore a server for two hours if the server does not respond to a request during the timeout-retransmit period.

```
switch(config)#radius-server deadtime 120
```

### Port

The port specifies the port number through which the switch and servers send information.

- The [radius-server host](#) command specifies the port numbers for an individual RADIUS server.
- The global RADIUS port numbers cannot be changed from the default values of 1812 for an authorization port and 1813 for an accounting port.

### Example

- These commands configure the switch to communicate with the RADIUS server named “RAD-1” through port number 1850 for authorization and port number 1851 for accounting.

```
switch(config)#radius-server host RAD-1 auth-port 1850
switch(config)#radius-server host RAD-1 acct-port 1851
```

To remove the configuration for this server, use `no radius-server host` command and specify the hostname or IP address with both the authorization and accounting port numbers.

#### 8.1.1.2.3.3 RADIUS Status

The [show radius](#) command displays configured RADIUS servers and their interactions with the switch.

### Example

- This command lists the configured RADIUS servers.

```
switch(config)#show radius

server1: 10.1.1.45
Messages sent: 24
Messages received: 20
Requests accepted: 14
```

```
Requests rejected: 8
Requests timeout: 2
Requests retransmitted: 1
Bad responses: 1
Last time counters were cleared: 0:07:02 ago
```

To reset the RADIUS status counters, use the `clear aaa counters radius` command.

### Example

- This command clears all RADIUS status counters.

```
switch(config)#clear aaa counters radius
```

### 8.1.1.3 Server Groups

A server group is a collection of servers that are associated with a single group name. Subsequent authorization and authentication commands can access all servers in a group by invoking the group name. The switch supports TACACS+ and RADIUS server groups.

The `aaa group server` commands create server groups and place the switch in a server-group configuration mode to assign servers to the group. Commands that reference an existing group place the switch in a server-group configuration mode to modify the group.

These commands create named server groups and enter the appropriate command mode for the specified group:

- `aaa group server radius`
- `aaa group server tacacs+`

The `server (server-group-RADIUS configuration mode)` commands add servers to the configuration mode server group. Servers must be previously configured with a `radius-server host` or `tacacs-server host` command before they are added to a group.

### Examples

- This command creates the TACACS+ server group named “TAC-GR” and enters server-group configuration mode for the new group.

```
switch(config)#aaa group server tacacs+ TAC-GR
switch(config-sg-tacacs+-TAC-GR)#
```

- These commands add two servers to the “TAC-GR” server group. To add servers to this group, the switch must be in sg-tacacs+-TAC-GR configuration mode.

The CLI remains in server-group configuration mode after adding the “TAC-1” server (port 49) and the server located at 10.1.4.14 (port 151) to the group.

```
switch(config-sg-tacacs+-TAC-GR)#server TAC-1
switch(config-sg-tacacs+-TAC-GR)#server 10.1.4.14 port 151
switch(config-sg-tacacs+-TAC-GR)#
```

- This command exits server-group configuration mode.

```
switch(config-sg-tacacs+-TAC-GR)#exit
switch(config)#
```

- This command creates the RADIUS server group named “RAD-SV1” and enters server-group configuration mode for the new group.

```
switch(config)#aaa group server radius RAD-SV1
```

```
switch(config-sg-radius-RAD-SV1) #
```

- These commands add two servers to the “RAD-SV1” server group. To add servers to this group, the switch must be in sg-radius-RAD-SV1 configuration mode.

The CLI remains in server-group configuration mode after adding the RAC-1 server (authorization port 1812, accounting port 1813) and the server located at 10.1.5.14 (authorization port 1812, accounting port 1850) to the group.

```
switch(config-sg-radius-RAD-SV1) #server RAC-1
switch(config-sg-radius-RAD-SV1) #server 10.1.5.14 acct-port 1850
switch(config-sg-radius-RAD-SV1) #
```

#### 8.1.1.4 Role-Based Authorization

Role-based authorization is a method of restricting access to CLI commands through the assignment of profiles, called “roles,” to user accounts. Each role consists of rules that permit or deny access to a set of commands within specified command modes.

All roles are accessible to the local security file through a [username](#) parameter and to remote users through RADIUS servers. Each role can be applied to multiple user accounts. Only one role may be applied to a user.

##### 8.1.1.4.1 Role Types

The switch defines two types of roles: user-defined and built-in.

- User-defined roles are created and edited through CLI commands.
- Built-in roles are supplied with the switch and are not user-editable.

Built-in roles supplied by the switch are “network-operator” and “network-admin.”

##### 8.1.1.4.2 Role Structure

A role is an ordered list of rules that restricts access to specified commands from users on whom it is applied. Roles consist of deny and permit rules. Each rule references a set of command modes and contains a regular expression that specifies one or more CLI commands. Commands are compared sequentially to the rules within a role until a rule’s regular expression matches the command.

- Commands that match a regular expression in a permit rule are executed.
- Commands that match a regular expression in a deny rule are disregarded.
- Commands that do not match a regular expression are evaluated against the next rule in the role.

Upon its entry in the CLI, a command is compared to the first rule of the role. Commands that match the rule are executed (permit rule) or disregarded (deny rule). Commands that do not match the rule are compared to the next rule. This process continues until the command either matches a rule or the rule list is exhausted. The switch disregards commands not matching any rule.

##### 8.1.1.4.3 Role Rules

Role rules consist of four components: sequence number, filter type, mode expression, and command expression.

###### Sequence Number

The sequence number designates a rule’s placement in the role. Sequence numbers range in value from 1 to 256. Rule commands that do not include a sequence number append the rule at the end of the list, deriving its sequence number by adding 10 to the sequence number of the last rule in the list.

---

## Example

- These rules have sequence numbers 10 and 20.

```
10 deny mode exec command reload
20 deny mode config command (no |default )?router
```

## Filter Type

The filter type specifies the disposition of matching commands. Filter types are permit and deny. Commands matching permit rules are executed. Commands matching deny rules are disregarded.

## Example

- These rules are deny and permit rules, respectively.

```
10 deny mode exec command reload
20 permit mode config command interface
```

## Mode Expression

The mode expression specifies the command mode under which the command expression is effective. The mode expression may be a regular expression or a designated keyword. Rules support the following mode expressions:

- **exec** EXEC and Privileged EXEC modes
- **config** Global Configuration Mode
- **config-all** All configuration modes, including Global Configuration Mode
- *short\_name* short key name of a command mode (exact match)
- *long\_name* long key name of a command mode (regular expression match of one or more modes)
- <no parameter> all command modes

The **prompt** command configures the CLI to display a configuration mode's key name:

- %P long key name
- %p short key name

## Example

- These commands use the prompt command to display short key name (**if**) and long key name (**if-Et1**) for interface-ethernet 1.

```
switch(config) #prompt switch%p
switch(config) #interface ethernet 1
switch(config-if) #exit
switch(config) #prompt switch%P
switch(config) #interface ethernet 1
switch(config-if-Et1) #
```

The command supports the use of regular expressions to reference multiple command modes.

## Example

These regular expressions correspond to the listed command modes:

- **if-Vlan(1|2)** matches interface-VLAN 1 or interface-VLAN 2
- **if** matches all interface modes
- **acl-text1** matches ACL configuration mode for "text1" ACL

## Command Expression

The command expression is a regular expression that corresponds to one or more CLI commands.

## Examples

These regular expressions correspond to the specified commands:

- **reload** reload command
- **(no |default )?router** commands that enter routing protocol configuration modes
- **(no |default )?(ip|mac) access-list** commands that enter ACL configuration modes
- **(no |default )?(ip|mac) access-group** commands that bind ACLs to interfaces
- **lacp|spanning-tree** LACP and STP commands
- **.\*** all commands

### 8.1.1.4.4 Creating and Modifying Roles

This section contains the following topics:

- [Built-in Role](#)
- [Managing Roles](#)
- [Modifying Roles](#)

#### 8.1.1.4.4.1 Built-in Role

The switch provides the following two built-in roles:

- **network-operator** Allows all commands in EXEC (Privileged) modes. Commands in all other modes are denied.
- **network-admin** Allows all CLI commands in all modes.

The **network-admin** role is typically assigned to the **admin** user to allow it to run any command.

Built-in roles are not editable.

## Example

These **show users roles** commands display the contents of the built-in roles.

```
switch(config)#show users roles network-operator
The default role is network-operator
role: network-operator
    10 deny mode exec command bash|\|
    20 permit mode exec command .*
switch(config)#show users roles network-admin
The default role is network-operator
role: network-admin
    10 permit command .*
switch(config)#
```

#### 8.1.1.4.4.2 Managing Roles

### Creating and Opening a Role

Roles are created and modified in Role Configuration Mode. To create a role, enter the [role](#) command with the role's name. The switch enters Role Configuration Mode. If the command is followed by the name of an existing role, subsequent commands edit that role.

---

## Example

This command places the switch in Role Configuration Mode to create a role named “sysuser.”

```
switch(config) #role sysuser
switch(config-role-sysuser) #
```

## Saving Role Changes

Role Configuration Mode is a group-change mode; changes are saved by exiting the mode.

## Examples

- These commands create a role, then add a deny rule to the role. Because the changes are not yet saved, the role remains empty, as shown by [show users roles](#).

```
switch(config) #role sysuser
switch(config-role-sysuser) #deny mode exec command reload
switch(config-role-sysuser) #show users roles sysuser
The default role is network-operator

switch(config-role-sysuser) #
```

To save all current changes to the role and exit role configuration mode, type **exit**.

```
switch(config-role-sysuser) #exit
switch(config) #show users roles sysuser
The default role is network-operator

role: sysuser
    10 deny mode exec command reload
switch(config) #
```

**Note:** After exiting role mode, **running-config** must be saved to **startup-config** to preserve role changes past system restarts.

## Discarding Role Changes

The **abort** command exits Role Configuration Mode without saving pending changes.

## Example

These commands enter Role Configuration Mode to add deny rules, but discard the changes before saving them to the role.

```
switch(config) #role sysuser
switch(config-role-sysuser) #deny mode exec command reload
switch(config-role-sysuser) #abort
switch(config) #show users roles sysuser
The default role is network-operator

switch(config) #
```

### 8.1.1.4.4.3 Modifying Roles

#### Adding Rules to a Role

The **deny (Role)** command adds a deny rule to the configuration mode role. The **permit (Role)** command adds a permit rule to the configuration mode role.

To append a rule to the end of a role, enter the rule without a sequence number while in Role Configuration Mode. The new rule's sequence number is derived by adding 10 to the last rule's sequence number.

### Example

These commands enter the first three rules into a new role.

```
switch(config)#role sysuser
switch(config-role-sysuser)#deny mode exec command reload
switch(config-role-sysuser)#deny mode config command (no |default )?
router
switch(config-role-sysuser)#permit command .*
switch(config-role-sysuser)#exit
switch(config)#show users roles sysuser
The default role is network-operator

role: sysuser
    10 deny mode exec command reload
    20 deny mode config command (no |default )?router
    30 permit command .*
switch(config)#
```

### Inserting a Rule

To insert a rule into a role, enter the rule with a sequence number between the existing rules numbers.

### Example

This command inserts a rule between the first two rules by assigning it the sequence number 15.

```
switch(config)#role sysuser
switch(config-role-sysuser)#15 deny mode config-all command lacp
switch(config-role-sysuser)#exit
switch(config)#show users roles sysuser
The default role is network-operator

role: sysuser
    10 deny mode exec command reload
    15 deny mode config-all command lacp
    20 deny mode config command (no |default )router
    30 permit command .*
switch(config)#
```

### Deleting a Rule

To remove a rule from the current role, perform one of these commands:

- Enter **no**, followed by the sequence number of the rule to be deleted.
- Enter **no**, followed by the rule to be deleted.
- Enter **default**, followed by the sequence number of the rule to be deleted.
- Enter **default**, followed by the rule to be deleted.

### Example

These equivalent commands remove rule 30 from the list.

```
switch(config-role-sysuser)#no 30
switch(config-role-sysuser)#default 30
```

```
switch(config-role-sysuser)#no permit command .*
switch(config-role-sysuser)#default permit command .*
```

This role results from entering one of the preceding commands.

```
switch(config)#show users roles sysuser
The default role is network-operator

role: sysuser
    10 deny mode exec command reload
    15 deny mode config-all command lacp|spanning-tree
    20 deny mode config command (no |default )router
switch(config)#
```

### Redistributing Sequence Numbers

Sequence numbers determine the order of the rules in a role. After a list editing session where existing rules are deleted and new rules are inserted between existing rules, the sequence number distribution may not be uniform. Redistributing rule numbers changes adjusts the sequence number of rules to provide a constant difference between adjacent rules. The [resequence \(Role\)](#) command adjusts the sequence numbers of role rules.

### Example

The **resequence** command renumbers rules in the sysuser role. The sequence number of the first rule is 100; subsequent rules numbers are incremented by 20.

```
switch(config)#show users roles sysuser
The default role is network-operator

role: sysuser
    10 deny mode exec command reload
    20 deny mode config-all command lacp|spanning-tree
    25 deny mode config command (no |default )?router
    30 permit command .*
switch(config)#role sysuser
switch(config-role-sysuser)#resequence 100 20
switch(config-role-sysuser)#exit
switch(config)#show users roles sysuser
The default role is network-operator

role: sysuser
    100 deny mode exec command reload
    120 deny mode config-all command lacp|spanning-tree
    140 deny mode config command (no |default )?router
    160 permit command .*
switch(config)#
```

#### 8.1.1.4.5 Assigning a Role to a Username

Roles are assigned to local users through the [username](#) command and to remote users through RADIUS servers. Each user is assigned one role. Each role can be assigned to multiple local and remote users.

### 8.1.1.4.5.1 Default Roles

Users that are not explicitly assigned a role are assigned the default role. The [aaa authorization policy local default-role](#) command designates the default role. The “network-operator” built-in role is the default role when the default role is not configured.

#### Examples

- These commands assign “sysuser” as the default role, then display the name of the default role.

```
switch(config)#aaa authorization policy local default-role sysuser
switch(config)#show users roles
The default role is sysuser

switch(config)#
```

- These commands restore “network-operator” as the default role by deleting the `aaa authorization policy local default-role` statement from *running-config*, then display the default role name.

```
switch(config)#no aaa authorization policy local default-role
switch(config)#show users roles
The default role is network-operator

switch(config)#
```

### 8.1.1.4.5.2 Local Security File (Username command)

Roles are assigned to users with the [username](#) command's `role` parameter. A username whose *running-config* `username` statement does not include a `role` parameter is assigned the default role.

The `role` parameter function in a command creating a username is different from its function in a command editing an existing name.

#### Assigning a Role to a New Username

A `username` command creating a username explicitly assigns a role to the username by including the `role` parameter; commands without a `role` parameter assigns the default role to the username.

#### Example

- These commands create two usernames. The first user is assigned a role; the second user assumes the default role.

```
switch(config)#username FRED secret 0 axced role sysuser1
switch(config)#username JANE nopassword
switch(config)#show running-config
<-----OUTPUT OMITTED FROM EXAMPLE----->
!
username FRED role sysuser1 secret 5 $1$dhJ6vrPV$PFOvJCX/vcqyIHV.vd.120
username JANE nopassword
!
<-----OUTPUT OMITTED FROM EXAMPLE----->
switch(config)#
```

---

## Editing the Role of an Existing Username

The role of a previously configured username may be edited by a **username** command without altering its password. The role assignment of a username is not changed by **username** commands that do not include a **role** parameter.

### Examples

- These commands assign a role to a previously configured username.

```
switch(config)#username JANE role sysuser2
switch(config)#show running-config

<-----OUTPUT OMITTED FROM EXAMPLE----->
!
username FRED role sysuser1 secret 5 $1$dhJ6vrPV$PFOvJCX/vcqyIHV.vd.120
username JANE role sysuser2 nopassword
!
<-----OUTPUT OMITTED FROM EXAMPLE----->
switch(config)#
```

- These commands reverts a username to the default role by removing its role assignment.

```
switch(config)#no username FRED role
switch(config)#show running-config
<-----OUTPUT OMITTED FROM EXAMPLE----->
!
username FRED secret 5 $1$dhJ6vrPV$PFOvJCX/vcqyIHV.vd.120
username JANE role sysuser2 nopassword
!
<-----OUTPUT OMITTED FROM EXAMPLE----->
switch(config)#
```

## Displaying the Role Assignments

The [show users accounts](#) command displays role assignment of the configured users. The [show users detail](#) command displays roles of users that are currently logged into the switch.

### Example

- This command displays the configured users and their role assignments.

```
switch(config)#show users accounts
user: FRED
    role: <unknown>
    privilege level: 1
user: JANE
    role: sysuser2
    privilege level: 1
user: admin
    role: network-admin
    privilege level: 1
switch(config)#
```

- This command displays information about the active AAA login sessions.

```
switch(config)# show aaa session
```

Session	Username	Roles	TTY	State	Duration	Auth	Remote Host
2	admin	network-operator	ttyS0	E	0:01:21	local	
4	Fred	sysadmin	telnet	E	0:02:01	local	sf.example.com
6	Jane	sysuser2	ssh	E	0:00:52	group radius	ny.example.com

9	admin	network-admin	ssh	E	0:00:07	local	bj.example.com
10	max	network-admin	telnet	E	0:00:07	local	sf.example.com

### 8.1.1.4.5.3 Radius Servers

A role can be assigned to a remote user authenticated through a RADIUS server. Roles are assigned through the vendor-specific attribute-value (AV) pair named "Arista-AVPair." The switch extracts the remote user's role upon a successful authentication when RADIUS authentication is enabled.

#### Example

This file extract is sample FreeRadius server code that includes the AV pair that assigns roles to three remote users.

```
# Sample RADIUS server users file
"Jane"          Cleartext-Password := "Abc1235"
                Arista-AVPair = "shell:roles=sysuser2",
                Service-Type = NAS-Prompt-User
"Mary"          Cleartext-Password := "xYz$2469"
                Arista-AVPair = "shell:roles=sysadmin",
                Service-Type = NAS-Prompt-User
"Fred"          Cleartext-Password := "rjx4#222"
                Arista-AVPair = "shell:roles=network-operator",
                Service-Type = NAS-Prompt-User
```

The `aaa authentication login` command selects the user authentication service (see [Configuring Service Lists](#)).

#### Example

This command configures the switch to authenticate users through all RADIUS servers.

```
switch(config)#aaa authentication login default group radius
```

### 8.1.1.4.5.4 Enable Role-Based Access Control

To enable Role-Based Access Control on the switch, apply the following configuration:

```
switch(config)#aaa authorization commands all default local
```

## 8.1.1.5 Activating Security Services

After configuring the access databases, `aaa authentication`, `aaa authorization`, and `aaa accounting` commands designate active and backup services for handling access requests.

These sections describe the methods of selecting the database that the switch uses to authenticate users and authorize access to network resources.

### 8.1.1.5.1 Authenticating Usernames and the Enable Password

Service lists specify the services the switch uses to authenticates usernames and the enable password.

#### 8.1.1.5.1.1 Service List Description

Service list elements are service options, ordered by their priority.

**Note:** When the local file is one of the service list elements, any attempts to locally authenticate a username that is not included in the local file will result in the switch continuing to the next service list element.

### Example

- This is an example service list for username authentication:
  1. Location\_1 server group - specifies a server group (see [Server Groups](#) ).
  2. Location\_2 server group - specifies a server group.
  3. TACACS+ servers - specifies all hosts for which a `tacacs-server host` command exists.
  4. Local file - specifies the local file.
  5. None - specifies that no authentication is required - all access attempts succeed.

To authenticate a username, the switch checks Location\_1 server group. If a server in the group is available, the switch authenticates the username through that group. Otherwise, it continues through the list until it finds an available service or utilizes option 5, which allows the access attempt to succeed without authentication.

#### 8.1.1.5.1.2 Configuring Service Lists

Service lists are incorporated into these `aaa authentication` commands to specify services the switch uses to authenticate usernames and the enable password.

- `aaa authentication login` specifies services the switch uses to authenticate usernames
- `aaa authentication enable` specifies services the switch uses to authenticate the enable password

#### Examples

- This command configures the switch to authenticate usernames through the TAC-1 server group. The local database is the backup method if TAC-1 servers are unavailable.

```
switch(config)#aaa authentication login default group TAC-1 local
```

- This command configures the switch to authenticate usernames through all TACACS+ servers, then all RADIUS servers if the TACACS+ servers are not available. If the RADIUS servers are unavailable, the switch does not authenticate any login attempts.

```
switch(config)#aaa authentication login default group tacacs+ group radius none
```

- This command configures the switch to authenticate the enable password through all TACACS+ servers, then through the local database if the TACACS+ servers are unavailable.

```
switch(config)#aaa authentication enable default group TACACS+ local
```

#### 8.1.1.5.2 Authorization

Authorization commands control EOS shell access, CLI command access, and configuration access through the console port. The switch also supports role-based authorization, which allows access to specified CLI commands by assigning command profiles (or roles) to usernames. See [Role-Based Authorization](#) for details.

During the exec authorization process, TACACS+ server responses may include attribute-value (AV) pairs. The switch recognizes the mandatory AV pair named "priv-lvl=x" (where x is between 0 and 15).

By default, a TACACS+ server that sends any other mandatory AV pair is denied access to the switch. The receipt of optional AV pairs by the switch has no affect on decisions to permit or deny access

to the TACACS+ server. The [tacacs-server policy](#) command programs the switch to allow access to TACACS+ servers that send unrecognized mandatory AV pairs.

Authorization to switch services is configured by the following `aaa authorization` commands.

- To specify the method of authorizing the opening of an EOS shell, enter [aaa authorization exec](#) .
- To specify the method of authorizing CLI commands, enter [aaa authorization commands](#) .

### Examples

- This command specifies that TACACS+ servers authorize users attempting to open a CLI shell.

```
switch(config)#aaa authorization exec default group tacacs+
```

- This command programs the switch to authorize configuration commands (privilege level 15) through the local file and to deny command access to users not listed in the local file.

```
switch(config)#aaa authorization commands all default local
```

- This command programs the switch to permit all commands entered on the CLI.

```
switch(config)#aaa authorization commands all default none
```

- This command configures the switch to permit access to TACACS+ servers that send unrecognized mandatory AV pairs.

```
switch(config)#tacacs-server policy unknown-mandatory-attribute ignore
```

All commands are typically authorized through [aaa authorization commands](#). However, the `no aaa authorization config-commands` command disables the authorization of configuration commands. In this state, authorization to execute configuration commands can be managed by controlling access to global configuration commands. The default setting authorizes configuration commands through the policy specified for all other commands.

- To enable the authorization of configuration commands with the policy specified for all other commands, enter [aaa authorization config-commands](#).
- To require authorization of commands entered on the console, enter [aaa authorization serial-console](#) .

By default, EOS does not verify authorization of commands entered on the console port.

### Examples

- This command disables the authorization of configuration commands.

```
switch(config)#no aaa authorization config-commands
```

- This command enables the authorization of configuration commands.

```
switch(config)#aaa authorization config-commands
```

- This command configures the switch to authorize commands entered on the console, using the method specified through a previously executed `aaa authorization` command.

```
switch(config)#aaa authorization serial-console
```

---

### 8.1.1.5.3 Accounting

The accounting service collects information for billing, auditing, and reporting. The switch supports TACACS+ and RADIUS accounting by reporting user activity to either the TACACS+ server or RADIUS server in the form of accounting records.

The switch supports two types of accounting:

- EXEC: Provides information about user CLI sessions.
- Commands: Command authorization for all commands, including configuration commands that are associated with a privilege level.

The accounting mode determines when accounting notices are sent. Mode options include:

- start-stop: a *start* notice is sent when a process begins; a *stop* notice is sent when it ends.
- stop-only: a *stop* accounting record is generated after a process successfully completes.

Accounting is enabled by the [aaa accounting](#) command.

#### Examples

- This command configures the switch to maintain start-stop accounting records for all commands executed by switch users and submits them to all TACACS+ hosts.

```
switch(config)#aaa accounting commands all default start-stop group tacacs+
```

- This command configures the switch to maintain stop accounting records for all user EXEC sessions performed through the console and submits them to all TACACS+ hosts.

```
switch(config)#aaa accounting exec console stop group tacacs+
```

### 8.1.1.6 TACACS+ Configuration Examples

These sections describe two sample TACACS+ host configurations.

#### 8.1.1.6.1 Single Host Configuration

The example single host configuration consists of a TACACS+ server with these attributes:

- IP address: 10.1.1.10
- encryption key: example\_1
- port number: 49 (global default)
- timeout: 5 seconds (global default)

The switch authenticates the username and enable command against all TACACS+ servers which, in this case, is one host. If the TACACS+ server is unavailable, the switch authenticates with the local file.

1. This step configures TACACS+ server settings â port number and timeout are global defaults.

```
switch(config)#tacacs-server host 10.1.1.10 key example_1
```

2. This step configures the login authentication service.

```
switch(config)#aaa authentication login default group tacacs+ local
```

3. This step configures the **enable** command password authentication service.

```
switch(config)#aaa authentication enable default group tacacs+ local
```

### 8.1.1.6.2 Multiple Host Configuration

The example multiple host configuration consists of three TACACS+ servers at these locations:

- IP address 10.1.1.2 - port 49
- IP address 172.16.4.12 - port 4900
- IP address 192.168.2.10 - port 49

The configuration combines the servers into these server groups:

- **Bldg\_1** group consists of the servers at 10.1.1.2 and 172.16.4.12
- **Bldg\_2** group consists of the servers at 192.168.2.10

All servers use these global TACACS+ defaults:

- encryption key - example\_2
- timeout - 10 seconds

The switch authenticates these access methods:

- username access against **Bldg\_1** group then, if they are not available, against the local file.
- enable command against **Bldg\_2** group, then **Bldg\_1** group, then against the local file.

#### 1. TACACS+ Host commands:

These commands configure the IP address and ports for the three TACACS+ servers. The port for the first and third server is default 49.

```
switch(config)#tacacs-server host 10.1.1.12
switch(config)#tacacs-server host 172.16.4.12 port 4900
switch(config)#tacacs-server host 192.168.2.10
```

#### 2. Global Configuration Commands:

These commands configure the global encryption key and timeout values.

```
switch(config)#tacacs-server key example_2
switch(config)#tacacs-server timeout 10
```

#### 3. Group Server Commands:

The **aaa group server** commands create the server groups and place the CLI in server group configuration mode, during which the servers are placed in the group. The port number must be included if it is not the default port, as in the line that adds 192.168.1.1.

```
switch(config)#aaa group server tacacs+ Bldg_1
switch(config-sg-tacacs+-Bldg_1)#server 10.1.1.2
switch(config-sg-tacacs+-Bldg_1)#server 192.168.1.1 port 4900
switch(config-sg-tacacs+-Bldg_1)#exit
switch(config)#aaa group server tacacs+ Bldg_2
switch(config-sg-tacacs+-Bldg_2)#server 192.168.2.2
switch(config-sg-tacacs+-Bldg_2)#exit
switch(config)#
```

#### 4. Login and enable configuration authentication responsibility commands:

These commands configure the username and enable command password authentication services.

```
switch(config)#aaa authentication login default group Bldg_1 local
switch(config)#aaa authentication enable default group Bldg_1 group
Bldg_2 local
```

---

## 8.1.1.7 AAA Commands

### Local Security File Commands

- `aaa root`
- `enable password`
- `show privilege`
- `show users`
- `show users accounts`
- `username`
- `username ssh-key`

### Accounting, Authentication, and Authorization Commands

- `aaa accounting`
- `aaa accounting dot1x`
- `aaa accounting system`
- `aaa authentication dot1x`
- `aaa authentication enable`
- `aaa authentication login`
- `aaa authentication policy local allow-nopassword-remote-login`
- `aaa authentication policy log`
- `aaa authorization commands`
- `aaa authorization config-commands`
- `aaa authorization exec`
- `aaa authorization policy local default-role`
- `aaa authorization serial-console`
- `clear aaa counters`
- `clear aaa counters radius`
- `clear aaa counters tacacs+`
- `show aaa`
- `show aaa counters`
- `show aaa methods`
- `show users detail`

### Server (RADIUS and TACACS+) Configuration Commands

- `ip radius source-interface`
- `ip tacacs source-interface`
- `radius-server deadline`
- `radius-server host`
- `radius-server key`
- `radius-server retransmit`
- `radius-server timeout`
- `show radius`
- `show tacacs`
- `tacacs-server host`
- `tacacs-server key`
- `tacacs-server policy`
- `tacacs-server timeout`

**Server Group Configuration Commands**

- `aaa group server radius`
- `aaa group server tacacs+`
- `server` (server-group-RADIUS configuration mode)
- `server` (server-group-TACACS+ configuration mode)

**Role-Based Authorization Configuration Commands**

- `deny` (Role)
- `no <sequence number>` (Role)
- `permit` (Role)
- `resequence` (Role)
- `role`
- `show users roles`

---

### 8.1.1.7.1 aaa accounting dot1x

The `aaa accounting dot1x` command enables the accounting of requested 802.1X services for network access.

The `no aaa accounting dot1x` and `default aaa accounting dot1x` commands disable the specified method list by removing the corresponding `aaa accounting dot1x` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
aaa accounting dot1x default[ METHOD_1][METHOD_2] ... [METHOD_N]
```

```
no aaa accounting dot1x default
```

```
default aaa accounting dot1x default
```

#### Parameters

- **MODE** accounting mode that defines when accounting notices are sent. Options include:
  - **start-stop** a *start* notice is sent when a process begins; a *stop* notice is sent when it ends.
- **METHOD\_X** server groups (methods) to which the switch can send accounting records. The switch sends the method list to the first listed group that is available.

Parameter value is not specified if **MODE** is set to **none**. If **MODE** is not set to **none**, the command must provide at least one method. Each method is composed of one of the following:

- **group name** the server group identified by *name*.
  - **group radius** server group that includes all defined RADIUS hosts.
  - **logging** server group that includes all defined TACACS+ hosts.

#### Examples

- This example configures IEEE 802.1X accounting on the switch.

```
switch(config)#aaa accounting dot1x default start-stop group
radius
switch(config)#
```

- This example disables IEEE 802.1X accounting on the switch.

```
switch(config)#no aaa accounting dot1x default
switch(config)#
```

### 8.1.1.7.2 aaa accounting system

The **aaa accounting system** command performs accounting for all system-level events.

The **no aaa accounting system** and **default aaa accounting system** commands clear the specified method list by removing the corresponding **aaa accounting system** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
aaa accounting system default [METHOD_1][METHOD_2] ... [METHOD_N]
```

```
no aaa accounting system default
```

```
default aaa accounting system default
```

#### Parameters

- **MODE** accounting mode that defines when accounting notices are sent. Options include:
  - **none** no notices are sent.
  - **start-stop** a *start* notice is sent when a process begins; a *stop* notice is sent when it ends.
  - **stop-only** a *stop* accounting record is generated after a process successfully completes.
- **METHOD\_X** server groups (methods) to which the switch can send accounting records. The switch sends the method list to the first listed group that is available.

Parameter value is not specified if **MODE** is set to **none**. If **MODE** is not set to **none**, the command must provide at least one method. Each method is composed of one of the following:

- **group name** the server group identified by *name*.
  - **group radius** server group that includes all defined RADIUS hosts.
  - **group tacacs+** server group that includes all defined TACACS+ hosts.
  - **logging** server group that includes all defined TACACS+ hosts.

#### Examples

- This command configures AAA accounting to not use any accounting methods for system events.

```
switch(config)#aaa accounting system default none
switch(config)#
```

- This command configures the switch to maintain stop accounting records for system events to all defined RADIUS hosts.

```
switch(config)#aaa accounting system default stop-only group
radius
switch(config)#
```

### 8.1.1.7.3 aaa accounting

The **aaa accounting** command configures accounting method lists for a specified authorization type. Each list consists of a prioritized list of methods. The accounting module uses the first available listed method for the authorization type.

The **no aaa accounting** and **default aaa accounting** commands clear the specified method list by removing the corresponding **aaa accounting** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
aaa accounting TYPE CONNECTION MODE [METHOD_1][METHOD_2] ... [METHOD_N]
```

```
no aaa accounting TYPE CONNECTION
```

```
default aaa accounting TYPE CONNECTION
```

#### Parameters

- **TYPE** authorization type for which the command specifies a method list. Options include:
  - **EXEC** records user authentication events.
  - **COMMANDS ALL** records all entered commands.
  - **COMMANDS level** records entered commands of the specified *level* (ranges from 0 to 15).
- **CONNECTION** connection type of sessions for which method lists are reported. Options include:
  - **console** console connection.
  - **default** all connections not covered by other command options.
- **MODE** accounting mode that defines when accounting notices are sent. Options include:
  - **none** no notices are sent.
  - **start-stop** a *start* notice is sent when a process begins; a *stop* notice is sent when it ends.
  - **stop-only** a *stop* accounting record is generated after a process successfully completes.
- **METHOD\_X** server groups (methods) to which the switch can send accounting records. The switch sends the method list to the first listed group that is available.

Parameter value is not specified if **MODE** is set to **none**. If **MODE** is not set to **none**, the command must provide at least one method. Each method is composed of one of the following:

- **group name** the server group identified by *name*.
  - **group radius** server group that includes all defined RADIUS hosts.
  - **group tacacs+** server group that includes all defined TACACS+ hosts.
  - **logging** log all accounting messages to syslog.

#### Examples

- This command configures the switch to maintain start-stop accounting records for all commands executed by switch users and submits them to all TACACS+ hosts.

```
switch(config)#aaa accounting commands all default start-stop
group tacacs+
switch(config)#
```

- This command configures the switch to maintain stop accounting records for all user EXEC sessions performed through the console and submits them to all TACACS+ hosts.

```
switch(config)#aaa accounting exec console stop group tacacs+
```

```
switch(config)#
```

- This command configures the switch to maintain start-stop accounting records for all commands executed by switch users and submits them to all TACACS+ hosts.

```
switch(config)#aaa accounting commands all default start-stop  
group tacacs+  
switch(config)#
```

- This command configures the switch to maintain stop accounting records for all user EXEC sessions performed through the console and submits them to all TACACS+ hosts.

```
switch(config)#aaa accounting exec console stop group tacacs+  
switch(config)#
```

---

#### 8.1.1.7.4 aaa authentication dot1x

The **aaa authentication dot1x** command configures the default authentication list of requested 802.1X services for network access.

The **no aaa authentication dot1x** and **default aaa authentication dot1x** commands remove the default authentication list for IEEE 802.1X.

##### Command Mode

Global Configuration

##### Command Syntax

```
aaa authentication dot1x default group {group_name | radius}
```

```
no aaa authentication dot1x default
```

```
default aaa authentication dot1x
```

##### Parameters

- **default** configures the default authentication list of requested 802.1X services for network access
- **group** configures server group
- **group\_name** server group name; multiple group names can be entered in a single command
- **radius** list of all defined RADIUS hosts

##### Examples

- This command configures the switch in the auth1 group for IEEE 802.1X authentication.

```
switch(config)#aaa authentication dot1x default group auth1
switch(config)#
```

### 8.1.1.7.5 aaa authentication enable

The **aaa authentication enable** command configures the service list that the switch references to authorize access to Privileged EXEC command mode.

The list consists of a prioritized list of service options. Available service options include:

- a named server group
- all defined TACACS+ hosts
- all defined RADIUS hosts
- local authentication
- no authentication

The switch authorizes access by using the first listed service option that is available. When the local file is a service list element, attempts to locally authenticate a username that is not in the local file result in the switch continuing to the next service list element.

When the list is not configured, it is set to **local**.

The **no aaa authentication enable** and **default aaa authentication enable** commands revert the list configuration as **local** by removing the **aaa authentication enable** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
aaa authentication enable default METHOD_1 [METHOD_2] ... [METHOD_N]
```

```
no aaa authentication enable default
```

```
default aaa authentication enable default
```

#### Parameters

- **METHOD\_X** authentication service method list. The command must provide at least one method. Each method is composed of one of the following:
  - **group name** the server group identified by *name*.
  - **group radius** a server group that consists of all defined RADIUS hosts.
  - **group tacacs+** a server group that consists of all defined TACACS+ hosts.
  - **local** local authentication.
  - **none** users are not authenticated; all access attempts succeed.

#### Example

- This command configures the switch to authenticate the enable password through all configured TACACS+ servers. Local authentication is the backup if TACACS+ servers are unavailable.

```
switch(config)#aaa authentication default enable group TACACS+
local
switch(config)#
```

### 8.1.1.7.6 aaa authentication login

The **aaa authentication login** command configures service lists the switch references to authenticate usernames. Service lists consist of service options ordered by usage priority. The switch authenticates usernames through the first available service option. Supported service options include:

- a named server group
- all defined TACACS+ hosts
- all defined RADIUS hosts
- local authentication
- no authentication

When the local file is a service list element, attempts to locally authenticate a username that is not in the local file result in the switch continuing to the next service list element.

The switch supports a **console** list for authenticating usernames through the console and a default list for authenticating usernames through all other connections.

- When the **console** list is not configured, the console connection uses the **default** list.
- When the **default** list is not configured, it is set to *local*.

The **no aaa authentication login** and **default aaa authentication login** commands revert the specified list configuration to its default by removing the corresponding **aaa authentication login** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
aaa authentication login CONNECTION SERVICE_1 [SERVICE_2] ... [SERVICE_N]
no aaa authentication login CONNECTION
default aaa authentication login CONNECTION
```

#### Parameters

- **CONNECTION** connection type of sessions for which authentication list is used
  - **default** the default authentication list
  - **console** the authentication list for console logins
- **SERVICE\_X** an authentication service. Settings include:
  - **group name** identifies a previously defined server group
  - **group radius** a server group that consists of all defined RADIUS hosts
  - **group tacacs+** a server group that consists of all defined TACACS+ hosts
  - **local** local authentication
  - **none** The switch does not perform authentication. All access attempts succeed.

#### Examples

- This command configures the switch to authenticate usernames through the TAC-1 server group. The local database is the backup method if TAC-1 servers are unavailable.

```
switch(config)#aaa authentication login default group TAC-1
local
switch(config)#
```

- This command configures the switch to authenticate usernames through all TACACS+ servers, then all RADIUS servers if the TACACS+ servers are not available. If the

RADIUS servers are also unavailable, the switch allows access to all login attempts without authentication.

```
switch(config)#aaa authentication login default group tacacs+  
group radius none  
switch(config)#
```

---

### 8.1.1.7.7 aaa authentication policy local allow-nopassword-remote-login

The **aaa authentication policy local allow-nopassword-remote-login** command permits usernames without passwords to log in from any port. The default switch setting only allows unprotected usernames to log in from the console.

The **no aaa authentication policy local allow-nopassword-remote-login** and **default aaa authentication policy local allow-nopassword-remote-login** commands return the switch to the default setting of allowing unprotected usernames to log in only from the console.

#### Command Mode

Global Configuration

#### Command Syntax

```
aaa authentication policy local allow-nopassword-remote-login
```

```
no aaa authentication policy local allow-nopassword-remote-login
```

```
default aaa authentication policy local allow-nopassword-remote-login
```

#### Examples

- This command configures the switch to allow unprotected usernames to log in from any port.

```
switch(config)#aaa authentication policy local allow-nopassw  
ord-remote-login  
switch(config)#
```

- This command configures the switch to allow unprotected usernames to log in only from the console port.

```
switch(config)#no aaa authentication policy local allow-  
nopassword-remote-login  
switch(config)#
```

### 8.1.1.7.8 aaa authentication policy log

The **aaa authentication policy log** command configures the switch to generate syslog messages for login authentication success or failure events.

The **no aaa authentication policy log** and the **default aaa authentication policy log** commands restore the default behavior of not generating syslog messages for these events.

#### Command Mode

Global Configuration

#### Command Syntax

```
aaa authentication policy {on-failure | on-success} log
no aaa authentication policy {on-failure | on-success} log
default aaa authentication policy {on-failure | on-success} log
```

#### Parameters

- **on-failure** generates syslog messages for failed login events.
- **on-success** generates syslog messages for successful login events.

#### Examples

This command configures the switch to log successful and failed login attempts.

```
switch(config)#aaa authentication policy on-success log
switch(config)#aaa authentication policy on-failure log
```

### 8.1.1.7.9 aaa authorization commands

The **aaa authorization commands** command configures the service list that authorizes CLI command access. All switch commands are assigned a privilege level that corresponds to the lowest level command mode from which it can be executed:

- Level 1: Commands accessible from EXEC mode.
- Level 15: Commands accessible from any mode except EXEC.

Command usage is authorized for each privilege level specified in the command.

The list consists of a prioritized list of service options. The switch authorizes access by using the first listed service option that is available. The available service options include:

- a named server group
- all defined TACACS+ hosts
- all defined RADIUS hosts
- local authorization
- no authorization

The list is set to **none** for all unconfigured privilege levels, allowing all CLI access attempts to succeed.

The **no aaa authorization commands** and **default aaa authorization commands** commands revert the list contents to **none** for the specified privilege levels.

#### Command Mode

Global Configuration

#### Command Syntax

```
aaa authorization commands PRIV default SERVICE_1[SERVICE_2] ... [SERVICE_N]
```

```
no aaa authorization commands PRIV default
```

```
default aaa authorization commands PRIV default
```

#### Parameters

- **PRIV** Privilege levels of the commands. Options include:
  - **level** numbers from **0** and **15**. Number, range, comma-delimited list of numbers and ranges.
  - **all** commands of all levels.
- **SERVICE\_X** Authorization service. Command must list at least one service. Options include:
  - **group name** the server group identified by *name*.
  - **group tacacs+** a server group that consists of all defined TACACS+ hosts.
  - **local** local authorization.
  - **none** the switch does not perform authorization. All access attempts succeed.

#### Examples

- This command authorizes configuration commands (privilege level 15) through the local file. The switch denies command access to users not listed in the local file.

```
switch(config)#aaa authorization commands all default local
switch(config)#
```

- This command authorizes all commands entered on the CLI.

```
switch(config)#aaa authorization commands all default none
```

```
switch(config)#
```

---

### 8.1.1.7.10 aaa authorization config-commands

The **aaa authorization config-commands** command enables authorization of commands in any configuration mode, such as Global Configuration and all interface configuration modes. Commands are authorized through the policy specified by the **aaa authorization commands** setting. Authorization is enabled by default, so issuing this command has no effect unless **running-config** contains the **no aaa authorization config-commands** command.

The **no aaa authorization config-commands** command disables configuration command authorization. When configuration command authorization is disabled, **running-config** contains the **no aaa authorization config-commands** command. The **default aaa authorization config-commands** command restores the default setting by removing the **no aaa authorization config-commands** from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
aaa authorization config-commands
no aaa authorization config-commands
default aaa authorization config-commands
```

#### Example

- This command disables the authorization of configuration commands.

```
switch(config)#no aaa authorization config-commands
switch(config)#
```

- This command enables the authorization of configuration commands.

```
switch(config)#aaa authorization config-commands
switch(config)#
```

### 8.1.1.7.11 aaa authorization exec

The **aaa authorization exec** command configures the service list that the switch references to authorize access to open an EOS CLI shell.

The list consists of a prioritized list of service options. The switch authorizes access by using the first listed service option to which the switch can connect. When the switch cannot communicate with an entity that provides a specified service option, it attempts to use the next option in the list.

The available service options include:

- a named server group
- all defined TACACS+ hosts
- all defined RADIUS hosts
- local authentication
- no authentication

When the list is not configured, it is set to **none**, allowing all CLI access attempts to succeed.

The **no aaa authorization exec** and **default aaa authorization exec** commands set the list contents to **none**.

#### Command Mode

Global Configuration

#### Command Syntax

```
aaa authorization exec default METHOD_1[METHOD_2] ... [METHOD_N]
```

```
no aaa authorization exec default
```

```
default aaa authorization exec default
```

#### Parameters

- **METHOD\_X** authorization service (method). The switch uses the first listed available method.

The command must provide at least one method. Each method is composed of one of the following:

- **group name** the server group identified by *name*.
  - **group radius** a server group that consists of all defined RADIUS hosts.
  - **group tacacs+** a server group that consists of all defined TACACS+ hosts.
  - **local** local authentication.
  - **none** the switch does not perform authorization. All access attempts succeed.

#### Guidelines

During the exec authorization process, the TACACS+ server response may include attribute-value (AV) pairs. The switch recognizes **priv-lvl=x** (where **x** is an integer between 0 and 15), which is a mandatory AV pair. A TACACS+ server that sends any other mandatory AV pair is denied access to the switch. The receipt of optional AV pairs by the switch has no affect on decisions to permit or deny access to the TACACS+ server.

#### Example

- This command specifies that the TACACS+ servers authorize users that attempt to open an EOS CLI shell.

```
switch(config)#aaa authorization exec default group tacacs+
switch(config)#
```

### 8.1.1.7.12 aaa authorization policy local default-role

The **aaa authorization policy local** command specifies the name of the default role. A role is a data structure that supports local command authorization through its assignment to user accounts. Roles consist of permit and deny rules that define authorization levels for specified commands. Applying a role to a username authorizes the user to execute commands specified by the role.

The default role is assigned to the following users:

- local or remote users assigned to a role that is not configured.
- local users to whom a role is not assigned.

When the default-role is not specified, **network-operator** is assigned to qualified users as the default role. The network-operator role authorizes assigned users access to all CLI commands in EXEC and Privileged EXEC modes.

The **no aaa authentication policy local default-role** and **default aaa authentication policy local default-role** commands remove the **authentication policy local default-role** statement from *running-config*. Removing this statement restores **network-operator** as the default role.

#### Command Mode

Global Configuration

#### Command Syntax

```
aaa authorization policy local default-role role_name
no aaa authorization policy local default-role
default aaa authorization policy local default-role
```

#### Parameters

- **role\_name** Name of the default role.

#### Related Commands

The [role](#) command places the switch in role configuration mode for creating and editing roles.

#### Examples

- This command configures the sysuser as the default role.

```
switch(config)#aaa authorization policy local default-role
  sysuser
switch(config)#
```

- This command restores **network-operator** as the default role.

```
switch(config)#no aaa authorization policy local default-role
switch(config)#
```

- This command displays the contents of the **network-operator** role.

```
switch#show users roles network-operator
The default role is network-operator
role: network-operator
      10 deny mode exec command bash|\|
      20 permit mode exec command .*
switch#
```

### 8.1.1.7.13 aaa authorization serial-console

The **aaa authorization serial-console** command configures the switch to authorize commands entered through the console. By default, commands entered through the console do not require authorization.

The **no aaa authorization serial-console** and **default aaa authorization serial-console** commands restore the default setting.

#### Command Mode

Global Configuration

#### Command Syntax

```
aaa authorization serial-console
no aaa authorization serial-console
default aaa authorization serial-console
```

#### Example

- This command configures the switch to authorize commands entered on the console, using the method specified through a previously executed [aaa authorization commands](#) command.

```
switch(config)#aaa authorization serial-console
switch(config)#
```

---

### 8.1.1.7.14 aaa group server radius

The **aaa group server radius** command enters the Server-group-RADIUS Configuration Mode for the specified group name. The command creates the specified group if it was not previously created. Commands are available to add servers to the group.

A server group is a collection of servers that are associated with a single label. Subsequent authorization and authentication commands access all servers in a group by invoking the group name. Server group members must be previously configured with a [radius-server host](#) command.

The **no aaa group server radius** and **default aaa group server radius** commands delete the specified server group from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
aaa group server radius group_name
no aaa group server radius group_name
default aaa group server radius group_name
```

#### Parameters

- **group\_name** name (text string) assigned to the group. Cannot be identical to a name already assigned to a TACACS+ server group.

#### Commands Available in Server-group-RADIUS Configuration Mode

- [server](#) (server-group-RADIUS configuration mode)

#### Related Commands

- [aaa group server tacacs+](#)

#### Example

- This command creates the RADIUS server group named RAD-SV1 and enters Server-group-RADIUS Configuration Mode for the new group.

```
switch(config)#aaa group server radius RAD-SV1
switch(config-sg-radius-RAD-SV1)#
```

### 8.1.1.7.15 aaa group server tacacs+

The **aaa group server tacacs+** command enters Server-group-TACACS+ Configuration Mode for the specified group name. The command creates the specified group if it was not previously created. Commands are available to add servers to the group.

A server group is a collection of servers that are associated with a single label. Subsequent authorization and authentication commands access all servers in a group by invoking the group name. Server group members must be previously configured with a [tacacs-server host](#) command.

The **no aaa group server tacacs+** and **default aaa group server tacacs+** commands delete the specified server group from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
aaa group server tacacs+ group_name
no aaa group server tacacs+ group_name
default aaa group server tacacs+ group_name
```

#### Parameters

**group\_name** name (text string) assigned to the group. Cannot be identical to a name already assigned to a RADIUS server group.

#### Commands Available in Server-group-TACACS+ Configuration Mode

[server](#) (server-group-TACACS+ configuration mode)

#### Related Command

[aaa group server radius](#)

#### Example

This command creates the TACACS+ server group named TAC-GR and enters Server-group-TACACS+ Configuration Mode for the new group.

```
switch(config)#aaa group server tacacs+ TAC-GR
switch(config-sg-tacacs+-TAC-GR)#
```

### 8.1.1.7.16 aaa root

The `aaa root` command specifies the password security level for the root account and can assign a password to the account.

The `no aaa root` and `default aaa root` commands disable the root account by removing the `aaa root` command from *running-config*. The root account is disabled by default.

#### Command Mode

Global Configuration

#### Command Syntax

```
aaa root SECURITY_LEVEL [ENCRYPT_TYPE] [password]
```

```
no aaa root
```

```
default aaa root
```

#### Parameters

- **SECURITY\_LEVEL** password assignment level. Settings include
  - **secret** the root account is assigned to the password.
  - **nopassword** the root account is not password protected.
- **ENCRYPT\_TYPE** encryption level of the *password* parameter. This parameter is present only when **SECURITY\_LEVEL** is **secret**. Settings include:
  - `<no parameter>` the password is entered as clear text.
  - **0** the password is entered as clear text. Equivalent to `<no parameter>`.
  - **5** the password is entered as an MD5-encrypted string.
  - **sha512** the password is entered as an SHA-512-encrypted string.
- *password* text that authenticates the username. The command includes this parameter only if **SECURITY\_LEVEL** is **secret**.
  - *password* must be in clear text if **ENCRYPT\_TYPE** specifies clear text.
  - *password* must be an appropriately encrypted string if **ENCRYPT\_TYPE** specifies encryption.

Encrypted strings entered through this parameter are generated elsewhere.

#### Examples

- These equivalent commands assign **f4980** as the root account password.

```
switch(config)#aaa root secret f4980
switch(config)#aaa root secret 0 f4980
```

- This command assigns the text (ab234) that corresponds to the encrypted string of \$1\$HW05LEY8\$QEVw6JqjD9VqDfh.O8r.b. as the root password.

```
switch(config)#aaa root secret 5 $1$HW05LEY8$QEVw6JqjD9VqDf
h.O8r.b
switch(config)#
```

- This command removes the password from the root account.

```
switch(config)#aaa root nopassword
switch(config)#
```

- This command disables the root login.

```
switch(config)#no aaa root
```

```
switch(config)#
```

### 8.1.1.7.17 clear aaa counters radius

The **clear aaa counters radius** command resets the counters that track the statistics for the RADIUS servers that the switch accesses. The **show radius** command displays the counters reset by the **clear aaa counters radius** command.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear aaa counters radius
```

#### Example

These commands display the effect of the **clear aaa counters radius** command on the RADIUS counters.

```
switch#show radius
RADIUS server          : radius/10
  Connection opens:    204
  Connection closes:   0
  Connection disconnects: 199
  Connection failures: 10
  Connection timeouts: 2
  Messages sent:       1490
  Messages received:   1490
  Receive errors:      0
  Receive timeouts:    0
  Send timeouts:       0

Last time counters were cleared: never
switch#clear aaa counters radius
switch#show radius
RADIUS server          : radius/10
  Connection opens:    0
  Connection closes:   0
  Connection disconnects: 0
  Connection failures: 0
  Connection timeouts: 0
  Messages sent:       0
  Messages received:   0
  Receive errors:      0
  Receive timeouts:    0
  Send timeouts:       0

Last time counters were cleared: 0:00:03 ago
switch#
```

### 8.1.1.7.18 clear aaa counters tacacs+

The **clear aaa counters tacacs+** command resets the counters that track the statistics for the TACACS+ servers that the switch accesses. The **show tacacs** command displays the counters reset by the **clear aaa counters tacacs+** command.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear aaa counters tacacs+
```

#### Example

- These commands display the effect of the **clear aaa counters tacacs+** command on the tacacs+ counters.

```
switch#show tacacs
TACACS+ server          : tacacs/49
  Connection opens:      15942
  Connection closes:    7
  Connection disconnects: 1362
  Connection failures:  0
  Connection timeouts:  0
  Messages sent:        34395
  Messages received:    34392
  Receive errors:       0
  Receive timeouts:    2
  Send timeouts:        0

Last time counters were cleared: never

TACACS+ source-interface: Enabled
  TACACS+ outgoing packets will be sourced with an IP address
  associated with the
  Loopback0 interface
switch#clear aaa counters tacacs+
switch#show tacacs
TACACS+ server          : tacacs/49
  Connection opens:      0
  Connection closes:    0
  Connection disconnects: 0
  Connection failures:  0
  Connection timeouts:  0
  Messages sent:        0
  Messages received:    0
  Receive errors:       0
  Receive timeouts:    0
  Send timeouts:        0

Last time counters were cleared: 0:00:03 ago
switch#

TACACS+ source-interface: Enabled
  TACACS+ outgoing packets will be sourced with an IP address
  associated with the
  Loopback0 interface
switch#
```

---

### 8.1.1.7.19 clear aaa counters

The **clear aaa counters** command resets the counters that track the number of service transactions performed by the switch since the last time the counters were reset. The [show aaa counters](#) command displays the counters reset by the **clear aaa counters** command.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear aaa counters [SERVICE_TYPE]
```

#### Example

- These commands display the effect of the **clear aaa counters** command on the AAA counters.

```
switch#clear aaa counters
switch#show aaa counters
Authentication
    Successful:          0
    Failed:              0
    Service unavailable: 0

Authorization
    Allowed:             1
    Denied:              0
    Service unavailable: 0

Accounting
    Successful:          0
    Error:               0
    Pending:             0

Last time counters were cleared: 0:00:44 ago
```

### 8.1.1.7.20 deny (Role)

The **deny** command adds a deny rule to the configuration mode role. Deny rules prohibit access of specified commands from usernames to which the role is applied. Sequence numbers determine rule placement in the role. Commands are compared sequentially to rules within a role until it matches a rule. A command's authorization is determined by the first rule it matches. Sequence numbers for commands without numbers are derived by adding 10 to the number of the role's last rule.

Deny rules use regular expressions to denote commands. A **mode** parameter specifies command modes from which commands are restricted. Modes are denoted either by predefined keywords, a command modes short key, or a regular expression that specifies the long key of one or more command modes.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode role. The **no <sequence number> (Role)** command also removes the specified rule from the role.

#### Command Mode

Role Configuration

#### Command Syntax

```
[SEQ_NUM] deny [MODE_NAME] command command_name
```

```
no deny [MODE_NAME] command command_name
```

```
default deny [MODE_NAME] command command_name
```

#### Parameters

- **SEQ\_NUM** Sequence number assigned to the rule. Options include:
  - **<no parameter>** Number is derived by adding 10 to the number of the role's last rule.
  - **<1 - 256>** Number assigned to entry.
- **MODE\_NAME** Command mode from which command access is prohibited. Values include:
  - **<no parameter>** All command modes
  - **mode short\_name** Exact match of a mode's short key name.
  - **mode long\_name** Regular expression matching long key name of one or more modes.
  - **mode config** Global configuration mode.
  - **mode config-all** All configuration modes, including global configuration mode.
  - **mode exec** EXEC and Privileged EXEC modes.
- **command\_name** Regular expression that denotes the name of one or more commands.

#### Guidelines

These CLI **prompt** format commands program the prompt to display the following mode keys:

- **%p** Short mode key.
- **%P** Long mode key.

**Deny** statements are saved to **running-config** only upon exiting **Role Configuration Mode**.

#### Related Commands

The **role** command places the switch in **Role Configuration Mode**.

#### Example

These commands append a **deny** rule at the end of the **sysuser** role that restricts access to the **reload** command from EXEC and Privileged EXEC mode.

```
switch(config)#role sysuser
switch(config-mode-sysuser)#deny mode exec command reload
```

---

```
switch(config-mode-sysuser) #
```

### 8.1.1.7.21 enable password

The **enable password** command creates a new enable password or changes an existing password.

The **no enable password** and **default enable password** commands delete the **enable password** by removing the **enable password** command from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
enable password [ENCRYPT_TYPE] password
```

```
no enable password
```

```
default enable password
```

#### Parameters

- **ENCRYPT\_TYPE** encryption level of the *password* parameter. Settings include:
  - **<no parameter>** the password is entered as clear text.
  - **0** the password is entered as clear text. Equivalent to <no parameter>.
  - **5** the password is entered as an MD5 encrypted string.
  - **sha512** the password is entered as an SHA-512-encrypted string.
- **password** text that authenticates the username.
  - **password** must be in clear text if **ENCRYPT\_TYPE** specifies clear text.
  - **password** must be an appropriately encrypted string if **ENCRYPT\_TYPE** specifies encryption.

Encrypted strings entered through this parameter are generated elsewhere.

#### Examples

- These equivalent commands assign *xyrt1* as the enable password.

```
switch(config)#enable password xyrt1
switch(config)#enable password 0 xyrt1
```

- This command assigns the enable password to the clear text (12345) that corresponds to the encrypted string *\$1\$8bPBrJnd\$Z8wbKLHpJEd7d4tc5Z/6h/*. The string was generated by an MD5-encryption program using 12345 as the seed.

```
switch(config)#enable password 5 $1$8bPBrJnd$Z8wbKLHpJEd7d4
tc5Z/6h/
switch(config)#
```

- This command deletes the enable password.

```
switch(config)#no enable password
switch(config)#
```

---

### 8.1.1.7.22 ip radius source-interface

The **ip radius source-interface** command specifies the interface from which the IPv4 address is derived for use as the source for outbound RADIUS packets. When a source interface is not specified, the switch selects an interface.

The **no ip radius source-interface** and **default ip radius source-interface** commands remove the **ip radius source-interface** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip radius [VRF_INST] source-interface INT_NAME
no ip radius [VRF_INST] source-interface
default ip radius [VRF_INST] source-interface
```

#### Parameters

- **VRF\_INST** specifies the VRF instance used to communicate with the specified server.
  - **<no parameter>** switch communicates with the server using the default VRF.
  - **vrf vrf\_name** switch communicates with the server using the specified user-defined VRF.
- **INT\_NAME** Interface type and number. Options include:
  - **interface ethernet e\_num** Ethernet interface specified by *e\_num*.
  - **interface loopback l\_num** Loopback interface specified by *l\_num*.
  - **interface management m\_num** Management interface specified by *m\_num*.
  - **interface port-channel p\_num** Port-channel interface specified by *p\_num*.
  - **interface vlan v\_num** VLAN interface specified by *v\_num*.

#### Example

This command configures the source address for outbound RADIUS packets as the IPv4 address assigned to the loopback interface.

```
switch(config)#ip radius source-interface loopback 0
switch(config)#
```

### 8.1.1.7.23 ip tacacs source-interface

The `ip tacacs source-interface` command specifies the interface from which the IPv4 address is derived for use as the source for outbound TACACS+ packets. When a source interface is not specified, the switch selects an interface.

The `no ip tacacs source-interface` and `default ip tacacs source-interface` commands remove the `ip tacacs source-interface` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip tacacs [VRF_INST] source-interface INT_NAME
```

```
no ip tacacs [VRF_INST] source-interface
```

```
default ip tacacs [VRF_INST] source-interface
```

#### Parameters

- **VRF\_INST** specifies the VRF instance used to communicate with the specified server.
  - **<no parameter>** switch communicates with the server using the default VRF.
  - **vrf vrf\_name** switch communicates with the server using the specified user-defined VRF.
- **INT\_NAME** Interface type and number. Options include:
  - **interface ethernet e\_num** Ethernet interface specified by **e\_num**.
  - **interface loopback l\_num** Loopback interface specified by **l\_num**.
  - **interface management m\_num** Management interface specified by **m\_num**.
  - **interface port-channel p\_num** Port-channel interface specified by **p\_num**.
  - **interface vlan v\_num** VLAN interface specified by **v\_num**.

#### Example

This command configures the source address for outbound TACACS+ packets as the IPv4 address assigned to the loopback interface.

```
switch(config)#ip tacacs source-interface loopback 0
switch(config)#
```

### 8.1.1.7.24 no <sequence number> (Role)

The **no <sequence number>** command removes the rule with the specified sequence number from the configuration-mode role. The **default <sequence number>** command also removes the specified rule.

#### Command Mode

Role Configuration

#### Command Syntax

```
no sequence_num
```

```
default sequence_num
```

#### Parameters

- **sequence\_num** sequence number of rule to be deleted. Values range from 1 to 256.

#### Guidelines

**Role** statement changes are saved to **running-config** only upon exiting Role Configuration Mode.

#### Related Command

The **role** command places the switch in Role Configuration Mode.

#### Example

These commands display the rules in the sysuser role, remove rule 30 from the role, then display the edited role.

```
switch(config)#show users roles sysuser
The default role is network-operator

role: sysuser
    10 deny mode exec command reload
    20 deny mode config command (no |default )?router
    30 deny mode config command (no |default )?(ip|mac)
access-list
    40 deny mode if command (no |default )?(ip|mac) access-
group
    50 deny mode config-all command lacp|spanning-tree
    60 permit command .*
switch(config)#role sysuser
switch(config-role-sysuser)#no 30
switch(config-role-sysuser)#exit
switch(config)#show users roles sysuser
The default role is network-operator

role: sysuser
    10 deny mode exec command reload
    20 deny mode config command (no |default )?router
    40 deny mode if command (no |default )?(ip|mac) access-
group
    50 deny mode config-all command lacp|spanning-tree
    60 permit command .*
switch(config)#
```

### 8.1.1.7.25 radius-server deadtime

The **radius-server deadtime** command defines global deadtime period, when the switch ignores a non-responsive RADIUS server. A non-responsive server is one that fails to answer any attempt to retransmit after a timeout expiry. Deadtime is disabled if a value is not configured.

The **no radius-server deadtime** and **default radius-server deadtime** commands restore the default global deadtime period of three minutes by removing the **radius-server deadtime** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
radius-server deadtime dead_interval
```

```
no radius-server deadtime
```

```
default radius-server deadtime
```

#### Parameters

- **dead\_interval** period that the switch ignores non-responsive servers (minutes). Values range from 1 to 1000. Default is 3.

#### Related Command

[radius-server host](#)

#### Example

This command programs the switch to ignore a server for two hours if it fails to respond to a request during the period defined by timeout and retransmit parameters.

```
switch(config)#radius-server deadtime 120  
switch(config)#
```

### 8.1.1.7.26 radius-server host

The `radius-server host` command sets parameters for communicating with a specific RADIUS server. These values override global settings when the switch communicates with the specified server.

A RADIUS server is defined by its server address, authorization port, and accounting port. Servers with different address-authorization port-accounting port combinations have separate configurations.

The `no radius-server host` and `default radius-server` commands remove settings for the RADIUS server configuration at the specified address-authorization port-accounting port location by deleting the corresponding `radius-server host` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
radius-server host ADDR [VRF_INST][AUTH][ACCT][TIMEOUT][DEAD][RETRAN][ENCRYPT]
no radius-server host [ADDR][VRF_INST][AUTH][ACCT]
default radius-server host [ADDR][VRF_INST][AUTH][ACCT]
```

#### Parameters

- **ADDR** RADIUS server location. Options include:
  - *ipv4\_addr* server's IPv4 address.
  - *host\_name* server's DNS host name (FQDN).
- **VRF\_INST** specifies the VRF instance used to communicate with the specified server.
  - *<no parameter>* switch communicates with the server using the default VRF.
  - *vrf vrf\_name* switch communicates with the server using the specified user-defined VRF.
- **AUTH** Authorization port number.
  - *<no parameter>* default port of 1812.
  - *auth-port number* number ranges from 1 to 65535.
- **ACCT** Accounting port number.
  - *<no parameter>* default port of 1813.
  - *acct-port number* numbers range from 1 to 65535.
- **TIMEOUT** timeout period (seconds). Ranges from 1 to 1000.
  - *<no parameter>* assigns global timeout value (see [radius-server timeout](#)).
  - *timeout number* assigns number as the timeout period. Ranges from 1 to 1000.
- **DEAD** period (minutes) when the switch ignores a non-responsive RADIUS server.
  - *<no parameter>* assigns global deadtime value (see [radius-server deadtime](#)).
  - *deadtime number* specifies deadtime, where number ranges from 1 to 1000.
- **RETRAN** attempts to access RADIUS server after the first timeout expiry.
  - *<no parameter>* assigns global retransmit value (see [radius-server retransmit](#)).
  - *retransmit number* specifies number of attempts, where number ranges from 1 to 100.
- **ENCRYPT** encryption key that switch and server use to communicate.
  - *<no parameter>* assigns global encryption key (see [radius-server key](#)).
  - *key key\_text* where *key\_text* is in clear text.
  - *key 5 key\_text* where *key\_text* is in clear text.
  - *key 7 key\_text* where *key\_text* is provide in an encrypted string.

#### Examples

- This command configures the switch to communicate with the RADIUS server located at *10.1.1.5*. The switch uses the global timeout, deadtime, retransmit, and key settings to communicate with this server, and communicates through port 1812 for authorization and 1813 for accounting.

```
switch(config)#radius-server host 10.1.1.5  
switch(config)#
```

- This command configures the switch to communicate with the RADIUS server assigned the host name *RAD-1*. Communication for authorization is through port 1850; communication for accounting is through port 1813 (the default).

```
switch(config)#radius-server host RAD-1 auth-port 1850  
switch(config)#
```

### 8.1.1.7.27 radius-server key

The **radius-server key** command defines the global encryption key the switch uses when communicating with any RADIUS server for which a key is not defined.

The **no radius-server key** and **default radius-server key** commands remove the global key from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
radius-server key [ENCRYPT_TYPE] encrypt_key
```

```
no radius-server key
```

```
default radius-server key
```

#### Parameters

- **ENCRYPT\_TYPE** encryption level of *encrypt\_key*.
  - **<no parameter>** encryption key is entered as clear text.
  - **0** encryption key is entered as clear text. Equivalent to <no parameter>.
  - **7** *encrypt\_key* is an encrypted string.
- ***encrypt\_key*** shared key that authenticates the username.
  - ***encrypt\_key*** must be in clear text if **ENCRYPT\_TYPE** specifies clear text.
  - ***encrypt\_key*** must be an encrypted string if **ENCRYPT\_TYPE** specifies an encrypted string.

Encrypted strings entered through this parameter are generated elsewhere.

#### Related Commands

- [radius-server host](#)

#### Examples

- This command configures *cv90jr1* as the global encryption key.

```
switch(config)#radius-server key 0 cv90jr1  
switch(config)#
```

- This command assigns *cv90jr1* as the key by specifying the corresponding encrypted string.

```
switch(config)#radius-server key 7 020512025B0C1D70  
switch(config)#
```

### 8.1.1.7.28 radius-server retransmit

The **radius-server retransmit** command defines the global retransmit count, which specifies the number of times the switch attempts to access the RADIUS server after the first timeout expiry.

The **no radius-server retransmit** and **default radius-server retransmit** commands restore the global retransmit count to its default value of three by deleting the **radius-server retransmit** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
radius-server retransmit count
no radius-server retransmit
default radius-server retransmit
```

#### Parameters

- **count** retransmit attempts after first timeout expiry. Values range from 1 to 100. Default is 3.

#### Related Command

[radius-server host](#)

#### Example

This command configures the switch to attempt five RADIUS server contacts after the initial timeout. If the timeout parameter is set to 50 seconds, then the total period that the switch waits for a response is  $((5+1)*50) = 300$  seconds.

```
switch(config)#radius-server retransmit 5
switch(config)#
```

---

### 8.1.1.7.29 radius-server timeout

The `radius-server timeout` command defines the global timeout the switch uses when communicating with any RADIUS server for which a timeout is not defined.

The `no radius-server timeout` and `default radius-server timeout` commands restore the global timeout default period of five seconds by removing the `radius-server timeout` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
radius-server timeout time_period
```

```
no radius-server timeout
```

```
default radius-server timeout
```

#### Parameters

- *time\_period* timeout period (seconds). Values range from 1 to 1000. Default is 5.

#### Related Commands

- [radius-server host](#)
- [radius-server key](#)
- [radius-server deadtime](#)
- [radius-server retransmit](#)

#### Example

This command configures the switch to wait 50 seconds for a RADIUS server response before issuing an error.

```
switch(config)#radius-server timeout 50
switch(config)#
```

### 8.1.1.7.30 resequence (Role)

The **resequence** command assigns sequence numbers to rules in the configuration mode role. Command parameters specify the number of the first rule and the numeric interval between consecutive rules.

The maximum sequence number is 256.

#### Command Mode

Role Configuration

#### Command Syntax

```
resequence start_num inc_num
```

#### Parameters

- **start\_num** sequence number assigned to the first rule. Value ranges from 1 to 256. Default is 10.
- **inc\_num** numeric interval between consecutive rules. Value ranges from 1 to 256. Default is 10.

#### Guidelines

**Role** statement changes are saved to **running-config** only upon exiting Role Configuration Mode.

#### Related Command

The **role** command places the switch in Role Configuration Mode.

#### Example

The **resequence** command renumbers the rules in the sysuser role, starting the first rule at 15 and incrementing subsequent lines by 5.

```
switch(config)#show users roles sysuser
The default role is network-operator

role: sysuser
    10 deny mode exec command reload
    20 deny mode config command (no |default )?router
    40 deny mode if command (no |default )?(ip|mac) access-
group
    50 deny mode config-all command lacp|spanning-tree
    60 permit command .*
switch(config)#role sysuser
switch(config-role-sysuser)#resequence 15 5
switch(config-role-sysuser)#exit
switch(config)#show users roles sysuser
The default role is network-operator

role: sysuser
    15 deny mode exec command reload
    20 deny mode config command (no |default )?router
    25 deny mode if command (no |default )?(ip|mac) access-
group
    30 deny mode config-all command lacp|spanning-tree
    35 permit command .*
switch(config)#
```

### 8.1.1.7.31 permit (Role)

The **permit** command adds a permit rule to the configuration mode role. Permit rules authorize access to specified commands for usernames to which the role is applied. Sequence numbers determine rule placement in the role. Commands are compared sequentially to rules within a role until it matches a rule. A command's authorization is determined by the first rule it matches. Sequence numbers for commands without numbers are derived by adding 10 to the number of the role's last rule.

Permit rules use regular expression to denote commands. A **mode** parameter specifies command modes in which commands are authorized. Modes are denoted either by predefined keywords, a command modes short key, or a regular expression that specifies the long key of one or more command modes.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode role. The **no <sequence number> (Role)** command also removes the specified rule from the role.

#### Command Mode

Role Configuration

#### Command Syntax

```
[SEQ_NUM] permit [MODE_NAME] command command_name
```

```
no permit [MODE_NAME] command ] command_name
```

```
default permit [MODE_NAME] command command_name
```

#### Parameters

- **SEQ\_NUM** Sequence number assigned to the rule. Options include:
  - **<no parameter>** Number is derived by adding 10 to the number of the roles last rule.
  - **<1 - 256>** Number assigned to entry.
- **MODE\_NAME** Command mode in which command access is authorized. Values include:
  - **<no parameter>** All command modes
  - **mode short\_name** Exact match of a modes short-key name.
  - **mode long\_name** Regular expression matching long-key name of one or more modes.
  - **mode config** Global configuration mode.
  - **mode config-all** All configuration modes, including global configuration mode.
  - **mode exec** EXEC and Privileged EXEC modes.
- **command\_name** Regular expression that denotes the name of one or more commands.

#### Guidelines

These CLI **prompt** format commands program the prompt to display the following mode keys:

- **%p** Short-mode key.
- **%P** Long-mode key.

**Permit** statements are saved to **running-config** only upon exiting **Role Configuration Mode**.

#### Related Commands

The **role** command places the switch in **Role Configuration Mode**.

#### Example:

These commands append a **permit** rule at the end of the **sysuser** role that authorizes all commands from **VLAN 1** or **VLAN 2** interface configuration modes.

```
switch(config)#role sysuser
switch(config-mode-sysuser)#permit mode if-Vl(1|2) command .*
```

```
switch(config-mode-sysuser) #
```

### 8.1.1.7.32 role

The **role** command places the switch in Role Configuration Mode, which is a group-change mode that modifies a role. A role is a data structure that supports local command authorization through its assignment to user accounts. Roles consist of permit and deny rules that define authorization levels for specified commands. Applying a role to a username authorizes the user to execute commands specified by the role.

The **role** command specifies the name of the role that subsequent commands modify and creates a role if it references a nonexistent role. All changes in a group change mode edit session are pending until the session ends:

- The **exit** command saves pending changes to **running-config** and returns the switch to Global Configuration Mode. Changes are also saved by entering a different configuration mode.
- The **abort** command discards pending changes, returning the switch to Global Configuration Mode.

The **no role** and **default role** commands delete the specified role by removing the role and its statements from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
role role_name
```

```
no role role_name
```

```
default role role_name
```

#### Parameters

- **role\_name** Name of role.

#### Commands Available in Role Configuration Mode:

- [deny \(Role\)](#)
- [permit \(Role\)](#)
- [no <sequence number> \(Role\)](#)
- [resequence \(Role\)](#)

#### Related Commands

- [show users roles](#)

#### Examples

- This command places the switch in Role Configuration Mode to modify the speaker role.

```
switch(config)#role speaker  
switch(config-role-speaker)#
```

- This command saves changes to **speaker** role, then returns the switch to Global Configuration Mode.

```
switch(config-role-speaker)#exit  
switch(config)#
```

- This command discards changes to **speaker**, then returns the switch to Global Configuration Mode.

```
switch(config-role-speaker)#abort
```

```
switch(config)#
```

### 8.1.1.7.33 server (server-group-RADIUS configuration mode)

The **server (server-group-RADIUS configuration mode)** command adds the specified RADIUS server to the configuration-mode group. Servers must be configured with the [radius-server host](#) command before adding them to the server group.

A RADIUS server is defined by its server address, authorization port, and accounting port. A group can contain multiple servers with the same IP address that have different authorization or accounting ports.

The **no server** and **default server** commands remove the specified server from the group.

#### Command Mode

Server-Group-RADIUS Configuration

#### Command Syntax

```
server LOCATION [VRF_INST][AUTH][ACCT]
no server LOCATION [VRF_INST][AUTH][ACCT]
default server LOCATION [VRF_INST][AUTH][ACCT]
```

#### Parameters

- **LOCATION** RADIUS server location. Options include:
  - **ipv4\_addr** server's IPv4 address.
  - **host\_name** server's DNS host name (FQDN).
- **VRF\_INST** specifies the VRF instance used to communicate with the specified server.
  - **<no parameter>** switch communicates with the server using the default VRF.
  - **vrf vrf\_name** switch communicates with the server using the specified user-defined VRF.
- **AUTH** Authorization port number.
  - **<no parameter>** default port of 1812.
  - **auth-port number number** ranges from 1 to 65535.
- **ACCT** Accounting port number.
  - **<no parameter>** default port of 1813.
  - **acct-port number number** ranges from 1 to 65535.

#### Related Commands

The [aaa group server radius](#) command places the switch in Server-group-RADIUS Configuration Mode.

#### Example

These commands add two servers to the RAD-SV1 server group.

```
switch(config)#aaa group server radius RAD-SV1
switch(config-sg-radius-RAD-SV1)#server RAC-1
switch(config-sg-radius-RAD-SV1)#server 10.1.5.14 acct-port 1851
switch(config-sg-radius-RAD-SV1)#
```

### 8.1.1.7.34 server (server-group-TACACS+ configuration mode)

The `server (server-group-TACACS+ configuration mode)` command adds the specified TACACS+ server to the configuration-mode group. Servers must be configured with the `tacacs-server host` command before adding them to the server group.

A TACACS+ server is defined by its server address and port number. Servers with different address-port combinations have separate statements in *running-config*.

The `no server` and `default server` commands remove the specified server from the group.

#### Command Mode

Server-group-TACACS+ Configuration

#### Command Syntax

```
server LOCATION [VRF_INST][PORT]
no server LOCATION [VRF_INST][PORT]
default server LOCATION [VRF_INST][PORT]
```

#### Parameters

- **LOCATION** TACACS+ server location. Options include:
  - **ipv4\_addr** server's IPv4 address.
  - **ipv6\_addr** server's IPv6 address.
  - **host\_name** server's DNS host name (FQDN).
- **VRF\_INST** specifies the VRF instance used to communicate with the specified server.
  - **<no parameter>** switch communicates with the server using the default VRF.
  - **vrf vrf\_name** switch communicates with the server using the specified user-defined VRF.
- **PORT** TCP connection port number.
  - **<no parameter>** default port of 49.
  - **port number number** ranges from 1 to 65535.

#### Related Command

The `aaa group server tacacs+` command places the switch in Server-group-TACACS+ Configuration Mode.

#### Example

These commands add two servers to the TAC-GR server group with default port number 49.

```
switch(config)#aaa group server tacacs+ TAC-GR
switch(config-sg-tacacs+-TAC-GR)#server TAC-1
switch(config-sg-tacacs+-TAC-GR)#server 10.1.4.14
switch(config-sg-tacacs+-TAC-GR)#
```

---

### 8.1.1.7.35 show aaa counters

The **show aaa counters** command displays the number of service transactions performed by the switch since the last time the counters were reset.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show aaa counters
```

#### Example

This command displays the number of AAA transactions.

```
switch#show aaa counters
Authentication
    Successful:          30
    Failed:              0
    Service unavailable: 0

Authorization
    Allowed:            188
    Denied:             0
    Service unavailable: 0

Accounting
    Successful:         0
    Error:              0
    Pending:            0

Last time counters were cleared: never
switch#
```

### 8.1.1.7.36 show aaa methods

The **show aaa methods** command displays all the named method lists defined in the specified Authentication, Authorization, and Accounting (AAA) service.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show aaa methods SERVICE_TYPE
```

#### Parameters

- **SERVICE\_TYPE** the service type of the method lists that the command displays.
  - **accounting** accounting services.
  - **authentication** authentication services.
  - **authorization** authorization services.
  - **all** accounting, authentication, and authorization services.

#### Example

This command configures the named method lists for all AAA services.

```
switch#show aaa methods all
Authentication method lists for LOGIN:
  name=default methods=group tacacs+, local
Authentication method list for ENABLE:
  name=default methods=local
Authorization method lists for COMMANDS:
  name=privilege0-15 methods=group tacacs+, local
Authentication method list for EXEC:
  name=exec methods=group tacacs+, local
Accounting method lists for COMMANDS:
  name=privilege0-15 default-action=none
Accounting method list for EXEC:
  name=exec default-action=none
switch#
```

---

### 8.1.1.7.37 show aaa

The **show aaa** command displays the user database. The command displays the encrypted enable password first, followed by a table of usernames and their corresponding encrypted password.

The command does not display unencrypted passwords.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show aaa
```

#### Example

This command displays the local user database.

```
switch#show aaa
Enable password (encrypted): $1$UL4gDWy6$3KqCPYPGRvxDxUq3qA/Hs/
Username   Encrypted passwd
-----
admin
janis      $1$VVnDH/Ea$iwsfnrGNO8nbDsf0tazp9/
thomas    $1$/MmXTUil$.fJxLfcumzppNSEDVDWq9.
switch#
```

### 8.1.1.7.38 show privilege

The `show privilege` command displays the current privilege level for the CLI session.

#### Command Mode

EXEC

#### Command Syntax

```
show privilege
```

#### Example

This command displays the current privilege level.

```
switch>show privilege  
Current privilege level is 15  
switch>
```

---

### 8.1.1.7.39 show radius

The **show radius** command displays statistics for the RADIUS servers that the switch accesses.

#### Command Mode

EXEC

#### Command Syntax

```
show radius
```

#### Example

This command displays statistics for connected RADIUS servers.

```
switch#show radius
RADIUS server          : radius/10
  Connection opens:      204
  Connection closes:    0
  Connection disconnects: 199
  Connection failures:  10
  Connection timeouts:  2
  Messages sent:        1490
  Messages received:    1490
  Receive errors:       0
  Receive timeouts:     0
  Send timeouts:        0

Last time counters were cleared: never
switch#
```

#### 8.1.1.7.40 show tacacs

The **show tacacs** command displays statistics for the TACACS+ servers that the switch accesses.

##### Command Mode

EXEC

##### Command Syntax

```
show tacacs
```

##### Example

This command displays statistics for connected TACACS+ servers.

```
switch#show tacacs
TACACS+ server          : tacacs/49
  Connection opens:      15942
  Connection closes:     7
  Connection disconnects: 1362
  Connection failures:   0
  Connection timeouts:   0
  Messages sent:         34395
  Messages received:     34392
  Receive errors:        0
  Receive timeouts:      2
  Send timeouts:         0

Last time counters were cleared: never

TACACS+ source-interface: Enabled
  TACACS+ outgoing packets will be sourced with an IP address
  associated with the
  Loopback0 interface
switch#
```

#### 8.1.1.7.41 show users accounts

The **show users accounts** command displays the names, roles, and privilege levels of users that are listed in *running-config*. The SSH public key is also listed for names for which an SSH key is configured.

##### Command Mode

Privileged EXEC

##### Command Syntax

```
show users accounts
```

##### Example

This command displays the usernames that are configured on the switch.

```
switch#show users accounts
user: FRED
      role: <unknown>
      privilege level: 1
      ssh public key: ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQBAQDjUg2VDiBX7In0q
HtN5PyHOWtYvIoeZsxF5YmesQ/rh++mbpT504dL7So+Bpr9T/0qIj+zilat8fX/J
lO42+3pjfkHY/+1
sT2EPNjGTK7uJv1wSGmhc3+90dNmJtr5YVlJFjjQ5m+5Pa+PGe3z4JIV11Y2Nh
LrV2fXtbcilDjnj6F
AlhXjiLt51DJhG13uUxGBJe0+NlGvpEsTJVJvMdJuS6weMi+xSXc9yQimVD2
weJBHsYFngHST2j0pAy
F2S7/EOU13pY42RztDSs42nMNNrutPT0q5Z17aAKvhpd0dDlc+qIwrCrXb
eIChHem7+0N8/zA3alBK4
eKSFSZBd3Pb admin@switch
switch#
user: JANE
      role: sysuser2
      privilege level: 1
user: admin
      role: network-admin
      privilege level: 1
```

### 8.1.1.7.42 show users detail

The **show users detail** command displays information about active AAA login sessions. Information includes username, roles, TTY, state of the session (pending or established), duration, authentication method, and if available, remote host and remote username.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show users detail
```

#### Example

This command displays information about the active AAA login sessions.

```
switch# show users detail
Session Username Roles TTY State Duration Auth Remote Host
-----
2 admin network-admin ttyS0 E 0:01:21 local
4 joe sysadmin telnet E 0:02:01 local sf.example.com
6 alice sysadmin ssh E 0:00:52 group radius ny.example.com
7 bob sysadmin ssh E 0:00:48 group radius la.example.com
8 kim network-admin1 ssh E 0:00:55 group radius de.example.com
9 admin network-admin ssh E 0:00:07 local bj.example.com
10 max network-admin telnet E 0:00:07 local sf.example.com
```

### 8.1.1.7.43 show users roles

The **show users roles** command displays the name of the default role and the contents of the specified roles. Commands that do not specify a role display the rules in all built-in and configured roles.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show users roles [ROLE_LIST]
```

#### Parameters

- **ROLE\_LIST** Roles that the command displays. Options include:
  - **<no parameter>** Command displays all roles.
  - **role\_name** Name of role displayed by command.

#### Related Command

The **role** command places the switch in Role Configuration Mode, which is used to create new roles or modify existing roles.

#### Example

This command displays the contents of all user-defined and built-in roles.

```
switch#show users roles
The default role is network-operator

role: network-admin
    10 permit command .*
role: network-operator
    10 deny mode exec command bash|\\|
    20 permit mode exec command .*

```

#### 8.1.1.7.44 show users

The **show users** command displays the usernames that are currently logged into the switch.

##### Command Mode

Privileged EXEC

##### Command Syntax

```
show users
```

##### Example

This command displays the users that are logged into the switch.

```
switch#show users
  Line      User      Host(s)      Idle      Location
  1 vty 2    john      idle        1d       10.22.6.113
  2 vty 4    jane      idle        21:33:00 10.22.26.26
 * 3 vty 6    ted       idle        00:00:01 10.17.18.71
switch#
```

### 8.1.1.7.45 tacacs-server host

The `tacacs-server host` command sets communication parameters for communicating with a specific TACACS+ server. These values override global settings when the switch communicates with the specified server.

A TACACS+ server is defined by its server address and port number. Servers with different combinations of address-port-VRF-multiplex settings have separate statements in *running-config*.

The `no tacacs-server host` and `default tacacs-server host` commands remove settings for the TACACS+ server configuration at the specified address-port-VRF combination by deleting the corresponding `tacacs-server host` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
tacacs-server host SERVER_ADDR [MULTIPLY][VRF_INST][PORT][TIMEOUT][ENCRYPT]
```

```
no tacacs-server host [SERVER_ADDR][MULTIPLY][VRF_INST][PORT]
```

```
default tacacs-server host [SERVER_ADDR][MULTIPLY][VRF_INST][PORT]
```

#### Parameters

- **SERVER\_ADDR** TACACS+ server location. Options include:
  - *ipv4\_addr* server's IPv4 address.
  - *ipv6\_addr* server's IPv6 address.
  - *host\_name* server's DNS host name (FQDN).
- **MULTIPLY** TACACS+ server support of multiplex sessions on a TCP connection.
  - *<no parameter>* server does not support multiplexing.
  - **single-connection** server supports session multiplexing.
- **VRF\_INST** specifies the VRF instance used to communicate with the specified server.
  - *<no parameter>* switch communicates with the server using the default VRF.
  - *vrf vrf\_name* switch communicates with the server using the specified user-defined VRF.
- **PORT** port number of the TCP connection.
  - *<no parameter>* default port of 49.
  - *port number* port number ranges from 1 to 65535.
- **TIMEOUT** timeout period (seconds).
  - *<no parameter>* assigns the globally configured timeout value (see [tacacs-server timeout](#)).
  - *timeout number* timeout period (seconds). *number* ranges from 1 to 1000.
- **ENCRYPT** encryption key the switch and server use to communicate. Settings include
  - *<no parameter>* assigns the globally configured encryption key (see [tacacs-server key](#)).
  - **key** *key\_text* where *key\_text* is in clear text.
  - **key 5** *key\_text* where *key\_text* is in clear text.
  - **key 7** *key\_text* where *key\_text* is an encrypted string.

#### Examples

- This command configures the switch to communicate with the TACACS+ server located at 10.1.1.5. The switch uses the global timeout, encryption key, and port settings.

```
switch(config)#tacacs-server host 10.1.1.5
switch(config)#
```

- This command configures the switch to communicate with the TACACS+ server assigned the host name *TAC\_1*. The switch defines the timeout period as *20 seconds* and the encryption key as *rp31E2v*.

```
switch(config)#tacacs-server host TAC_1 timeout 20 key rp31E2v
switch(config)#
```

- This command configures the switch to communicate with the TACACS+ server located at *10.12.7.9*, indicates that the server supports multiplexing sessions on the same TCP connection, and that access is through port 54.

```
switch(config)#tacacs-server host 10.12.7.9 single-connection
port 54
switch(config)#
```

---

### 8.1.1.7.46 tacacs-server key

The **tacacs-server key** command defines the global encryption key the switch uses when communicating with any TACACS+ server for which a key is not defined.

The **no tacacs-server key** and **default tacacs-server key** commands remove the global key from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
tacacs-server key [ENCRYPT_TYPE] encrypt_key
```

```
no tacacs-server key
```

```
default tacacs-server key
```

#### Parameters

- **ENCRYPT\_TYPE** encryption level of *encrypt\_key*.
  - **<no parameter>** encryption key is entered as clear text.
  - **0** encryption key is entered as clear text. Equivalent to <no parameter>.
  - **7** *encrypt\_key* is an encrypted string.
- **encrypt\_key** shared key that authenticates the username.
  - *encrypt\_key* must be in clear text if **ENCRYPT\_TYPE** specifies clear text.
  - *encrypt\_key* must be an encrypted string if **ENCRYPT\_TYPE** specifies an encrypted string.

Encrypted strings entered through this parameter are generated elsewhere.

#### Related Commands

- [tacacs-server host](#)

#### Examples

- This command configures *cv90jr1* as the encryption key.

```
switch(config)#tacacs-server key 0 cv90jr1  
switch(config)#
```

- This command assigns *cv90jr1* as the key by specifying the corresponding encrypted string.

```
switch(config)#tacacs-server key 7 020512025B0C1D70  
switch(config)#
```

### 8.1.1.7.47 tacacs-server policy

The **tacacs-server policy** command programs the switch to permit access to TACACS+ servers that send mandatory attribute-value (AV) pairs that the switch does not recognize. By default, the switch denies access to TACACS+ servers when it receives unrecognized AV pairs from the server.

The switch recognizes the following mandatory AV pairs:

- **priv-lvl=x** where x is an integer between 0 and 15.

The **no tacacs-server policy** and **default tacacs-server policy** commands restore the switch default of denying access to servers from which it receives unrecognized mandatory AV pair by deleting the **tacacs-server policy** statement from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
tacacs-server policy unknown-mandatory-attribute ignore
no tacacs-server policy unknown-mandatory-attribute ignore
default tacacs-server policy unknown-mandatory-attribute ignore
```

#### Example

This command configures the switch to permit access to TACACS+ servers that send unrecognized mandatory AV pairs.

```
switch(config)#tacacs-server policy unknown-mandatory-attribute
ignore
switch(config)#
```

---

### 8.1.1.7.48 tacacs-server timeout

The `tacacs-server timeout` command defines the global timeout the switch uses when communicating with any TACACS+ server for which a timeout is not defined.

The `no tacacs-server timeout` and `default tacacs-server timeout` commands restore the global timeout default period of five seconds by removing the `tacacs-server timeout` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
tacacs-server timeout time_period
```

```
no tacacs-server timeout
```

```
default tacacs-server timeout
```

#### Parameters

***time\_period*** timeout period (seconds). Values range from 1 to 1000. Default is 5.

#### Related Command

[tacacs-server host](#)

#### Example

This command configures the switch to wait 20 seconds for a TACACS+ server response before issuing an error.

```
switch(config)#tacacs-server timeout 20  
switch(config)#
```

### 8.1.1.7.49 username ssh-key

The **username ssh-key** command configures an SSH key for the specified username. Command options allow the key to be entered directly into the CLI or referenced from a file.

The specified username must be previously configured through a **username** command.

The **no username ssh-key** and **default username ssh-key** commands delete the SSH key for the specified username by removing the corresponding **username ssh-key** command from **running-config**.

The **no username ssh-key role** and **default username ssh-key role** commands perform the following:

- delete the SSH key for the specified username by removing the corresponding **username ssh-key** command from **running-config**.
- delete the role assignment from the specified username by editing the corresponding **username** statement in **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
username name sshkey KEY
no username name sshkey [role]
default username name sshkey [role]
```

#### Parameters

- **name** username text that the user enters at the login prompt to access the CLI.

Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:

```
@ # $ % ^ & * - _ = + ; < > , . ~ |
```

- **KEY** SSH key. Options include:
  - **key\_text** username is associated with ssh key specified by *key\_text* string.
  - **file** *key\_file* username is associated with SSH key in the specified file.

#### Example

These commands create the username **john**, assign it the password **x245**, then associate it to the SSH key listed in the file named **john-ssh**.

```
switch(config)#username john secret x245
switch(config)#username john sshkey file john-ssh
switch(config)#
```

---

### 8.1.1.7.50 username

The **username** command adds a username to the local file and optionally assigns a password to the username. If the command specifies an existing username, the command replaces the password in the local file. The command can also define a username without a password or remove the password from a username.

The **no username** command deletes the specified username by removing the corresponding **username** statement from *running-config*. The **default username** command removes user-specified usernames, but restores the **admin** username to its default parameters.

The **no username role** command assigns the default role assignment to the specified **username** statement by editing the corresponding **username** statement in *running-config*. The **default username role** command reverts the specified username to its default role by editing the corresponding **username** statement in *running-config*. For the **admin** username, this restores **network-admin** as its role, even if the **admin** username has been deleted and then created again.

#### Command Mode

Global Configuration

#### Command Syntax

```
username name [PRIVILEGE_LEVEL] SECURITY [ROLE_USER]
no username name[role]
default username name [role]
```

All parameters except *name* can be placed in any order.

#### Parameters

- **name** username text that the user enters at the login prompt to access the CLI.  
Valid usernames begin with A-Z, a-z, or 0-9 and may also contain any of these characters:  
@ # \$ % ^ & \* - \_ = + ; < > , . ~ |
- **PRIVILEGE\_LEVEL** user's initial session privilege level. This parameter is used when an authorization command includes the local option.
  - **<no parameter>** the privilege level is set to 1.
  - **privilege rank** where *rank* is an integer between 0 and 15.
- **SECURITY** password assignment option.
  - **nopassword** *name* is not password protected.
  - **secret password** *name* is protected by specified password (clear-text string).
  - **secret 0 password** *name* is protected by specified password (clear-text string).
  - **secret 5 password** *name* is protected by specified password. (MD5-encrypted string).
  - **secret sha5 password** *name* is protected by specified password (SHA-512-encrypted string).
- **ROLE\_USER** specifies the role for performing command authorization. Options include:
  - **<no parameter>** user is assigned default role [aaa authorization policy local default-role](#).
  - **role** *role\_name* specifies role assigned to the user.

#### Guidelines

Encrypted strings entered through this parameter are generated elsewhere. The secret 5 option (**SECURITY**) is typically used to enter a list of username-passwords from a script.

The **SECURITY** parameter is mandatory for unconfigured usernames. For previously configured users, the command can specify a **PRIVILEGE\_LEVEL** or **ROLE** without a **SECURITY** setting.

The **admin** username is provided by the initial configuration, but it can be deleted, and its parameters are editable. The initial **admin** configuration is:

```
username admin privilege 1 role network-admin nopassword
```

**Note:** when deleting the **admin** username, it is advisable to create at least one other username on the switch before saving the configuration.

### Examples

- These equivalent commands create the username *john* and assign it the password *x245*. The password is entered in clear text because the **ENCRYPTION** parameter is either omitted or zero.

```
switch(config)#username john secret x245
switch(config)#username john secret 0 x245
```

- This command creates the username *john* and assigns it to the text password that corresponds to the encrypted string *\$1\$sU.7hptc\$TsJ1qslCL7ZYVbyXNG1wg1*. The string was generated by an MD5-encryption program using *x245* as the seed.

```
switch(config)#username john secret 5 $1$sU.7hptc$T
sJ1qslCL7ZYVbyXNG1wg1
switch(config)#
```

- A user authenticates the username *john* by entering **x245** when the CLI prompts for a password.
- This command creates the username *jane* without securing it with a password or removes a password if the *jane* username exists.

```
switch(config)#username jane nopassword
switch(config)#
```

- This command removes the username *william* from the local file.

```
switch(config)#no username william
switch(config)#
```

## 8.2 Control Plane Security

This section contains the following topics:

- [Transport Layer Security](#)
- [802.1X Port Security](#)

### 8.2.1 Transport Layer Security

Transport Layer Security (TLS), the successor to Secure Sockets Layer (SSL), is a security protocol used to communicate between client and server. It establishes an encrypted communication channel to secure data.

By default, EOS uses a self signed certificate for client and server connections. However, some browsers or TLS libraries may refuse connections to the default self-signed certificates on EOS and in such case it is recommended to install the TLS server certificates that meet the following criteria:

- RSA key sizes must be greater than or equal to 2048 bits.

- There must be less than 825 days to expiry.
- Certificate must use SHA-2 family of Hashing function.

**Note:**

Although Arista switches use TLS, the terms TLS and SSL are used interchangeably in this document.

Following are the two main components used by TLS for authentication of identity before any communication starts.

- Certificate
- Key

An SSL certificate is required to establish a secure connection between the client and server. The certificate includes all of the details which are necessary for authentication. Cryptographic keys are used to provide a secure channel of communication. TLS uses two cryptographic keys: a private key known only to the server and a public key embedded in the certificate. The keys are used to validate the certificate.

This chapter contains the following sections.

[Overview](#)

[Configuration](#)

[Resetting Diffie-Hellman Parameters](#)

[Configuring the TLS Handshake Settings](#)

[Displaying Certificate and Key Information](#)

[TLS Commands](#)

### 8.2.1.1 Overview

With SSL certificate, key, and profile management framework we can manage and configure SSL certificates, keys and profiles. The SSL is an application-layer protocol which transfers the data securely between the client and server using a combination of authentication, encryption, and data integrity. The SSL uses certificates and private-public key pairs to provide this security. An user can configure a SSL profile which includes certificate, key and trusted CA certificates used in SSL communication. A user can manage certificates, keys, and also multiple SSL profiles. A SSL profile can be configured and attached to any other EOS configuration which supports SSL communication. The individual EOS configuration using this framework includes details of using SSL profile in their configuration.

The only private keys supported are those using the RSA algorithm. Both the certificate and keys must be encoded in Privacy Enhanced Mail (PEM) format.

**Example**

This is a code sample of a PEM encoded certificate.

**\$cat server.crt**

```

**8.2.1.2 Configuration**

[Configuring Certificates](#)

[Configuring Keys](#)

[Configuring a certificate with a RSA key in SSL Profile](#)

## 8.2.1.2.1 Configuring Certificates

### Copying a certificate to the Switch

The `copy certificate` command copies the certificate to certificate: file system from any supported source URLs of the `copy` command.

#### Example

This command copies a `server.crt` certificate to certificate: file system.

```
switch#copy file:/tmp/ssl/server.crt certificate:
Copy completed successfully.
```

### Errors while Copying the certificates

#### Examples

- A single source file can contain multiple PEM encoded certificates but only one PEM encoded certificate per file is supported. An error occurs when such multiple PEM encoded file is copied and the copy fails and error is displayed as shown.

```
switch#copy file:tmp/ssl/multi.crt certificate:
% Error copying file:tmp/ssl/multi.crt to certificate:
(Multiple PEM entities in
single file not supported)
```

- An error occurs when a source file containing an invalid PEM encoded certificate is copied. When such files are copied, the copy fails and an error is displayed as shown.

```
switch#copy file:tmp/ssl/bad.crt certificate:
% Error copying file:tmp/ssl/bad.crt to certificate: (Invalid
certificate)
```

- An error occurs when a source file containing a certificate with password protected key is copied. When such files are copied, the copy fails and an error is displayed as shown.

```
switch#copy file:tmp/ssl/pass.key sslkey:
% Error copying file:tmp/ssl/pass.key to sslkey: (Password
protected keys are not
supported)
```

**Note:** Only certificates with RSA public keys are supported. When a certificate, without RSA public keys, is copied, the copy fails and an error is displayed as shown below.

```
switch#copy file:tmp/ssl/dsa.crt certificate:
% Error copying file:tmp/ssl/dsa.crt to certificate:
(Certificate does not have
RSA key)
```

### Deleting a certificate

The `delete` command deletes the certificate configuration from the certificate: file system on switch.

**Example**

This command deletes the server.crt certificate from the switch.

```
switch#delete certificate:server.crt
```

**Generating certificates**

The following commands help user to generate a self-signed certificate or certificate signing request (CSR).

**Examples**

- This command generates a self-signed certificate or certificate signing request (CSR). In the example below an existing private key (test.key) is used to generate the certificates. The generated certificate signing request (CSR) can be viewed on the CLI, whereas a self-signed certificate will be saved to the certificate: file system.

```
switch#security pki certificate generate self-signed test.crt
key test.key
```

- This command specifies the digest and the validity (in days) of the certificate.

```
switch#security pki certificate generate signing-request key
test.key digest sha256 validity 365
```

- This command adds the certificate parameters such as common-name, country, email and others.

```
switch#security pki certificate generate signing-request key
test.key parameters common-name Test [country US ...]
```

**8.2.1.2.2 Configuring Keys****Copying a key to the Switch**

The `copy` command copies the RSA key to sslkey: file system. The key can be copied from any supported source URLs of the copy command.

**Example**

This command copies a server.key RSA key to sslkey: file system.

```
switch#copy file:/tmp/ssl/server.key sslkey:
Copy completed successfully.
```

**Errors While Copying the keys****Examples**

- Generally a single source file can contain multiple PEM encoded keys but only one PEM encoded key per file is supported. An error occurs when such multiple PEM encoded file is copied and the copy fails and error is displayed as shown.

```
switch#copy file:tmp/ssl/multi.key sslkey:  
% Error copying file:tmp/ssl/multi.key to sslkey: (Multiple  
  PEM entities in  
  single file not supported)
```

- An error occurs when a source file containing invalid PEM encoded key is copied. When such files are copied the copy fails, and an error is displayed as shown.

```
switch#copy file:tmp/ssl/bad.key sslkey:  
% Error copying file:tmp/ssl/bad.key to sslkey: (Invalid RSA  
  key)
```

### Deleting a key

The **delete** command deletes the key configuration from the switch.

#### Example

This command deletes the server.key key from the switch.

```
switch#delete sslkey:server.key
```

### Generating keys

The following commands help user to generate RSA keys.

#### Examples

- This command generate a 2048-bit long RSA private key and saves it to sslkey:test.key.

```
switch#security pki key generate rsa 2048 test.key
```

- This command generate a 4096-bit long self-signed certificate RSA key and 2048-bit long certificate signing request RSA key.

```
switch#security pki certificate generate self-signed test.crt  
key test.key  
generate rsa 4096  
switch#security pki certificate generate signing-request key  
test.key  
generate rsa 2048
```

#### 8.2.1.2.3 Configuring a certificate with a RSA key in SSL Profile

A SSL profile is configured with a certificate and its corresponding RSA key. The public key information in the certificate must match the RSA key. This certificate and RSA key pair are used to authenticate to the peer during SSL negotiation. The individual EOS features that use SSL profile configuration will decide whether the certificate and key configuration is optional or mandatory.

**Example**

```
switch#config
switch(config)#management security
switch(config-mgmt-security)#ssl profile server
switch(config-mgmt-sec-ssl-profile-server)#certificate server.crt
key server.key
```

In case, if the RSA key configured in SSL profile does not match with the configured certificate, the SSL profile state becomes invalid, and an error is displayed.

**Example**

```
switch(config-mgmt-security)#ssl profile server
switch(config-mgmt-sec-ssl-profile-server)#certificate server.crt
key client.key
switch(config-mgmt-sec-ssl-profile-server)#show management
security ssl profile
```

Profile	State	Error
server	invalid	Certificate 'server.crt' does not match with key

**8.2.1.2.3.1 Configuring SSL Profile with a certificate authority (CA)**

During SSL negotiation with mutual authentication, the peer (or client) certificate is verified by checking if it is signed by one of these trusted certificates. For peer certificates that do not have a chain to a trusted certificate, the full bundle of certificates leading to the trusted certificates must be included. The individual EOS features that use SSL profile configuration will decide whether the trusted certificate configuration is optional or mandatory.

**Example**

```
switch#config
switch(config)#management security
switch(config-mgmt-security)#ssl profile server
switch(config-mgmt-sec-ssl-profile-server)#trust certificate ca1.crt
switch(config-mgmt-sec-ssl-profile-server)#trust certificate ca2.crt
```

**8.2.1.2.3.2 Configuring certificate chains**

The certificate chains are used to provide a chain of trust for the SSL Profile server certificate to a remote party. Several chain certificate commands can be issued to build a certificate chain with many intermediate CAs, regardless of the order. Use the **chain certificate** command to configure the certificate chain for a SSL profile. The no form of the command deletes the certificate configuration.

**Examples**

- These commands configure the certificate chains for intermediate.crt, assuming that server.crt is issued by an intermediate CA intermediate.crt and intermediate.crt is itself issued by the root CA ca.crt.

```
switch#config
```

```

switch#(config)#management security
switch#(config-mgmt-security)#ssl profile server
switch#(config-mgmt-sec-ssl-profile-server)#certificate
server.crt key
server.key
switch#(config-mgmt-sec-ssl-profile-server)#chain certificate
intermediate.crt

```

- The other peer can be configured to trust ca.crt in order to verify the certificate chain during the TLS handshake as shown in the below example.

```

switch#config
switch#(config)#management security
switch(config-mgmt-security)#ssl profile client
switch(config-mgmt-sec-ssl-profile-client)#certificate
client.crt key client.key
switch(config-mgmt-sec-ssl-profile-client)#trust certificate
ca.crt

```

- To check the revocation status of the server certificate chain, the client can add the certificate Revocation List (CRLs) to its SSL profile configuration. One CRL needs to be specified for every CA in the chain, even if its not revoking any certificate.

```

switch#config
switch#(config)#management security
switch(config-mgmt-security)#ssl profile client
switch(config-mgmt-sec-ssl-profile-client)#crl intermediate.
crl
switch(config-mgmt-sec-ssl-profile-client)#crl ca.crl

```

**Note:** Both the chain certificate and crl commands look into the certificate: directory to find the right PEM file.

### 8.2.1.2.3.3 Local certificate checks

The way certificates are verified locally before SSL negotiation can be modified to add or relax some checks. The following are the few checks to perform before any communication with the peer.

#### Examples

- Check if the certificate has an extended key usage attribute:

```

switch(config-mgmt-sec-ssl-profile-client)#certificate
requirement extended-key-usage

```

- Check if all the trusted certificates or certificates in the chain have a CA basic constraints set to true.

```

switch(config-mgmt-sec-ssl-profile-client)#trust certificate
requirement
basic-constraints ca true
switch(config-mgmt-sec-ssl-profile-client)#chain certificate
requirement
basic-constraints ca true

```

- Do not mark an expired certificate as invalid.

```
switch(config-mgmt-sec-ssl-profile-client)#certificate policy
expiry-date ignore
```

#### 8.2.1.2.3.4 Displaying SSL profile status and SSL profile errors

The `show management security ssl profile` command displays the SSL profile status information. To view a specific SSL profile status use the name of the SSL profile, else all SSL profile status are displayed.

##### Example

This command displays the status of SSL profile server.

```
switch#show management security ssl profile server
Profile      State
-----
server       valid
```

If there are any errors in the SSL profile, an **invalid** state is displayed and the errors are listed in the third column. Once the error is fixed, the SSL profile becomes **valid**.

##### Examples

- When the certificate 'server.crt' does not match with the key the following error is shown.

```
switch#show management security ssl profile server
Profile      State      Error
-----
server       invalid    Certificate 'server.crt' does not
match                               with key
```

- When a trusted certificate 'ca2.crt' does not exist the following error is shown.

```
switch#show management security ssl profile server
Profile      State      Error
-----
server       invalid    Certificate 'ca2.crt' does not
exist
```

- When a trusted certificate 'foo.crt' is not self-signed root certificate the following error is shown.

```
switch#show management security ssl profile server
Profile      State      Error
-----
server       invalid    Certificate 'foo.crt' is trusted
and not                                           a root certificate
```

- When the certificate 'server.crt' is expired the following error is shown.

```
switch#show management security ssl profile server
  Profile           State           Error
-----
server             invalid        Certificate 'server.crt' has
expired
```

- When the certificate chain is missing an intermediate certificate the following error is shown.

```
switch#show management security ssl profile server
  Profile           State           Error
-----
server             invalid        Profile has invalid certificate
chain
does not exist      Certificate 'intermediate.crt'
```

### 8.2.1.3 Resetting Diffie-Hellman Parameters

The Diffie-Hellman parameters file is used for symmetric key exchange during SSL negotiation. When the system is booted, the system auto generates a Diffie-Hellman parameters file if one does not exist. To reset the auto generated Diffie-Hellman parameters file, use the reset command. The individual features that use SSL profile configuration will decide whether they also use the Diffie-Hellman parameters file. The switch uses 2048-bit Diffie-Hellman parameters with no options to select the size.

 **Note:** Not all features that use SSL profile configuration will use Diffie-Hellman parameters file.

#### Example

This command resets the Diffie-Hellman parameters file.

```
switch#reset ssl diffie-hellman parameters
```

#### 8.2.1.3.1 Displaying the Diffie-Hellman parameters

The `show management security ssl diffie-hellman` command displays the Diffie-Hellman parameters.

#### Example

This command displays the Diffie-Hellman parameters.

```
switch#show management security ssl diffie-hellman
Last successful reset on Apr 10 16:18:08 2015
Diffie-Hellman Parameters 1024 bits
Generator: 2
Prime:      dc47b5edc0d2b41451432f79f45efab452bba7b1ab118c194d67
1d6752ed1c550
           664ed8f052ad0fdad623c1d54ae5aee5e728d2bd7a6221636b78
7a4c08d1fef8c
```

```

6dcd10759d38f8b70b47d1c7972d69b0b295a2ee6ab44cfc7352
cb133e85197c8
9f1fc27aac7e8e02afb4fb01ca1cb05558a7bef505b73a8d06cd
fe403576b

```

#### 8.2.1.4 Configuring the TLS Handshake Settings

During a TLS handshake, both peers send each other a list of the TLS versions they support as a way to agree on and use the highest common version. In a SSL profile the following allowable versions can be configured using the `tls versions` command. By default, TLSv1, TLSv1.1 and TLSv1.2 are enabled.

##### Examples

- This command will force TLSv1.2 to be used. If the other peer doesn't support this version, the TLS handshake will fail.

```

switch#config
switch#(config)#management security
switch(config-mgmt-security)#ssl profile client
switch(config-mgmt-sec-ssl-profile-client)#
switch(config-mgmt-sec-ssl-profile-client)#tls versions 1.2

```

- These commands add support for TLSv1.1 on top of the already configured TLSv1.2.

```

switch(config-mgmt-sec-ssl-profile-client)#tls versions add
1.1
switch(config-mgmt-sec-ssl-profile-client)#tls versions 1.1
1.2

```

Similarly to the TLS version, the cipher suite is negotiated between the client and the server during a TLS handshake. Ideally, the client will send the list of cipher suites it supports and the server will choose a common cipher suite after looking at the client's list as well as its own list of cipher suites. The cipher-list setting here is an Open SSL cipher string that is `HIGH:!NULL:!MD5`, which only allows key length larger than 128 bits and forbids cipher suites using MD5. The full list of cipher suites can be expanded using the shell command `openssl ciphers HIGH:!NULL:!MD5`

##### Example

This command builds a cipher suite list.

```

switch(config-mgmt-sec-ssl-profile-client)#cipher-list AESGCM
switch(config-mgmt-sec-ssl-profile-client)#cipher-list
SHA256:SHA384
switch(config-mgmt-sec-ssl-profile-client)#cipher-list ECDHE-
ECDSA-AES256-GCM-SHA384

```

#### 8.2.1.4.1 Enabling the Federal Information Processing Standards (FIPS) Mode

Federal Information Processing Standards (FIPS) is a cryptographic standard used to restrict the cryptographic functions and protocol versions that are used by OpenSSL.

### Example

This command enables the FIPS mode for a SSL profile.

```
switch(config-mgmt-sec-ssl-profile-client)#fips restrictions
```

## 8.2.1.5 Displaying Certificate and Key Information

[Displaying Certificate Information](#)

[Displaying Key Information](#)

### 8.2.1.5.1 Displaying Certificate Information

#### Displaying the directory information

The `dir` command displays the directory output of certificate file systems.

### Example

This command displays the directory output of certificate: file-system.

```
switch#dir certificate:
Directory of certificate:/
-rw- 3319 Apr 10 11:50 server.crt
No space information available
```

#### Displaying the certificate information

The `show management security ssl certificate` command displays the certificate information. To view a specific certificate use the name of the certificate, else all the certificates are displayed.

### Example

This command displays the server.crt certificate information.

```
switch#show management security ssl certificate server.crt
Certificate server.crt:
Version:                               1
Serial Number:                           9
Issuer:
  Common name:                            ca
  Email address:                          ca@foo.com
  Organizational unit:                    Foo Org
  Organization:                           Foo
  Locality:                                SC
  State:                                   CA
  Country:                                 US
Validity:
  Not before:                             Aug 11 21:44:17 2014 GMT
  Not After:                               May 14 21:44:17 2069 GMT
Subject:
  Common name:                            server
```

```

Email address:      server@arista.com
Organizational unit: Foo Org
Organization:      Foo
Locality:          SC
State:             CA
Country:           US
Subject public key info:
Encryption Algorithm: RSA
Size:              2048 bits
Public exponent:   65537
Modulus:           e04e3ff8e1c64dbcb141fe9613
3f998e90a322c671b9f28307bf873

                   635a831d5ec96d841

```

### Displaying Certificate Revocation List (CRL) information

The **show management security ssl crl** command displays the installed Certificate Revocation List (CRL) information. To view a specific CRL use the name of the CRL, else all the CRLs are displayed.

#### Example

This command displays the intermediate.crl information.

```

switch#show management security ssl crl intermediate.crl
CRL intermediate.crl:
  CRL Number: 11
  Issuer:
    Common name: intermediate
    Email address: intermediate@foo.com
    Organizational unit: Foo Org
    Organization: Foo
    State: CA
    Country: US
  Validity:
    Last Update: Jul 19 19:27:34 2016 GMT
    Next Update: Dec 05 19:27:34 2043 GMT

```

### 8.2.1.5.2 Displaying Key Information

#### Displaying the directory information

The **dir** command displays the directory output of SSL key file systems.

#### Example

This command displays the directory output of sslkey: file-system.

```

switch#dir sslkey:

```

```
Directory of sslkey:/
-rw- 1675 Apr 10 12:55 server.key
No space information available
```

### Displaying the RSA key information

The **show management security ssl key** command displays the RSA key information. To view a specific RSA key use the name of the key, else all the keys are displayed. For security reasons, only the public part of the key is displayed.

#### Example

This command displays the server.key key information.

```
switch#show management security ssl key server.key
Key server.key:
  Encryption Algorithm: RSA
  Size:                2048 bits
  Public exponent:    65537
  Modulus:            e04e3ff8e1c64dbcb141fe96133f998e90a322c
671b9f28307bf873
                    2239f69804a77fbb8f146841eb6253b7bb50bf6

                    0d7985cfd939c9913b4ba4f6cb8655b208ed02
54a269ecab574987
                    b502f8c3f541fa3bae59743cced6e6ca04f6ca6
c9268744add79c3a
                    f8178d12dd744ddf5db100b33c46b40e53f0a1c
7d49f83488976c5d
```

### 8.2.1.6 TLS Commands

#### Configuration Commands

- `copy file: certificate:`
- `copy file: sslkey:`
- `delete certificate:`
- `delete sslkey:`
- `dir certificate:`
- `dir sslkey:`
- `reset ssl diffie-hellman parameters`
- `security pki certificate generate`
- `security pki key generate`
- `ssl profile`

#### Show Commands

- `show management security ssl certificate`
- `show management security ssl crl`
- `show management security ssl diffie-hellman`
- `show management security ssl key`
- `show management security ssl profile`

---

### 8.2.1.6.1 copy file: certificate:

The **copy file: certificate:** command copies the certificate to certificate: file system. The certificate can be copied from any supported source URLs of the **copy** command.

#### Command Mode

Global Configuration

#### Command Syntax

```
copy file: file_name certificate:
```

#### Parameters

- *file\_name* location or the path of the file or the directory where the certificate is saved.

#### Guidelines

The following points to be considered while using the copy command:

- Generally a single source file can contain multiple PEM encoded certificates but only one PEM encoded certificate per file is supported. An error occurs when such multiple PEM encoded file is copied and the copy fails and displays an error.
- An error occurs when a source file containing invalid PEM encoded certificate is copied. When such files are copied the copy fails, and displays an error.
- An error occurs when a source files containing a certificate with password protected key is copied. When such files are copied the copy fails, and displays an error.

The following errors occur while copying the certificates:

- When multiple PEM encoded certificates are copied, the copy task fails and the following error is displayed.

```
switch(config)#copy file:tmp/ssl/multi.crt certificate:
% Error copying file:tmp/ssl/multi.crt to certificate: (Multiple PEM
entities in
single file not supported)
```

- When a source file containing invalid PEM encoded certificate is copied, the copy task fails and the following error is displayed.

```
switch(config)#copy file:tmp/ssl/bad.crt certificate:
% Error copying file:tmp/ssl/bad.crt to certificate: (Invalid
certificate)
```

- When a source file containing a certificate with password protected key is copied, the copy task fails and the following error is displayed.

```
switch(config)#copy file:tmp/ssl/pass.key sslkey:
% Error copying file:tmp/ssl/pass.key to sslkey: (Password protected
keys are not
supported)
```

- Only certificates with RSA public keys are supported. When a certificate without RSA public key is copied the copy fails, and an error is displayed.

```
switch(config)#copy file:tmp/ssl/dsa.crt certificate:
% Error copying file:tmp/ssl/dsa.crt to certificate: (Certificate does
not have
RSA key)
```

#### Example

---

This command copies a server.crt certificate to certificate: file system.

```
switch(config)#copy file:/tmp/ssl/server.crt certificate:  
Copy completed successfully.
```

---

### 8.2.1.6.2 copy file: sslkey:

The **copy file: sslkey:** command copies the SSL key to the sslkey: file system. The key can be copied from any supported source URLs of the **copy** command.

#### Command Mode

Global Configuration

#### Command Syntax

```
copy file: file_name sslkey:
```

#### Parameters

*file\_name* location or the path of the file or the directory where the key is saved.

#### Guidelines

The following points to be considered while using the copy command:

- Generally a single source file can contain multiple PEM encoded keys but only one PEM encoded key per file is supported. An error occurs when such multiple PEM encoded file is copied and the copy fails and shows an error.
- An error occurs when a source file containing invalid PEM encoded key is copied. When such files are copied the copy fails, and shows an error.

The following errors occur while copying the certificates:

- When multiple PEM encoded keys are copied, the copy fails and the following error occurs.

```
switch#copy file:tmp/ssl/multi.key sslkey:
% Error copying file:tmp/ssl/multi.key to sslkey: (Multiple PEM
entities in
single file not supported)
```

- When a source file containing invalid PEM encoded key is copied, the following error occurs.

```
switch#copy file:tmp/ssl/bad.key sslkey:
% Error copying file:tmp/ssl/bad.key to sslkey: (Invalid RSA key)
```

#### Example

This command copies a server.key key to the sslkey: file system.

```
switch(config)#copy file:/tmp/ssl/server.key sslkey:
Copy completed successfully.
```

### 8.2.1.6.3 delete certificate:

The **delete certificate:** command deletes a specified certificate from certificate: file system on the switch.

#### Command Mode

Global Configuration

#### Command Syntax

```
delete certificate: certificate_name
```

#### Parameters

*certificate\_name* name of the certificate to be deleted.

#### Example

This command deletes the server.crt certificate from the switch.

```
switch(config)#delete certificate:server.crt
```

---

#### 8.2.1.6.4 delete sslkey:

The `delete sslkey:` command deletes a SSL key from sslkey: file system on a switch.

##### Command Mode

Global Configuration

##### Command Syntax

```
delete sslkey: key_name
```

##### Parameters

*key\_name* name of the key.

##### Example

This command deletes the server.key SSL key on the switch.

```
switch(config)#delete sslkey:server.key
```

### 8.2.1.6.5 `dir certificate:`

The `dir certificate:` command displays the directory output of certificate: file system on the switch.

#### Command Mode

Global Configuration

#### Command Syntax

`dir certificate:`

#### Example

This command shows the directory output of certificate: file system on the switch.

```
switch(config)#dir certificate:
Directory of certificate:/
  -rw- 3319 Apr 10 11:50 server.crt
No space information available
```

---

### 8.2.1.6.6 `dir sslkey:`

The `dir sslkey:` command displays the directory output of `sslkey:` file system on the switch.

#### Command Mode

Global Configuration

#### Command Syntax

`dir sslkey:`

#### Example

This command shows the directory output of `sslkey:` file system on the switch.

```
switch(config)#dir sslkey:  
Directory of sslkey:/  
  -rw- 1675 Apr 10 12:55 server.key  
No space information available
```

### 8.2.1.6.7 reset ssl diffie-hellman parameters

The `reset ssl diffie-hellman parameters` command resets the Diffie-Hellman parameters file after a system reboot.

#### Command Mode

Global Configuration

#### Command Syntax

```
reset ssl diffie-hellman parameters
```

#### Example

This command resets the Diffie-Hellman parameters file.

```
switch(config)#reset ssl diffie-hellman parameters
switch(config)#
```

---

### 8.2.1.6.8 security pki certificate generate

The **security pki certificate generate** command is used to generate a self-signed certificate or a certificate signing request (CSR) certificate. The generated CSR is displayed on the CLI, whereas a self-signed certificate is saved to the certificate: file system.

Many other parameters can be entered and applied to the certificate as shown in the following examples below.

#### Command Mode

Global Configuration

#### Command Syntax

```
security pki certificate generate {self-signed | signing-request} certificate_name  
Key key_name
```

#### Parameters

- *certificate\_name* name of the certificate to generate. Options includes.
  - self-signed request to generate self-signed certificate.
  - signing-request request to generate signing-request.
  - **digest** signs the certificate or key with the following cryptographic hash algorithm (sha256, sha384, sha512).
  - *key\_name* name of the key to modify.
- *parameters* signing request parameters for a certificate. Option includes.
  - **common-name** common name for use in subject.
  - **country** two-letter country code for use in subject
  - **email** email address for use in subject
  - **locality** locality name for use in subject
  - **organization** organization name for use in subject
  - **organization-unit** organization Unit Name for use in subject
  - **state** state for use in subject
  - **subject-alternative-name** subject alternative name extension
- **validity** validity of the certificate in days. Value ranges from 1 to 30000 .

#### Examples

- This command generates a self-signed certificate or CSR certificate. In the example below an existing private key (test.key) is used to generate the certificates.

```
switch(config) #security pki certificate generate self-signed test.crt  
key test.key
```

- This command specifies the digest and the validity (in days) of the certificate or key.

```
switch(config) #security pki certificate generate signing-request key  
test.key digest sha256 validity 365
```

- This command adds the certificate parameters such as common-name, country, email, and others.

```
switch(config) #security pki certificate generate signing-request key  
test.key parameters common-name Test [country US ...]
```

### 8.2.1.6.9 security pki key generate

The **security pki key generate** command generates a RSA key used to validate a specific certificate.

The key generated can be modified and saved by entering the value of the length in generate rsa <length> parameter.

#### Command Mode

Global Configuration

#### Command Syntax

```
security pki key generate rsa key_name
```

#### Parameters

- *rsa* use Rivest-Shamir-Adleman (RSA) algorithm. Options include.
  - **2048** Use 2048-bit keys
  - **3072** Use 3072-bit keys
  - **4096** Use 4096-bit keys
- *key\_name* name of the key to generate.

#### Examples

- This command generates a a 2048-bit long RSA private key(test.key) and save it to sslkey:test.key.

```
switch(config)#security pki key generate rsa 2048 test.key
```

- This command modifies the generated RSA key length value.

```
switch(config)#security pki certificate generate self-signed test.crt
key
test.key generate rsa 4096
switch(config)#security pki certificate generate signing-request key
test.key
generate rsa 2048
```

### 8.2.1.6.10 show management security ssl certificate

The **show management security ssl certificate** command displays information about the certificate. Provide the name of the certificate if you want to view more information of the certificate. If no name is provided, this command displays information of all the certificates.

#### Command Mode

EXEC

#### Command Syntax

```
show management security ssl certificate [certificate_name]
```

#### Parameter

*certificate\_name* name of the certificate. This is optional.

#### Example

This command displays the server.crt certificate information.

```
switch#show management security ssl certificate server.crt
Certificate server.crt:
Version:                1
Serial Number:          9
Issuer:
  Common name:           ca
  Email address:         ca@foo.com
  Organizational unit:   Foo Org
  Organization:          Foo
  Locality:              SC
  State:                 CA
  Country:               US
Validity:
  Not before:            Aug 11 21:44:17 2014 GMT
  Not After:             May 14 21:44:17 2069 GMT
Subject:
  Common name:           server
  Email address:         server@arista.com
  Organizational unit:   Foo Org
  Organization:          Foo
  Locality:              SC
  State:                 CA
  Country:               US
Subject public key info:
Encryption Algorithm:   RSA

### 8.2.1.6.11 show management security ssl crl

The **show management security ssl crl** command displays the basic information on the installed certificate revocation list (CRLs). To view information of a specific CRL provide the name of the CRL. If no name is provided, this command shows information of all the CRLs.

**Note:** The command only shows basic information and does not show any information on the revocation status of certificates.

#### Command Mode

EXEC

#### Command Syntax

```
show management security ssl crl
```

#### Example

This command displays the basic information of the intermediate.crl CRL.

```
switch#show management security ssl crl intermediate.crl
CRL intermediate.crl:
  CRL Number: 11
  Issuer:
    Common name: intermediate
    Email address: intermediate@foo.com
    Organizational unit: Foo Org
    Organization: Foo
    State: CA
    Country: US
  Validity:
    Last Update: Jul 19 19:27:34 2016 GMT
    Next Update: Dec 05 19:27:34 2043 GMT
```

---

### 8.2.1.6.12 show management security ssl diffie-hellman

The `show management security ssl diffie-hellman` command displays the Diffie-Hellman parameter information.

#### Command Mode

EXEC

#### Command Syntax

```
show management security ssl diffie-hellman
```

#### Example

This command displays the Diffie-Hellman parameter information.

```
switch#show management security ssl diffie-hellman
Last successful reset on Apr 10 16:18:08 2015
Diffie-Hellman Parameters 1024 bits
  Generator: 2
  Prime:      dc47b5edc0d2b41451432f79f45efab452bba7b1ab118c194d67

```

### 8.2.1.6.13 show management security ssl key

The **show management security ssl key** command displays the RSA key information. To view information of a specific key, provide the name of the key in the command. If no name is provided, this command displays information of all the keys.

**Note:** For security reasons, only the public part of the key is shown.

#### Command Mode

EXEC

#### Command Syntax

```
show management security ssl key [key_name]
```

#### Parameter

**key\_name** name of the key. This is optional.

#### Example

This command displays the server.key key information.

```
switch#show management security ssl key server.key
Key server.key:
Encryption Algorithm: RSA
Size:                2048 bits

```

#### 8.2.1.6.14 show management security ssl profile

The **show management security ssl profile** command displays the SSL profile status information. To display information of a specific SSL profile, provide the name of the profile. If no name is provided, this command displays profile status of all the SSL profiles.

If there are any errors in the SSL profile, the state is shown invalid and the errors are listed in the third column as shown in the example below.

##### Command Mode

EXEC

##### Command Syntax

```
show management security ssl profile [profile_name]
```

##### Parameter

***profile\_name*** name of the SSL profile, this is optional.

##### Examples

- This command displays the SSL profile status of profile server.

```
switch#show management security ssl profile server
Profile      State
-----
server       valid
```

- If the certificate 'server.crt' does not match with the key the following error occurs.

```
switch#show management security ssl profile server
Profile      State      Error
-----
server       invalid    Certificate 'server.crt' does not match
with key
```

- If a trusted certificate 'ca2.crt' does not exist the following error occurs.

```
switch#show management security ssl profile server
Profile      State      Error
-----
server       invalid    Certificate 'ca2.crt' does not exist
```

- If a trusted certificate 'foo.crt' is not self-signed root certificate the following error occurs.

```
switch#show management security ssl profile server
Profile      State      Error
-----
server       invalid    Certificate 'foo.crt' is trusted and not
a root certificate
```

- If the certificate 'server.crt' is expired the following error occurs.

```
switch#show management security ssl profile server
Profile      State      Error
-----
server       invalid    Certificate 'server.crt' has expired
```

- If the certificate chain is missing an intermediate certificate the following error occurs.

```
switch#show management security ssl profile server
Profile      State      Error
-----
-----
```

---

```
server      invalid  Profile has invalid certificate chain
            exist   Certificate 'intermediate.crt' does not
```

### 8.2.1.6.15 ssl profile

The **ssl profile** command places the switch in the SSL profile configuration mode. Various SSL profile management configurations are allowed in this mode. For example, this mode allows to configure a SSL profile with a certificate and its corresponding RSA key.

Similarly, other configurations such as trust certificate, chain certificate, crl, tls, cipher-list can be configured to a SSL profile in this mode.

The no form of the command deletes the SSL profile management configuration from *running-config*.

#### Command Mode

Management Security Mode

SSL Profile Mode

#### Command Syntax

```
ssl profile profile_name
```

#### Parameter

*profile\_name* name of the profile.

#### Examples

- These commands place the switch in SSL profile mode.

```
switch#config
switch(config)#management security
switch(config-mgmt-security)#ssl profile server
switch(config-mgmt-sec-ssl-profile-server)#
```

- These commands configure SSL profile server with a certificate and its corresponding RSA key. The **no** command deletes the certificate configuration.

```
switch#config
switch(config)#management security
switch(config-mgmt-security)#ssl profile server
switch(config-mgmt-sec-ssl-profile-server)#certificate server.crt key
server.key
switch(config-mgmt-sec-ssl-profile-server)#no certificate server.crt
key server.key
```

- These commands configure the trust certificate ca1.crt to an SSL profile. The **no** command deletes a trusted certificate configuration.

```
switch#config
switch(config)#management security
switch(config-mgmt-security)#ssl profile server
switch(config-mgmt-sec-ssl-profile-server)#trust certificate ca1.crt
switch(config-mgmt-sec-ssl-profile-server)#no trust certificate ca1.crt
```

- These commands configure the intermediate.crt chain certificate to an SSL profile. The **no** command deletes a chain certificate configuration.

```
switch#config
switch(config)#management security
switch(config-mgmt-security)#ssl profile server
switch(config-mgmt-sec-ssl-profile-server)#certificate server.crt key
server.key
switch(config-mgmt-sec-ssl-profile-server)#chain certificate
intermediate.crt
```

```
switch(config-mgmt-sec-ssl-profile-server) #no chain certificate
intermediate.crt
```

- These commands provides certificate revocation list (CRL) to a SSL profile to check the revocation status of the certificate chain. The **no** command deletes the crl configuration.

```
switch#config
switch(config) #management security
switch(config-mgmt-security) #ssl profile server
switch(config-mgmt-sec-ssl-profile-server) #crl intermediate.crl
switch(config-mgmt-sec-ssl-profile-server) #crl ca.crl
switch(config-mgmt-sec-ssl-profile-server) #no crl ca.crl
```

- These commands configure TLSv1.2 to be used in the SSL profile.

```
switch#config
switch(config) #management security
switch(config-mgmt-security) #ssl profile server
switch(config-mgmt-sec-ssl-profile-server) #tls versions 1.2
```

- These commands build a cipher suite list.

```
switch#config
switch(config) #management security
switch(config-mgmt-security) #ssl profile server
switch(config-mgmt-sec-ssl-profile-server) #cipher-list AESGCM
switch(config-mgmt-sec-ssl-profile-server) #cipher-list SHA256:SHA38
switch(config-mgmt-sec-ssl-profile-server) #cipher-list ECDHE-ECDSA-A
ES256-GCM-SHA384
```

- This command check that the certificate has an extended key usage attribute.

```
switch(config-mgmt-sec-ssl-profile-client) #certificate requirement
extended-key-usage
```

- These commands check that all the trusted certificates or certificates in the chain have a CA basic constraints set to true.

```
switch(config-mgmt-sec-ssl-profile-client) #trust certificate
requirement basic-constraints ca true
switch(config-mgmt-sec-ssl-profile-client) #chain certificate
requirement basic-constraints ca true
```

- This command enables the Federal Information Processing Standards (FIPS) mode for a SSL profile.

```
switch(config-mgmt-sec-ssl-profile-client) #fips restrictions
```

## 8.2.2 802.1X Port Security

This section explains the basic concepts behind 802.1X port security, including switch roles, how the switches communicate, and the procedure used for authenticating clients.

- [802.1X Port Security Introduction](#)
- [802.1X Port Security Description](#)
- [Configuring 802.1X Port Security](#)
- [Displaying 802.1X Information](#)
- [802.1X Configuration Commands](#)

---

### 8.2.2.1 802.1X Port Security Introduction

802.1X is an IEEE standard protocol that prevents unauthorized devices from gaining access to the network.

802.1X defines three device roles,

- Supplicant (client)
- Authenticator (switch)
- Authentication server (RADIUS)

Before authentication can succeed, switchport is in unauthorized mode and blocks all traffic but, after authentication has succeeded, normal data can then flow through the switchport.

Port security control who can send or receive traffic from an individual switch port. An end node is not allowed to send or receive traffic through a port until the node is authenticated by a RADIUS server.

This prevents unauthorized individuals from connecting to a switch port to access your network. Only designated valid users on a RADIUS server will be allowed to use the switch to access the network.

### 8.2.2.2 802.1X Port Security Description

802.1X port security controls can send traffic through and receive traffic from the individual switch ports. A supplicant must authenticate itself using EAPoL packets with the switch before it can gain full access to the port. Arista switches act as an authenticator, passing the messages from 802.1X supplicants through to the RADIUS server and vice versa. 802.1X can operate in two different modes:

**Single Host Mode:** Once the 802.1X supplicant is authenticated on the port, only the traffic coming from the supplicant's MAC is allowed through the port.

**Multi-Host Mode:** Once the 802.1X supplicant is authenticated on the port, traffic coming from any source MAC is allowed through the port.

Both these modes allow only one 802.1X supplicant to be authenticated for one port. Once it is successfully authenticated, no other 802.1X supplicant can be authenticated, unless the current one logs off.

Apart from 802.1X authentication, Arista switches also support MAC-Based Authentication (MBA), which allows devices not speaking 802.1X to have access to the network. The authenticator uses the MAC address of such devices as username/password in its RADIUS request packets. Depending on the MAC-Based Authentication configuration on the RADIUS server, it decides whether to authenticate the supplicant or not. Unlike 802.1X supplicants, multiple MBA supplicants are allowed on a single port. The MBA configuration is independent of the 802.1X host modes. MBA supplicants will not be considered to allow or reject unauthenticated traffic, based on the host mode.

Arista switches also support Dynamic VLAN assignment, which allows the RADIUS server to indicate the desired VLAN for the supplicant, using the tunnel attributes with the Access-Accept message. Both 802.1X and MBA supplicants can be assigned a VLAN via the RADIUS server. Note that only one VLAN per port is supported. When the first host authenticates, the authenticator port is put in the respective VLAN (via dynamic VLAN assignment) and subsequently, all other hosts must belong to that VLAN as well.

802.1X features are now supported on 802.1Q trunk ports allowing the user to have Port-Based Network Access Control (PNAC) on such a port. With this feature, traffic coming into an 802.1X enabled port with a VLAN tag can also be authenticated via both 802.1X or MBA.

By default, traffic from any unauthenticated device on an 802.1X enabled port is dropped. By configuring Authentication Failure VLAN on the authenticator switch, 802.1X or MBA supplicants traffic can be put into a specific VLAN, if the supplicant fails to authenticate via the RADIUS server.

**Note:** Only one configurable VLAN for failure is supported. That is, failure due to server timeout, server unreachable, server AUTH-FAIL, or Quarantine.

### 8.2.2.2.1 Switch Roles for 802.1X Configurations

The 802.1X standard specifies the roles of **Supplicant (client)**, **Authenticator**, and **Authentication Server** in a network. [Switch Roles for 802.1X Configurations](#) illustrates these roles.

**Authentication server** The switch that validates the client and specifies whether or not the client may access services on the switch. The switch supports Authentication Servers running RADIUS.

**Authenticator** The switch that controls access to the network. In an 802.1X configuration, the switch serves as the Authenticator. As the Authenticator, it moves messages between the client and the Authentication Server. The Authenticator either grants or does not grant network access to the client based on the identity data provided by the client, and the authentication data provided by the Authentication Server.

**Figure 3: Authenticator, Supplicant, and Authentication Server in an 802.1X configuration**

**Supplicant/Client** The client provides a username or password data to the Authenticator. The Authenticator sends this data to the Authentication Server. Based on the supplicants information, the Authentication Server determines whether the supplicant can use services given by the Authenticator. The Authentication Server gives this data to the Authenticator, which then provides services to the client, based on the authentication result.

### 8.2.2.2.2 Authentication Process

The authentication that occurs between a supplicant, authenticator, and authentication server include the following processes.

- Either the authenticator (a switch port) or the supplicant starts an authentication message exchange. The switch starts an exchange when it detects a change in the status of a port, or if it gets a packet on the port with a source MAC address that is not included in the MAC address table.
- An authenticator starts the negotiation by sending an EAP-Request/Identity packet. A supplicant starts the negotiation with an EAPOL-Start packet, to which the authenticator answers with a EAP-Request/Identity packet.
- The supplicant answers with an EAP-Response/Identity packet to the authentication server via the authenticator.
- The authentication server responds with an EAP-Request packet to the supplicant via the authenticator.
- The supplicant responds with an EAP-Response.

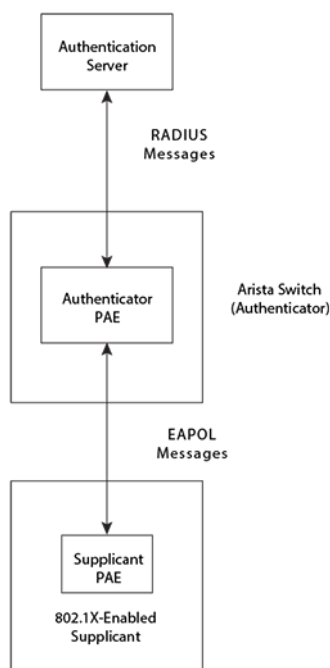

- The authentication server transmits either an EAP-Success packet or EAP-Reject packet to the supplicant.
- If an EAP-Reject is received, the supplicant will receive an EAP-Reject message and their traffic will not be forwarded.

### 8.2.2.2.3 Communication Between the Switches

For communication between the switches, 802.1X port security uses the Extensible Authentication Protocol (EAP), defined in RFC 2284 and the RADIUS authentication protocol.

The 802.1X standard defines a method for encapsulating EAP messages so they can be sent over a LAN. This encapsulated kind of EAP is known as EAP over LAN (EAPOL). The standard also specifies a means of transferring the EAPOL information between the client or Supplicant, Authenticator, and Authentication Server.

EAPOL messages are passed between the Supplicants and Authenticators Port Access Entity (PAE). [Communication Between the Switches](#) shows the relationship between the Authenticator PAE and the Supplicant PAE.

**Figure 4: Authenticator PAE and Supplicant PAE**

**Authenticator PAE:** The Authenticator PAE communicates with the Supplicant PAE to receive the Supplicants identifying information. Behaving as a RADIUS client, the Authenticator PAE passes the Supplicants information to the Authentication Server, which decides whether to grant the Supplicant access. If the Supplicant passes authentication, the Authenticator PAE allows it access to the port.

**Supplicant PAE** The Supplicant PAE provides information about the client to the Authenticator PAE and replies to requests from the Authenticator PAE. The Supplicant PAE may initiate the authentication procedure with the Authenticator PAE, as well as send logoff messages.

### 8.2.2.2.4 Enable 802.1X Port Control

To enable 802.1X port authentication on the switch, global command configuration is required:

```
switch(config) #dot1x system-auth-control
```

Port mode can be set to access/trunk port and 802.1X port access entity is set to authenticator:

```
switch(config-if-Et1) #switchport mode access
switch(config-if-Et1) #dot1x pae authenticator
```

### 8.2.2.2.5 Controlled and Uncontrolled Ports

A physical port on the switch used with 802.1X has two virtual access points that include a controlled port and an uncontrolled port. The controlled port grants full access to the network. The uncontrolled port only gives access for EAPOL traffic between the client and the Authentication Server. When a client is authenticated successfully, the controlled port is opened to the client.

Figure 5: Ports before and after client authentication

#### 8.2.2.2.5.1 Control Port State

Before the port is authenticated, the port is in an unauthorized state. In this state, only EAPOL packets are processed by 802.1X agent and all other packets are dropped. After the port is successfully authenticated, the port is in the authorized state and all packets are allowed to pass. The state transition is controlled by authentication exchange between supplicant and authentication server. However, the user can control the state by using any one of the following commands:

```
switch(config-if-Et1) #dot1x port-control force-authorized
switch(config-if-Et1) #dot1x port-control force-unauthorized
switch(config-if-Et1) #dot1x port-control auto
```

- 
- **force-authorized** disables 802.1X authentication and directly put the port to the authorized state. This is the default setting.
  - **force-unauthorized** also disables 802.1X authentication and directly put the port to unauthorized state, ignoring all attempts by the client to authenticate.
  - **auto** enables 802.1X authentication and put the port to unauthorized state first. The port state remains in an unauthorized state or transit to authorized state according to authentication result and configuration.

#### **8.2.2.2.5.2 Uncontrolled Port State**

The uncontrolled port on the Authenticator is the only one open before a client is authenticated. The uncontrolled port permits only EAPOL frames to be swapped between the client and the Authentication Server. No traffic is allowed to pass through the controlled port in the unauthorized state.

During authentication, EAPOL messages are swapped between the Supplicant PAE and the Authenticator PAE, and RADIUS messages are swapped between the Authenticator PAE and the Authentication Server. If the client is successfully authenticated, the controlled port becomes authorized, and traffic from the client can flow through the port normally.

All controlled ports on the switch are placed in the authorized state, allowing all traffic, by default. When authentication is initiated, the controlled port on the interface is initially set in the unauthorized state. If a client connected to the port is authenticated successfully, the controlled port is set in the authorized state.

#### **8.2.2.2.6 Message Exchange During Authentication**

[Multiple clients connected to a 802.1X-enabled port](#) illustrates an exchange of messages between an 802.1X-enabled client, a switch operating as Authenticator, and a RADIUS server operating as an Authentication Server.

Arista switches support MD5-challenge TLS and any other EAP-encapsulated authentication types in EAP Request or Response messages. In other words, the switches are transparent to the authentication scheme used.

#### **8.2.2.2.7 Authenticating Multiple Clients Connected to the Same Port**

Arista switches support 802.1X authentication for ports with more than one client connected to them. [Multiple clients connected to a 802.1X-enabled port](#) illustrates a sample configuration where multiple clients are connected to a single 802.1X port. 802.1X authentication may use multi-host mode, or (on selected switches) single-host mode. In both modes, the port authenticates the packets received from any one client, and the packets received from other clients are dropped, until the connected client is authenticated by the RADIUS server.

##### **8.2.2.2.7.1 Single-host Mode**

In single-host mode, once the 802.1X client has been authenticated by the RADIUS server further authentication is not required, but the port accepts packets only from the MAC address of the authenticated client.

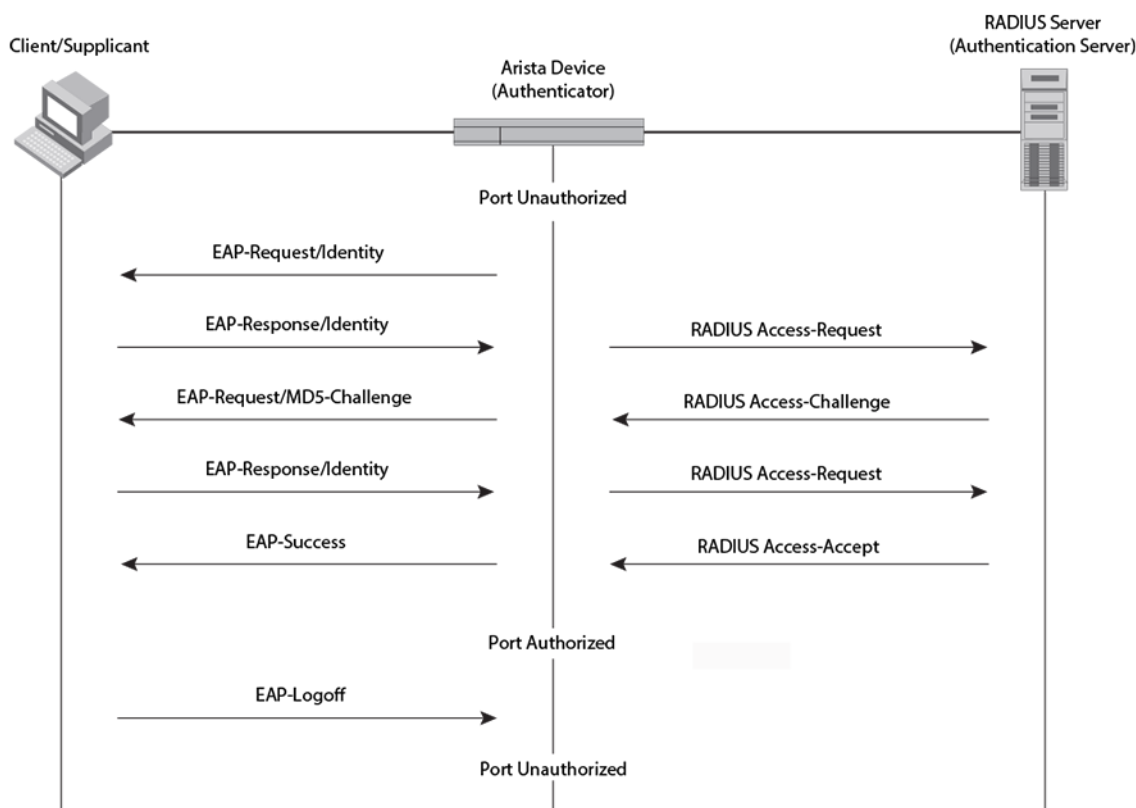

Figure 6: Message Exchange During Authentication

#### 8.2.2.2.7.2 Multi-host Mode

In multi-host mode, once the 802.1X client has been authenticated by the RADIUS server, the port is open to accept all packets from any connected client, and these packets do not require any authentication.

#### 8.2.2.2.8 802.1X MAC- Based Authentication

The 802.1X MAC-based authentication allows a set of MAC addresses to be programmed into the RADIUS server. These MAC addresses (MAC-based authentication supplicants) do not connect to 802.1X profiles but are still allowed access to the network. The authenticator identifies devices that do not support 802.1X and uses the MAC address of these devices as username and password in its RADIUS request packets.

In a MAC-based authentication, every supplicant trying to gain access to the authenticator port is individually authenticated as opposed to authenticating just one supplicant on a given VLAN or port with 802.1X. The behavior is different for MAC-based authentication supplicants when we have a 802.1.x supplicant authenticated in single host and multi-host 802.1X modes.

To enable Mac-based authentication, use the following command:

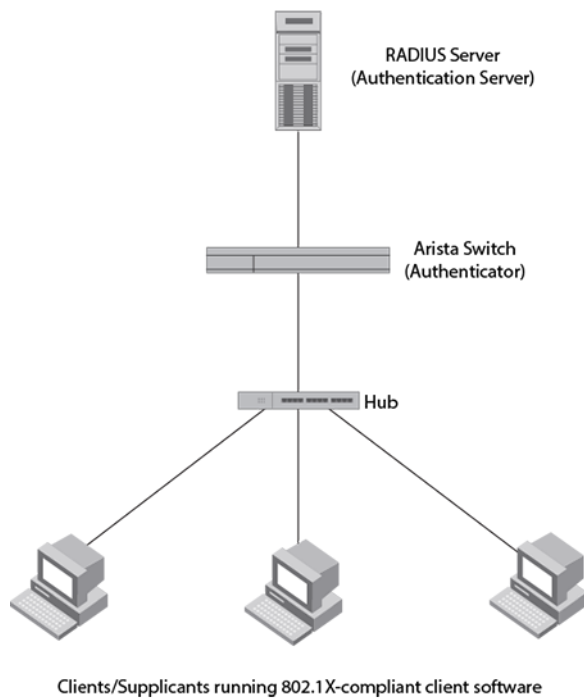

```
switch(config-if-Et1/1)#dot1x mac based authentication
```

**Note:** This command is added to the existing 802.1X configuration on the port, so a typical 802.1X interface configuration with MAC-Based Authentication enabled may look something like this:

```
switch(config-if-Et1/1)#show active
speed forced 1000full
dot1x pae authenticator
```

```
dot1x port-control auto
dot1x mac based authentication
```

**Figure 7: Multiple clients connected to a 802.1X-enabled port**

### 8.2.2.3 Configuring 802.1X Port Security

Basic steps to implementing 802.1X Port-based Network Access Control and RADIUS accounting on the switch:

1. A RADIUS server is required on one or more of your network servers or management stations. 802.1X is not supported with the TACACS+ authentication protocol.
2. You must create supplicant accounts on the RADIUS server:
  - The account for a supplicant connected to an authenticator port must have a username and password combination when set to the 802.1X authentication mode.
  - An account for the supplicant connected to an authenticator port and placed in the MAC address-based authentication mode needs use the MAC address of the node as both the username and password.
  - Connected clients to an 802.1X authenticator port will require 802.1X client software.
3. The RADIUS client must be configured by entering the IP addresses and encryption keys of the authentication servers on your network.
4. The port access control settings must be configured on the switch. This includes the following:
  - Specifying the port roles.
  - Configuring 802.1X port parameters.
    - Enabling 802.1X Port-based Network Access Control.

#### Guidelines

- Do not set a port that is connected to a RADIUS authentication server to the authenticator role as an authentication server cannot authenticate itself.
- A supplicant connected to an authenticator port set to the 802.1X username and password authentication method must have 802.1X client software.

- To prevent unauthorized individuals from accessing the network through unattended network workstations, end users of 802.1X port-based network access control should always log off when they are finished with a work session.
- The RADIUS client should be configured on the switch before activating port-based access control.

### 8.2.2.3.1 Configuring 802.1X Authentication Methods

IEEE 802.1X port security relies on external client-authentication methods, which must be configured for use. The method currently supported on Arista switches is RADIUS authentication. To configure the switch to use a RADIUS server for client authentication, use the `aaa authentication dot1x` command.

#### Example

This command configures the switch to use RADIUS authentication.

```
switch(config) #aaa authentication dot1x default group radius
switch(config) #
```

### 8.2.2.3.2 Globally Enable IEEE 802.1X

To enable IEEE 802.1X port authentication globally on the switch, use the `dot1x system-auth-control` command.

#### Example

This command enables IEEE 802.1X globally on the switch.

```
switch(config) #dot1x system-auth-control
switch(config)
```

### 8.2.2.3.3 Designating Authenticator Ports

To set the port access entity (PAE) type of an Ethernet or management interface to the **authenticator**, use the `dot1x pae authenticator` command.

#### Example

These commands configure the PAE type to **authenticator** on the Ethernet interface 1 to enable IEEE 802.1X on the port.

```
switch(config) #interface ethernet 1
switch(config-if-Et1) #dot1x pae authenticator
switch(config-if-Et1) #
```

#### Example

For ports to act as authenticator ports to connected supplicants, those ports must be designated using the `dot1x port-control` command.

The **auto** option of the `dot1x port-control` command designates an authenticator port for immediate use, blocking all traffic that is not authenticated by the AAA server.

#### Example

This command configures Ethernet 1 to immediately begin functioning as an authenticator port.

```
switch(config) #interface ethernet 1
switch(config-if-Et1) #dot1x port-control auto
switch(config-if-Et1) #
```

---

The **force-authorized** option of the **dot1x port-control** command sets the state of the port to **authorized** without authentication, allowing traffic to continue uninterrupted.

### Example

These commands designate Ethernet 1 as an authenticator port that will forward packets without authentication.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#dot1x port-controlforce-authorized
switch(config-if-Et1)#
```

To designate a port as an authenticator but prevent it from authorizing any traffic, use the **force-unauthorized** option of the **dot1x port-control** command.

### Example

The **force-unauthorized** option of the **dot1x port-control** command places the specified port in the unauthorized state, which will deny any access requests from users of the ports.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#dot1x port-controlforce-unauthorized
switch(config-if-Et1)#
```

#### 8.2.2.3.4 Specifying the Authentication Mode for Multiple Clients

By default, Arista switches authenticate in multi-host mode, allowing packets from any source MAC address once 802.1X authentication has taken place. To configure the switch for single-host mode (allowing traffic only from the authenticated clients MAC address), use the **dot1x host-mode** command.

### Example

These commands configure Ethernet interface 1 to use single-host mode for 802.1X authentication.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#dot1x host-mode single-host
switch(config-if-Et1)#
```

#### 8.2.2.3.5 Configuring Re-authentication

The **dot1x reauthentication** command enables re-authentication of authenticator ports with the default values.

The **dot1x timeout reauth-period** command allows to customize the re-authentication period of authenticator ports.

### Examples

- These commands configures the configuration mode interface to require re-authentication from clients at regular intervals.

```
switch(config)#interface Ethernet 1
switch(config-if-Eth)#dot1x reauthentication
```

- These commands configure the Ethernet interface 1 authenticator to require re-authentication from clients every 6 hours (21600 seconds).

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#dot1x reauthentication
switch(config-if-Et1)#dot1x timeout reauth-period 21600
```

```
switch(config-if-Et1) #
```

- These commands deactivate re-authentication on Ethernet interface 1.

```
switch(config) #interface Ethernet 1
switch(config-if-Et1) #no dot1x reauthentication
switch(config-if-Et1) #
```

### 8.2.2.3.6 Setting the EAP Request Maximum

The `dot1x reauthorization request limit` command configures the number of times the switch retransmits an 802.1X Extensible Authentication Protocol (EAP) request packet before ending the conversation and restarting authentication.

#### Example

These commands set the number of times the authenticator sends an EAP request packet to the client before restarting authentication.

```
switch(config) #interface ethernet 1
switch(config-if-Et1) #dot1x reauthorization request limit 4
switch(config-if-Et1) #
```

The default value is 2.

### 8.2.2.3.7 Disabling Authentication on a Port

To disable authentication on an authenticator port, use the **no** form of the `dot1x port-control` command.

#### Example

These commands disable authentication on Ethernet interface 1.

```
switch(config) #interface ethernet 1
switch(config-if-Et1) #no dot1x port-control
switch(config-if-Et1) #
```

### 8.2.2.3.8 Setting the Quiet Period

If the switch fails to immediately authenticate the client, the time the switch waits before trying again is specified by the `dot1x timeout quiet-period` command. This timer also indicates how long a client that failed authentication is blocked.

#### Example

These commands set the 802.1X quiet period for Ethernet interface 1 to 30 seconds.

```
switch(config) #interface ethernet 1
switch(config-if-Et1) #dot1x timeout quiet-period 30
```

The default value is 60 seconds.

### 8.2.2.3.9 Setting the Dot1x Timeout Reauth-period

The `dot1x timeout reauth-period` command specifies the time period in seconds that the configuration mode interface waits before requiring re-authentication from clients.

#### Example

---

These commands configure the timeout reauth-period to 21600 seconds.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#dot1x reauthentication
switch(config-if-Et1)#dot1x timeout reauth-period 21600
```

The default value is 3600 seconds.

#### 8.2.2.3.10 Setting the Transmission Timeout

Authentication and re-authentication are accomplished by the authenticator sending an Extensible Authentication Protocol (EAP) request to the supplicant and the supplicant sending a reply which the authenticator forwards to an authentication server. If the authenticator doesn't receive a reply to the EAP request, it waits a specified period of time before retransmitting. To configure that wait time, use the **dot1x timeout tx-period** command.

##### Example

These commands configure Ethernet interface 1 to wait 30 seconds before retransmitting EAP requests to the supplicant.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#dot1x timeout tx-period 30
switch(config-if-Et1)#
```

The default value is 5 seconds.

#### 8.2.2.3.11 Enable Authentication Failure VLAN

Configure Authentication Failure VLAN on a dot1x-enabled port using the following CLI command under the **interface-config** mode. The CLI command to set VLAN10 as authentication failure VLAN is as follows:

```
switch(config-if-Et1/1)#dot1x authentication failure action traffic allow
vlan 10
```

When **no authentication failure** VLAN is configured on a dot1x-enabled port, the default action is to drop any unauthorized traffic on the port. This behavior can also be specified using the following command:

##### Example

```
switch(config-if-Et1/1)#dot1x authentication failure action traffic drop
```

#### 8.2.2.3.12 Clearing 802.1X Statistics

The **clear dot1x statistics** command resets the 802.1X counters.

##### Examples

- This command clears the 802.1X counters on all interfaces.

```
switch#clear dot1x statistics all
switch#
```

- This command clears the 802.1X counters on Ethernet interface 1.

```
switch#clear dot1x statistics interface ethernet 1
switch#
```

### 8.2.2.4 Displaying 802.1X Information

You can display information about 802.1X on the switch and on individual ports.

#### 8.2.2.4.1 Displaying 802.1X statistics

Use the `show dot1x statistics` command to display 802.1X statistics for the specified port or ports.

##### Example

This command displays IEEE 802.1X statistics for Ethernet interface 5.

```
switch#show dot1x interface ethernet 5 statistics
Dot1X Authenticator Port Statistics for Ethernet5
-----
RxStart = 0          RxLogoff = 0      RxRespId = 0
RxResp = 0          RxInvalid = 0     RxTotal = 0
TxReqId = 0         TxReq = 0        TxTotal = 0
RxVersion = 0      LastRxSrcMAC = 0000.0000.0000
switch#
```

#### 8.2.2.4.2 Displaying 802.1X supplicant information

Use the `show dot1x hosts` command to display information for all the supplicants.

##### Example

This command displays 802.1X supplicant information.

```
switch#show dot1x hosts
Interface: Ethernet1/1
Supplicant MAC      Auth Method      State      VLAN Id
-----
e2:29:cb:11:2f:4a  EAPOL           SUCCESS    300
e2:29:cb:11:2f:4b  MAC-BASED-AUTH  SUCCESS    300
```

#### 8.2.2.4.3 Displaying Mac-address Tables

Use the `show mac address-table` command to display the MAC address of the supplicants allowed to pass the traffic through the port.

##### Example

```
switch#show mac address-table
Mac Address Table
-----
Vlan    Mac Address      Type      Ports      Moves      Last Move
----    -
300     e229.cb11.2f4a  STATIC    Et1/1
300     e229.cb11.2f4b  STATIC    Et1/1
Total Mac Addresses for this criterion: 2
```

#### 8.2.2.4.4 Displaying Port Security Configuration Information

The `show dot1x` command shows information about the 802.1X configuration on the specified port or ports.

##### Example

This commands displays IEEE 802.1X configuration information for Ethernet interface 5.

```
switch#show dot1x interface ethernet 5
Dot1X Information for Ethernet5
-----
PortControl           : auto
QuietPeriod           : 60 seconds
TxPeriod              : 5 seconds
ReauthPeriod          : 3600 seconds
MaxReauthReq          : 2
switch#
```

#### 8.2.2.4.5 Displaying the Status of the 802.1X Attributes for each Port.

Use the `show dotx1 interface interface-id` command to display the status of the 802x1 attributes for each port.

##### Example

```
switch(config-if-Et1/1)#show dot1x interface ethernet1/1
Dot1X Information for Ethernet1
-----
PortControl           : force-authorized
HostMode              : multi-host
QuietPeriod           : 60 seconds
TxPeriod              : 5 seconds
ReauthPeriod          : 0 seconds
MaxReauthReq          : 2
ReauthTimeoutIgnore  : No
AuthFailVlan          : 10
```

#### 8.2.2.4.6 Displaying VLANS

Use the `show vlan` command to display if a VLAN has been dynamically assigned to the port.

##### Example

```
switch#show vlan
VLAN  Name                               Status  Ports
-----
1     default                               active
2     VLAN0002                             active  Et7, Et17, Et18, Et41
300*  VLAN0300                             active  Et1/1, Et6, Et19, Et20, Et29
                                           Et30, Et31, Et32, Et42, Et43, Et44

* indicates a Dynamic VLAN
```

#### 8.2.2.4.7 Displaying\_802.1X\_Information

Use the `show dot1x all brief` command to display IEEE 802.1X status for all ports.

##### Example

- The following commands display a summary of IEEE 802.1X status.

```
switch#show dot1x all brief
Interface Client Status
-----
Ethernet5 None Unauthorized
switch#
```

### 8.2.2.5 802.1X Configuration Commands

#### Global Configuration Commands

- [dot1x system-auth-control](#)

#### Interface Configuration Commands Ethernet Interface

- [dot1x host-mode](#)
- [dot1x mac based authentication](#)
- [dot1x pae authenticator](#)
- [dot1x port-control](#)
- [dot1x reauthentication](#)
- [dot1x reauthorization request limit](#)
- [dot1x timeout quiet-period](#)
- [dot1x timeout reauth-period](#)
- [dot1x timeout tx-period](#)

#### Privileged EXEC Commands

- [clear dot1x statistics](#)
- [show dot1x](#)
- [show dot1x all brief](#)
- [show dot1x hosts](#)
- [show dot1x statistics](#)

---

### 8.2.2.5.1 clear dot1x statistics

The `clear dot1x statistics` command resets the 802.1X counters on the specified interface or all interfaces.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear dot1x statistics INTERFACE_NAME
```

#### Parameters

- **INTERFACE\_NAME** Interface type and number. Options include:
  - **all** Display information for all interfaces.
  - **interface ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **interface loopback** *l\_num* Loopback interface specified by *l\_num*.
  - **interface management** *m\_num* Management interface specified by *m\_num*.
  - **interface port-channel** *p\_num* Port-Channel Interface specified by *p\_num*.
  - **interface vlan** *v\_num* VLAN interface specified by *v\_num*.

#### Example

This command resets the 802.1X counters on all interfaces.

```
switch#clear dot1x statistics all  
switch#
```

### 8.2.2.5.2 dot1x mac based authentication

The **dot1x mac based authentication** command enables MAC-based authentication on the existing 802.1X authenticator port.

The **no dot1x mac based authentication** and the **default dot1x mac based authentication** commands restore the switch default by disabling the corresponding dot1x mac based authentication command for the specific 802.1X authenticator port.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
dot1x mac based authentication
```

```
no dot1x mac based authentication
```

```
default dot1x mac based authentication
```

#### Related Command

```
show dot1x hosts
```

#### Example

These commands configure MAC-based authentication on *Ethernet interface 1*.

```
switch(config)#interface ethernet 1  
switch(config-if-Et1)#dot1x mac based authentication  
switch(config-if-Et1)#
```

---

### 8.2.2.5.3 dot1x pae authenticator

The `dot1x pae authenticator` command sets the port access entity (PAE) type of the configuration mode interface to **authenticator**, which enables IEEE 802.1X on the port. IEEE 802.1X is disabled on all ports by default.

The `no dot1x pae authenticator` and `default dot1x pae authenticator` commands restore the switch default by deleting the corresponding `dot1x pae authenticator` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
dot1x pae authenticator
no dot1x pae authenticator
default dot1x pae authenticator
```

#### Examples

- These commands configure *Ethernet interface 2* as a port access entity (PAE) authenticator, enabling IEEE 802.1X on the port.

```
switch(config-if-Et1)#interface ethernet 2
switch(config-if-Et1)#dot1x pae authenticator
switch(config-if-Et1)#
```

- These commands disable IEEE 802.1X authentication on *Ethernet interface 2*.

```
switch(config-if-Et1)#interface ethernet 2
switch(config-if-Et1)#no dot1x pae authenticator
switch(config-if-Et1)#
```

#### 8.2.2.5.4 dot1x reauthentication

The `dot1x reauthentication` command configures the configuration mode interface to require re-authentication from clients at regular intervals. The interval is set by the `dot1x timeout reauth-period` command.

The `no dot1x reauthentication` and `default dot1x reauthentication` commands restore the default setting by deleting the corresponding `dot1x reauthentication` command from *running-config*.

##### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

##### Command Syntax

```
dot1x reauthentication
```

```
no dot1x reauthentication
```

```
default dot1x reauthentication
```

##### Example

These commands configure the *Ethernet interface 1* authenticator to require periodic re-authentication from clients.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#dot1x reauthentication
switch(config-if-Et1)#
```

---

### 8.2.2.5.5 dot1x reauthorization request limit

The `dot1x reauthorization request limit` command configures how many times the switch retransmits an 802.1X Extensible Authentication Protocol (EAP) request packet before ending the conversation and restarting authentication.

The `no dot1x reauthorization request limit` and `default dot1x reauthorization request limit` commands restore the default value of 2 by deleting the corresponding `dot1x reauthorization request limit` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
dot1x reauthorization request limit attempts
no dot1x reauthorization request limit
default dot1x reauthorization request limit
```

#### Parameters

attempts Maximum number of attempts. Values range from 1 to 10; default value is 2.

#### Examples

- This command sets the 802.1X EAP-request retransmit limit to 6.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#dot1x reauthorization request limit 6
switch(config-if-Et1)#
```

- This command restores the default request repetition value of 2.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#no dot1x reauthorization request limit
switch(config-if-Et1)#
```

### 8.2.2.5.6 dot1x system-auth-control

The `dot1x system-auth-control` command enables 802.1X authentication on the switch.

The `no dot1x system-auth-control` and `default dot1x system-auth-control` commands disables 802.1X authentication by removing the `dot1x system-auth-control` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
dot1x system-auth-control
no dot1x system-auth-control
default dot1x system-auth-control
```

#### Examples

- This command enables 802.1X authentication on the switch.

```
switch(config)#dot1x system-auth-control
switch(config)#
```

- This command disables 802.1X authentication on the switch.

```
switch(config)#no dot1x system-auth-control
switch(config)#
```

---

### 8.2.2.5.7 dot1x timeout quiet-period

If the switch fails to immediately authenticate the client, the time the switch waits before trying again is specified by the `dot1x timeout quiet-period` command. This timer also indicates how long a client that failed authentication is blocked.

The `no dot1x timeout quiet-period` and `default dot1x timeout quiet-period` commands restore the default quiet period of 60 seconds by removing the corresponding `dot1x timeout quiet-period` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
dot1x timeout quiet-period quiet_time
no dot1x timeout quiet-period
default dot1x timeout quiet-period
```

#### Parameter

quiet\_time Interval in seconds. Values range from 1 to 65535. Default value is 60.

#### Example

These commands set the 802.1X quiet period for Ethernet interface 1 to 30 seconds.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#dot1x timeout quiet-period 30
switch(config-if-Et1)#
```

### 8.2.2.5.8 dot1x timeout reauth-period

The `dot1x timeout reauth-period` command specifies the time period that the configuration mode interface waits before requiring re-authentication from clients.

The `no dot1x timeout reauth-period` and `default dot1x timeout reauth-period` commands restore the default period of 60 minutes by removing the corresponding `dot1x timeout reauth-period` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
dot1x timeout reauth-period reauth_time
```

```
no dot1x timeout reauth-period
```

```
default dot1x timeout reauth-period
```

#### Parameter

`reauth_time` The number of seconds the interface passes traffic before requiring re-authentication. Values range from 1 to 65535. Default value is 3600.

#### Example

These commands configure the Ethernet interface 1 authenticator to require re-authentication from clients every 6 hours (21600 seconds).

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#dot1x reauthentication
switch(config-if-Et1)#dot1x timeout reauth-period 21600
switch(config-if-Et1)#
```

---

### 8.2.2.5.9 dot1x timeout tx-period

Authentication and re-authentication are accomplished by the authenticator sending an Extensible Authentication Protocol (EAP) request to the supplicant and the supplicant sending a reply which the authenticator forwards to an authentication server. If the authenticator does not get a reply to the EAP request, it waits a specified period of time before retransmitting. The `dot1x timeout tx-period` command configures that wait time.

The `no dot1x timeout tx-period` and `default dot1x timeout tx-period` commands restore the default wait time by removing the corresponding `dot1x timeout tx-period` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
dot1x timeout tx-period tx_time  
no dot1x timeout tx-period  
default dot1x timeout tx-period
```

#### Parameter

tx\_time Values range from 1 to 65535. Default value is 5.

#### Example

These commands configure *Ethernet interface 1* to wait 30 seconds before retransmitting EAP requests to the supplicant.

```
switch(config)#interface Ethernet 1  
switch(config-if-Et1)#dot1x timeout tx-period 30  
switch(config-if-Et1)#
```

### 8.2.2.5.10 dot1x host-mode

When multiple clients are connected to an Ethernet interface providing 802.1X authentication, the port can either accept packets from all MAC addresses once the supplicant has been authenticated (multi-host mode), or it can accept only those packets originating from the MAC address of the authenticated client (single-host mode). The `dot1x host-mode` command specifies the host mode for authentication of multiple clients on the configuration mode interface.

The `no dot1x host-mode` and `default dot1x host-mode` commands restore the switch default (multi-host mode) by removing the corresponding dot1x host-mode command for the configuration mode interface.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
dot1x host-mode [multi-host | single-host]
```

```
no dot1x host-mode
```

```
default dot1x host-mode
```

#### Parameters

- **multi-host** Configures the interface to use multi-host mode (the default).
- **single-host** Configures the interface to use single-host mode.

#### Example

- These commands configure Ethernet interface 1 to use single-host mode for 802.1X authentication.

```
switch(config)#interface ethernet 1  
switch(config-if-Et1)#dot1x host-mode single-host  
switch(config-if-Et1)#
```

---

### 8.2.2.5.11 dot1x port-control

The `dot1x port-control` command configures the configuration mode interface as an authenticator port and specifies whether it will authenticate traffic.

The `no dot1x port-control` and `default dot1x port-control` commands configure the port to pass traffic without authorization by removing the corresponding `dot1x port-control` command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
dot1x port-control STATE
```

```
no dot1x port-control
```

```
default dot1x port-control
```

#### Parameters

- STATE Specifies whether the interface will authenticate traffic. The default value is **force-authorized**. Options include:
  - **auto** Configures the port to authenticate traffic using Extensible Authentication Protocol messages.
  - **force-authorized** Configures the port to pass traffic without authentication.
  - **force-unauthorized** Configures the port to block all traffic regardless of authentication.

#### Examples

- These commands configure Ethernet interface 1 to pass traffic without authentication. This is the default setting.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#dot1x port-control force-authorized
switch(config-if-Et1)#
```

- These commands configure Ethernet interface 1 to block all traffic.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#dot1x port-control force-unauthorized
switch(config-if-Et1)#
```

- These commands configure Ethernet interface 1 to authenticate traffic using EAP messages.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#dot1x port-control auto
switch(config-if-Et1)#
```

### 8.2.2.5.12 Specifying the Authentication Mode for Multiple Clients

By default, Arista switches authenticate in multi-host mode, allowing packets from any source MAC address once 802.1X authentication has taken place. To configure the switch for single-host mode (allowing traffic only from the authenticated clients MAC address), use the `dot1x host-mode` command.

#### Example

These commands configure Ethernet interface 1 to use single-host mode for 802.1X authentication.

```
switch(config)#interface Ethernet 1  
switch(config-if-Et1)#dot1x host-mode single-host  
switch(config-if-Et1)#
```

---

### 8.2.2.5.13 show dot1x all brief

The `show dot1x all brief` command displays the IEEE 802.1X status for all ports.

#### Command Mode

EXEC

#### Command Syntax

```
show dot1x all brief
```

#### Example

This command displays the IEEE 802.1X status.

```
switch#show dot1x all brief
Interface          Client          Status
-----
Ethernet5         None           Unauthorized
switch#
```

#### 8.2.2.5.14 show dot1x hosts

The `show dot1x hosts` command displays 802.1X information for all the supplicants.

##### Command Mode

EXEC

##### Command Syntax

```
show dot1x hosts [ethernet]
```

##### Parameter

ethernet *e\_num* Ethernet interface specified by *e\_num*.

##### Related Command

[dot1x mac based authentication](#)

##### Example

This command displays 802.1X information for all the supplicants.

```
switch#show dot1x hosts
Interface: Ethernet1/1
  Supplicant MAC           Auth Method           State           VLAN Id
  -----
  e2:29:cb:11:2f:4a       MAC-BASED-AUTH       SUCCESS        300
```

### 8.2.2.5.15 show dot1x statistics

The `show dot1x statistics` command displays 802.1X statistics for the specified port or ports.

#### Command Mode

EXEC

#### Command Syntax

```
show dot1x INTERFACE_NAME statistics
```

#### Parameters

- **INTERFACE\_NAME** Interface type and number. Options include:
  - **all** Display information for all interfaces.
  - **ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **loopback** *l\_num* Loopback interface specified by *l\_num*.
  - **management** *m\_num* Management interface specified by *m\_num*.
  - **port-channel** *p\_num* Port-Channel Interface specified by *p\_num*.
  - **vlan** *v\_num* VLAN interface specified by *v\_num*.

#### Output Fields

- **RxStartNumber** of EAPOL-Start frames received on the port.
- **TxReqIdNumber** of EAP-Request/Identity frames transmitted on the port.
- **RxVersionVersion** number of the last EAPOL frame received on the port.
- **RxLogoffNumber** of EAPOL-Logoff frames received on the port.
- **RxInvalidNumber** of invalid EAPOL frames received on the port.
- **TxReqNumber** of transmitted EAP-Request frames that were not EAP-Request/Identity.
- **LastRxSrcMAC**The source MAC address in the last EAPOL frame received on the port.
- **RxRespId**The number of EAP-Response/Identity frames received on the port
- **RxTotal**The total number of EAPOL frames transmitted on the port.
- **TxTotal**The total number of EAPOL frames transmitted on the port.

#### Example

This command displays the 802.1X statistics for *Ethernet interface 5*.

```
switch#show dot1x interface ethernet 5 statistics
Dot1X Authenticator Port Statistics for Ethernet5
-----
RxStart = 0          RxLogoff = 0          RxRespId = 0
RxStart= 0          RxInvalid = 0         RxTotal = 0
TxReqId = 0         TxReq = 0            TxTotal = 0
RxVersion = 0      LastRxSrcMAC = 0000.0000.0000
switch#
```

### 8.2.2.5.16 show dot1x

The **show dot1x** command displays 802.1X information for the specified interface.

#### Command Mode

EXEC

#### Command Syntax

```
show dot1x INTERFACE_NAME INFO
```

#### Parameters

- **INTERFACE\_NAME** Interface type and number. Options include:
  - all Display information for all interfaces.
  - ethernet *e\_num* Ethernet interface specified by *e\_num*.
  - loopback *l\_num* Loopback interface specified by *l\_num*.
  - management *m\_num* Management interface specified by *m\_num*.
  - port-channel *p\_num* Port-Channel Interface specified by *p\_num*.
  - vlan *v\_num* VLAN interface specified by *v\_num*.
- **INFO** Type of information the command displays. Values include:
  - *<no parameter>* displays summary of the specified interface.
  - detail displays all 802.1X information for the specified interface.

#### Examples

- This command displays 802.1X summary information for Ethernet interface 5.

```
switch#show dot1x interface ethernet 5
Dot1X Information for Ethernet5
-----
PortControl           : auto
QuietPeriod           : 60 seconds
TxPeriod              : 5 seconds
ReauthPeriod          : 3600 seconds
MaxReauthReq          : 2
switch#
```

- This command displays detailed 802.1X information for Ethernet interface 5.

```
switch#show dot1x interface ethernet 5 detail
Dot1X Information for Ethernet5
-----
PortControl           : auto
QuietPeriod           : 60 seconds
TxPeriod              : 5 seconds
ReauthPeriod          : 3600 seconds
MaxReauthReq          : 2

Dot1X Authenticator Client

Port Status           : Unauthorized
switch#
```

## 8.3 Data Plane Security

This section contains the following topics:

- [IP NAT](#)

- 
- [Media Access Control Security](#)
  - [Internet Protocol Security \(IPsec\)](#)
  - [Macro-Segmentation Service \(CVX\)](#)

### 8.3.1 IP NAT

Network address translation (NAT) is a router process that modifies address information of IP packets in transit. NAT is typically used to correlate address spaces between a local network and a remote, often public, network. Static NAT defines a one-to-one map between local and remote IP addresses. Static maps are configured manually through CLI commands. An interface can support multiple NAT commands, but each command must specify a unique local IP address-port location.

NAT is configured on routers that have interfaces connecting to the local networks and interfaces connecting to a remote network.

s

#### Inside and Outside Addresses

In NAT configurations, IP addresses are placed into one of two categories: inside or outside. Inside refers to IP addresses used within the organizational network. Outside refers to addresses on an external network outside the organizational network.

### 8.3.2 Media Access Control Security

This section explains the basic concepts about Media Access Control Security (MACsec) including overview, configuration, and the different MACsec commands that are used.

- [MACsec Overview](#)
- [Configuring MACsec](#)
- [Displaying MACsec Information](#)
- [MACsec Key Retirement Immediate](#)
- [MACsec EAP-FAST Support](#)
- [MACsec Proxy For VXLAN](#)
- [MACsec Fallback to Unprotected Traffic](#)
- [MACsec Commands](#)

### 8.3.3 Internet Protocol Security (IPsec)

This section describes Aristas IPsec implementation. Topics in this section include:

- [IPsec Introduction](#)
- [IPsec Overview](#)
- [Configuring IPsec](#)
- [IPsec Commands](#)

### 8.3.4 Macro-Segmentation Service (CVX)

Arista MSS is designed as a service in CloudVision that provides the point of integration between individual vendor firewalls or a firewall manager and the Arista network fabric. MSS provides flexibility on where to place the service devices and workloads. It is specifically aimed at Physical-to-Physical (P-to-P) and Physical-to-Virtual (P-to-V) workloads.

Topics in this section include:

- [Overview](#)
- [How MSS Works](#)
- [Configuration](#)

- [MSS Commands](#)

## Quality of Service and Traffic Management

---

This chapter describes Arista's Quality of Service (QoS) implementation and Traffic Management, including configuration instructions and command descriptions. Topics covered by this chapter include:

- [Quality of Service](#)
- [Traffic Management](#)

### 9.1 Quality of Service

This chapter describes Arista's Quality of Service (QoS) implementation, including configuration instructions and command descriptions. Topics covered by this chapter include:

- [Quality of Service Conceptual Overview](#)
- [QoS Configuration: Platform-Independent Features](#)
- [QoS Configuration: Arad Platform Switches](#)
- [QoS Configuration: Jericho Platform Switches](#)
- [QoS Configuration: FM6000 Platform Switches](#)
- [QoS Configuration: Petra Platform Switches](#)
- [QoS Configuration: Trident and Tomahawk Platform Switches](#)
- [QoS Configuration: Trident II and Helix Platform Switches](#)
- [ACL based QoS Configuration](#)
- [Quality of Service Configuration Commands](#)

#### 9.1.1 Quality of Service Conceptual Overview

QoS processes apply to traffic that flows through Ethernet ports and control planes. These processes can modify data fields (CoS or DSCP) or assign data streams to traffic classes for prioritized handling. Transmission queues are configurable for individual Ethernet ports to shape traffic based on its traffic class. Many switches also support traffic policies that apply to data that is filtered by access control lists.

The following sections describe QoS features:

- [QoS Data Fields and Traffic Classes](#)
- [Transmit Queues and Port Shaping](#)
- [Explicit Congestion Notification \(ECN\)](#)
- [ACL Policing](#)
- [Quality of Service \(QoS\) Profiles](#)

##### 9.1.1.1 QoS Data Fields and Traffic Classes

Quality of Service defines a method of differentiating data streams to provide varying levels of service to the different streams.

Criteria determining a packet's priority level include packet field contents and the port where data packets are received. QoS settings are translated into traffic classes, which are then used by switches to manage all traffic flows. Traffic flow management varies with each switch platform.

---

### 9.1.1.1.1 QoS Data Fields

Quality of service decisions are based on the contents of the following packet fields:

- CoS (three bits): Class of service (CoS) is a 3-bit field in Ethernet frame headers using VLAN tagging. The field specifies a priority value between zero and seven. Class of service operates at layer 2.
- DSCP (six bits): Differentiated Service Code Point (DSCP) is a 6-bit field in the Type Of Service (TOS) field of IP packet headers.

### 9.1.1.1.2 Port Settings – Trust Mode and Traffic Class

Ethernet and port channel interfaces support three QoS trust modes:

- CoS Trust: Ports use inbound packet CoS field contents to derive the traffic class.
- DSCP Trust: Ports use inbound packets DSCP field contents to derive the traffic class.
- Untrusted: Ports use their default values to derive the traffic class, ignoring packet contents.

The default mode setting is **CoS trust** for switched ports and **DSCP trust** for routed ports.

Ports are associated with default CoS, DSCP, and traffic class settings; defaults vary by platform.

These sections describe procedures for configuring port settings:

- [CoS and DSCP Port Settings – Arad Platform Switches](#)
- [CoS and DSCP Port Settings – FM6000 Platform Switches](#)
- [CoS and DSCP Port Settings – Petra Platform Switches](#)
- [CoS and DSCP Port Settings – Trident and Tomahawk Platform Switches](#)
- [CoS and DSCP Port Settings – Trident II and Helix Platform Switches](#)

### 9.1.1.1.3 Rewriting CoS and DSCP

#### CoS Rewrite

Switches can rewrite the CoS field for outbound tagged packets. The new CoS value is configurable, and is derived from a data stream's traffic class as specified by the traffic class-to-CoS rewrite map. CoS rewrite is disabled on all the traffic received on CoS trusted ports.

On Arad, Jericho, FM6000, Trident and Tomahawk, Trident II, and Helix platform switches, CoS rewrite can be enabled or disabled on DSCP trusted ports and untrusted ports.

- CoS rewrite is globally enabled by default for packets received on untrusted ports and DSCP trusted ports if at least one port is explicitly configured in **DSCP trust** or **untrusted** mode.
- CoS rewrite is globally disabled by default for packets received on untrusted ports and DSCP trusted ports if there are no ports explicitly configured in **DSCP trust** or **untrusted** mode.

On Petra platform switches, CoS rewrite is always enabled on DSCP trusted ports and untrusted ports.

#### DSCP Rewrite

Switches can rewrite the DSCP field for outbound IP packets. On FM6000, Trident and Tomahawk, Trident II, and Helix platform switches, DSCP rewrite is disabled by default on all ports and always disabled for traffic received on DSCP trusted ports. On Petra, Arad, and Jericho platform switches, DSCP rewrite is always disabled.

FM6000, Trident and Tomahawk, Trident II, and Helix platform switches provide a command that enables or disables DSCP rewrite for packets received on CoS trusted ports and untrusted ports. The new DSCP value is configurable, based on the data stream's traffic class, as specified by the traffic class-to-DSCP rewrite map.

These sections describe procedures for rewriting CoS and DSCP fields:

- [CoS Rewrite – Arad Platform Switches](#)
- [CoS and DSCP Rewrite – FM6000 Platform Switches](#)
- [CoS Rewrite – Petra Platform Switches](#)
- [CoS and DSCP Rewrite – Trident and Tomahawk Platform Switches](#)
- [CoS and DSCP Rewrite – Trident II and Helix Platform Switches](#)

#### 9.1.1.1.4 Traffic Classes

Data stream distribution is based on their traffic classes. Data stream management varies by switch platform. Traffic classes are derived from these data stream, inbound port, and switch attributes:

- CoS field contents
- DSCP field contents
- Inbound port trust setting
- CoS default setting (Arad, Jericho, FM6000, Trident and Tomahawk, Trident II, and Helix platform switches)
- DSCP default setting (Arad, Jericho, FM6000, Trident and Tomahawk, and Trident II platform switches)
- Traffic class default setting (Petra platform switches)

When a port is configured to derive a data stream's traffic class from the CoS or DSCP value associated with the stream, the traffic class is determined from a conversion map.

- A CoS-to-traffic class map derives a traffic class from a CoS value.
- A DSCP-to-traffic class map derives a traffic class from a DSCP value.

Map entries are configurable through CLI commands. Default maps determine the traffic class value when CLI map entry commands are not configured. Default maps vary by switch platform.

These sections describe traffic class configuration procedures:

- [Traffic Class Derivations – Arad Platform Switches](#)
- [Traffic Class Derivations – Jericho Platform Switches](#)
- [Traffic Class Derivations – FM6000 Platform Switches](#)
- [Traffic Class Derivations – Petra Platform Switches](#)
- [Traffic Class Derivations – Trident and Tomahawk Platform Switches](#)
- [Traffic Class Derivations – Trident II and Helix Platform Switches](#)

#### 9.1.1.2 Transmit Queues and Port Shaping

Transmit queues are logical partitions of an Ethernet port's egress bandwidth. Data streams are assigned to queues based on their traffic class, then sent as scheduled by port and transmit settings. Support varies by switch platform. A queue's label determines its priority: queues with the suffix "0" have the lowest priority.

Parameters that determine transmission schedules include:

- **Traffic class-to-transmit queue** mapping determines the transmit queue for transmitting data streams based on traffic class. The set of available transmit maps vary by switch platforms:
  - Arad, Jericho, FM6000, Trident II, and Helix platforms: one map for all unicast and multicast traffic.
  - Trident and Tomahawk platform: one map for unicast traffic and one map for multicast traffic.
  - Petra platform: one map for unicast traffic. Queue shaping is not available for multicast traffic.
- **Port shaping** specifies a port's maximum egress bandwidth.
- **Queue shaping** specifies a transmit queue's maximum egress bandwidth, and implementation varies by platform.

- Trident and Tomahawk platform: queue shaping is configurable separately for unicast and multicast queues.
- Trident II platform: queue shaping is configurable for transmit queues. Port shaping and queue shaping are supported only in store-and-forward switching mode.
- Petra platform: queue shaping is not available for multicast traffic.
- Helix platform: queue shaping is configurable for transmit queues.
- FM6000 platform: switches do not support simultaneous port shaping and queue shaping. Enabling port shaping on an FM6000 switch disables queue shaping, regardless of the previous configuration.
- **Guaranteed bandwidth** guarantees the allocation of a specified bandwidth for a transmit queue. Guaranteed bandwidth is supported only on Trident II platforms.
- **Queue priority** specifies the priority at which a transmit queue is serviced. The switch defines two queue priority types:
  - *Strict priority queues* are serviced in the order of their priority rank - subject to each queue's configured maximum bandwidth. Data is not handled for a queue until all queues with higher priority are emptied or their transmission limit is reached. These queues typically carry low latency real time traffic and require highest available priority.
  - *Round robin queues* are serviced simultaneously subject to assigned bandwidth percentage and configured maximum bandwidth. All round robin queues have lower priority than strict priority queues. Round robin queues can be starved by strict priority queues.
- **Queue scheduling** determines how packets from different transmit queues are serviced to be sent out on the port.
- **Queue bandwidth allocation** specifies the time slice (percentage) assigned to a round robin queue, relative to all other round robin queues.

These sections describe transmit queue and port shaping configuration procedures:

- [Transmit Queues and Port Shaping – Arad Platform Switches](#)
- [Transmit Queues and Port Shaping – Jericho Platform Switches](#)
- [Transmit Queues and Port Shaping – FM6000 Platform Switches](#)
- [Transmit Queues and Port Shaping – Petra Platform Switches](#)
- [Transmit Queues and Port Shaping – Trident and Tomahawk Platform Switches](#)
- [Transmit Queues and Port Shaping – Trident II and Helix Platform Switches](#)

### 9.1.1.3 Explicit Congestion Notification (ECN)

Explicit Congestion Notification (ECN) is an IP and TCP extension that facilitates end-to-end network congestion notification without dropping packets. ECN recognizes early congestion and sets flags that signal affected hosts. Trident and Tomahawk, Trident II, and Helix platform switches extend ECN support to non-TCP packets.

ECN usage requires that it is supported and enabled by both endpoints. Although only unicast flows are modified by ECN markers, the multicast, broadcast, and unmarked unicast flows can affect network congestion and influence the indication of unicast packet congestion.

#### 9.1.1.3.1 ECN Conceptual Overview

The ECN field in the IP header (bits 6 and 7 in the IPv4 TOS or IPv6 traffic class octet) advertises ECN capabilities:

- 00: Router does not support ECN.
- 10: Router supports ECN.
- 01: Router supports ECN.
- 11: Congestion encountered.

Networks typically signal congestion by dropping packets. After an ECN-capable host negotiates ECN, it signals impending congestion by marking the IP header of packets encountering the congestion instead of dropping the packets. The recipient echoes the congestion indication back to the sender, which reduces its transmission rate as if it had detected a dropped packet.

Switches support ECN for unicast queues through Weighted Random Early Detection (WRED), an active queue management (AQM) algorithm that extends Random Early Detection (RED) to define multiple thresholds for an individual queue. WRED determines congestion by comparing average queue size with queue thresholds. Average queue size depends on the previous average and current queue size:

$$\text{average queue size} = (\text{old\_avg} * (1 - 2^{(-\text{weight})})) + (\text{current\_queue\_size} * 2^{(-\text{weight})})$$

where weight is the exponential weight factor used for averaging the queue size.

Packets are marked based on WRED as follows:

- If average queue size is below the minimum threshold, packets are queued as in normal operation without ECN.
- If average queue size is greater than the maximum threshold, packets are marked for congestion.
- If average queue size is between minimum and maximum queue threshold, packets are either queued or marked. The proportion of packets that are marked increases linearly from 0% at the minimum threshold to 100% at the maximum threshold.

Treatment of packets marked as not ECN capable varies by platform.

These sections describe ECN configuration procedures:

- [ECN Configuration – Arad Platform Switches](#)
- [ECN Configuration – Trident and Tomahawk Platform Switches](#)

#### 9.1.1.4 ACL Policing

ACL policing monitors the ingress data rates for a particular class of traffic and performs the action configured when the traffic exceeds the user configured value. Therefore, it allows the user to control ingress bandwidth based on packet classification. The incoming traffic is metered and marked by the policing, and based on the metering results the actions are performed.

ACL policing uses a token bucket shaping algorithm for packet transmission. Packets are eligible for transmission when token count is positive, and when token count is negative the next packet will have to wait until the token count turns positive again. The tokens are renewed at 96ns time interval (Tc). The tokens are collected in the policer bucket up to a max burst size of 16KB, and any traffic beyond this shape rate and burst size is buffered in the shared memory. The packets are dropped if there is a memory overflow.

**Note:** The policer bucket is refilled at a sweeper period of 0.333 millisecond. This is applicable for all the platforms.

For example, let us assume that shaping is not enabled, and the link is at 10 Gbps, that is 1.25 bytes/nsec. In such case a each refill cycle will add tokens worth 120 bytes. For a shape rate of 500 Mbps, each refill cycle will add 6 bytes. And for 64 byte worth of tokens we need around 11 refill cycles = 1us. A 64 byte packet coming immediately after a jumbo frame will have to wait longer compared to a jumbo frame coming after 64 byte packet.

Token size depends on the interface speed, following the last example:

- For 10 Gbps, each refill cycle will add tokens worth 120 bytes.
- For 1 Gbps, each refill cycle will add tokens worth 12 bytes.

At lower shaping rates (less than 10 Mbps), granularity and rounding errors may alter the actual shaping rate by 20% from the specified rate, and the rounding errors are much less at higher speeds. For example, At 100 Mbps you will see 98.9 Mbps configured in hardware. User can use the `show qos interfaces` command to verify the interface speed.

The policing uses three types of traffic metering and coloring mechanisms.

- **Single Rate Two Color Marker**
- **Single Rate Three Color Marker**
- **Two Rate Three Color Marker**

#### **Single Rate Two Color Marker**

It meters the packet stream and marks packets based on committed burst size (bc) and excess burst size (be).

#### **Single Rate Three Color Marker**

It meters the packet stream and marks packets based on single rate committed information rate (cir), and committed burst size (bc) and excess burst size (be). The packets are marked in green if it does not exceed the set burst size, and marked in yellow if it does exceed the burst size but not the excess burst size, and marked red otherwise. The packets are marked in two color modes.

- **Color-blind Mode:** In color-blind mode the incoming packet color is ignored.
- **Color-aware Mode:** In color-aware mode it is assumed that incoming packet is colored by preceding entity. And, in color-aware mode, a packet never get better than it was. If the input color of the packet is green, it can be marked as green, yellow, or red. But if the input color is yellow, then it can be marked only yellow or red

#### **Two Rate Three Color Marker**

It meters the packet stream and marks its packets based on two rates, peak information rate (pir) and committed information rate (cir), and associated burst sizes (bc and be).The packet is marked red if rate exceeds 'pir', and yellow if it exceeds 'cir' but not 'pir' and marked green if rate is lower than 'cir'. The two rate mode is configured by setting four parameters pir, cir, bc, and be.

The ACL policing is supported on platforms specified in the table below.

#### **ACL Policing Support Matrix**

Platform Supported	ACL Policing	ACL Policing on LAG Interface
Trident	Yes	Yes
Trident II	Yes	Yes
Trident+	Yes	Yes
FM6000	Yes	Yes
Arad	Yes	Only Per-Port
Jericho	Yes	Yes
Helix	Yes	Yes
XP	Yes	Yes
Trident 3	Yes	Yes
Tomahawk	Yes	Yes

Tomahawk 2	Yes	Yes
Tofino	No	No

#### 9.1.1.4.1 Configuring ACL Policing

The policer is applied to the class inside the policy map. Policy maps can contain one or more policy map classes, each with different match criteria and policers. The following is the default behavior on conditions and available policing actions:

- Police command creates a per-interface policer. If you attach per-interface policers to multiple ingress ports, each one polices the matched traffic on each ingress port separately. Per interface statistics gathered for conformed/allowed traffic and exceeded/dropped traffic
- If there is no policer configured within a class, all traffic is transmitted without any policing. If there are any actions configured, the configured actions are applied
  - conform-action (green): transmit (default)
  - exceed-action (yellow): drop (default)
  - violate-action (red): drop (default)
- The policer bucket is refilled at a sweeper period of 0.333 milliseconds, and the tokens in the policer bucket are renewed at 96ns time interval (Tc). This is applicable for all the platforms.

#### Steps to Configure ACL Policing

These commands set the CIR, burst size, and creates a class and applies the policing to the policy map:

1. Create a policy map.
2. Create a class-map.
3. Apply the policer to the policy map created.

#### Examples

- These commands configure the ACL policing for a policy map.

```
switch#configure terminal
switch(config)#policy-map [type qos] policy-name
switch(config-pmap)#class { class-name }
switch(config-pmap-c)#[no] police cir cir [{bps|kbps|mbps}] bc
committed-burst-size [{bytes|kbytes|mbytes}]
```

- These commands configure ACL policing in single-rate, two-color mode.

```
switch(config)#class-map type qos match-any class1
switch(config-cmap-class1)#match ip access-group acl1
switch(config-cmap-class1)#exit

switch(config)#policy-map type quality-of-service policy1
switch(config-pmap)#class class1
switch(config-pmap-c)#police cir 512000 bc 96000
switch(config-pmap-c)#exit
switch(config-pmap)#
```

#### Displaying ACL Policing Information

#### Examples

- This command shows the contents of all policy maps on the switch.

```
switch(config)#show policy-map
```

```

Service-policy p
  Class-map: c (match-any)
    Match: ip access-group name a
    police rate 1000 mbps burst-size 100 bytes
  Class-map: class-default (match-any)
Service-policy p
  Class-map: c (match-any)
    Match: ip access-group name a
    police rate 1000 mbps burst-size 100 bytes
  Class-map: class-default (match-any)

```

- This command shows the interface-specific police counters for Ethernet interface 1.

```

switch(config)#show policy-map interface Ethernet 1 input counters
Service-policy input: policy1
Hardware programming status: Successful

Class-map: class1 (match-any) Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes Conformed 4351 packets, 1857386
bytes
Conformed 2536 packets, 3384260 bytes

Class-map: class-default (match-any) matched packets: 0

```

- This command shows the counters associated with the policy map called “p1.”

```

switch(config)#show policy-map type qos p1 input counters
Service-policy input: p1 Class-map: c1 (match-any)
Match: ip access-group name a1
Police cir 512000 bps bc 96000 bytes Interface: Ethernet1
Conformed 4351 packets, 1857386 bytes
Exceeded 2536 packets, 3384260 bytes
Interface: Ethernet2
Conformed 2351 packets, 957386 bytes
Exceeded 1536 packets, 1384260 bytes
Class-map: class-default (match-any)
Matched packets : 3229

```

- This command shows the QoS policy map for Ethernet interface 1.

```

switch(config)#show policy-map interface Ethernet 1 input type qos
Interface: Ethernet 1 Service-policy input: policy1
Hardware programming status: Successful Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 9000 bytes
Class-map: class2 (match-any)
Match: ip access-group name acl2 set dscp 2
Class-map: class3 (match-any) Match: ip access-group name acl3
Police cir 1280000 bps bc 9000 bytes
Class-map: class-default (match-any)

```

### 9.1.1.5 Quality of Service (QoS) Profiles

Quality of Service (QoS) profiles are sets of QoS configuration instructions defined and applied at the interface level. A QoS profile serves the traffic better by reducing disorder in the running configuration. QoS profiles can modify all interface-level QoS configurations, and are supported on fabric, Ethernet, and port-channel interfaces. Control-plane policies cannot be applied using QoS profiles. Because configuration can be applied through QoS profiles or directly at the interface level, multiple configurations can be applied to the same interface. In such cases, QoS configurations with non-default values, whether configured through the CLI at the interface level or through a QoS profile,

are given priority. In the case of multiple non-default values being configured, the interface-level CLI configuration is given priority.

Policy maps incorporating traffic resolution commands can also be applied by a QoS profile. If two policy maps are applied to the same interface (one through a QoS profile and another directly to the CLI).

Policy maps cannot be used on fabric interfaces. If a QoS profile which includes a policy map is applied to a fabric interface, a warning message will be displayed and the policy map will not be applied to the interface, but any additional supported configurations in the QoS profile will be applied. On SVIs and subinterfaces, QoS profiles are not supported, so policy maps must be applied directly through the CLI for these interfaces.

**Note:** For tx-queue configuration, conflicts between QoS profiles and configuration entered via the CLI are resolved at the tx-queue level and not at the tx-queue attribute level. If any non-default configuration has been entered for the tx-queue through the CLI, all tx-queue configuration included in the QoS profile is ignored.

## 9.1.2 QoS Configuration: Platform-Independent Features

### 9.1.2.1 Creating QoS Profiles

QoS profiles are created by using the `qos profile` command. This also places the switch in QoS profile configuration mode, where the QoS parameters applied to interfaces are configured. To delete a QoS profile from the running configuration, use the no form of the command.

#### Example

This command creates a QoS profile named “Test-Profile” and places the switch in QoS profile configuration mode for the profile.

```
switch(config)#qos profile Test-Profile
switch(config-qos-profile-Test-Profile)#
```

### 9.1.2.2 Configuring QoS Profiles

The parameters that a QoS profile will apply to interfaces are configured in QoS profile configuration mode by issuing the same QoS configuration commands that are available in interface configuration mode. **QoS profile** configuration mode is a group change mode, and changes made in the mode are not saved until the mode is exited. To abandon all changes made while in the mode, use the `abort` command.

#### Example

These commands enter QoS profile configuration mode for a QoS profile named “Test Profile,” configure the CoS value and transmit queue, and save the changes to the profile.

```
switch(config)#qos profile Test-Profile
switch(config-qos-profile-Test-Profile)#qos cos 3
switch(config-qos-profile-Test-Profile)#priority-flow-control on
switch(config-qos-profile-Test-Profile)#exit

switch(config)#
```

### 9.1.2.3 Attaching Policy-Map to a QoS Profile

The `qos profile` command places the switch in QoS profile configuration mode. The profile applies the QoS configurations to Ethernet and Port-Channel, and even to the Fabric interfaces, if it exists.

---

A profile specifies the policy-map and other QoS supported configurations. The policy-map is then attached to the QoS profile using **service-policy** command.

Profiles are created in QoS-profile configuration mode, then applied to an interface in interface configuration mode.

### Examples

- This command places the switch in QoS profile configuration mode, the policy-map is then attached to the profile using **service-policy** command in this mode.

```
switch(config)#qos profile TP
switch(config-qos-profile-TP)#
```

- This command applies the policy-map to the QoS profile.

```
switch(config-qos-profile-TP)#service-policy type qos input PM-1
```

#### 9.1.2.4 Applying a QoS profile on an Interface

The **service-profile** command applies a QoS profile to the configuration mode interface.

### Example

This command applies the QoS profile TP to Ethernet interface 13.

```
switch(config)#interface ethernet 13
switch(config-if-Et13)#service-profile TP
```

#### 9.1.2.5 Displaying the QoS Profile Information

The **show qos profile** command displays information about the QoS profiles configured and their parameters. To display the attribute of a specific profile, add the name of the profile. To display a list of configured QoS profiles and the interfaces on which they are configured, add the **summary** keyword.

### Examples

- This command displays the configured profiles and their configuration.

```
switch#show qos profile
qos profile p
  qos cos 1
  no priority-flow-control pause watchdog
  priority-flow-control priority 1 no-drop
  priority-flow-control priority 2 no-drop
qos profile p2
  qos cos 3
  priority-flow-control priority 0 no-drop
```

- This command displays the contents of a specific profile.

```
switch#show qos profile p2
qos profile p2
  qos cos 3
  priority-flow-control priority 0 no-drop
```

- This command displays the interfaces on which each profile is applied.

```
switch#show qos profile summary
Qos Profile: p
Configured on: Et13,7
```

```
Fabric
Po12
Qos Profile: p2
Configured on: Et56
```

### 9.1.3 QoS Configuration: Arad Platform Switches

Implementing QoS on an Arad platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- [CoS and DSCP Port Settings – Arad Platform Switches](#)
- [Traffic Class Derivations – Arad Platform Switches](#)
- [CoS Rewrite – Arad Platform Switches](#)
- [Transmit Queues and Port Shaping – Arad Platform Switches](#)
- [ECN Configuration – Arad Platform Switches](#)
- [ACL Policing – Arad Platform Switches](#)

**Note:** QoS traffic policy is supported on Trident and Tomahawk, Trident II, FM6000, Arad, and Jericho.

#### 9.1.3.1 CoS and DSCP Port Settings – Arad Platform Switches

[Port Settings – Trust Mode and Traffic Class](#) describes port trust and default port CoS and DSCP values.

#### Configuring Port Trust Settings

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is **CoS**. The port-trust default for routed ports is **DSCP**.

- `qos trust cos` specifies **CoS** as the port's port-trust mode.
- `qos trust dscp` specifies **DSCP** as the port's port-trust mode.
- `no qos trust` specifies **untrusted** as the port's port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

#### Example

- These commands configure and display the following trust modes:
  - Ethernet 3/5/1: dscp
  - Ethernet 3/5/2: untrusted
  - Ethernet 3/5/3: cos
  - Ethernet 3/5/4: default as a switched port
  - Ethernet 3/6/1: default as a routed port

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#qos trust dscp
switch(config-if-Et3/5/1)#interface ethernet 3/5/2
switch(config-if-Et3/5/2)#no qos trust
switch(config-if-Et3/5/2)#interface ethernet 3/5/3
switch(config-if-Et3/5/3)#qos trust cos
switch(config-if-Et3/5/3)#interface ethernet 3/5/4
switch(config-if-Et3/5/4)#switchport
switch(config-if-Et3/5/4)#default qos trust
switch(config-if-Et3/5/4)#interface ethernet 3/6/1
switch(config-if-Et3/6/1)#no switchport
switch(config-if-Et3/6/1)#default qos trust
```

```

switch(config-if-Et3/6/1)#show qos interface ethernet 3/5/1 - 3/6/1
trust
Port                                     Trust Mode
Operational                               Configured
-----
Ethernet3/5/1                           DSCP
Ethernet3/5/2                           UNTRUSTED
Ethernet3/5/3                           COS
Ethernet3/5/4                           COS
Ethernet3/6/1                           DSCP
Ethernet3/6/1                           DEFAULT
switch(config-if-Et3/6/1)#

```

### Configuring Default Port Settings

Default CoS and DSCP values are assigned to each Ethernet and port channel interface. These commands specify the configuration mode interface commands specify the port's default CoS and DSCP values.

- `qos cos` configures a port's default CoS value.
- `qos dscp` configures a port's default DSCP value.

### Example

```

These commands configure default CoS (4) and DSCP (44) values on
Ethernet
interface 3/6/2.
switch(config)#interface ethernet 3/6/2
switch(config-if-Et3/6/2)#qos cos 4
switch(config-if-Et3/6/2)#qos dscp 44
switch(config-if-Et3/6/2)#show active
interface Ethernet3/6/2
  qos cos 4
  qos dscp 44
switch(config-if-Et3/6/2)#show qos interfaces ethernet 3/6/2
Ethernet3/6/2:
  Trust Mode: COS
  Default COS: 4
  Default DSCP: 44
switch(config-if-Et3/6/2)#

```

### 9.1.3.2 Traffic Class Derivations – Arad Platform Switches

[Traffic Classes](#) describes traffic classes.

#### Traffic Class Derivation Source

The following table displays the source for deriving a data stream's traffic class.

**Table 5: Traffic Class Derivation Source: Arad Platform Switches**

	Untrusted	CoS Trusted	DSCP Trusted
<b>Untagged Non-IP</b>	Default CoS (port)	Default CoS (port)	Default DSCP (port)
<b>Untagged IP</b>	Default CoS (port)	Default CoS (port)	DSCP (packet)
<b>Tagged Non-IP</b>	Default CoS (port)	CoS (packet)	Default DSCP (port)
<b>Tagged IP</b>	Default CoS (port)	CoS (packet)	DSCP (packet)

[CoS and DSCP Port Settings – Arad Platform Switches](#) describes the default CoS and DSCP settings for each port.

### Mapping CoS to Traffic Class

The `qos map cos` command assigns a traffic class to a list of CoS values. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the chip upon which it is received.

#### Example

This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

```
switch(config)#qos map cos 1 3 5 7 to traffic-class 5
switch(config)#show qos maps
    Number of Traffic Classes supported: 8

Cos-tc map:
  cos:  0  1  2  3  4  5  6  7
  -----
  tc:   1  5  2  5  4  5  6  5

switch(config)#
```

The following table displays the default CoS to Traffic Class map on Arad platform switches.

**Table 6: Default CoS to Traffic Class Map: Arad Platform Switches**

Inbound CoS	Untagged	0	1	2	3	4	5	6	7
Traffic Class	Derived: use default CoS as inbound	1	0	2	3	4	5	6	7

### Mapping DSCP to Traffic Class

The `qos map dscp` command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

#### Example

This command assigns the traffic class of 0 to DSCP values of 12, 24, 41, and 44-47.

```
switch(config)#qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)#show qos maps
    Number of Traffic Classes supported: 8

Dscp-tc map:
  d1 :  d2 0  1  2  3  4  5  6  7  8  9
  -----
  0 :    1  1  1  1  1  1  1  1  0  0
  1 :    0  0  0  0  0  0  2  2  2  2
  2 :    2  2  2  2  0  3  3  3  3  3
  3 :    3  3  4  4  4  4  4  4  4  4
  4 :    5  0  5  5  0  0  0  0  6  6
  5 :    6  6  6  6  6  6  7  7  7  7
  6 :    7  7  7  7
```

```
switch(config)#
```

The following table displays the default DSCP to traffic class map on Arad platform switches.

**Table 7: Default DSCP to Traffic Class Map: Arad Platform Switches**

Inbound DSCP	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
Traffic Class	1	0	2	3	4	5	6	7

### 9.1.3.3 CoS Rewrite – Arad Platform Switches

[Rewriting CoS and DSCP](#) describes the CoS rewrite functions.

#### Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-CoS rewrite map.

#### Example

This command assigns the CoS of two to traffic classes 1, 3, and 5.

```
switch(config)#qos map traffic-class 1 3 5 to cos 2
switch(config)#show qos map
  Number of Traffic Classes supported: 8

Tc-cos map:
  tc:   0  1  2  3  4  5  6  7
  -----
  cos:  1  2  2  2  4  2  6  7

switch(config)#
```

The following table displays the default Traffic Class to CoS rewrite value map on Arad platform switches.

**Table 8: Default Traffic Class to CoS Rewrite Value Map: Arad Platform Switches**

Traffic Class	0	1	2	3	4	5	6	7
CoS Rewrite Value	1	0	2	3	4	5	6	7

#### Traffic Class to DSCP Rewrite Map

DSCP rewrite is always disabled on Arad platform switches.

### 9.1.3.4 Transmit Queues and Port Shaping – Arad Platform Switches

[Transmit Queues and Port Shaping](#) describes transmit queues and port shaping.

Arad platform switches provide 16 physical queues for each egress port: eight unicast and eight multicast queues. Data is scheduled to the physical queues based on transmit queue assignments.

Multicast queue capacity that remains after multicast traffic is serviced is available for unicast traffic of a corresponding priority. Similarly, unicast queue capacity that remains after unicast traffic is serviced

is available for overflow multicast traffic. Under conditions of unicast and multicast congestion, egress traffic is evenly split between unicast and multicast traffic.

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class–transmit queue map for unicast and multicast traffic on all Ethernet and port channel interfaces. The `show qos maps` command displays the traffic class–transmit queue map.

The following table displays the default traffic class to transmit queue map on Arad platform switches.

**Table 9: Default Traffic Class to Transmit Queue Map: Arad Platform Switches**

<b>Traffic Class</b>	0	1	2	3	4	5	6	7
<b>Transmit Queue</b>	0	1	2	3	4	5	6	7

Transmit queue parameters are configured in tx-queue configuration command mode, which is entered from interface-ethernet configuration mode.

### Mapping Traffic Classes to a Transmit Queue

The `qos map traffic-class to tx-queue` command assigns traffic classes to a transmit queue. Multiple commands complete the traffic class-transmit queue map. Traffic class 7 and transmit queue 7 are always mapped to each other. This association is not editable.

#### Example

These commands assign traffic classes of 1, 3, and 5 to transmit queue 1, traffic classes 2, 4, and 6 to transmit queue 2, and traffic class 0 to transmit queue 0, then display the resultant map.

```
switch(config)#qos map traffic-class 1 3 5 to tx-queue 1
switch(config)#qos map traffic-class 2 4 6 to tx-queue 2
switch(config)#qos map traffic-class 0 to tx-queue 0
switch(config)#show qos maps
    Number of Traffic Classes supported: 8
    Number of Transmit Queues supported: 8

    Tc - tx-queue map:
    tc:          0  1  2  3  4  5  6  7
    -----
    tx-queue:   0  1  2  1  2  1  2  7

switch(config)#
```

### Entering Tx-Queue Configuration Mode

The `tx-queue (Arad/Jericho)` command places the switch in tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue 7 is not configurable. The `show qos interfaces` displays the transmit queue configuration for a specified port.

#### Example

This command enters Tx-queue configuration mode for transmit queue 4 of Ethernet interface 3/3/3.

```
switch(config)#interface ethernet 3/3/3
switch(config-if-Et3/3/3)#tx-queue 4
switch(config-if-Et3/3/3-txq-4)#
```

## Configuring the Shape Rate – Port and Transmit Queues

A port's shape rate specifies its maximum outbound traffic bandwidth. A transmit queue's shape rate specifies the queue's maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

- To configure a port's shape rate, enter [shape rate \(Interface – Arad/Jericho\)](#) from the port's interface configuration mode.
- To configure a transmit queue's shape rate, enter [shape rate \(Tx-queue – Arad/Jericho\)](#) from the queue's tx-queue configuration mode.

### Examples

- This command configures a port shape rate of 5 Gbps on Ethernet interface 3/5/1.

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#shape rate 5000000
switch(config-if-Et3/5/1)#show qos interfaces ethernet 3/5/1
Ethernet3/5/1:

  Port shaping rate: 5000012 / 5000000 kbps

  Tx      Bandwidth      Shape Rate      Priority  ECN
  Queue   (percent)            (units)
  -----
  7       - / -             - / -   ( - )    SP / SP   D

switch(config-if-Et3/5/1)#
```

- These commands configure a shape rate of 1 Gbps on transmit queues 3 and 4 of Ethernet interface 3/4/1.

```
switch(config)#interface ethernet 3/4/1
switch(config-if-Et3/4/1)#tx-queue 4
switch(config-if-Et3/4/1-txq-4)#shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-4)#tx-queue 3
switch(config-if-Et3/4/1-txq-3)#shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-3)#show qos interface ethernet 3/4/1
Ethernet3/4/1:

  Port shaping rate: disabled

  Tx      Bandwidth      Shape Rate      Priority  ECN
  Queue   (percent)            (units)
  -----
  7       - / -             - / -   ( - )    SP / SP   D
  6       - / -             - / -   ( - )    SP / SP   D
  5       - / -             - / -   ( - )    SP / SP   D
  4       - / -           999 / 1000 ( Mbps )  SP / SP   D
  3       - / -           999 / 1000 ( Mbps )  SP / SP   D
  2       - / -             - / -   ( - )    SP / SP   D
  1       - / -             - / -   ( - )    SP / SP   D
  0       - / -             - / -   ( - )    SP / SP   D

switch(config-if-Et3/4/1-txq-3)#
```

## Configuring Queue Priority

The [priority \(Arad/Jericho\)](#) command configures a transmit queue's priority type:

- The **priority strict** command configures the queue as a strict priority queue.
- The **no priority** command configures the queue as a round robin queue.

A queue's configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The **bandwidth percent (Arad/Jericho)** command configures a round robin queue's bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

### Examples

- These commands configure queues 0 through 3 (Ethernet interface 3/5/1) as round robin, then allocate bandwidth for three queues at 30% and one queue at 10%.

The **no priority** statement for queue 3 also configures queues 0, 1, and 2 as round robin queues. Removing this statement reverts the other queues to **strict priority** type unless **running-config** contains a **no priority** statement for one of these queues.

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#tx-queue 3
switch(config-if-Et3/5/1-txq-3)#no priority
switch(config-if-Et3/5/1-txq-3)#bandwidth percent 10
switch(config-if-Et3/5/1-txq-3)#tx-queue 2
switch(config-if-Et3/5/1-txq-2)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-2)#tx-queue 1
switch(config-if-Et3/5/1-txq-1)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-1)#tx-queue 0
switch(config-if-Et3/5/1-txq-0)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-0)#show qos interfaces ethernet 3/5/1
Ethernet3/5/1:
```

Tx Queue	Bandwidth (percent)	Shape Rate (units)	Priority	ECN
7	- / -	- / - ( - )	SP / SP	D
6	- / -	- / - ( - )	SP / SP	D
5	- / -	- / - ( - )	SP / SP	D
4	- / -	- / - ( - )	SP / SP	D
3	10 / 10	- / - ( - )	RR / RR	D
2	30 / 30	- / - ( - )	RR / SP	D
1	30 / 30	- / - ( - )	RR / SP	D
0	30 / 30	- / - ( - )	RR / SP	D

```
switch(config-if-Et3/5/1-txq-0)#
```

- Changing the bandwidth percentage for queue 3 to 30 changes the operational bandwidth of each queue to its configured bandwidth divided by 120% (10%+20%+30%+60%).

```
switch(config-if-Et3/5/1-txq-0)#tx-queue 3
switch(config-if-Et3/5/1-txq-3)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-3)#show qos interfaces ethernet 3/5/1
Ethernet3/5/1:
```

Port shaping rate: disabled

Tx Queue	Bandwidth (percent)	Shape Rate (units)	Priority	ECN
7	- / -	- / - ( - )	SP / SP	D
6	- / -	- / - ( - )	SP / SP	D
5	- / -	- / - ( - )	SP / SP	D
4	- / -	- / - ( - )	SP / SP	D
3	24 / 30	- / - ( - )	RR / RR	D
2	24 / 30	- / - ( - )	RR / SP	D

1	24 / 30	- / -	( - )	RR / SP	D
0	24 / 30	- / -	( - )	RR / SP	D

Note: Values are displayed as Operational/Configured

```
switch(config-if-Et3/5/1-txq-3)#
```

### 9.1.3.5 ECN Configuration – Arad Platform Switches

[Explicit Congestion Notification \(ECN\)](#) describes Explicit Congestion Notification (ECN).

ECN is independently configurable on all egress queues of each Ethernet interface. ECN settings for Port-Channels are applied on each of the channel's member Ethernet interfaces. Average queue length is tracked for transmit queues. When it reaches maximum threshold, all subsequent packets are marked.

Although the switch does not limit the number of queues that can be configured for ECN, hardware table limitations restrict the number of queues that can simultaneously implement ECN.

The [random-detect ecn \(Arad/Jericho\)](#) command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes.

#### Example

These commands enable ECN marking of unicast packets from unicast transmit queue 4 of Ethernet interface 3/5/1, setting thresholds at 128 kbytes and 1280 kbytes.

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#tx-queue 4
switch(config-if-Et3/5/1-txq-4)#random-detect ecn minimum-threshold 128
kbytes
maximum-threshold 1280 kbyte
switch(config-if-Et3/5/1-txq-4)#show active
interface Ethernet3/5/1
  tx-queue 4
    random-detect ecn minimum-threshold 128 kbytes maximum-threshold
1280 kbytes
switch(config-if-Et3/5/1-txq-4)#
```

### 9.1.3.6 ACL Policing – Arad Platform Switches

[ACL Policing](#) describes ACL policing.

Implementing ACL policing consists of configuring the following:

- policy-map settings
- class-name
- committed information rate (CIR) the data speed committed to any given circuit regardless of the number of users
- burst size the maximum burst size in bytes the network commits to moving under normal conditions

The default unit for the metering rate CIR is bits per second; the default unit for the burst size is bytes.

The policer is applied to the class inside the policy map. Policy maps can contain one or more policy map classes, each with different match criteria and policer.

Default behavior and available policing actions are as follows:

- Policy map can be applied on multiple interfaces. Interfaces on the same chip will share the policer. (Applicable for Arad only.)
- If there is no policer configured within a class, all traffic is transmitted without any policing.
- If there are any actions configured, the configured actions are applied:

- Conform-action (green): transmit (default)
- Violate-action (red): drop (default)

### Example

These commands configure ACL policing in single-rate, two-color mode.

```
switch(config)#class-map type qos match-any class1
switch(config-cmap-class1)#match ip access-group acl1
switch(config-cmap-class1)#exit
switch(config)#policy-map type quality-of-service policy1
switch(config-policy1)#class class1
switch(config-policy1-class1)#police cir 512000 bc 96000
switch(config-policy1-class1)#exit
switch(config-policy1)#exit
switch(config)#
```

### Displaying ACL Policing Information

#### Examples

- This command shows the contents of all policy maps on the switch.

```
switch(config)#show policy-map
Service-policy policy1

Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes

Class-map: class-default (match-any)
switch(config)#
```

- This command shows the interface-specific police counters for Ethernet interface 1.

```
switch(config)#show policy-map interface Ethernet 1 input counters
Service-policy input: policy1
Hardware programming status: Successful

Class-map: class1 (match-any) Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes Conformed 4351 packets, 1857386
bytes
Conformed 2536 packets, 3384260 bytes

Class-map: class-default (match-any) matched packets: 0

switch(config)#
```

- This command shows the counters associated with the policy map called “p1.”

```
switch(config)#show policy-map type qos p1 input counters
Service-policy input: p1 Class-map: c1 (match-any)
Match: ip access-group name a1
Police cir 512000 bps bc 96000 bytes Interface: Ethernet1
Conformed 4351 packets, 1857386 bytes
Exceeded 2536 packets, 3384260 bytes
Interface: Ethernet2
Conformed 2351 packets, 957386 bytes
Exceeded 1536 packets, 1384260 bytes
Class-map: class-default (match-any)
```

```
Matched packets : 3229
```

```
switch(config)#
```

- This command shows the QoS policy map for Ethernet interface 1.

```
switch(config)#show policy-map interface Ethernet 1 input type qos
Interface: Ethernet 1 Service-policy input: policy1
Hardware programming status: Successful Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 9000 bytes
Class-map: class2 (match-any)
Match: ip access-group name acl2 set dscp 2
Class-map: class3 (match-any) Match: ip access-group name acl3
Police cir 1280000 bps bc 9000 bytes
Class-map: class-default (match-any)

switch(config)#
```

## 9.1.4 QoS Configuration: Jericho Platform Switches

Implementing QoS on an Jericho platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- [CoS and DSCP Port Settings – Jericho Platform Switches](#)
- [Traffic Class Derivations – Jericho Platform Switches](#)
- [CoS Rewrite – Jericho Platform Switches](#)
- [Transmit Queues and Port Shaping – Jericho Platform Switches](#)
- [ACL Policing – Jericho Platform Switches](#)

**Note:** QoS traffic policy is supported on Trident and Tomahawk, Trident II, FM6000, Arad, and Jericho.

### 9.1.4.1 CoS and DSCP Port Settings – Jericho Platform Switches

[Port Settings – Trust Mode and Traffic Class](#) describes port trust and default port CoS and DSCP values.

#### Configuring Port Trust Settings

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is **CoS**. The port-trust default for routed ports is **DSCP**.

- `qos trust cos` specifies **CoS** as the port's port-trust mode.
- `qos trust dscp` specifies **DSCP** as the port's port-trust mode.
- `no qos trust` specifies **untrusted** as the port's port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

#### Example

- These commands configure and display the following trust modes:
  - Ethernet 3/5/1: dscp
  - Ethernet 3/5/2: untrusted
  - Ethernet 3/5/3: cos
  - Ethernet 3/5/4: default as a switched port

- Ethernet 3/6/1: default as a routed port

```

switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#qos trust dscp
switch(config-if-Et3/5/1)#interface ethernet 3/5/2
switch(config-if-Et3/5/2)#no qos trust
switch(config-if-Et3/5/2)#interface ethernet 3/5/3
switch(config-if-Et3/5/3)#qos trust cos
switch(config-if-Et3/5/3)#interface ethernet 3/5/4
switch(config-if-Et3/5/4)#switchport
switch(config-if-Et3/5/4)#default qos trust
switch(config-if-Et3/5/4)#interface ethernet 3/6/1
switch(config-if-Et3/6/1)#no switchport
switch(config-if-Et3/6/1)#default qos trust
switch(config-if-Et3/6/1)#show qos interface ethernet 3/5/1 - 3/6/1
trust

```

Port	Trust Mode	
	Operational	Configured
Ethernet3/5/1	DSCP	DSCP
Ethernet3/5/2	UNTRUSTED	UNTRUSTED
Ethernet3/5/3	COS	COS
Ethernet3/5/4	COS	DEFAULT
Ethernet3/6/1	DSCP	DEFAULT

```

switch(config-if-Et3/6/1)#

```

### Configuring Default Port Settings

Default CoS and DSCP values are assigned to each Ethernet and port channel interface. These commands specify the configuration mode interface commands specify the port's default CoS and DSCP values.

- `qos cos` configures a port's default CoS value.
- `qos dscp` configures a port's default DSCP value.

### Example

```

These commands configure default CoS (4) and DSCP (44) values on
Ethernet
interface 3/6/2.
switch(config)#interface ethernet 3/6/2
switch(config-if-Et3/6/2)#qos cos 4
switch(config-if-Et3/6/2)#qos dscp 44
switch(config-if-Et3/6/2)#show active
interface Ethernet3/6/2
  qos cos 4
  qos dscp 44
switch(config-if-Et3/6/2)#show qos interfaces ethernet 3/6/2
Ethernet3/6/2:
  Trust Mode: COS
  Default COS: 4
  Default DSCP: 44

switch(config-if-Et3/6/2)#

```

#### 9.1.4.2 Traffic Class Derivations – Jericho Platform Switches

[Traffic Classes](#) describes traffic classes.

## Traffic Class Derivation Source

The following table displays the source for deriving a data stream's traffic class on Jericho platform switches.

**Table 10: Traffic Class Derivation Source: Jericho Platform Switches**

	Untrusted	CoS Trusted	DSCP Trusted
<b>Untagged Non-IP</b>	Default CoS (port)	Default CoS (port)	Default DSCP (port)
<b>Untagged IP</b>	Default CoS (port)	Default CoS (port)	DSCP (packet)
<b>Tagged Non-IP</b>	Default CoS (port)	CoS (packet)	Default DSCP (port)
<b>Tagged IP</b>	Default CoS (port)	CoS (packet)	DSCP (packet)

[CoS and DSCP Port Settings – Arad Platform Switches](#) describes the default CoS and DSCP settings for each port.

## Mapping CoS to Traffic Class

The `qos map cos` command assigns a traffic class to a list of CoS values. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the chip upon which it is received.

### Example

This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

```
switch(config)#qos map cos 1 3 5 7 to traffic-class 5
switch(config)#show qos maps
Number of Traffic Classes supported: 8

Cos-tc map:
cos:  0  1  2  3  4  5  6  7
-----
tc:   1  5  2  5  4  5  6  5

switch(config)#
```

The following table displays the default CoS to Traffic Class map on Jericho platform switches.

**Table 11: Default CoS to Traffic Class Map: Jericho Platform Switches**

Inbound CoS	Untagged	0	1	2	3	4	5	6	7
<b>Traffic Class</b>	Derived: use default CoS as inbound	1	0	2	3	4	5	6	7

## Mapping DSCP to Traffic Class

The `qos map dscp` command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

### Example

This command assigns the traffic class of 0 to DSCP values of 12, 24, 41, and 44-47.

```
switch(config)#qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)#show qos maps
```

```

Number of Traffic Classes supported: 8

Dscp-tc map:
d1 : d2 0 1 2 3 4 5 6 7 8 9
-----
0 :    1 1 1 1 1 1 1 1 0 0
1 :    0 0 0 0 0 0 2 2 2 2
2 :    2 2 2 2 0 3 3 3 3 3
3 :    3 3 4 4 4 4 4 4 4 4
4 :    5 0 5 5 0 0 0 0 6 6
5 :    6 6 6 6 6 6 7 7 7 7
6 :    7 7 7 7

switch(config)#

```

The following table displays the default DSCP to traffic class map on Jericho platform switches.

**Table 12: Default DSCP to Traffic Class Map: Jericho Platform Switches**

Inbound DSCP	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
Traffic Class	1	0	2	3	4	5	6	7

### 9.1.4.3 CoS Rewrite – Jericho Platform Switches

[Rewriting CoS and DSCP](#) describes the CoS rewrite functions.

#### Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

#### Example

This command assigns the CoS of two to traffic classes 1, 3, and 5.

```

switch(config)#qos map traffic-class 1 3 5 to cos 2
switch(config)#show qos map
Number of Traffic Classes supported: 8

Tc-cos map:
tc:  0 1 2 3 4 5 6 7
-----
cos: 1 2 2 2 4 2 6 7

switch(config)#

```

The following table displays the default Traffic Class to CoS rewrite value map on Jericho platform switches.

**Table 13: Default Traffic Class to CoS Rewrite Value Map: Jericho Platform Switches**

Traffic Class	0	1	2	3	4	5	6	7
CoS Rewrite Value	1	0	2	3	4	5	6	7

## Traffic Class to DSCP Rewrite Map

DSCP rewrite is always disabled on Jericho platform switches.

### 9.1.4.4 Transmit Queues and Port Shaping – Jericho Platform Switches

[Transmit Queues and Port Shaping](#) describes transmit queues and port shaping.

Jericho platform switches provide 16 physical queues for each egress port: eight unicast and eight multicast queues. Data is scheduled to the physical queues based on transmit queue assignments.

Multicast queue capacity that remains after multicast traffic is serviced is available for unicast traffic of a corresponding priority. Similarly, unicast queue capacity that remains after unicast traffic is serviced is available for overflow multicast traffic. Under conditions of unicast and multicast congestion, egress traffic is evenly split between unicast and multicast traffic.

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class–transmit queue map for unicast and multicast traffic on all Ethernet and port channel interfaces. The [show qos maps](#) command displays the traffic class–transmit queue map.

The following table displays the default traffic class to transmit queue map on Jericho platform switches.

**Table 14: Default Traffic Class to Transmit Queue Map: Jericho Platform Switches**

<b>Traffic Class</b>	0	1	2	3	4	5	6	7
<b>Transmit Queue</b>	0	1	2	3	4	5	6	7

Transmit queue parameters are configured in tx-queue configuration command mode, which is entered from interface-ethernet configuration mode.

### Mapping Traffic Classes to a Transmit Queue

The [qos map traffic-class to tx-queue](#) command assigns traffic classes to a transmit queue. Multiple commands complete the traffic class-transmit queue map. Traffic class 7 and transmit queue 7 are always mapped to each other. This association is not editable.

### Example

These commands assign traffic classes of 1, 3, and 5 to transmit queue 1, traffic classes 2, 4, and 6 to transmit queue 2, and traffic class 0 to transmit queue 0, then display the resultant map.

```
switch(config)#qos map traffic-class 1 3 5 to tx-queue 1
switch(config)#qos map traffic-class 2 4 6 to tx-queue 2
switch(config)#qos map traffic-class 0 to tx-queue 0
switch(config)#show qos maps
    Number of Traffic Classes supported: 8
    Number of Transmit Queues supported: 8

    Tc - tx-queue map:
    tc:          0  1  2  3  4  5  6  7
    -----
    tx-queue:   0  1  2  1  2  1  2  7

switch(config)#
```

## Entering Tx-Queue Configuration Mode

The `tx-queue (Arad/Jericho)` command places the switch in tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue 7 is not configurable. The `show qos interfaces` displays the transmit queue configuration for a specified port.

### Example

This command enters Tx-queue configuration mode for transmit queue 4 of Ethernet interface 3/3/3.

```
switch(config)#interface ethernet 3/3/3
switch(config-if-Et3/3/3)#tx-queue 4
switch(config-if-Et3/3/3-txq-4)#
```

## Configuring the Shape Rate – Port and Transmit Queues

A port's shape rate specifies its maximum outbound traffic bandwidth. A transmit queue's shape rate specifies the queue's maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

- To configure a port's shape rate, enter `shape rate (Interface – Arad/Jericho)` from the port's interface configuration mode.
- To configure a transmit queue's shape rate, enter `shape rate (Tx-queue – Arad/Jericho)` from the queue's tx-queue configuration mode.

### Examples

- This command configures a port shape rate of 5 Gbps on Ethernet interface 3/5/1.

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#shape rate 5000000
switch(config-if-Et3/5/1)#show qos interfaces ethernet 3/5/1
Ethernet3/5/1:

  Port shaping rate: 5000012 / 5000000 kbps

  Tx   Bandwidth   Shape Rate   Priority   ECN
  Queue (percent)   (units)
  -----
  7    - / -        - / -      ( - )    SP / SP   D

switch(config-if-Et3/5/1)#
```

- These commands configure a shape rate of 1 Gbps on transmit queues 3 and 4 of Ethernet interface 3/4/1.

```
switch(config)#interface ethernet 3/4/1
switch(config-if-Et3/4/1)#tx-queue 4
switch(config-if-Et3/4/1-txq-4)#shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-4)#tx-queue 3
switch(config-if-Et3/4/1-txq-3)#shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-3)#show qos interface ethernet 3/4/1
Ethernet3/4/1:

  Port shaping rate: disabled

  Tx   Bandwidth   Shape Rate   Priority   ECN
  Queue (percent)   (units)
  -----
  7    - / -        - / -      ( - )    SP / SP   D
  6    - / -        - / -      ( - )    SP / SP   D
  5    - / -        - / -      ( - )    SP / SP   D
  4    - / -        999 / 1000 ( Mbps ) SP / SP   D
```

```

3      - / -      999 / 1000 ( Mbps )   SP / SP   D
2      - / -      - / -      ( - )     SP / SP   D
1      - / -      - / -      ( - )     SP / SP   D
0      - / -      - / -      ( - )     SP / SP   D

switch(config-if-Et3/4/1-txq-3) #

```

### Configuring Queue Priority

The `priority (Arad/Jericho)` command configures a transmit queue's priority type:

- The `priority strict` command configures the queue as a strict priority queue.
- The `no priority` command configures the queue as a round robin queue.

A queue's configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The `bandwidth percent (Arad/Jericho)` command configures a round robin queue's bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

### Examples

- These commands configure queues 0 through 3 (Ethernet interface 3/5/1) as round robin, then allocate bandwidth for three queues at 30% and one queue at 10%.

The `no priority` statement for queue 3 also configures queues 0, 1, and 2 as round robin queues. Removing this statement reverts the other queues to **strict priority** type unless *running-config* contains a `no priority` statement for one of these queues.

```

switch(config) #interface ethernet 3/5/1
switch(config-if-Et3/5/1) #tx-queue 3
switch(config-if-Et3/5/1-txq-3) #no priority
switch(config-if-Et3/5/1-txq-3) #bandwidth percent 10
switch(config-if-Et3/5/1-txq-3) #tx-queue 2
switch(config-if-Et3/5/1-txq-2) #bandwidth percent 30
switch(config-if-Et3/5/1-txq-2) #tx-queue 1
switch(config-if-Et3/5/1-txq-1) #bandwidth percent 30
switch(config-if-Et3/5/1-txq-1) #tx-queue 0
switch(config-if-Et3/5/1-txq-0) #bandwidth percent 30
switch(config-if-Et3/5/1-txq-0) #show qos interfaces ethernet 3/5/1
Ethernet3/5/1:

```

Tx Queue	Bandwidth (percent)	Shape Rate (units)	Priority	ECN
7	- / -	- / - ( - )	SP / SP	D
6	- / -	- / - ( - )	SP / SP	D
5	- / -	- / - ( - )	SP / SP	D
4	- / -	- / - ( - )	SP / SP	D
3	10 / 10	- / - ( - )	RR / RR	D
2	30 / 30	- / - ( - )	RR / SP	D
1	30 / 30	- / - ( - )	RR / SP	D
0	30 / 30	- / - ( - )	RR / SP	D

```

switch(config-if-Et3/5/1-txq-0) #

```

- Changing the bandwidth percentage for queue 3 to 30 changes the operational bandwidth of each queue to its configured bandwidth divided by 120% (10%+20%+30%+60%).

```

switch(config-if-Et3/5/1-txq-0) #tx-queue 3
switch(config-if-Et3/5/1-txq-3) #bandwidth percent 30

```

```
switch(config-if-Et3/5/1-txq-3)#show qos interfaces ethernet 3/5/1
Ethernet3/5/1:
```

Port shaping rate: disabled

Tx Queue	Bandwidth (percent)	Shape Rate (units)	Priority	ECN
7	- / -	- / - ( - )	SP / SP	D
6	- / -	- / - ( - )	SP / SP	D
5	- / -	- / - ( - )	SP / SP	D
4	- / -	- / - ( - )	SP / SP	D
3	24 / 30	- / - ( - )	RR / RR	D
2	24 / 30	- / - ( - )	RR / SP	D
1	24 / 30	- / - ( - )	RR / SP	D
0	24 / 30	- / - ( - )	RR / SP	D

Note: Values are displayed as Operational/Configured

```
switch(config-if-Et3/5/1-txq-3)#
```

#### 9.1.4.5 ACL Policing – Jericho Platform Switches

[ACL Policing](#) describes ACL policing.

Implementing ACL policing consists of configuring the following:

- policy-map settings
- class-name
- committed information rate (CIR) the data speed committed to any given circuit regardless of the number of users
- burst size the maximum burst size in bytes the network commits to moving under normal conditions

The default unit for the metering rate CIR is bits per second; the default unit for the burst size is bytes.

The policer is applied to the class inside the policy map. Policy maps can contain one or more policy map classes, each with different match criteria and policer.

Default behavior and available policing actions are as follows:

- Policy map can be applied on multiple interfaces. Interfaces on the same chip will share the policer. (Applicable for Arad and Jericho only.)
- If there is no policer configured within a class, all traffic is transmitted without any policing.
- If there are any actions configured, the configured actions are applied:
  - Conform-action (green): transmit (default)
  - Violate-action (red): drop (default)

#### Example

These commands configure ACL policing in single-rate, two-color mode.

```
switch(config)#class-map type qos match-any class1
switch(config-cmap-class1)#match ip access-group acl1
switch(config-cmap-class1)#exit
switch(config)#policy-map type quality-of-service policy1
switch(config-policy1)#class class1
switch(config-policy1-class1)#police cir 512000 bc 96000
switch(config-policy1-class1)#exit
switch(config-policy1)#exit
```

```
switch(config)#
```

## Displaying ACL Policing Information

### Examples

- This command shows the contents of all policy maps on the switch.

```
switch(config)#show policy-map
Service-policy policyl

Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes

Class-map: class-default (match-any)
switch(config)#
```

- This command shows the interface-specific police counters for **Ethernet interface 1**.

```
switch(config)#show policy-map interface Ethernet 1 input counters
Service-policy input: policyl
Hardware programming status: Successful

Class-map: class1 (match-any) Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes Conformed 4351 packets, 1857386
bytes
Conformed 2536 packets, 3384260 bytes

Class-map: class-default (match-any) matched packets: 0

switch(config)#
```

- This command shows the counters associated with the policy map called **"p1"**.

```
switch(config)#show policy-map type qos p1 input counters
Service-policy input: p1 Class-map: c1 (match-any)
Match: ip access-group name a1
Police cir 512000 bps bc 96000 bytes Interface: Ethernet1
Conformed 4351 packets, 1857386 bytes
Exceeded 2536 packets, 3384260 bytes
Interface: Ethernet2
Conformed 2351 packets, 957386 bytes
Exceeded 1536 packets, 1384260 bytes
Class-map: class-default (match-any)
Matched packets : 3229

switch(config)#
```

- This command shows the QoS policy map for **Ethernet interface 1**.

```
switch(config)#show policy-map interface Ethernet 1 input type qos
Interface: Ethernet 1 Service-policy input: policyl
Hardware programming status: Successful Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 9000 bytes
Class-map: class2 (match-any)
Match: ip access-group name acl2 set dscp 2
Class-map: class3 (match-any) Match: ip access-group name acl3
Police cir 1280000 bps bc 9000 bytes
Class-map: class-default (match-any)
```

```
switch(config)#
```

## 9.1.5 QoS Configuration: FM6000 Platform Switches

Implementing QoS on an FM6000 platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- [CoS and DSCP Port Settings – FM6000 Platform Switches](#)
- [Traffic Class Derivations – FM6000 Platform Switches](#)
- [CoS and DSCP Rewrite – FM6000 Platform Switches](#)
- [Transmit Queues and Port Shaping – FM6000 Platform Switches](#)

### 9.1.5.1 CoS and DSCP Port Settings – FM6000 Platform Switches

[Port Settings – Trust Mode and Traffic Class](#) describes port trust and default port CoS and DSCP values.

#### Configuring Port Trust Settings

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is **cos**. The port-trust default for routed ports is **dscp**.

- `qos trust cos` specifies **cos** as the port's port-trust mode.
- `qos trust dscp` specifies **dscp** as the port's port-trust mode.
- `no qos trust` specifies **untrusted** as the port's port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

#### Example

- These commands configure and display the following trust modes:
  - Ethernet 15: dscp
  - Ethernet 16: untrusted
  - Ethernet 17: cos
  - Ethernet 18: default as a switched port
  - Ethernet 19: default as a routed port

```
switch(config)#interface ethernet 15
switch(config-if-Et15)#qos trust dscp
switch(config-if-Et15)#interface ethernet 16
switch(config-if-Et16)#no qos trust
switch(config-if-Et16)#interface ethernet 17
switch(config-if-Et17)#qos trust cos
switch(config-if-Et17)#interface ethernet 18
switch(config-if-Et18)#switchport
switch(config-if-Et18)#default qos trust
switch(config-if-Et19)#interface ethernet 19
switch(config-if-Et19)#no switchport
switch(config-if-Et19)#default qos trust
switch(config-if-Et19)#show qos interface ethernet 15 - 19 trust
```

Port	Trust Mode	
	Operational	Configured
Ethernet15	DSCP	DSCP
Ethernet16	UNTRUSTED	UNTRUSTED
Ethernet17	COS	COS
Ethernet18	COS	DEFAULT
Ethernet19	DSCP	DEFAULT

```
switch(config-if-Et19) #
```

### Configuring Default Port Settings

Default CoS and DSCP settings are assigned to individual port channel and Ethernet interfaces. These configuration mode interface commands specify the port's default CoS and DSCP values.

- `qos cos` configures a port's default CoS value.
- `qos dscp` configures a port's default DSCP value.

### Example

These commands configure default CoS (4) and DSCP (44) settings on Ethernet interface 19.

```
switch(config) #interface ethernet 19
switch(config-if-Et19) #qos cos 4
switch(config-if-Et19) #qos dscp 44
switch(config-if-Et19) #show active
interface Ethernet19
  qos cos 4
  qos dscp 44
switch(config-if-Et19) #show qos interfaces ethernet 19
Ethernet19:
  Trust Mode: COS
  Default COS: 4
  Default DSCP: 44

switch(config-if-Et19) #
```

## 9.1.5.2 Traffic Class Derivations – FM6000 Platform Switches

[Traffic Classes](#) describes traffic classes.

### Traffic Class Derivation Source

The following table displays the source for deriving a data stream's traffic class.

**Table 15: Traffic Class Derivation Source: FM6000 Platform Switches**

	Untrusted	CoS Trusted	DSCP Trusted
<b>Untagged Non-IP</b>	Default CoS (port)	Default CoS (port)	Default DSCP (port)
<b>Untagged IP</b>	Default CoS (port)	Default CoS (port)	DSCP (packet)
<b>Tagged Non-IP</b>	Default CoS (port)	CoS (packet)	Default DSCP (port)
<b>Tagged IP</b>	Default CoS (port)	CoS (packet)	DSCP (packet)

[CoS and DSCP Port Settings – FM6000 Platform Switches](#) describes the default CoS and DSCP settings for each port.

### Mapping CoS to Traffic Class

The `qos map cos` command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the port upon which it is received.

### Example

This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

```
switch(config)#qos map cos 1 3 5 7 to traffic-class 5
switch(config)#show qos maps
  Number of Traffic Classes supported: 8
  Number of Transmit Queues supported: 8

Cos-tc map:
  cos:  0  1  2  3  4  5  6  7
  -----
  tc:   1  5  2  5  4  5  6  5

switch(config)#
```

The following table displays the default CoS to Traffic Class map on FM6000 platform switches.

**Table 16: Default CoS to Traffic Class Map: FM6000 Platform Switches**

Inbound CoS	Untagged	0	1	2	3	4	5	6	7
Traffic Class	Derived: use default CoS as inbound CoS	1	0	2	3	4	5	6	7

### Mapping DSCP to Traffic Class

The `qos map dscp` command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

### Example

This command assigns the traffic class of three to the DSCP values of 12, 13, 25, and 37.

```
switch(config)#qos map dscp 12 13 25 37 to traffic-class 3
switch(config)#show qos map
  Number of Traffic Classes supported: 8

Dscp-tc map:
  d1 :  d2 0  1  2  3  4  5  6  7  8  9
  -----
  0 :    1  1  1  1  1  1  1  1  0  0
  1 :    0  0  3  3  0  0  2  2  2  2
  2 :    2  2  2  2  3  3  3  3  3  3
  3 :    3  3  4  4  4  4  4  3  4  4
  4 :    5  5  5  5  5  5  5  5  6  6
  5 :    6  6  6  6  6  6  7  7  7  7
  6 :    7  7  7  7

switch(config)#
```

The following displays the default DSCP to Traffic Class map on FM6000 platform switches.

**Table 17: Default DSCP to Traffic Class Map: FM6000 Platform Switches**

Inbound DSCP	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
Traffic Class	1	0	2	3	4	5	6	7

### 9.1.5.3 CoS and DSCP Rewrite – FM6000 Platform Switches

[Rewriting CoS and DSCP](#) describes the CoS and DSCP rewrite functions.

#### Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-CoS rewrite map.

#### Example

This command assigns the CoS rewrite value of two to traffic classes 1, 3, and 5.

```
switch(config)#qos map traffic-class 1 3 5 to cos 2
switch(config)#show qos map
  Number of Traffic Classes supported: 8

  Tc - tx-queue map:
  tc:      0  1  2  3  4  5  6  7
  -----
  tx-queue: 0  1  2  3  4  5  6  7

switch(config)#
```

The following table displays the default traffic class-CoS rewrite map on FM6000 platform switches.

**Table 18: Default Traffic Class to CoS Rewrite Map: FM6000 Platform Switches**

Traffic Class	0	1	2	3	4	5	6	7
CoS Rewrite Value	1	0	2	3	4	5	6	7

#### Traffic Class to DSCP Rewrite Map

The DSCP rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-DSCP rewrite map. The `qos map traffic-class to dscp` command assigns a DSCP rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-DSCP rewrite map.

#### Example

This command assigns the DSCP rewrite value of 37 to traffic classes 2, 4, and 6.

```
switch(config)#qos map traffic-class 2 4 6 to dscp 37
switch(config)#show qos map
  Number of Traffic Classes supported: 8

  Tc-dscp map:
  tc:      0  1  2  3  4  5  6  7
  -----
  dscp:   8  0 37 24 37 40 37 56

switch(config)#
```

The following table displays the default traffic class-DSCP rewrite map on on FM6000 platform switches.

**Table 19: Default Traffic Class to DSCP Rewrite Map: FM6000 Platform Switches**

<b>Traffic Class</b>	0	1	2	3	4	5	6	7
<b>DSCP Rewrite Value</b>	8	0	16	24	32	40	48	56

#### 9.1.5.4 Transmit Queues and Port Shaping – FM6000 Platform Switches

[Transmit Queues and Port Shaping](#) describes transmit queues and port shaping.

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class-transmit queue map for all Ethernet and port channel interfaces and is used for unicast and multicast traffic. The [show qos maps](#) command displays the traffic class to transmit queue map.

The following table displays the default traffic class to transmit queue map on FM6000 platform switches.

**Table 20: Default Traffic Class to Transmit Queue Map: FM6000 Platform Switches**

<b>Traffic Class</b>	0	1	2	3	4	5	6	7
<b>Transmit Queue</b>	0	1	2	3	4	5	6	7

#### Mapping Traffic Classes to a Transmit Queue

The [qos map traffic-class to tx-queue](#) command assigns traffic classes to a transmit queue. Multiple commands create the complete map.

#### Example

These commands assign traffic classes of 1, 3, and 5 to transmit queue 1, traffic classes 2, 4, and 6 to transmit queue 2, and traffic class 0 to transmit queue 0, then display the resultant map.

```
switch(config)#qos map traffic-class 1 3 5 to tx-queue 1
switch(config)#qos map traffic-class 2 4 6 to tx-queue 2
switch(config)#qos map traffic-class 0 to tx-queue 0
switch(config)#show qos maps
  Number of Traffic Classes supported: 8
  Number of Transmit Queues supported: 8

Tc - tx-queue map:
tc:      0  1  2  3  4  5  6  7
-----
tx-queue: 0  1  2  1  2  1  2  7

switch(config)#
```

#### Entering TX-Queue Configuration Mode

Transmit queues are configurable on Ethernet ports and port channels. Queue parameters are configured in tx-queue configuration command mode, which is entered from interface ethernet configuration mode. The [tx-queue \(FM6000\)](#) command places the switch in tx-queue configuration mode. The [show qos interfaces](#) displays the transmit queue configuration for a specified port.

#### Example

This command enters tx-queue configuration mode for transmit queue 3 of Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#tx-queue 3
switch(config-if-Et5-txq-3)#
```

### Configuring the Shape Rate – Port and Transmit Queues

A port's shape rate specifies its maximum outbound traffic bandwidth. A transmit queue's shape rate specifies the queue's maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

**Note:** Enabling port shaping on an FM6000 interface disables queue shaping internally. Disabling port shaping restores queue shaping as specified in *running-config*.

- To configure a port's shape rate, enter [shape rate \(Interface – FM6000\)](#) from the port's interface configuration mode.
- To configure a transmit queue's shape rate, enter [shape rate \(Tx-queue – FM6000\)](#) from the queue's tx-queue configuration mode.

### Example

These commands configure a shape rate of 5 Gbs on Ethernet port 3, then configure the shape rate for the following transmit queues:

- transmit queues 0, 1, and 2: 500 Mbps
- transmit queues 3, 4, and 5: 400 Mbps

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#shape rate 5000000
switch(config-if-Et3)#tx-queue 0
switch(config-if-Et3-txq-0)#shape rate 500000
switch(config-if-Et3-txq-0)#tx-queue 1
switch(config-if-Et3-txq-1)#shape rate 500000
switch(config-if-Et3-txq-1)#tx-queue 3
switch(config-if-Et3-txq-3)#shape rate 400000
switch(config-if-Et3-txq-3)#tx-queue 4
switch(config-if-Et3-txq-4)#shape rate 400000
switch(config-if-Et3-txq-4)#tx-queue 5
switch(config-if-Et3-txq-5)#shape rate 400000
switch(config-if-Et3-txq-5)#exit
switch(config-if-Et3)#show qos interface ethernet 3
Ethernet3:
```

Port shaping rate: 5000000Kbps

Tx-Queue	Bandwidth (percent)	Shape Rate (Kbps)	Priority
7	N/A	disabled	strict
6	N/A	disabled	strict
5	N/A	400000	strict
4	N/A	400000	strict
3	N/A	400000	strict
2	N/A	disabled	strict
1	N/A	500000	strict
0	N/A	500000	strict

```
switch(config-if-Et3)#
```

## Configuring Queue Priority

Queue priority rank is denoted by the queue number; transmit queues with higher numbers have higher priority. The `priority (FM6000)` command configures a transmit queue's priority type:

- `priority strict` configures the queue as a strict priority queue.
- `no priority` configures the queue as a round robin queue.

A queue's configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The `bandwidth percent (FM6000)` command configures a round robin queue's bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

### Examples

- These commands configure transmit queue 3 (on Ethernet interface 19) as a round robin queue, then allocates 10%, 20%, 30%, and 40% bandwidth to queues 0 through 3.

The `no priority` statement for queue 3 also configures queues 0, 1, and 2 as round robin queues. Removing this statement reverts the other queues to `strict priority` type unless *running-config* contains a `no priority` statement for one of these queues.

```
switch(config)#interface ethernet 19
switch(config-if-Et19)#tx-queue 3
switch(config-if-Et19-txq-3)#no priority
switch(config-if-Et19-txq-3)#bandwidth percent 40
switch(config-if-Et19-txq-2)#tx-queue 2
switch(config-if-Et19-txq-2)#bandwidth percent 30
switch(config-if-Et19-txq-1)#tx-queue 1
switch(config-if-Et19-txq-1)#bandwidth percent 20
switch(config-if-Et19-txq-0)#tx-queue 0
switch(config-if-Et19-txq-0)#bandwidth percent 10
switch(config-if-Et19-txq-0)#show qos interface ethernet 19
Ethernet19:
  Port shaping rate: disabled
```

Tx-Queue	Bandwidth (percent)	Shape Rate (Kbps)	Priority
7	N/A	disabled	strict
6	N/A	disabled	strict
5	N/A	disabled	strict
4	N/A	disabled	strict
3	40	disabled	round-robin
2	30	disabled	round-robin
1	20	disabled	round-robin
0	10	disabled	round-robin

```
switch(config-if-Et19-txq-0)#
```

- Changing the bandwidth percentage for queue 3 to 60 changes the operational bandwidth of each queue to its configured bandwidth divided by 120% (10%+20%+30%+60%).

```
switch(config-if-Et19-txq-0)#tx-queue 3
switch(config-if-Et19-txq-3)#bandwidth percent 60
switch(config-if-Et19-txq-3)#show qos interface ethernet 19
Ethernet19:
  Port shaping rate: disabled
```

Tx-Queue	Bandwidth	Shape Rate	Priority
7	N/A	disabled	strict
6	N/A	disabled	strict
5	N/A	disabled	strict
4	N/A	disabled	strict
3	60	disabled	round-robin
2	30	disabled	round-robin
1	20	disabled	round-robin
0	10	disabled	round-robin

	(percent)	(Kbps)	
7	N/A	disabled	strict
6	N/A	disabled	strict
5	N/A	disabled	strict
4	N/A	disabled	strict
3	49	disabled	round-robin
2	24	disabled	round-robin
1	16	disabled	round-robin
0	8	disabled	round-robin

```
switch(config-if-Et19-txq-3) #
```

## 9.1.6 QoS Configuration: Petra Platform Switches

Implementing QoS on a Petra platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- [CoS and DSCP Port Settings – Petra Platform Switches](#)
- [Traffic Class Derivations – Petra Platform Switches](#)
- [CoS Rewrite – Petra Platform Switches](#)
- [Transmit Queues and Port Shaping – Petra Platform Switches](#)

### 9.1.6.1 CoS and DSCP Port Settings – Petra Platform Switches

[Port Settings – Trust Mode and Traffic Class](#) describes port trust and default port CoS and DSCP values.

#### Configuring Port Trust Settings

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is **cos**. The port-trust default for routed ports is **dscp**.

- `qos trust cos` specifies **cos** as the port's port-trust mode.
- `qos trust dscp` specifies **dscp** as the port's port-trust mode.
- `no qos trust` specifies **untrusted** as the port's port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

#### Example

- These commands configure and display the following trust modes:
  - Ethernet 3/25: dscp
  - Ethernet 3/26: untrusted
  - Ethernet 3/27: cos
  - Ethernet 3/28: default as a switched port
  - Ethernet 3/29: default as a routed port

```
switch(config) #interface ethernet 3/25
switch(config-if-Et3/25) #qos trust dscp
switch(config-if-Et3/25) #interface ethernet 3/26
switch(config-if-Et3/26) #no qos trust
switch(config-if-Et3/26) #interface ethernet 3/27
switch(config-if-Et3/27) #qos trust cos
switch(config-if-Et3/27) #interface ethernet 3/28
switch(config-if-Et3/28) #switchport
switch(config-if-Et3/28) #default qos trust
switch(config-if-Et3/28) #interface ethernet 3/29
```

```

switch(config-if-Et3/29)#no switchport
switch(config-if-Et3/29)#default qos trust
switch(config-if-Et3/29)#show qos interface ethernet 3/25 - 3/29
trust
Port                                     Trust Mode
                                      Operational   Configured
-----
Ethernet3/25                            DSCP          DSCP
Ethernet3/26                            UNTRUSTED     UNTRUSTED
Ethernet3/27                            COS           COS
Ethernet3/28                            COS           DEFAULT
Ethernet3/29                            DSCP         DEFAULT

switch(config-if-Et3/29)#

```

### Configuring Default Port Settings

Port channel and Ethernet interfaces are not assigned default CoS or DSCP settings.

#### 9.1.6.2 Traffic Class Derivations – Petra Platform Switches

[Traffic Classes](#) describes traffic classes.

#### Traffic Class Derivation Source

The following table displays the source for deriving a data stream's default traffic class.

**Table 21: Traffic Class Derivation Source: Petra Platform Switches**

	Untrusted	CoS Trusted	DSCP Trusted
<b>Untagged Non-IP</b>	Default TC (chip)	Default TC (chip)	Default TC (chip)
<b>Untagged IP</b>	Default TC (chip)	Default TC (chip)	DSCP (packet)
<b>Tagged Non-I</b>	Default TC (chip)	CoS (packet)	Default TC (chip)
<b>Tagged IP</b>	Default TC (chip)	CoS (packet)	DSCP (packet)

### Configuring Default Traffic Class

Petra platform switches assign a default traffic class to the set of Ethernet interfaces controlled by individual PetraA chips. Default traffic class values are configurable for each PetraA chip, not individual interfaces.

The [platform petraA traffic-class](#) command specifies the default traffic class used by all ports controlled by a specified chip. The [show platform petraA traffic-class](#) command displays traffic class assignments.

#### Examples

- This command configures the default traffic class to five for the ports 32-39 on linecard 3 (7500 Series).

```

switch(config)#platform petraA petra3/4 traffic-class 5
switch(config)#show platform petraA module 3 traffic-class
Petra3/0 traffic-class: 1
Petra3/1 traffic-class: 1
Petra3/2 traffic-class: 1
Petra3/3 traffic-class: 1
Petra3/4 traffic-class: 5
Petra3/5 traffic-class: 1

```

```
switch(config)#
```

- This command configures the default traffic class to three for all ports on linecard 6 (7500 Series).

```
switch(config)#platform petraA module 6 traffic-class 6
switch(config)#show platform petraA module 6 traffic-class
Petra6/0 traffic-class: 6
Petra6/1 traffic-class: 6
Petra6/2 traffic-class: 6
Petra6/3 traffic-class: 6
Petra6/4 traffic-class: 6
Petra6/5 traffic-class: 6
switch(config)#
```

### Mapping CoS to Traffic Class

The `qos map cos` command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS-traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the port upon which it is received.

#### Example

This command assigns the traffic class of 4 to the classes of service 1, 3, 5, and 7.

```
switch(config)#qos map cos 1 3 5 7 to traffic-class 4
switch(config)#show qos maps
    Number of Traffic Classes supported: 8

Cos-tc map:
  cos:  0  1  2  3  4  5  6  7
  -----
  tc:   1  4  2  4  4  4  6  4

switch(config)#
```

The following table displays the default CoS to traffic class map on Petra platform switches.

**Table 22: Default CoS to Traffic Class Map: Petra Platform Switches**

Inbound CoS	untagged	0	1	2	3	4	5	6	7
Traffic Class	Derived: use default CoS as inbound CoS	1	0	2	3	4	5	6	7

### Mapping DSCP to Traffic Class

The `qos map dscp` command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

#### Example

This command assigns the traffic class of three to the DSCP values of 12, 13, 25, and 37.

```
switch(config)#qos map dscp 12 13 14 25 48 to traffic-class 3
switch(config)#show qos maps
```

```
Number of Traffic Classes supported: 8
```

```
Dscp-tc map:
```

```
d1 : d2 0 1 2 3 4 5 6 7 8 9
-----
0 : 1 1 1 1 1 1 1 1 0 0
1 : 0 0 3 3 3 0 2 2 2 2
2 : 2 2 2 2 3 3 3 3 3 3
3 : 3 3 4 4 4 4 4 4 4 4
4 : 5 5 5 5 5 5 5 5 3 6
5 : 6 6 6 6 6 6 7 7 7 7
6 : 7 7 7 7
```

```
switch(config)#
```

The following table displays the default DSCP to Traffic Class map on Petra platform switches.

**Table 23: Default DSCP to Traffic Class Map: Petra Platform Switches**

Inbound DSCP	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
Traffic Class	1	0	2	3	4	5	6	7

### 9.1.6.3 CoS Rewrite – Petra Platform Switches

[Rewriting CoS and DSCP](#) describes the CoS rewrite function.

#### Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-CoS rewrite map. The [qos map traffic-class to cos](#) command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-CoS rewrite map.

#### Example

This command assigns the CoS of two to traffic classes 1, 3, and 5.

```
switch(config)#qos map traffic-class 1 3 5 to cos 2
switch(config)#show qos map
Number of Traffic Classes supported: 8

Tc-cos map:
tc: 0 1 2 3 4 5 6 7
-----
cos: 1 2 2 2 4 2 6 7

switch(config)#
```

The following table displays the default Traffic Class to CoS rewrite value map on Petra platform switches.

**Table 24: Default Traffic Class to CoS Rewrite Value Map: Petra Platform Switches**

Traffic Class	0	1	2	3	4	5	6	7
CoS Rewrite Value	1	0	2	3	4	5	6	7

## Traffic Class to DSCP Rewrite Map

DSCP rewrite is always disabled on Petra platform switches.

### 9.1.6.4 Transmit Queues and Port Shaping – Petra Platform Switches

[Transmit Queues and Port Shaping](#) describes transmit queues and port shaping.

Petra platform switches provide four physical queues for each egress port: Unicast High, Unicast Low, Multicast High, and Multicast Low. Data is scheduled for the high or low queue based on its priority as defined by its transmit queue assignment (unicast traffic) or traffic class (multicast traffic), as shown in the table below. A Petra transmit queue is a data structure that defines scheduling of unicast traffic among physical egress queues.

**Table 25: Traffic Distribution to Egress Port Queues**

	High Priority Queue	Low Priority Queue
<b>Unicast Traffic</b>	Transmit Queues 5 – 7	Transmit Queues 0 – 4
<b>Multicast Traffic</b>	Traffic Classes 5 – 7	Traffic Classes 0 – 4

Multicast queue capacity that is available after multicast traffic is serviced is used for unicast traffic of a corresponding priority. Similarly, unicast queue capacity that is available after unicast traffic is serviced is used for overflow multicast traffic. Under conditions of unicast and multicast congestion, egress traffic is evenly split between unicast and multicast traffic.

[Unicast Transmit Queues and Port Shaping](#) describes unicast transmit queues and shaping. [Multicast Egress Scheduling](#) describes multicast priority and traffic classes.

#### 9.1.6.4.1 Unicast Transmit Queues and Port Shaping

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class–transmit queue map for unicast traffic on all Ethernet interfaces. The [show qos maps](#) command displays the traffic class–transmit queue map. The following table displays the default traffic class to transmit queue map on Petra platform switches.

**Table 26: Default Traffic Class to Transmit Queue Map: Petra Platform Switches**

Traffic Class	0	1	2	3	4	5	6	7
Transmit Queue	0	1	2	3	4	5	6	7

Transmit queue parameters are configured in tx-queue configuration command mode.

#### Mapping Traffic Classes to a Transmit Queue

The [qos map traffic-class to tx-queue](#) command assigns traffic classes to a transmit queue. Multiple commands complete the traffic class-transmit queue map. Traffic class 7 and transmit queue 7 are always mapped to each other. This association is not editable.

#### Example

These commands assign traffic classes of 1, 3, and 5 to transmit queue 1, traffic classes 2, 4, and 6 to transmit queue 2, and traffic class 0 to transmit queue 0, then display the resultant map.

```
switch(config)#qos map traffic-class 1 3 5 to tx-queue 1
switch(config)#qos map traffic-class 2 4 6 to tx-queue 2
switch(config)#qos map traffic-class 0 to tx-queue 0
```

```

switch(config)#show qos maps
  Number of Traffic Classes supported: 8
  Number of Transmit Queues supported: 8

  Tc - tx-queue map:
    tc:          0  1  2  3  4  5  6  7
    -----
    tx-queue:   0  1  2  1  2  1  2  7

switch(config)#

```

### Entering Tx-Queue Configuration Mode

The `tx-queue` (Petra) command places the switch in tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue 7 is not configurable. The `show qos interfaces` displays the transmit queue configuration for a specified port.

### Example

This command enters tx-queue configuration mode for transmit queue 3 of Ethernet interface 3/28.

```

switch(config)#interface ethernet 3/28
switch(config-if-Et3/28)#tx-queue 3
switch(config-if-Et3/28-txq-3)#

```

### Configuring the Shape Rate – Port and Transmit Queues

A port's shape rate specifies its maximum outbound traffic bandwidth. A transmit queue's shape rate specifies the queue's maximum outbound bandwidth. Shape rate commands specify data rates in kbps.

- To configure a port's shape rate, enter `shape rate (Interface – Petra)` from the port's interface configuration mode.
- To configure a transmit queue's shape rate, enter `shape rate (Tx-queue – Petra)` from the queue's tx-queue configuration mode.

### Example

These commands configure a shape rate of 5 Gbs on Ethernet port 3, then configure the shape rate for the following transmit queues:

- transmit queues 0, 1, and 2: 500 Mbps
- transmit queues 3, 4, and 5: 400 Mbps

```

switch(config)#interface ethernet 3/28
switch(config-if-Et3/28)#shape rate 5000000
switch(config-if-Et3/28)#tx-queue 0
switch(config-if-Et3/28-txq-0)#shape rate 500000
switch(config-if-Et3/28-txq-0)#tx-queue 1
switch(config-if-Et3/28-txq-1)#shape rate 500000
switch(config-if-Et3/28-txq-1)#tx-queue 2
switch(config-if-Et3/28-txq-2)#shape rate 500000
switch(config-if-Et3/28-txq-5)#tx-queue 3
switch(config-if-Et3/28-txq-3)#shape rate 400000
switch(config-if-Et3/28-txq-3)#tx-queue 4
switch(config-if-Et3/28-txq-4)#shape rate 400000
switch(config-if-Et3/28-txq-4)#tx-queue 5
switch(config-if-Et3/28-txq-5)#shape rate 400000
switch(config-if-Et3/28-txq-5)#show qos interface ethernet 3/28
Ethernet3/28:

```

```

Port shaping rate: 5000000Kbps

Tx-Queue   Bandwidth   Shape Rate   Priority
  (percent)   (Kbps)
-----
      7       N/A       disabled     strict
      6       N/A       disabled     strict
      5       N/A       400000      strict
      4       N/A       400000      strict
      3       N/A       400000      strict
      2       N/A       500000      strict
      1       N/A       500000      strict
      0       N/A       500000      strict

switch(config-if-Et3/28-txq-5) #

```

### Configuring Queue Priority

The `priority (Petra)` command configures a transmit queue's priority type:

- The `priority strict` command configures the queue as a strict priority queue.
- The `no priority` command configures the queue as a round robin queue.

A queue's configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The `bandwidth percent (Petra)` command configures a round robin queue's bandwidth share. The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

### Examples

- These commands configure transmit queue 3 (on Ethernet interface 3/28) as a round robin queue, then allocates 10%, 20%, 30%, and 40% bandwidth to queues 0 through 3.

The `no priority` statement for queue 3 also configures queues 0, 1, and 2 as round robin queues. Removing this statement reverts the other queues to `strict priority` type unless *running-config* contains a `no priority` statement for one of these queues.

```

switch(config-if-Et3/28) #tx-queue 3
switch(config-if-Et3/28-txq-3) #no priority
switch(config-if-Et3/28-txq-3) #bandwidth percent 40
switch(config-if-Et3/28-txq-3) #tx-queue 2
switch(config-if-Et3/28-txq-2) #bandwidth percent 30
switch(config-if-Et3/28-txq-2) #tx-queue 1
switch(config-if-Et3/28-txq-1) #bandwidth percent 20
switch(config-if-Et3/28-txq-1) #tx-queue 0
switch(config-if-Et3/28-txq-0) #bandwidth percent 10
switch(config-if-Et3/28-txq-0) #show qos interface ethernet 3/28
Ethernet3/28:

Port shaping rate: 5000000Kbps

Tx-Queue   Bandwidth   Shape Rate   Priority
  (percent)   (Kbps)
-----
      7       N/A       disabled     strict
      6       N/A       disabled     strict
      5       N/A       400000      strict
      4       N/A       400000      strict
      3        40       400000     round-robin
      2        30       500000     round-robin

```

```

1          20          500000    round-robin
0          10          500000    round-robin

switch(config-if-Et3/28-txq-0) #

```

- Changing the bandwidth percentage for queue 3 to 60 changes the operational bandwidth of each queue to its configured bandwidth divided by 120% (10%+20%+30%+60%).

```

switch(config-if-Et3/28-txq-0) #tx-queue 3
switch(config-if-Et3/28-txq-3) #bandwidth percent 60
switch(config-if-Et3/28-txq-3) #show qos interface ethernet 3/28
Ethernet3/28:

1           16          500000       round-robin
0           8           500000       round-robin

switch(config-if-Et3/28-txq-3) #

```

#### 9.1.6.4.2 Multicast Egress Scheduling

Multiclass traffic is not affected by traffic class assignment or port shaping statements. Multicast traffic is assigned to port egress queues based on traffic class and uses strict priority to schedule egress between the high and low queues.

### 9.1.7 QoS Configuration: Trident and Tomahawk Platform Switches

Implementing QoS on a Trident and Tomahawk platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- [CoS and DSCP Port Settings – Trident and Tomahawk Platform Switches](#)
- [Traffic Class Derivations – Trident and Tomahawk Platform Switches](#)
- [CoS and DSCP Rewrite – Trident and Tomahawk Platform Switches](#)
- [Transmit Queues and Port Shaping – Trident and Tomahawk Platform Switches](#)
- [ECN Configuration – Trident and Tomahawk Platform Switches](#)

#### 9.1.7.1 CoS and DSCP Port Settings – Trident and Tomahawk Platform Switches

##### Configuring Port Trust Settings

The `qos trust` command configures the QoS port trust mode for the configuration mode interface. Trust-enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is **CoS**. The port-trust default for routed ports is **DSCP**.

- `qos trust cos` specifies **CoS** as the port's trust mode.
- `qos trust dscp` specifies **DSCP** as the port's trust mode.
- `no qos trust` specifies **untrusted** as the port's trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

##### Example

- These commands configure and display the following trust modes:
  - **Ethernet 15:** dscp
  - **Ethernet 16:** untrusted
  - **Ethernet 17:** cos
  - **Ethernet 18:** default as a switched port
  - **Ethernet 19:** default as a routed port

```

switch(config)#interface ethernet 15
switch(config-if-Et15)#qos trust dscp
switch(config-if-Et15)#interface ethernet 16
switch(config-if-Et16)#no qos trust
switch(config-if-Et16)#interface ethernet 17
switch(config-if-Et17)#qos trust cos
switch(config-if-Et17)#interface ethernet 18
switch(config-if-Et18)#switchport
switch(config-if-Et18)#default qos trust
switch(config-if-Et18)#interface ethernet 19
switch(config-if-Et19)#no switchport
switch(config-if-Et19)#default qos trust
switch(config-if-Et19)#show qos interface ethernet 15 - 19 trust

```

Port	Operational	Trust Mode	Configured
Ethernet15	DSCP		DSCP
Ethernet16	UNTRUSTED		UNTRUSTED
Ethernet17	COS		COS
Ethernet18	COS		DEFAULT
Ethernet19	DSCP		DEFAULT

```

switch(config-if-Et19)#

```

### Configuring Default Port Settings

Default CoS and DSCP settings are assigned to individual port channel and Ethernet interfaces. These configuration mode interface commands specify the port's default CoS and DSCP values.

- `qos cos` configures a port's default CoS value.
- `qos dscp` configures a port's default DSCP value.

### Example

These commands configure default CoS (4) and DSCP (44) values on Ethernet interface 7.

```

switch(config)#interface ethernet 7
switch(config-if-Et7)#qos cos 4
switch(config-if-Et7)#qos dscp 44
switch(config-if-Et7)#show active
interface Ethernet7
  qos cos 4
  qos dscp 44
switch(config-if-Et7)#show qos interfaces ethernet 7
Ethernet7:
  Trust Mode: COS
  Default COS: 4
  Default DSCP: 44
switch(config-if-Et7)#

```

### 9.1.7.2 Traffic Class Derivations – Trident and Tomahawk Platform Switches

[Traffic Classes](#) describes traffic classes.

#### Traffic Class Derivation Source

The following table displays the source for deriving a data stream's traffic class.

**Table 27: Traffic Class Derivation Source: Trident and Tomahawk Platform Switches**

	Untrusted	CoS Trusted	DSCP Trusted
<b>Untagged Non-IP</b>	Default CoS (port)	Default CoS (port)	Default DSCP (port)
<b>Untagged IP</b>	Default CoS (port)	Default CoS (port)	DSCP (packet)
<b>Tagged Non-IP</b>	Default CoS (port)	CoS (packet)	Default DSCP (port)
<b>Tagged IP</b>	Default CoS (port)	CoS (packet)	DSCP (packet)

[CoS and DSCP Port Settings – Trident and Tomahawk Platform Switches](#) describes the default CoS and DSCP settings for each port.

#### Mapping CoS to Traffic Class

The `qos map cos` command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the port upon which it is received.

#### Example

This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

```
switch(config)#qos map cos 1 3 5 7 to traffic-class 5
switch(config)#show qos maps
  Number of Traffic Classes supported: 8

  Cos-tc map:
  cos:  0  1  2  3  4  5  6  7
  -----
  tc:   1  5  2  5  4  5  6  5

switch(config)#
```

The following table displays the default CoS–traffic class map on Trident and Tomahawk platform switches.

**Table 28: Default CoS to Traffic Class Map: Trident and Tomahawk Platform Switches**

<b>Inbound CoS</b>	0	1	2	3	4	5	6	7
<b>Traffic Class</b>	1	0	2	3	4	5	6	7

#### Mapping DSCP to Traffic Class

The `qos map dscp` command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

#### Example

This command assigns the traffic class of 0 to DSCP values of 12, 24, 41, and 44-47.

```
switch(config)#qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)#show qos maps
Number of Traffic Classes supported: 8

Dscp-tc map:
d1 : d2 0 1 2 3 4 5 6 7 8 9
-----
0 : 1 1 1 1 1 1 1 1 0 0
1 : 0 0 0 0 0 0 2 2 2 2
2 : 2 2 2 2 0 3 3 3 3 3
3 : 3 3 4 4 4 4 4 4 4 4
4 : 5 0 5 5 0 0 0 0 6 6
5 : 6 6 6 6 6 6 7 7 7 7
6 : 7 7 7 7

switch(config)#
```

The following table displays the default DSCP–traffic class map on Trident and Tomahawk platform switches.

**Table 29: Default DSCP to Traffic Class Map: Trident and Tomahawk Platform Switches**

Inbound DSCP	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
Traffic Class	1	0	2	3	4	5	6	7

### 9.1.7.3 CoS and DSCP Rewrite – Trident and Tomahawk Platform Switches

[Rewriting CoS and DSCP](#) describes the CoS and DSCP rewrite functions.

#### Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream’s traffic class, as specified by the traffic class-CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

#### Example

This command assigns the CoS of two to traffic classes 1, 3, and 5.

```
switch(config)#qos map traffic-class 1 3 5 to cos 2
switch(config)#show qos map
Number of Traffic Classes supported: 8

Tc-cos map:
tc: 0 1 2 3 4 5 6 7
-----
cos: 1 2 2 2 4 2 6 7

switch(config)#
```

The following table displays the default Traffic Class to CoS rewrite value map on Trident and Tomahawk platform switches.

**Table 30: Default Traffic Class to CoS Rewrite Value Map: Trident and Tomahawk Platform Switches**

Traffic Class	0	1	2	3	4	5	6	7
	1	2	2	2	4	2	6	7

<b>CoS Rewrite Value</b>	1	0	2	3	4	5	6	7
--------------------------	---	---	---	---	---	---	---	---

### Traffic Class to DSCP Rewrite Map

The DSCP rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-DSCP rewrite map. The `qos map traffic-class to dscp` command assigns a DSCP rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-DSCP rewrite map.

#### Example

This command assigns the DSCP value of 29 to traffic classes 2, 4, and 6.

```
switch(config)#qos map traffic-class 2 4 6 to dscp 29
switch(config)#show qos map
    Number of Traffic Classes supported: 8

    Tc-dscp map:
    tc:      0  1  2  3  4  5  6  7
    -----
    dscp:   8  0 29 24 29 40 29 56

switch(config)#
```

The following displays the default traffic class to DSCP rewrite map on Trident and Tomahawk platform switches.

**Table 31: Traffic Class to DSCP Rewrite Value Map: Trident and Tomahawk Platform Switches**

<b>Traffic Class</b>	0	1	2	3	4	5	6	7
<b>DSCP</b>	8	0	16	24	32	40	48	56

### 9.1.7.4 Transmit Queues and Port Shaping – Trident and Tomahawk Platform Switches

[Transmit Queues and Port Shaping](#) describes transmit queues and port shaping.

Trident and Tomahawk platform switches define 12 transmit queues: eight unicast (UC0 – UC7) and four multicast (MC0 – MC3). The traffic class–transmit queue maps are configured globally and apply to all Ethernet interfaces. The `show qos maps` command displays the traffic class–transmit queue maps.

The following table displays the default traffic class–transmit queue maps.

**Table 32: Default Traffic Class to Transmit Queue Map: Trident and Tomahawk Platform Switches**

<b>Traffic Class</b>	0	1	2	3	4	5	6	7
<b>Unicast Transmit Queue</b>	0	1	2	3	4	5	6	7
<b>Multicast Transmit Queue</b>	0	0	1	1	2	2	3	3

#### Mapping Traffic Classes to a Transmit Queue

These commands assign traffic classes to a transmit queue:

- `qos map traffic-class to uc-tx-queue` associates a unicast queue to a traffic class set.
- `qos map traffic-class to mc-tx-queue` associates a multicast queue to a traffic class set.

---

Multiple commands create the complete maps.

### Example

- These commands assign the following on Ethernet interface 7:
  - traffic classes 1, 3, and 5 to unicast queue 1
  - traffic classes 2, 4, and 6 to unicast queue 5
  - traffic classes 1, 2, and 3 to multicast queue 1
  - traffic classes 4, 5, and 6 to multicast queue 3
  - traffic class 0 to unicast queue 0 and multicast queue 0

```
switch(config)#default interface ethernet 7
switch(config)#qos map traffic-class 1 3 5 to uc-tx-queue 1
switch(config)#qos map traffic-class 2 4 6 to uc-tx-queue 5
switch(config)#qos map traffic-class 1 2 3 to mc-tx-queue 1
switch(config)#qos map traffic-class 4 5 6 to mc-tx-queue 3
switch(config)#qos map traffic-class 0 to uc-tx-queue 0
switch(config)#qos map traffic-class 0 to mc-tx-queue 0
switch(config)#show qos maps
Number of Traffic Classes supported: 8
Number of Transmit Queues supported: 12

Tc - uc-tx-queue map:
tc:          0  1  2  3  4  5  6  7
-----
uc-tx-queue: 0  1  5  1  5  1  5  7

Tc - mc-tx-queue map:
tc:          0  1  2  3  4  5  6  7
-----
mc-tx-queue: 0  1  1  1  3  3  3  3

switch(config)#
```

### Entering a Transmit Queue Configuration Mode

Transmit queues are configurable on individual Ethernet ports. Parameters for individual transmit queues are configured in one of two transmit queue configuration modes. Transmit queue modes are accessed from an interface-ethernet configuration mode.

- [uc-tx-queue](#) places the switch in uc-tx-queue mode to configure a unicast transmit queue.
- [mc-tx-queue](#) places the switch in mc-tx-queue mode to configure a multicast transmit queue.

The [show qos interfaces](#) displays the transmit queue configuration for a specified port.

### Examples

- This command enters the mode that configures unicast transmit queue 3 of Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#uc-tx-queue 3
switch(config-if-Et5-uc-txq-3)#
```

- This command enters the mode to configure multicast transmit queue 3 of Ethernet interface 5.

```
switch(config-if-Et5)#mc-tx-queue 2
switch(config-if-Et5-mc-txq-2)#
```

## Configuring the Shape Rate – Port and Transmit Queues

A port's shape rate specifies the port's maximum outbound traffic bandwidth. A shape rate can also be configured for all transmit queues on each port. All shape rate commands use kbps to specify data rates.

- To configure a port's shape rate, enter [shape rate \(Interface – Trident and Tomahawk\)](#) from the port's interface configuration mode.
- To configure a transmit queue's shape rate, enter [shape rate \(Tx-queue – Trident and Tomahawk\)](#) from the queue's tx-queue configuration mode.

### Example

These commands configure a shape rate of 5 Gbs on Ethernet port 7, then configure the shape rate for the following transmit queues:

- unicast transmit queues 0 and 1: 500 Mbps
- unicast transmit queues 3 and 4: 400 Mbps
- multicast transmit queues 0 and 2: 300 Mbps

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#shape rate 5000000
switch(config-if-Et7)#uc-tx-queue 0
switch(config-if-Et7-uc-txq-0)#shape rate 500000
switch(config-if-Et7-uc-txq-0)#uc-tx-queue 1
switch(config-if-Et7-uc-txq-1)#shape rate 500000
switch(config-if-Et7-uc-txq-1)#uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)#shape rate 400000
switch(config-if-Et7-uc-txq-3)#uc-tx-queue 5
switch(config-if-Et7-uc-txq-5)#shape rate 400000
switch(config-if-Et7-uc-txq-5)#mc-tx-queue 0
switch(config-if-Et7-mc-txq-0)#shape rate 300000
switch(config-if-Et7-mc-txq-0)#mc-tx-queue 2
switch(config-if-Et7-mc-txq-2)#shape rate 300000
switch(config-if-Et7-mc-txq-2)#exit
switch(config-if-Et7)#show qos interface ethernet 7
Ethernet7:
```

Port shaping rate: 5000000Kbps

Tx-Queue	Bandwidth (percent)	Shape Rate (Kbps)	Priority	Priority Group
UC7	N/A	disabled	strict	1
UC6	N/A	disabled	strict	1
MC3	N/A	disabled	strict	1
UC5	N/A	400000	strict	0
UC4	N/A	disabled	strict	0
MC2	N/A	300000	strict	0
UC3	N/A	400000	strict	0
UC2	N/A	disabled	strict	0
MC1	N/A	disabled	strict	0
UC1	N/A	500000	strict	0
UC0	N/A	500000	strict	0
MC0	N/A	300000	strict	0

```
switch(config-if-Et7)#
```

## Configuring Queue Priority

Trident and Tomahawk platform switch queues are categorized into two priority groups. Priority group 1 queues have priority over priority 0 queues. The following lists display the priority group queues in order from higher priority to lower priority.

- Priority Group 1: UC7, UC6, MC3
- Priority Group 0: UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0

The `priority (Trident and Tomahawk)` command configures a transmit queue's priority type:

- The `priority strict` command configures the queue as a strict priority queue.
- The `no priority` command configures the queue as a round robin queue.

A queue's configuration as **round robin** also applies to all lower priority queues regardless of other configuration statements.

The `bandwidth percent (Trident and Tomahawk)` command configures a round robin queue's bandwidth share. The cumulative operational bandwidth of all round robin queues is always 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

Priority Group 1 queues (UC7, UC6, MC3) are not configurable as round robin queues. The `bandwidth percent` command is not available for these queues.

### Examples

- These commands configure unicast transmit queue 3 as a round robin queue, then allocates 5%, 15%, 25%, 35%, 8%, and 12% bandwidth to unicast transmit queues 0 through 3 and multicast transmit queues 0 and 1, respectively.

The `no priority` statement for queue 3 also configures priority for all lower priority queues. Removing the statement reverts the other queues to `strict priority` type unless *running-config* contains a `no priority` statement for one of these queues.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)#no priority
switch(config-if-Et7-uc-txq-3)#bandwidth percent 5
switch(config-if-Et7-uc-txq-3)#uc-tx-queue 2
switch(config-if-Et7-uc-txq-2)#bandwidth percent 15
switch(config-if-Et7-uc-txq-2)#uc-tx-queue 1
switch(config-if-Et7-uc-txq-1)#bandwidth percent 25
switch(config-if-Et7-uc-txq-1)#uc-tx-queue 0
switch(config-if-Et7-uc-txq-0)#bandwidth percent 35
switch(config-if-Et7-uc-txq-0)#mc-tx-queue 1
switch(config-if-Et7-mc-txq-1)#bandwidth percent 12
switch(config-if-Et7-mc-txq-1)#mc-tx-queue 0
switch(config-if-Et7-mc-txq-0)#bandwidth percent 8
switch(config-if-Et7-mc-txq-0)#show qos interface ethernet 7
Ethernet7:
```

Port shaping rate: disabled

Tx-Queue	Bandwidth (percent)	Shape Rate (Kbps)	Priority	Priority Group
UC7	N/A	disabled	strict	1
UC6	N/A	disabled	strict	1
MC3	N/A	disabled	strict	1
UC5	N/A	disabled	strict	0
UC4	N/A	disabled	strict	0
MC2	N/A	disabled	strict	0
UC3	5	disabled	round-robin	0

```

UC2      15      disabled  round-robin  0
MC1      12      disabled  round-robin  0
UC1      25      disabled  round-robin  0
UC0      35      disabled  round-robin  0
MC0      8       disabled  round-robin  0

switch(config-if-Et7-mc-txq-0) #

```

- Changing the bandwidth percentage for unicast queue 3 to 30 changes the operational bandwidth of each queue to its configured bandwidth divided by 125% (8%+12%+30%+15%+25%+35%).

```

switch(config-if-Et7-uc-txq-0) #uc-tx-queue 3
switch(config-if-Et7-uc-txq-3) #bandwidth percent 30
switch(config-if-Et7-uc-txq-3) #show qos interface ethernet 7
Ethernet7:

Port shaping rate: disabled

Tx-Queue   Bandwidth   Shape Rate   Priority   Priority Group
(percent)   (Kbps)
-----
UC7         N/A         disabled    strict    1
UC6         N/A         disabled    strict    1
MC3         N/A         disabled    strict    1
UC5         N/A         disabled    strict    0
UC4         N/A         disabled    strict    0
MC2         N/A         disabled    strict    0
UC3         24         disabled    round-robin  0
UC2         12         disabled    round-robin  0

UC1         20         disabled    round-robin  0
UC0         28         disabled    round-robin  0
MC0         6          disabled    round-robin  0

switch(config-if-Et7-uc-txq-3) #

```

### 9.1.7.5 ECN Configuration – Trident and Tomahawk Platform Switches

[Explicit Congestion Notification \(ECN\)](#) describes Explicit Congestion Notification (ECN).

ECN is independently configurable on all egress queues of each Ethernet interface. ECN settings for Port-Channels are applied on each of the channel's member Ethernet interfaces. ECN is also globally configurable to mark packets from the shared pool used for dynamically allocating memory to the queues. Multicast packets contribute to the globally shared pool and can contribute to global level congestion that result in ECN marking of unicast packets queued after the multicast packets.

Average queue length is tracked for transmit queues and the global pool independently. When either entity reaches its maximum threshold, all subsequent packets are marked.

Although the switch does not limit the number of queues that can be configured for ECN, hardware table limitations restrict the number of queues (including the global shared pool) that can simultaneously implement ECN.

The [qos random-detect ecn global-buffer \(Trident and Tomahawk\)](#) command enables ECN marking for globally shared packet memory and specifies minimum and maximum queue threshold sizes.

#### Examples

- This command enables ECN marking of unicast packets from the global data pool and sets the minimum and maximum thresholds at 20 and 500 segments.

```

switch(config) #qos random-detect ecn global-buffer minimum-threshold 20
segments

```

```
maximum-threshold 500 segments
switch(config)#
```

- This command disables ECN marking of unicast packets from the global data pool.

```
switch(config)#no qos random-detect ecn global-buffer
switch(config)#
```

The [random-detect ecn \(Trident and Tomahawk\)](#) command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes.

- These commands enable ECN marking of unicast packets from transmit queue 4 of Ethernet interface 15, setting thresholds at 10 and 100 segments.

```
switch(config)#interface ethernet 15
switch(config-if-Et15)#uc-tx-queue 4
switch(config-if-Et15-uc-txq-4)#random-detect ecn minimum-threshold 10
segments
maximum-threshold 100 segments
switch(config-if-Et15-uc-txq-4)#show active
interface Ethernet15
    uc-tx-queue 4
        random-detect ecn minimum-threshold 10 segments maximum-threshold
        100
segments
switch(config-if-Et15-uc-txq-4)#exit
switch(config-if-Et15)#
```

- This command disables ECN marking of unicast packets from transmit queue 4 of Ethernet interface 15.

```
switch(config-if-Et15-uc-txq-4)#no random-detect ecn
switch(config-if-Et15-uc-txq-4)#show active
interface Ethernet15
switch(config-if-Et15-uc-txq-4)#exit
switch(config-if-Et15)#
```

## 9.1.8 QoS Configuration: Trident II and Helix Platform Switches

Implementing QoS on a Trident platform switch consists of configuring port trust settings, default port settings, default traffic classes, conversion maps, and transmit queues.

- [CoS and DSCP Port Settings – Trident II and Helix Platform Switches](#)
- [Traffic Class Derivations – Trident II and Helix Platform Switches](#)
- [CoS and DSCP Rewrite – Trident II and Helix Platform Switches](#)
- [Transmit Queues and Port Shaping – Trident II and Helix Platform Switches](#)
- [Ingress Policing on LAG](#)
- [Fabric QoS -- – Trident II Platform Switches](#)

### 9.1.8.1 CoS and DSCP Port Settings – Trident II and Helix Platform Switches

#### Configuring Port Trust Settings

The [qos trust](#) command configures the QoS port trust mode for the configuration mode interface. Trust enabled ports use packet CoS or DSCP values to classify traffic. The port-trust default for switched ports is **cos**. The port-trust default for routed ports is **dscp**.

- `qos trust cos` specifies **cos** as the port's port-trust mode.
- `qos trust dscp` specifies **dscp** as the port's port-trust mode.

- `no qos trust` specifies *untrusted* as the port's port-trust mode.

The `show qos interfaces trust` command displays the trust mode of specified interfaces.

### Example

These commands configure and display the following trust modes:

- **Ethernet 7/1:** dscp.
- **Ethernet 7/2:** untrusted.
- **Ethernet 7/3:** cos.
- **Ethernet 7/4:** default as a switched port.
- **Ethernet 8/1:** default as a routed port.

```
switch(config)#interface ethernet 7/1
switch(config-if-Et7/1)#qos trust dscp
switch(config-if-Et7/1)#interface ethernet 7/2
switch(config-if-Et7/2)#no qos trust
switch(config-if-Et7/2)#interface ethernet 7/3
switch(config-if-Et7/3)#qos trust cos
switch(config-if-Et7/3)#interface ethernet 7/4
switch(config-if-Et7/4)#switchport
switch(config-if-Et7/4)#default qos trust
switch(config-if-Et7/4)#interface ethernet 8/1
switch(config-if-Et8/1)#no switchport
switch(config-if-Et8/1)#default qos trust
switch(config-if-Et8/1)#show qos interface ethernet 7/1 - 8/1 trust
```

Port	Trust Mode	
	Operational	Configured
Ethernet7/1	DSCP	DSCP
Ethernet7/2	UNTRUSTED	UNTRUSTED
Ethernet7/3	COS	COS
Ethernet7/4	COS	DEFAULT
Ethernet8/1	DSCP	DEFAULT

```
switch(config-if-Et8/1)#
```

### Configuring Default Port Settings

Default CoS and DSCP settings are assigned to individual port channel and Ethernet interfaces. These configuration mode interface commands specify the port's default CoS and DSCP values.

- `qos cos` configures a port's default CoS value.
- `qos dscp` configures a port's default DSCP value.

### Example

These commands configure default **CoS (4)** and **DSCP (44)** values on **Ethernet interface 7/3**.

```
switch(config)#interface ethernet 7/3
switch(config-if-Et7/3)#qos cos 4
switch(config-if-Et7/3)#qos dscp 44
switch(config-if-Et7/3)#show active

interface Ethernet7/3
  qos cos 4
  qos dscp 44

switch(config-if-Et7/3)#show qos interfaces ethernet 7/3

Ethernet7/3:
```

```

Trust Mode: COS
Default COS: 4
Default DSCP: 44

switch(config-if-Et7/3) #

```

### 9.1.8.2 Traffic Class Derivations – Trident II and Helix Platform Switches

[Traffic Classes](#) describes traffic classes.

 **Note:** Qos traffic policy is supported on Trident II platform switches.

#### Traffic Class Derivation Source

The following table displays the source for deriving a data stream’s traffic class.

**Table 33: Traffic Class Derivation Source: Trident II Platform Switches**

	Untrusted	CoS Trusted	DSCP Trusted
<b>Untagged Non-IP</b>	Default CoS (port)	Default CoS (port)	Default DSCP (port)
<b>Untagged IP</b>	Default CoS (port)	Default CoS (port)	DSCP (packet)
<b>Tagged Non-IP</b>	Default CoS (port)	CoS (packet)	Default DSCP (port)
<b>Tagged IP</b>	Default CoS (port)	CoS (packet)	DSCP (packet)

[CoS and DSCP Port Settings – Trident II and Helix Platform Switches](#) describes the default CoS and DSCP settings for each port.

#### Mapping CoS to Traffic Class

The `qos map cos` command assigns a traffic class to a list of CoS settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet’s CoS field or the port upon which it is received.

#### Example

This command assigns the traffic class of 5 to the classes of service 1, 3, 5, and 7.

```

switch(config) #qos map cos 1 3 5 7 to traffic-class 5
switch(config) #show qos maps
  Number of Traffic Classes supported: 8

  Cos-tc map:
  cos:  0  1  2  3  4  5  6  7
  -----
  tc:   1  5  2  5  4  5  6  5

switch(config) #

```

The following table displays the default CoS–traffic class map on Trident II platform switches.

**Table 34: Default CoS to Traffic Class Map: Trident II Platform Switches**

<b>Inbound CoS</b>	0	1	2	3	4	5
<b>Traffic Class</b>	1	0	2	3	4	5

## Mapping DSCP to Traffic Class

The `qos map dscp` command assigns a traffic class to a set of DSCP values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

### Example

This command assigns the traffic class of 0 to DSCP values of 12, 24, 41, and 44-47.

```
switch(config)#qos map dscp 12 24 41 44 45 46 47 to traffic-class 0
switch(config)#show qos maps
Number of Traffic Classes supported: 8

Dscp-tc map:
d1 : d2 0 1 2 3 4 5 6 7 8 9
-----
0 :    1 1 1 1 1 1 1 1 0 0
1 :    0 0 0 0 0 0 2 2 2 2
2 :    2 2 2 2 0 3 3 3 3 3
3 :    3 3 4 4 4 4 4 4 4 4
4 :    5 0 5 5 0 0 0 0 6 6
5 :    6 6 6 6 6 6 7 7 7 7
6 :    7 7 7 7

switch(config)#
```

The following table displays the default DSCP–traffic class map on Trident II platform switches.

**Table 35: Default DSCP to Traffic Class Map: Trident II Platform Switches**

Inbound DSCP	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
Traffic Class	1	0	2	3	4	5	6	7

### 9.1.8.3 CoS and DSCP Rewrite – Trident II and Helix Platform Switches

[Rewriting CoS and DSCP](#) describes the CoS and DSCP rewrite functions.

#### Traffic Class to CoS Rewrite Map

The CoS rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-CoS rewrite map. The `qos map traffic-class to cos` command assigns a CoS rewrite value to a list of traffic classes. Multiple commands create the complete traffic class–CoS rewrite map.

### Example

This command assigns the CoS of two to traffic classes **1**, **3**, and **5**.

```
switch(config)#qos map traffic-class 1 3 5 to cos 2
switch(config)#show qos map

Number of Traffic Classes supported: 8

Tc-cos map:
tc:  0 1 2 3 4 5 6 7
-----
cos: 1 2 2 2 4 2 6 7

switch(config)#
```

The following table displays the default Traffic Class to CoS rewrite value map on Trident II platform switches.

**Table 36: Default Traffic Class to CoS Rewrite Value Map: Trident II Platform Switches**

<b>Traffic Class</b>	0	1	2	3	4	5	6	7
<b>CoS Rewrite Value</b>	1	0	2	3	4	5	6	7

### Traffic Class to DSCP Rewrite Map

The DSCP rewrite value is configurable and based on a data stream's traffic class, as specified by the traffic class-DSCP rewrite map. The `qos map traffic-class to dscp` command assigns a DSCP rewrite value to a list of traffic classes. Multiple commands create the complete traffic class-DSCP rewrite map.

### Example

This command assigns the DSCP value of **29** to traffic classes **2**, **4**, and **6**.

```
switch(config)#qos map traffic-class 2 4 6 to dscp 29
switch(config)#show qos map

Number of Traffic Classes supported: 8

Tc-dscp map:
tc:      0  1  2  3  4  5  6  7
-----
dscp:   8  0 29 24 29 40 29 56

switch(config)#
```

The following table displays the default traffic class to DSCP rewrite map on Trident II platform switches.

**Table 37: Traffic Class to DSCP Rewrite Value Map: Trident II Platform Switches**

<b>Traffic Class</b>	0	1	2	3	4	5	6	7
<b>DSCP</b>	8	0	16	24	32	40	48	56

## 9.1.8.4 Transmit Queues and Port Shaping – Trident II and Helix Platform Switches

[Transmit Queues and Port Shaping](#) describes transmit queues and port shaping.

A data stream's traffic class determines the transmit queue it uses. The switch defines a single traffic class-transmit queue map for all Ethernet interfaces and is used for unicast and multicast traffic. The traffic class to transmit queue maps are configured globally and apply to all Ethernet and port channel interfaces. The `show qos maps` command displays the traffic class to transmit queue map.

Trident II platform switches have eight unicast (UC0 – UC7) and eight multicast (MC0 – MC7) queues. Each UCx-MCx queue set is combined into a single queue group (L1.x), which is exposed to the CLI through this command.

The following table displays the default traffic class to transmit queue maps.

**Table 38: Default Traffic Class to Transmit Queue Map: Trident II Platform Switches**

<b>Traffic Class</b>	0	1	2	3	4	5	6	7
<b>Transmit Queue Group</b>	0	1	2	3	4	5	6	7

### Mapping Traffic Classes to a Transmit Queue

The `qos map traffic-class to tx-queue` command assigns traffic classes to a transmit queue. Multiple commands create the complete map.

#### Example

These commands assign traffic classes of 1, 3, and 5 to transmit queue 1, traffic classes 2, 4, and 6 to transmit queue 2, and traffic class 0 to transmit queue 0, then display the resultant map.

```
switch(config)#qos map traffic-class 1 3 5 to tx-queue 1
switch(config)#qos map traffic-class 2 4 6 to tx-queue 2
switch(config)#qos map traffic-class 0 to tx-queue 0
switch(config)#show qos maps
  Number of Traffic Classes supported: 8
  Number of Transmit Queues supported: 8

  Tc - tx-queue map:
  tc:          0  1  2  3  4  5  6  7
  -----
  tx-queue:    0  1  2  1  2  1  2  7

switch(config)#
```

### Entering a Transmit Queue Configuration Mode

Transmit queues are configurable on Ethernet ports and port channels. Queue parameters are configured in tx-queue configuration command mode, which is entered from the appropriate interface configuration mode. The `tx-queue (Trident II)` command places the switch in tx-queue configuration mode. The `show qos interfaces` displays the transmit queue configuration for a specified port.

#### Example

This command enters tx-queue configuration mode for transmit queue 3 of Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#tx-queue 3
switch(config-if-Et5-txq-3)#
```

### Configuring the Shape Rate – Port and Transmit Queues

A port's shape rate specifies the port's maximum outbound traffic bandwidth. A shape rate can also be configured for all transmit queues on each port. All shape rate commands use kbps to specify data rates.

- To configure a port's shape rate, enter `shape rate (Interface – Trident II)` from the port's interface configuration mode.
- To configure a transmit queue's shape rate, enter `shape rate (Tx-queue – Trident II)` from the queue's tx-queue configuration mode.

#### Example

These commands configure a shape rate of 5 Gbs on Ethernet port 3, then configure the shape rate for the following transmit queues:

- transmit queues 0, 1, and 2: 500 Mbps
- transmit queues 3, 4, and 5: 400 Mbps

```

switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#shape rate 5000000
switch(config-if-Et17/3)#tx-queue 0
switch(config-if-Et17/3-txq-0)#shape rate 500000
switch(config-if-Et17/3-txq-0)#tx-queue 1
switch(config-if-Et17/3-txq-1)#shape rate 500000
switch(config-if-Et17/3-txq-1)#tx-queue 3
switch(config-if-Et17/3-txq-3)#shape rate 400000
switch(config-if-Et17/3-txq-3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#shape rate 400000
switch(config-if-Et17/3-txq-4)#tx-queue 5
switch(config-if-Et17/3-txq-5)#shape rate 400000
switch(config-if-Et17/3-txq-5)#exit
switch(config-if-Et17/3)#show qos interface ethernet 17/3
Ethernet17/3:

```

Tx Queue	Bandwidth Guaranteed (units)	Shape Rate (units)	Priority
7	- / - ( - )	- / - ( - )	SP / SP
6	- / - ( - )	- / - ( - )	SP / SP
5	- / - ( - )	400 / 400 ( Mbps )	SP / SP
4	- / - ( - )	400 / 400 ( Mbps )	SP / SP
3	- / - ( - )	400 / 400 ( Mbps )	SP / SP
2	- / - ( - )	- / - ( - )	SP / SP
1	- / - ( - )	500 / 500 ( Mbps )	SP / SP
0	- / - ( - )	500 / 500 ( Mbps )	SP / SP

```
switch(config-if-Et17/3)#
```

### Configuring Queue Priority

Queue priority rank is denoted by the queue number; transmit queues with higher numbers have higher priority. Trident II supports strict priority queues; round robin queues are not supported.

The [bandwidth guaranteed \(Trident II\)](#) command configures specifies the minimum bandwidth for outbound traffic on the transmit queue.

### Example

These commands configure a minimum egress bandwidth of 1 Mbps for transmit queue 4 of Ethernet interface 17/3.

```

switch(config-if-Et17/3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#show qos interface ethernet 17/3

```

Tx Queue	Bandwidth Guaranteed (units)	Shape Rate (units)	Priority
7	- / - ( - )	- / - ( - )	SP / SP
6	- / - ( - )	- / - ( - )	SP / SP
5	- / - ( - )	400 / 400 ( Mbps )	SP / SP
4	1 / 1 ( Mbps )	400 / 400 ( Mbps )	SP / SP
3	- / - ( - )	400 / 400 ( Mbps )	SP / SP
2	- / - ( - )	- / - ( - )	SP / SP
1	- / - ( - )	500 / 500 ( Mbps )	SP / SP
0	- / - ( - )	500 / 500 ( Mbps )	SP / SP

```
switch(config-if-Et17/3-txq-4) #
```

### 9.1.8.5 Ingress Policing on LAG

Ingress policing on a port-channel polices the matched traffic from all member interfaces combined, i.e. it provides aggregate policing and statistics (DCS-7050X, DCS-7010T, DCS-7250X, and DCS-7300X series). When a per-interface policer is attached to a port-channel, one set of TCAM entries is created for all member interfaces. The associated interface bitmap is updated, and aggregate policing is performed on all member interfaces.

#### Examples

- These commands configure a service-policy (with policer action) on LAG by creating the service-policy and applying the service-policy on a port-channel.

```
switch(config) #policy-map policy-1
switch(config-pmap-qos-policy-1) #class class-1
switch(config-pmap-c-qos-policy-1-class-1) #police cir 512000 bps bc
96000
switch(config-pmap-c-qos-policy-1-class-1) #exit
switch(config-pmap-qos-policy-1) #exit
switch(config) #interface Et 4 / 5 / 4
switch(config-if-Et4/5/4) #channel-group 2 mode active
switch(config-if-Et4/5/4) #exit
switch(config) #interface po2
switch(config-if-Po2) #service-policy type qos input policy-1
switch(config-if-Po2) #exit
switch(config) #
```

- These commands configure ACL policing in single-rate, two-color mode.

```
switch(config) #class-map type qos match-any class1
switch(config-cmap-qos-class1) #match ip access-group acl1
switch(config-cmap-qos-class1) #exit
switch(config) #policy-map type quality-of-service policy1
switch(config-pmap-qos-policy1) #class class1
switch(config-pmap-c-qos-policy1-class1) #police cir 512000 bc 96000
switch(config-pmap-c-qos-policy1-class1) #exit
switch(config-pmap-qos-policy1) #exit
switch(config) #show policy-map
Service-policy policy1

Class-map: class1 (match-any)
  Match: ip access-group name acl1
        police rate 512000 bps burst-size 96000 bytes

Class-map: class-default (match-any)

switch(config) #
```

### 9.1.8.6 Fabric QoS -- Trident II Platform Switches

EOS is optimized to support QoS configuration on the Fabric interfaces on 7250x and 7300 series switches. Configuring QoS on the Fabric interfaces in addition to front panel ports allows user to have end-to-end control and helps to manage traffic better over these switches. By default, tx queues are configured as strict priority on 7250X and 7300X series.

The following QoS configuration options are supported on Fabric interfaces on 7250x and 7300 series switches.

- **Guaranteed Bandwidth:** In order to prevent queue starvation on fabric ports EOS supports minimum bandwidth configuration on per queue basis across all fabric ports.
- **Explicit Congestion Notification (ECN):** EOS supports enabling ECN on a per queue basis across all fabric ports.
- **Priority Flow Control (PFC):** Queue back-pressure propagates across the backplane such that flow control messages can be generated to the upstream devices. This is done by enabling PFC for the desired backplane traffic-classes.
- **Weight Round Robin (WRR):** EOS supports configuring Weighted Round Robin (WRR) on a per queue basis across all fabric ports.

### 9.1.8.6.1 Configuring Fabric QoS on 7250X and 7300X Series

Fabric QoS is configured using a QoS profiles which is then applied on fabric interfaces on 7250x and 7300x series. Following are the steps to configure Fabric QoS.

1. Use `qos profile` command to create a QoS profile.
2. Use `tx-queue (Trident II)` command to configure a transmit queue on the configuration mode interface.
3. Use `bandwidth guaranteed (Trident II)` command to specify the minimum bandwidth for outbound traffic on the transmit queue.
4. Use `random-detect ecn (Trident)` command to enable the ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes.
5. Use `priority-flow-control priority` command to configure the packet resolution setting on the configuration mode interface.
6. Use `interface fabric` command to configure Fabric interface.
7. Use `service-profile` command to apply the QoS profile to the Fabric interface.

#### Examples

- These commands create a QoS profile named `fabricProfile` with tx queue, bandwidth, ECN, PFC and DLB values defined in it and then the profile is attached to Fabric interface of the switch.

 **Note:** To support PFC on a particular priority, DLB is disabled for that priority.

```
switch(config)#qos profile fabricProfile
switch(config-qos-profile-fabricProfile)#tx-queue 0
switch(config-qos-profile-fabricProfile-txq-0)#bandwidth
guaranteed 10000 kbps
switch(config-qos-profile-fabricProfile-txq-0)#random-detect
ecn
minimum-threshold 10 mbytes maximum-threshold 10 mbytes
switch(config-qos-profile-fabricProfile)#priority-flow-control
priority 1
no-drop
switch(config-qos-profile-fabricProfile)#priority-flow-control
priority 6
no-drop dlb
```

- Applying the QoS profile on 'interface fabric' of the switch.

```
switch#configure terminal
switch(config)#interface fabric
switch(config-if-fabric)#service-profile fabricProfile
```

### 9.1.8.6.2 Displaying Fabric QoS Information

These show commands display the configured Fabric QoS information on the switch.

- **show qos profile [profile Name]**: Displays the list of QoS profiles configured on the switch.
- **show qos interfaces fabric**: Displays the profile applied on the fabric interface on the switch.

### Examples

- This command displays the fabricProfile profile information.

```
switch#show qos profile fabricProfile
qos profile fabricProfile
  priority-flow-control priority 1 no-drop
  priority-flow-control priority 6 no-drop dlb
  tx-queue 0
    bandwidth guaranteed 10000 kbps
    random-detect ecn minimum-threshold 10 mbytes maximum-thres
hold 10 mbytes
```

- This command displays the profile applied on the fabric interface.

```
switch#show qos interfaces fabric
qos profile fabricProfile
```

## 9.1.9 ACL based QoS Configuration

### 9.1.9.1 ACL Based QoS (DCS-7160)

The IPv4 ACL based QoS is enabled on switches through policy-map configuration. The ACL based QoS can be configured on front panel ports, port-channel interfaces on **DCS-7160** series switches.

#### 9.1.9.1.1 ACL based QoS on SVIs

The ACL based QoS policy applied on SVIs modify the QoS parameters for SVI traffic (L3 VLAN) based on ACL classification. The ACL based QoS on Switched Virtual Interface (SVI) ports is supported on DCS-7500E, DCS-7280E, DCS-7010, DCS-7050, DCS-7050X, DCS-7250X, DCS-7300X, DCS-7020TR.

#### 9.1.9.1.2 ACL Sharing on QoS

The ACLs applied on QoS shares the hardware resources (TCAM) when potentially large QoS policy-maps are applied to multiple SVIs. For ACL based QoS on SVIs in sharing mode we share TCAM for class-maps without policer action and replicate entries for policer class-maps. The following platforms support ACL sharing on QoS - HelixFour, TridentTwo, Tomahawk, TomahawkPlus, TomahawkTwo, Trident3, TridentThreeXThree.

The QoS actions is applicable only to the routed traffic flowing through the members of the corresponding VLAN.

The steps to configure ACL based QoS is as follows:

1. Create a access list using **ip access-list** command.
2. Create a class map and attach it to the access list using **class-map** command.
3. Create a policy and attach the class map to the policy created, using the **policy-map** command.
4. Apply the policy to the interface using the **service-policy input** command.

### Examples

- These command configure the access list acl1.

```
switch(config)#ip access-list acl1
```

```
switch(config-acl-acl1)#permit ip 10.1.1.1/24 any  
switch(config-acl-acl1)#exit
```

- These commands configure the class map class1.

```
switch(config)#class-map match-any class1  
switch(config-cmap-qos-class1)#match ip access-group acl1  
switch(config-cmap-qos-class1)#exit
```

- These commands configure the policy map policy1.

```
switch(config)#policy-map policy1  
switch(config-pmap-qos-policy1)#class class1  
switch(config-pmap-c-qos-policy1-class1)#set dscp 20  
switch(config-pmap-c-qos-policy1-class1)#set traffic-class 2  
switch(config-pmap-c-qos-policy1-class1)#exit  
switch(config-pmap-c-qos-policy1)#exit
```

- These commands apply the policy1 to the interface Ethernet 1/1.

```
switch(config)#interface Et1/1  
switch(config-if-Et1/1)#service-policy input policy1  
switch(config-if-Et1/1)#exit
```

- These commands configure a ACL based QoS on the SVI interface VLAN10.

```
switch(config)#interface vlan 10  
switch(config-if-Vl10)#service-policy [type qos] input policy1
```

- This command enables the resource (hardware) sharing when a ACL based QoS is attached to VLAN interface. The no form of the command disables it.

```
switch(config)#hardware access-list qos resource sharing vlan in
```

## Show Commands

The following show commands display the status of policy-maps programmed on the interface, for more information on these commands refer [Quality of Service Configuration Commands](#).

- **show policy-map [policy-name]**: Displays the policy-map programming status.
- **show policy-map interface interface id**: Displays the policy-map that is currently programmed on the interface.
- **show policy-map [policy-name] counters**: Displays the policy-map traffic hits.
- **show platform xp qos tcam [hits]**: Displays the TCAM entries programmed for each policy-map as well as the traffic hits. The hits option is used to see the TCAM entries with nonzero traffic hits.
- **show run | grep sharing**: Displays if whether the ACL based QoS is enabled or disabled.
- **show platform trident tcam shared vlan interface-class-id**: Displays what SVIs are currently sharing the QoS policy-map.
- **show platform trident tcam qos detail**: Displays the list of all the SVIs that are sharing the TCAM entries.

### 9.1.9.1.3 Limitations

- Maximum number of TCAM entries that can be programmed in hardware for all QoS policy-maps on the box is 1024.
- Layer 4 port ranges are not supported for ACL based QoS. The ranges will be expanded into multiple TCAM rules and programmed in the hardware.
- Configured policer rate should be above 1mbps and recommended burst value is 2000 bytes.
- Policer action can't be associated with policy-maps applied to Port-Channels.

The following are the limitations specific to DCS-7500E, DCS-7280E and DCS-7020TR:

- User cannot apply more than 31 QoS service policies per chip on L3 interfaces.
  - When different QoS service policies are applied to the SVI and its member interfaces, the behavior is indeterministic.
  - When QoS service policies are applied on SVIs with partial failures due to limited hardware resources, any event that triggers a forwarding agent restart will lead to indeterministic behavior.
  - When QoS service policies are applied on 2 SVIs, any event that triggers the VLAN membership change of a member interface may result in a policy-map programming failure. To change the VLAN membership, remove the interface from the first VLAN and then add it to the other.
  - Outgoing COS rewrite is not supported.
  - QoS policy-map counters are not supported.

The following are the limitations specific to DCS-7010, DCS-7050, DCS-7050X, DCS-7250X, DCS-7300X:

- TCAM resources won't be shared for the same policy-map applied to multiple SVIs.
- Policy-map applied to a SVI will result in TCAM allocation on all chips irrespective of whether the SVI members are present or not.

When QoS service policies are applied to both SVI and its member interfaces and packets hit both policies, the behavior is indeterministic.

---

## 9.1.10 Quality of Service Configuration Commands

### QoS Data Field and Traffic Class Configuration Commands

- hardware access-list qos resource sharing vlan in
- platform petraA traffic-class
- qos cos
- qos dscp
- qos map cos
- qos map dscp
- qos map traffic-class to cos
- qos map traffic-class to dscp
- qos map traffic-class to mc-tx-queue
- qos map traffic-class to tx-queue
- qos map traffic-class to uc-tx-queue
- qos profile
- qos rewrite cos
- qos rewrite dscp
- qos trust
- service-policy type qos input
- service-profile

### QoS and ECN Display Commands

- show platform petraA traffic-class
- show policy-map
- show policy-map interface
- show qos interfaces
- show qos interfaces trust
- show qos interfaces random-detect ecn
- show qos maps
- show qos profile
- show runlgrep sharing
- show platform trident tcam shared vlan interface-class-id
- show platform trident tcam qos detail
- show qos profile summary
- show qos random-detect ecn
- show platform xp qos tcam hit

### ECN Configuration Commands

- qos random-detect ecn global-buffer (Helix)
- qos random-detect ecn global-buffer (Trident and Tomahawk)
- random-detect ecn (Arad/Jericho)
- random-detect ecn (Helix)
- random-detect ecn (Trident and Tomahawk)

### Transmit Queue and Port Shaping Commands – Arad and Jericho Platforms

- bandwidth percent (Arad/Jericho)
- priority (Arad/Jericho)

- [shape rate \(Interface – Arad/Jericho\)](#)
- [shape rate \(Tx-queue – Arad/Jericho\)](#)
- [tx-queue \(Arad/Jericho\)](#)

#### **Transmit Queue and Port Shaping Commands – FM6000 Platform**

- [bandwidth percent \(FM6000\)](#)
- [priority \(FM6000\)](#)
- [shape rate \(Interface – FM6000\)](#)
- [shape rate \(Tx-queue – FM6000\)](#)
- [tx-queue \(FM6000\)](#)

#### **Transmit Queue and Port Shaping Commands – Helix Platform**

- [bandwidth guaranteed \(Helix\)](#)
- [shape rate \(Interface – Helix\)](#)
- [shape rate \(Tx-queue – Helix\)](#)
- [tx-queue \(Helix\)](#)

#### **Transmit Queue and Port Shaping Commands – Petra Platform**

- [bandwidth percent \(Petra\)](#)
- [priority \(Petra\)](#)
- [shape rate \(Interface – Petra\)](#)
- [shape rate \(Tx-queue – Petra\)](#)
- [tx-queue \(Petra\)](#)

#### **Transmit Queue and Port Shaping Commands – Trident and Tomahawk Platform**

- [bandwidth percent \(Trident and Tomahawk\)](#)
- [mc-tx-queue](#)
- [priority \(Trident and Tomahawk\)](#)
- [shape rate \(Interface – Trident and Tomahawk\)](#)
- [shape rate \(Tx-queue – Trident and Tomahawk\)](#)
- [uc-tx-queue](#)

#### **Transmit Queue and Port Shaping Commands – Trident II Platform**

- [bandwidth guaranteed \(Trident II\)](#)
- [shape rate \(Tx-queue – Trident II\)](#)
- [shape rate \(Interface – Trident II\)](#)
- [tx-queue \(Trident II\)](#)
- [interface fabric \(Trident II\)](#)

### 9.1.10.1 bandwidth guaranteed (Helix)

The **bandwidth guaranteed** command specifies the minimum bandwidth for outbound traffic on the transmit queue. By default, no bandwidth is guaranteed to any transmit queue.

The **no bandwidth guaranteed** and **default bandwidth guaranteed** commands remove the minimum bandwidth guarantee on the transmit queue by deleting the corresponding **bandwidth guaranteed** command from *running-config*.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
bandwidth guaranteed rate DATA_MIN
```

```
no bandwidth guaranteed
```

```
default bandwidth guaranteed
```

#### Parameters

- **DATA\_MIN** Minimum bandwidth. Value range varies with data unit:
  - **<8 to 40000000>** **8** to **40000000** kbytes per second.
  - **<8 to 40000000>kbps** **8** to **40000000** kbytes per second.
  - **<1 to 60000000>pps** **1** to **60000000** packets per second.

#### Related Command

[tx-queue \(Helix\)](#) places the switch in tx-queue configuration mode.

#### Example

These commands configure a minimum egress bandwidth of **1 Mbps** for *transmit queue 4* of *Ethernet interface 17/3*.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#tx-queue 4
switch(config-if-Et17-txq-4)#bandwidth guaranteed 1000 kbps
switch(config-if-Et17-txq-4)#show qos interfaces ethernet 17
```

```
Ethernet17/3:
```

```
Trust Mode: COS
Default COS: 0
Default DSCP: 0
```

```
Port shaping rate: disabled
```

Tx Queue	Bandwidth Guaranteed (units)	Shape Rate (units)	Priority
7	- / - ( - )	- / - ( - )	SP / SP
6	- / - ( - )	- / - ( - )	SP / SP
5	- / - ( - )	- / - ( - )	SP / SP
4	1 / 1 ( Mbps )	- / - ( - )	SP / SP
3	- / - ( - )	- / - ( - )	SP / SP
2	- / - ( - )	- / - ( - )	SP / SP
1	- / - ( - )	- / - ( - )	SP / SP
0	- / - ( - )	- / - ( - )	SP / SP

Note: Values are displayed as Operational/Configured

```
switch(config-if-Et17-txq-4) #
```

## 9.1.10.2 bandwidth guaranteed (Trident II)

The **bandwidth guaranteed** command specifies the minimum bandwidth for outbound traffic on the transmit queue. By default, no bandwidth is guaranteed to any transmit queue.

The **no bandwidth guaranteed** and **default bandwidth guaranteed** commands remove the minimum bandwidth guarantee on the transmit queue by deleting the corresponding **bandwidth guaranteed** command from *running-config*.

### Command Mode

Tx-Queue Configuration

### Command Syntax

```
bandwidth guaranteed rate DATA_MIN
```

```
no bandwidth guaranteed
```

```
default bandwidth guaranteed
```

### Parameters

- **DATA\_MIN** minimum bandwidth. Value range varies with data unit:
  - **<8 to 40000000>** **8** to **40000000** kbytes per second.
  - **<8 to 40000000>kbps** **8** to **40000000** kbytes per second.
  - **<1 to 60000000>pps** **1** to **60000000** packets per second.

### Related Commands

[tx-queue \(Trident II\)](#) places the switch in tx-queue configuration mode.

### Example

These commands configure a minimum egress bandwidth of 1 Mbps for *transmit queue 4* of *Ethernet interface 17/3*.

```
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#bandwidth guaranteed 1000 kbps
switch(config-if-Et17/3-txq-4)#show qos interfaces ethernet 17/3
```

```
Ethernet17/3:
```

```
Trust Mode: COS
Default COS: 0
Default DSCP: 0
```

```
Port shaping rate: disabled
```

Tx Queue	Bandwidth Guaranteed (units)	Shape Rate (units)	Priority
7	- / - ( - )	- / - ( - )	SP / SP
6	- / - ( - )	- / - ( - )	SP / SP
5	- / - ( - )	- / - ( - )	SP / SP
4	1 / 1 ( Mbps )	- / - ( - )	SP / SP
3	- / - ( - )	- / - ( - )	SP / SP
2	- / - ( - )	- / - ( - )	SP / SP
1	- / - ( - )	- / - ( - )	SP / SP
0	- / - ( - )	- / - ( - )	SP / SP

Note: Values are displayed as Operational/Configured

```
switch(config-if-Et17/3-txq-4) #
```

### 9.1.10.3 bandwidth percent (Arad/Jericho)

The **bandwidth percent** command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port's round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The **no bandwidth percent** and **default bandwidth percent** commands restore the default bandwidth share of the transmit queue by removing the corresponding **bandwidth percent** command from *running-config*.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
bandwidth percent proportion
```

```
no bandwidth percent
```

```
default bandwidth percent
```

#### Parameters

***proportion*** Bandwidth percentage assigned to queues. Values range from **1** to **100**.

#### Related Command

[tx-queue \(Arad/Jericho\)](#) places the switch in tx-queue configuration mode.

#### Examples

- These commands configure queues **0** through **3** (**Ethernet interface 3/5/1**) as round robin, then allocate bandwidth for three queues at **30%** and one queue at **10%**.

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#tx-queue 3
switch(config-if-Et3/5/1-txq-3)#no priority
switch(config-if-Et3/5/1-txq-3)#bandwidth percent 10
switch(config-if-Et3/5/1-txq-3)#tx-queue 2
switch(config-if-Et3/5/1-txq-2)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-2)#tx-queue 1
switch(config-if-Et3/5/1-txq-1)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-1)#tx-queue 0
switch(config-if-Et3/5/1-txq-0)#bandwidth percent 30
switch(config-if-Et3/5/1-txq-0)#show qos interfaces ethernet
3/5/1
```

Ethernet3/5/1:

Tx Queue	Bandwidth (percent)	Shape Rate (units)	Priority	ECN
7	- / -	- / - ( - )	SP / SP	D
6	- / -	- / - ( - )	SP / SP	D
5	- / -	- / - ( - )	SP / SP	D
4	- / -	- / - ( - )	SP / SP	D
3	10 / 10	- / - ( - )	RR / RR	D
2	30 / 30	- / - ( - )	RR / SP	D

```
switch(config-if-Et3/5/1-txq-3)#
```

#### 9.1.10.4 bandwidth percent (FM6000)

The **bandwidth percent** command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port's round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The **no bandwidth percent** and **default bandwidth percent** commands restore the default bandwidth share of the transmit queue by removing the corresponding **bandwidth percent** command *running-config*.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
bandwidth percent proportion
```

```
no bandwidth percent
```

```
default bandwidth percent
```

#### Parameters

**proportion** Configured bandwidth percentage. Value ranges from **1** to **100**. Default value is **0**.

#### Related Command

[tx-queue \(FM6000\)](#) places the switch in tx-queue configuration mode.

#### Examples

- These commands configure queues **0** through **3** (**Ethernet interface 19**) as round robin, then allocate bandwidth for three queues at **30%** and one queue at **10%**.

```
switch(config)#interface Ethernet 19
switch(config-if-Et19)#tx-queue 3
switch(config-if-Et19-txq-3)#no priority
switch(config-if-Et19-txq-3)#bandwidth percent 10
switch(config-if-Et19-txq-3)#tx-queue 2
switch(config-if-Et19-txq-2)#bandwidth percent 30
switch(config-if-Et19-txq-2)#tx-queue 1
switch(config-if-Et19-txq-1)#bandwidth percent 30
switch(config-if-Et19-txq-1)#tx-queue 0
switch(config-if-Et19-txq-0)#bandwidth percent 30

### 9.1.10.5 bandwidth percent (Petra)

The **bandwidth percent** command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port's round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The **no bandwidth percent** and **default bandwidth percent** commands restore the default bandwidth share of the transmit queue by removing the corresponding **bandwidth percent** command *running-config*.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
bandwidth percent proportion
```

```
no bandwidth percent
```

```
default bandwidth percent
```

#### Parameters

***proportion*** Bandwidth percentage assigned to queues. Values range from **1** to **100**.

#### Related Command

[tx-queue \(Petra\)](#) places the switch in tx-queue configuration mode.

#### Examples

- These commands configure queues **0** through **3** (**Ethernet interface 3/28**) as round robin, then allocate bandwidth for three queues at **30%** and one queue at **10%**.

```
switch(config)#interface ethernet 3/28
switch(config-if-Et3/28)#tx-queue 3
switch(config-if-Et3/28-txq-3)#no priority
switch(config-if-Et3/28-txq-3)#bandwidth percent 10
switch(config-if-Et3/28-txq-3)#tx-queue 2
switch(config-if-Et3/28-txq-2)#bandwidth percent 30
switch(config-if-Et3/28-txq-2)#tx-queue 1
switch(config-if-Et3/28-txq-1)#bandwidth percent 30
switch(config-if-Et3/28-txq-1)#tx-queue 0
switch(config-if-Et3/28-txq-0)#bandwidth percent 30
switch(config-if-Et3/28-txq-0)#show qos interface ethernet
3/28
```

Ethernet3/28:

Tx-Queue	Bandwidth (percent)	Shape Rate (Kbps)	Priority
7	N/A	disabled	strict
6	N/A	disabled	strict

switch(config-if-Et3/28-txq-3) #
```

### 9.1.10.6 bandwidth percent (Trident and Tomahawk)

The **bandwidth percent** command configures the bandwidth share of the transmit queue when configured for round robin priority. Bandwidth is allocated to all queues based on the cumulative configured bandwidth of all the port's round robin queues.

The cumulative operational bandwidth of all round robin queues is always less than or equal to 100%. If the cumulative configured bandwidth is greater than 100%, each port's operational bandwidth is its configured bandwidth divided by the cumulative configured bandwidth.

The **no bandwidth percent** and **default bandwidth percent** commands restore the default bandwidth share of the transmit queue by removing the corresponding **bandwidth percent** command *running-config*.

#### Command Mode

Mc-Tx-Queue configuration

Uc-Tx-Queue configuration

#### Command Syntax

```
bandwidth percent proportion
```

```
no bandwidth percent
```

```
default bandwidth percent
```

#### Parameters

***proportion*** Bandwidth percentage assigned to queues. Values range from **1** to **100**.

#### Related Commands

- [mc-tx-queue](#) places the switch in mc-tx-queue configuration mode.
- [uc-tx-queue](#) places the switch in uc-tx-queue configuration mode.

#### Examples

- These commands configure **unicast transmit queue 3** (and all other queues of lower priority) as round robin, then allocate bandwidth for unicast transmit queues **1, 2, and 3** at **30%** and **multicast transmit queue 1** at **10%**.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)#no priority
switch(config-if-Et7-uc-txq-3)#bandwidth percent 30
switch(config-if-Et7-uc-txq-3)#uc-tx-queue 2
switch(config-if-Et7-uc-txq-2)#bandwidth percent 30
switch(config-if-Et7-uc-txq-2)#uc-tx-queue 1
switch(config-if-Et7-uc-txq-1)#bandwidth percent 30
switch(config-if-Et7-uc-txq-1)#mc-tx-queue 1
switch(config-if-Et7-mc-txq-1)#bandwidth percent 10
switch(config-if-Et7-mc-txq-1)#show qos interfaces ethernet 7
```

```
Ethernet7:
```

```
Trust Mode: COS
```

```
Default COS: 0
```

```
Default DSCP: 0
```

```
Port shaping rate: disabled
```

Tx-Queue Group	Bandwidth (percent)	Shape Rate (Kbps)	Priority	Priority
-------------------	------------------------	----------------------	----------	----------

```

-----
1      UC7      N/A      disabled      strict
1      UC6      N/A      disabled      strict
1      MC3      N/A      disabled      strict

### 9.1.10.7 hardware access-list qos resource sharing vlan in

The **hardware access-list qos resource sharing vlan in** command enables the ACL based QoS resources sharing on a VLAN interface.

The **no hardware access-list qos resource sharing vlan in** disables the ACL based QoS resources sharing on a VLAN interface. By default this function is disabled.

#### Command Mode

Global Configuration

#### Command Syntax

```
hardware access-list qos resource sharing vlan in
```

```
no hardware access-list qos resource sharing vlan in
```

#### Example

This commands enables the ACL based QoS resources sharing on a VLAN interface.

```
switch(config)#hardware access-list qos resource sharing vlan in
```

### 9.1.10.8 interface fabric (Trident II)

The **interface fabric** command places the switch in Fabric-interface configuration mode and allows the user to attach the QoS profile to the fabric interface of the switch.

#### Command Mode

Global Configuration

#### Command Syntax

```
interface fabric
```

#### Example

This command places the switch in Fabric-interface configuration mode.

```
switch(config) #interface fabric  
switch(config-if-fabric) #
```

---

### 9.1.10.9 mc-tx-queue

The `mc-tx-queue` command places the switch in mc-tx-queue configuration mode to configure a multicast transmit queue on the configuration mode interface. Mc-tx-queue configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The `exit` command does not affect the configuration.

Trident and Tomahawk switches have four multicast queues (MC0 – MC03) and eight unicast queues (UC0 – UC7), categorized into two priority groups. All queues are exposed through the CLI and are user configurable.

- **Priority Group 1:** UC7, UC6, MC3
- **Priority Group 0:** UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0

The `exit` command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The `no mc-tx-queue` and `default mc-tx-queue` commands remove the configuration for the specified transmit queue by deleting the all corresponding `mc-tx-queue` mode commands from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
mc-tx-queue queue_level
```

#### Parameters

- **queue\_level** The multicast transmit queue number. Values range from **0** to **3**.

#### Commands Available in tx-queue Configuration Mode

- [bandwidth percent \(Trident and Tomahawk\)](#)
- [priority \(Trident and Tomahawk\)](#)
- [shape rate \(Tx-queue – Trident and Tomahawk\)](#)

#### Related Command

[: Configures unicast transmit queues on Trident and Tomahawk platform switches.](#)

#### Example

This command enters mc-tx-queue configuration mode for **multicast transmit queue 3** of **Ethernet interface 5**.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#mc-tx-queue 3  
switch(config-if-Et5-mc-txq-3)#
```

### 9.1.10.10 platform petraA traffic-class

The `platform petraA traffic-class` command configures the default traffic class used by all ports on a specified chip. The default traffic class is implemented by Petra platform switches to replace `qos cos` and `qos dscp` commands. Traffic class values range from `0` to `7`. The default traffic class is `1`.

When `platform ?` returns **Petra**:

- **CoS trusted ports:** inbound untagged packets are assigned to the default traffic class. Tagged packets are assigned to the traffic class that corresponds to the contents of its CoS field.
- **DSCP trusted ports:** inbound non-IP packets are assigned to the default traffic class. IP packets are assigned to the traffic class that corresponds to the contents of its DSCP field.
- **Untrusted ports:** all inbound packets are assigned to the default traffic class.

The `no platform petraA traffic-class` and `default platform petraA traffic-class` commands restore the default traffic class of one for all ports on the specified chips by deleting the corresponding `platform petraA traffic-class` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform petraA [CHIP_NAME] traffic-class tc_value
no platform petraA [CHIP_NAME] traffic-class
default platform petraA [CHIP_NAME] traffic-class
```

#### Parameters

- **CHIP\_NAME** Trust mode assigned to the specified ports. Port designation options include:
  - `<no parameter>` All ports on the switch.
  - `module cardX` All ports on specified linecard (7500 Series).
  - `petra cardX / chipY` All ports on PetraA chip `chipY` on linecard `cardX` (7500 Series).
  - `petra -chipZ` All ports on PetraA chip `chipZ` (7048 Series)

#### 7500 Series

Switches can contain up to eight linecards. **CardX** varies from `3` to `10`.

Each linecard contains six PetraA chips. Each chip controls eight ports. **ChipY** varies from `0` to `5`:

- `0` controls ports `1` through `8`:
  - `1` controls ports `9` through `16`.
  - `2` controls ports `17` through `24`.
  - `3` controls ports `25` through `32`.
  - `4` controls ports `33` through `40`.
  - `5` controls ports `41` through `48`.

#### 7048 Series

Each switch contains two PetraA chips. **ChipZ** varies from `0` to `1`:

- `0` controls ports `1` through `32`.
  - `1` controls ports `33` through `52`.
- **tc\_value** Traffic class value. Values range from `0` to `7`. Default value is `1`.

#### Related Command

`show platform petraA traffic-class` displays the traffic class assignment on all specified Petra chips.

---

### Example

This command configures the default *traffic class 6* for ports **25-32** on linecard **5**.

```
switch(config)#platform petraA petra5/3 traffic-class 6  
switch(config)#
```

### 9.1.10.11 priority (Arad/Jericho)

The **priority** command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority:** contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all queues is strict priority.
- **round robin priority:** contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

**Tx-queue 7** is set to strict priority and is not configurable.

When a queue is configured as a round robin queue, all lower priority queues also function as round robin queues. A queue's numerical label denotes its priority: higher labels denote higher priority. **Tx-queue 6** has higher priority than **Tx-queue 5**, and **Tx-queue 0** has the lowest priority.

The **priority strict** and **default priority** commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The **no priority** command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
priority strict
no priority
default priority
```

#### Related Command

[tx-queue \(Arad/Jericho\)](#) places the switch in tx-queue configuration mode.

#### Example

These commands perform the following on Ethernet interface 3/4/1:

- Displays the default state of all transmit queues.
- Configures **transmit queue 3** as a round robin queue.
- Displays the effect of the **no priority** command on all transmit queues on the interface.

```
switch(config)#interface ethernet 3/4/1
switch(config-if-Et3/4/1)#show qos interfaces ethernet 3/4/1
```

Ethernet3/4/1:

Tx Queue	Bandwidth (percent)	Shape Rate (units)	Priority	ECN
7	- / -	- / - ( - )	SP / SP	D
6	- / -	- / - ( - )	SP / SP	D
5	- / -	- / - ( - )	SP / SP	D
4	- / -	999 / 1000 ( Mbps )	SP / SP	D
3	- / -	999 / 1000 ( Mbps )	SP / SP	D
2	- / -	- / - ( - )	SP / SP	D
1	- / -	- / - ( - )	SP / SP	D
0	- / -	- / - ( - )	SP / SP	D

Note: Values are displayed as Operational/Configured

```

switch(config-if-Et3/4/1)#tx-queue 3
switch(config-if-Et3/4/1-txq-3)#no priority
switch(config-if-Et3/4/1-txq-3)#show qos interfaces ethernet
3/4/1

```

Ethernet3/4/1:

Tx Queue	Bandwidth (percent)	Shape Rate (units)	Priority	ECN
7	- / -	- / - ( - )	SP / SP	D
6	- / -	- / - ( - )	SP / SP	D
5	- / -	- / - ( - )	SP / SP	D
4	- / -	999 / 1000 ( Mbps )	SP / SP	D
3	25 / -	999 / 1000 ( Mbps )	RR / RR	D
2	25 / -	- / - ( - )	RR / SP	D
1	25 / -	- / - ( - )	RR / SP	D
0	25 / -	- / - ( - )	RR / SP	D

Note: Values are displayed as Operational/Configured

```
switch(config-if-Et3/4/1-txq-3)#
```

### 9.1.10.12 priority (FM6000)

The **priority** command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority:** contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all queues is strict priority.
- **round robin priority:** contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

When a queue is configured as a round robin queue, all lower priority queues also function as round robin queues. A queue's numerical label denotes its priority: higher labels denote higher priority. **Tx-queue 6** has higher priority than **Tx-queue 5**, and **Tx-queue 0** has the lowest priority.

The **priority strict** and **default priority** commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The **no priority** command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
priority strict
```

```
no priority
```

```
default priority
```

#### Related Command

[tx-queue \(FM6000\)](#) places the switch in tx-queue configuration mode.

#### Example

These commands perform the following on **Ethernet interface 2**:

- Displays the default state of all transmit queues.
- Configures **transmit queue 3** as a round robin queue.
- Displays the effect of the **no priority** command on all transmit queues on the interface.

```
switch(config)#interface ethernet 19
switch(config-if-Et19)#show qos interface ethernet 19
```

```
Ethernet19:
```

```

5	N/A	disabled	strict
4	N/A	disabled	strict
3	N/A	disabled	strict
2	N/A	disabled	strict
1	N/A	disabled	strict
0	N/A	disabled	strict

```
switch(config-if-Et19)#tx-queue 3
switch(config-if-Et19-txq-3)#no priority
switch(config-if-Et19-txq-3)#show qos interface ethernet 19
```

```
Ethernet19:
Trust Mode: COS

Tx-Queue   Bandwidth   Shape Rate   Priority
          (percent)   (Kbps)
-----
          6       N/A     disabled     strict
          5       N/A     disabled     strict
          4       N/A     disabled     strict
          3        25     disabled   round-robin
          2        25     disabled   round-robin
          1        25     disabled   round-robin
          0        25     disabled   round-robin

switch(config-if-Et19-txq-3)#
```

### 9.1.10.13 priority (Petra)

The **priority** command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority:** contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all queues is strict priority.
- **round robin priority:** contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

**Tx-queue 7** is set to strict priority and is not configurable.

When a queue is configured as a round robin queue, all lower priority queues also function as round robin queues. A queue's numerical label denotes its priority: higher labels denote higher priority. **Tx-queue 6** has higher priority than **Tx-queue 5**, and **Tx-queue 0** has the lowest priority.

The **priority strict** and **default priority** commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The **no priority** command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
priority strict
```

```
no priority
```

```

```
switch(config-if-Et3/28-txq-3)#
```

### 9.1.10.14 priority (Trident and Tomahawk)

The **priority** command specifies the priority of the transmit queue. The switch supports two queue priorities:

- **strict priority:** contents are removed from the queue - subject to maximum bandwidth limits, before data from lower priority queues. The default setting on all other queues is strict priority.
- **round robin priority:** contents are removed proportionately from all round robin queues - subject to maximum bandwidth limits assigned to the strict priority queues.

Trident and Tomahawk switches have eight unicast queues (UC0 – UC7) and four multicast queues (MC0 – MC03), categorized into two priority groups. **Priority group 1** queues have priority over **priority 0** queues. The following lists display the priority group queues in order from higher priority to lower priority.

- **Priority Group 1:** UC7, UC6, MC3
- **Priority Group 0:** UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0

**Priority group 1** queues are strict priority queues and are not configurable as round robin. **Priority 0** queues are strict priority by default and are configurable as round robin. When a queue is configured as a round robin queue, all lower priority queues automatically function as round robin queues.

The **priority strict** and **default priority** commands configure a transmit queue to function as a strict priority queue unless a higher priority queue is configured as a round robin queue.

The **no priority** command configures a transmit queue as a round robin queue. All lower priority queues also function as round robin queues regardless of their configuration.

#### Command Mode

Mc-Tx-Queue configuration

Uc-Tx-Queue configuration

#### Command Syntax

```
priority strict
```

```

MC0      16      disabled  round-robin  0

switch(config-if-Et7-uc-txq-3) #

```

### 9.1.10.15 qos cos

The `qos cos` command specifies the default class of service (CoS) value of the configuration mode interface. CoS values range from `0` to `7`. Default value is `0`.

**Arad, Jericho, fm6000, Trident, Tomahawk, and Trident II platform switches:**

- CoS trusted ports: the default CoS value determines the traffic class for inbound untagged packets. Tagged packets are assigned to the traffic class that corresponds to the contents of its CoS field.
- Untrusted ports: the default CoS value determines the traffic class for all inbound packets.

**Petra platform switches:**

- CoS trusted ports: inbound untagged packets are assigned to the default traffic class, as configured by [platform petraA traffic-class](#). Tagged packets are assigned to the traffic class that corresponds to the contents of its CoS field.
- Untrusted ports: all inbound packets are assigned to the default traffic class.

The `no qos cos` and `default qos cos` commands restore the port's default CoS value to zero by deleting the corresponding `qos cos` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
qos cos cos_value
```

```
no qos cos
```

```
default qos cos
```

**Parameters**

**cos\_value** CoS value assigned to port. Value ranges from **0** to **7**. Default value is **0**.

**Example**

This command configures the default **CoS 4** on **Ethernet interface 8**.

```
switch(config-if-Et8)#qos cos 4
switch(config-if-Et8)#
```

**9.1.10.16 qos dscp**

The **qos dscp** command specifies the default Differentiated Services Code Point (DSCP) value of the configuration mode interface. The default DSCP determines the traffic class for non-IP packets that are inbound on DSCP trusted ports. DSCP trusted ports determine the traffic class for inbound packets as follows:

- **Arad, Jericho, fm6000, Trident, Tomahawk, and Trident II** platform switches:
  - non-IP packets: default DSCP value specified by **qos dscp** determines the traffic class.
  - IP packets: assigned to the traffic class corresponding to its DSCP field contents.
- **Petra** platform switches:
  - non-IP packets: assigned to default traffic class configured by [platform petraA traffic-class](#).
  - IP packets: assigned to the traffic class corresponding to its DSCP field contents.

The **no qos dscp** and **default qos dscp** commands restore the port's default DSCP value to zero by deleting the corresponding **qos dscp** command from **running-config**.

**Command Mode**

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

**Command Syntax**

```
qos dscp dscp_value
```

```
no qos dscp
```

```
default qos dscp
```

**Parameters**

**dscp\_value** DSCP value assigned to the port. Value ranges from **0** to **63**. Default value is **0**.

**Example**

This command sets the default DSCP of **44** on **Ethernet 7 interface**.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#qos dscp 44
switch(config-if-Et7)
```

### 9.1.10.17 qos map cos

The `qos map cos` command associates a traffic class to a list of class of service (CoS) settings. Multiple commands create a complete CoS to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's CoS field or the port upon which it is received.

The `no qos map cos` and `default qos map cos` commands restore the specified CoS values to their default traffic class setting by deleting the corresponding `qos map cos` statements from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos map cos cos_value_1 [cos_value_2 ... cos_value_n] to traffic-class tc_value
```

```
no qos map cos cos_value_1 [cos_value_2 ... cos_value_n]
```

```
default qos map cos cos_value_1 [cos_value_2 ... cos_value_n]
```

#### Parameters

- **cos\_value\_x** Class of service (CoS) value. Value ranges from **0** to **7**.
- **tc\_value** Traffic class value. Value range varies by platform.

Default CoS to traffic class map varies by platform ([Table 39: Default CoS to Traffic Class Map](#)).

#### Default Inbound CoS to Traffic Class Map

[Table 39: Default CoS to Traffic Class Map](#) displays the default CoS to traffic class map for each platform.

**Table 39: Default CoS to Traffic Class Map**

Inbound CoS	untagged	0	1	2	3	4	5	6	7
Traffic Class (Arad / Jericho)	Derived: use default CoS as inbound CoS	1	0	2	3	4	5	6	7
Traffic Class (FM6000)	Derived: use default CoS as inbound CoS	1	0	2	3	4	5	6	7
Traffic Class (Helix)	Derived: use default CoS as inbound CoS	1	0	2	3	4	5	6	7
Traffic Class (Petra)	Assigned default traffic class	1	0	2	3	4	5	6	7
Traffic Class (Trident and Tomahawk)	Derived: use default CoS as inbound CoS	1	0	2	3	4	5	6	7
Traffic Class (Trident II)	Derived: use default CoS as inbound CoS	1	0	2	3	4	5	6	7

#### Related Commands

- [qos cos](#) specifies the default CoS.
- [platform petraA traffic-class](#) specifies the default traffic class.

#### Example

This command assigns the **traffic class 5** to the classes of service **1, 3, 5, and 7**.

```
switch(config)#qos map cos 1 3 5 7 to traffic-class 5
```

```
switch(config)#
```

### 9.1.10.18 qos map dscp

The `qos map dscp` command associates a traffic class to a set of Differentiated Services Code Point (DSCP) values. Multiple commands create a complete DSCP to traffic class map. The switch uses this map to assign a traffic class to data packets on the basis of the packet's DSCP field or the chip upon which it is received.

The `no qos map dscp` and `default qos map dscp` commands restore the specified DSCP values to their default traffic class settings by deleting corresponding `qos map dscp` statements from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos map dscp dscpv_1 [dscpv_2...dscpv_n] to traffic-class tc_value
```

```
no qos map dscp dscpv_1 [dscpv_2...dscpv_n]
```

```
default qos map dscp dscpv_1 [dscpv_2...dscpv_n]
```

#### Parameters

- **dscpv\_x** Differentiated services code point (DSCP) value. Value ranges from **0** to **63**.
- **tc\_value** Traffic class value. Value range varies by platform.

Default map varies by platform ([Table 40: Default DSCP to Traffic Class Map](#)).

#### Default Inbound DSCP to Traffic Class Map

[Table 40: Default DSCP to Traffic Class Map](#) displays the default DSCP to traffic class map for each platform.

**Table 40: Default DSCP to Traffic Class Map**

Inbound DSCP	0-7	8-15	16-23	24-31	32-39	40-47	48-55	56-63
Traffic Class (Arad / Jericho)	1	0	2	3	4	5	6	7
Traffic Class (FM6000)	1	0	2	3	4	5	6	7
Traffic Class (Helix)	1	0	2	3	4	5	6	7
Traffic Class (Petra)	1	0	2	3	4	5	6	7
Traffic Class (Trident and Tomahawk)	1	0	2	3	4	5	6	7
Traffic Class (Trident II)	1	0	2	3	4	5	6	7

#### Example

This command assigns the **traffic class 3** to the DSCP values of **12, 13, 25, and 37**.

```
switch(config)#qos map dscp 12 13 25 37 to traffic-class 3
switch(config)#
```

### 9.1.10.19 qos map traffic-class to cos

The `qos map traffic-class to cos` command associates a class of service (CoS) to a list of traffic classes. Multiple commands create a complete traffic class to CoS map. The switch uses this map in CoS rewrite operations to fill the CoS field in outbound packets. This map is applicable to DSCP trusted ports and untrusted ports. CoS rewrite is disabled on CoS trusted ports. The `show qos maps` command displays the CoS to traffic class map.

The `no qos traffic-class to cos` and `default qos traffic-class to cos` commands restore the specified traffic class values to their default CoS settings by removing the corresponding `qos map traffic-class to cos` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to cos cos_value
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to cos
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to cos
```

#### Parameters

- ***tc\_num\_x*** Traffic class value. Value range varies by switch platform.
- ***cos\_value*** Class of service (CoS) value. Value ranges from 0 to 7.

#### Default Inbound Traffic Class to CoS Map

[Table 41: Default Traffic Class to CoS Rewrite Value Map](#) displays the default traffic class to CoS map for each platform.

**Table 41: Default Traffic Class to CoS Rewrite Value Map**

Traffic Class	0	1	2	3	4	5	6	7
CoS Rewrite Value (Arad and / Jericho)	1	0	2	3	4	5	6	7
CoS Rewrite Value (FM6000)	1	0	2	3	4	5	6	7
CoS Rewrite Value (Helix)	1	0	2	3	4	5	6	7
CoS Rewrite Value (Petra)	1	0	2	3	4	5	6	7
CoS Rewrite Value (Trident and Tomahawk)	1	0	2	3	4	5	6	7
CoS Rewrite Value (Trident II)	1	0	2	3	4	5	6	7

#### Example

This command assigns the **CoS 2** to traffic classes **1, 3, and 5**.

```
switch(config)#qos map traffic-class 1 3 5 to cos 2
switch(config)#
```

### 9.1.10.20 qos map traffic-class to dscp

The `qos map traffic-class to dscp` command associates a Differentiated Services Code Point (DSCP) value to a list of traffic classes. Multiple commands create a complete traffic class to DSCP map. The switch uses this map in DSCP rewrite operations to fill the DSCP field in outbound packets. This map is applicable to CoS trusted ports and untrusted ports but disabled by default on these ports. DSCP rewrite is disabled on DSCP trusted ports. The `show qos maps` command displays the traffic class to DSCP map.

The `no qos traffic-class to dscp` and `default qos traffic-class to dscp` commands restore the specified traffic class values to their default DSCP settings by removing the corresponding `qos map traffic-class to dscp` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to dscp dscp_value
```

```
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to dscp
```

```
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to dscp
```

#### Parameters

- ***tc\_num\_x*** Traffic class value. Value range varies by switch platform.
- ***dscp\_value*** Differentiated services code point (DSCP) value. Value ranges from **0** to **63**.

#### Default Inbound Traffic Class to DSCP Map

[Table 42: Default Traffic Class to DSCP Rewrite Value Map](#) displays the default traffic class to DSCP map for each platform.

**Table 42: Default Traffic Class to DSCP Rewrite Value Map**

Traffic Class	0	1	2	3	4	5	6	7
DSCP Rewrite Value (FM6000)	8	0	16	24	32	40	48	56
DSCP Rewrite Value (Helix)	8	0	16	24	32	40	48	56
DSCP Rewrite Value (Trident and Tomahawk)	8	0	16	24	32	40	48	56
DSCP Rewrite Value (Trident II)	8	0	16	24	32	40	48	56

#### Example

This command assigns the DSCP value of **17** to traffic classes **1**, **2**, and **4**.

```
switch(config)#qos map traffic-class 1 2 4 to dscp 17
switch(config)#
```

### 9.1.10.21 qos map traffic-class to mc-tx-queue

The `qos map traffic-class to mc-tx-queue` command associates a multicast transmit queue to a list of traffic classes. Multiple commands create a complete traffic class to mc-tx-queue map. The switch uses this map to route outbound packets to transmit queues, which in turn schedules their transmission from the switch. The `show qos maps` command displays the traffic class to multicast transmit queue map.

The `no qos traffic-class to mc-tx-queue` and `default qos traffic-class to mc-tx-queue` commands restore the default traffic class to multicast transmit queue map for the specified traffic class values by removing the corresponding `qos map traffic-class to mc-tx-queue` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to mc-tx-queue mtq_value
```

```
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to mc-tx-queue
```

```
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to mc-tx-queue
```

#### Parameters

- ***tc\_num\_x*** Traffic class value. Value ranges from **0** to **7**.
- ***mtq\_value*** Multicast transmit queue number. Value ranges from **0** to **3**.

#### Default Inbound Traffic Class to Multicast Transmit Queue Map

[Table 43: Default Traffic Class to Multicast Transmit Queue Map](#) displays the default traffic class to multicast transmit queue map for Trident and Tomahawk platform switches.

**Table 43: Default Traffic Class to Multicast Transmit Queue Map**

Traffic Class	0	1	2	3	4	5	6	7
Multicast Transmit Queue (Trident and Tomahawk)	0	0	1	1	2	2	3	3

#### Related Commands

- `qos map traffic-class to uc-tx-queue` (Trident and Tomahawk) associates traffic classes to a multicast transmit queue.
- `qos map traffic-class to tx-queue` (all other platforms) associates traffic classes to a transmit queue.

#### Example

This command maps traffic classes **0**, **4**, and **5** to **mc-tx-queue 2**.

```
switch(config)#qos map traffic-class 0 4 5 to mc-tx-queue 2
switch(config)#
```

### 9.1.10.22 qos map traffic-class to tx-queue

The `qos map traffic-class to tx-queue` command associates a transmit queue (tx-queue) to a list of traffic classes. Multiple commands create a complete traffic to tx-queue map. The switch uses this map to route outbound packets to transmit queues, which in turn schedules their transmission from the switch. The [show qos maps](#) command displays the transmit queue to traffic class map.

The `no qos traffic-class to tx-queue` and `default qos traffic-class to tx-queue` commands restore the specified traffic class values to their default transmit queue settings by removing the corresponding `qos map traffic-class to tx-queue` command from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to tx-queue txq_value
```

```
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to tx-queue
```

```
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to tx-queue
```

#### Parameters

- ***tc\_num\_x*** Traffic class value. Value range varies by platform.
- ***txq\_value*** Transmit queue value. Value range varies by platform.

#### Restrictions

FM6000: When priority flow control (PFC) is enabled, traffic classes are mapped to their corresponding transmit queues, regardless of existing `qos map traffic-class to tx-queue` statements.

Arad, Jericho, and Petra: Traffic class 7 always maps to transmit queue 7. This association is not editable.

#### Default Inbound Traffic Class to Transmit Queue Map

[Table 44: Default Traffic Class to Transmit Queue Map](#) displays the transmit queue to traffic class map.

**Table 44: Default Traffic Class to Transmit Queue Map**

Traffic Class	0	1	2	3	4	5	6	7
Transmit Queue (Arad / Jericho)	0	1	2	3	4	5	6	7
Transmit Queue (FM6000)	0	1	2	3	4	5	6	7
Transmit Queue (Helix)	0	1	2	3	4	5	6	7
Transmit Queue (Petra)	0	1	2	3	4	5	6	7
Transmit Queue (Trident II)	0	1	2	3	4	5	6	7

#### Related Commands

- [qos map traffic-class to mc-tx-queue](#) (Trident and Tomahawk) associates traffic classes to a unicast transmit queue.
- [qos map traffic-class to uc-tx-queue](#) (Trident and Tomahawk) associates traffic classes to a multicast transmit queue.

#### Example

This command maps traffic classes **0**, **4**, and **5** to **tx-queue 4**.

```
switch(config)#qos map traffic-class 0 4 5 to tx-queue 4
switch(config)#
```

### 9.1.10.23 qos map traffic-class to uc-tx-queue

The `qos map traffic-class to uc-tx-queue` command associates a unicast transmit queue to a list of traffic classes. Multiple commands create a complete traffic class to unicast transmit queue map. The switch uses this map to route outbound packets to transmit queues, which in turn schedules their transmission from the switch. The `show qos maps` command displays the traffic class to unicast transmit queue map.

The `no qos traffic-class to uc-tx-queue` and `default qos traffic-class to uc-tx-queue` commands restore the default traffic class to unicast transmit queue map for the specified traffic class values by removing the corresponding `qos map traffic-class to uc-tx-queue` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to uc-tx-queue utq_value
```

```
no qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to uc-tx-queue
```

```
default qos map traffic-class tc_num_1 [tc_num_2 ... tc_num_n] to uc-tx-queue
```

#### Parameters

- ***tc\_num\_x*** Traffic class value. Value ranges from **0** to **7**.
- ***utq\_value*** Unicast transmit queue number. Value ranges from **0** to **7**.

#### Default Inbound Traffic Class to Unicast Transmit Queue Map

[Table 45: Default Traffic Class to Unicast Transmit Queue Map](#) displays the default traffic class to Unicast transmit queue map for Trident and Tomahawk platform switches.

**Table 45: Default Traffic Class to Unicast Transmit Queue Map**

Traffic Class	0	1	2	3	4	5	6	7
Unicast Transmit Queue (Trident and Tomahawk)	0	1	2	3	4	5	6	7

#### Related Commands

- `qos map traffic-class to mc-tx-queue` (Trident and Tomahawk) associates traffic classes to a unicast transmit queue.
- `qos map traffic-class to tx-queue` (all other platforms) associates traffic classes to a transmit queue.

#### Example

This command maps traffic classes **0**, **4**, and **5** to *unicast transmit queue 4*.

```
switch(config)#qos map traffic-class 0 4 5 to uc-tx-queue 4
switch(config)#
```

### 9.1.10.24 qos profile

The **qos profile** command places the switch in QoS profile configuration mode and for the specified profile and creates the profile if it does not already exist. QoS profiles are used to apply the same QoS configuration to multiple interfaces.

The **no qos profile** and **default qos profile** command deletes the QoS profile from the running configuration.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos profile profile_name
```

```
no qos profile profile_name
```

```
default qos profile profile_name
```

#### Parameter

***profile\_name*** QoS profile name.

**Note:** Commands use a subset of the listed fields. Available subset depends on the specified parameter. Use CLI syntax assistance to view options for specific parameter when creating a QoS profile.

#### Example

This command places the switch in QoS profile configuration mode for policy map policy map “TP” and creates the policy map if it does not already exist.

```
switch(config)#qos profile TP  
switch(config-qos-profile-TP)#
```

---

### 9.1.10.25 qos random-detect ecn global-buffer (Helix)

The `qos random-detect ecn global-buffer` command enables ECN marking for globally shared packet memory and specifies minimum and maximum queue threshold sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field's two least significant bits:

- **00** Non ECN Capable transport.
- **10** ECN Capable transport.
- **01** ECN Capable transport.
- **11** Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked **congestion encountered**.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked **congestion encountered**. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked **Non ECN Capable**, congestion packets are dropped, not marked.

The `no qos random-detect ecn global-buffer` and `default qos random-detect ecn global-buffer` commands disables ECN marking for the shared buffer by removing the `qos random-detect ecn global-buffer` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos random-detect ecn global-buffer minimum-threshold MIN maximum-threshold MAX
no qos random-detect ecn global-buffer
default qos random-detect ecn global-buffer
```

#### Guidelines

Packet memory is divided into 46080 208-byte cells, whose allocation is managed by the memory management unit (MMU). The MMU tracks the cells that each entity uses and determines the number of cells that can be allocated to an entity.

#### Parameters

**MIN** and **MAX** parameters must use the same data unit.

- **MIN** Minimum threshold. Options include:
  - **<1 to 19456> segments** 208-byte segments units.
  - **<1 to 4> mbytes** Megabyte units.
  - **<1 to 4046> kbytes** Kilobyte units.
  - **<1 to 4046848> bytes** Byte units.
- **MAX** Maximum threshold. Options include:
  - **<1 to 19456> segments** 208-byte segments units.
  - **<1 to 4> mbytes** Megabyte units.
  - **<1 to 4046> kbytes** Kilobyte units.

- <1 to 4046848> bytes Byte units.

#### Related Command

[random-detect ecn \(Helix\)](#) enables ECN marking for a unicast transmit queue.

#### Examples

- This command enables ECN marking of unicast packets from the global data pool and sets the minimum and maximum thresholds at 20 and 500 segments.

```
switch(config)#qos random-detect ecn global-buffer minimum-  
threshold 20 segments  
maximum-threshold 500 segments  
switch(config)#
```

- This command disables ECN marking of unicast packets from the global data pool.

```
switch(config)#no qos random-detect ecn global-buffer  
switch(config)#
```

---

### 9.1.10.26 qos random-detect ecn global-buffer (Trident and Tomahawk)

The `qos random-detect ecn global-buffer` command enables ECN marking for globally shared packet memory and specifies minimum and maximum queue threshold sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field's two least significant bits:

- **00** Non ECN Capable transport.
- **10** ECN Capable transport.
- **01** ECN Capable transport.
- **11** Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked **congestion encountered**.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked **congestion encountered**. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked **Non ECN Capable**, congestion packets are dropped, not marked.

The `no qos random-detect ecn global-buffer` and `default qos random-detect ecn global-buffer` commands disables ECN marking for the shared buffer by removing the `qos random-detect ecn global-buffer` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos random-detect ecn global-buffer minimum-threshold MIN maximum-threshold MAX
no qos random-detect ecn global-buffer
default qos random-detect ecn global-buffer
```

#### Guidelines

Packet memory is divided into 46080 208-byte cells, whose allocation is managed by the memory management unit (MMU). The MMU tracks the cells that each entity uses and determines the number of cells that can be allocated to an entity.

#### Parameters

**MIN** and **MAX** parameters must use the same data unit.

- **MIN** Minimum threshold. Options include:
  - **<1 to 46080> segments** 208-byte segments units.
  - **<1 to 9> mbytes** Megabyte units.
  - **<1 to 9584> kbytes** Kilobyte units.
  - **<1 to 9584640> bytes** Byte units.
- **MAX** Maximum threshold. Options include:
  - **<1 to 46080> segments** 208-byte segments units.
  - **<1 to 9> mbytes** Megabyte units.
  - **<1 to 9584> kbytes** Kilobyte units.

- <1 to **9584640**> bytes Byte units.

#### Related Command

`random-detect ecn` (Trident and Tomahawk) enables ECN marking for a unicast transmit queue.

#### Examples

- This command enables ECN marking of unicast packets from the global data pool and sets the minimum and maximum thresholds at **20** and **500** segments.

```
switch(config)#qos random-detect ecn global-buffer minimum-  
threshold 20 segments maximum-threshold 500 segments  
switch(config)#
```

- This command disables ECN marking of unicast packets from the global data pool.

```
switch(config)#no qos random-detect ecn global-buffer  
switch(config)#
```

---

### 9.1.10.27 qos rewrite cos

The `qos rewrite cos` command enables the rewriting of the CoS field for outbound tagged packets that were received on DSCP trusted ports and untrusted ports. CoS rewrite is always disabled on CoS trusted ports. The CoS value that is written into the packet is based on the data stream's traffic class. CoS rewriting is active by default.

The `no qos rewrite cos` command disables CoS rewriting on the switch. The default `qos rewrite cos` command restores the default setting of enabling CoS rewriting by removing the `no qos rewrite cos` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos rewrite cos
```

```
no qos rewrite cos
```

```
default qos rewrite cos
```

#### Related Command

[qos map traffic-class to cos](#) configures the traffic class to CoS rewrite map.

#### Example

This command enables CoS rewrite.

```
switch(config)#qos rewrite cos
switch(config)#
```

### 9.1.10.28 qos rewrite dscp

The `qos rewrite dscp` command enables the rewriting of the DSCP field for outbound tagged packets that were received on CoS trusted ports and untrusted ports. DSCP rewrite is always disabled on DSCP trusted ports. The DSCP value that is written into the packet is based on the data stream's traffic class. DSCP rewriting is disabled by default.

The `no qos rewrite dscp` and `default qos rewrite dscp` commands disable DSCP rewriting on the switch by removing the `no qos rewrite dscp` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
qos rewrite dscp
```

```
no qos rewrite dscp
```

```
default qos rewrite dscp
```

#### Related Command

[qos map traffic-class to dscp](#) configures the traffic class to DSCP rewrite map.

#### Example

This command enables DSCP rewrite.

```
switch(config)#qos rewrite dscp  
switch(config)#
```

### 9.1.10.29 qos trust

The `qos trust` command configures the quality of service port trust mode for the configuration mode interface. Trust-enabled ports classify traffic by examining the traffic's CoS or DSCP value. Port trust mode default setting is `cos` for switched interfaces and `dscp` for routed interfaces.

The `default qos trust` command restores the default trust mode on the configuration mode interface by removing the corresponding `qos trust` or `no qos trust` statement from *running-config*.

The `no qos trust` command performs the following:

- `no qos trust` places the port in *untrusted* mode.
- `no qos trust cos` removes the corresponding `qos trust cos` statement.
- `no qos trust dscp` removes the corresponding `qos trust dscp` statement.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
qos trust [MODE]
```

```
no qos trust [MODE]
```

```
default qos trust
```

#### Parameters

- **MODE** Trust mode assigned to the port. Options include:
  - `cos` Enables cos trust mode.
  - `dscp` Enables dscp trust mode.

`no qos trust` Enables untrusted mode on the port.

#### Examples

- This command configures trust mode of dscp for *Ethernet interface 7*.

```
switch(config)#interface Ethernet 7
switch(config-if-Et7)#qos trust dscp
switch(config-if-Et7)#show active
interface Ethernet7
    qos trust dscp
switch(config-if-Et7)#
```

- This command configures trust mode of untrusted for *Port Channel interface 23*.

```
switch(config)#interface port-channel 23
switch(config-if-Po23)#no qos trust
switch(config-if-Po23)#show active
interface Port-Channel23
    no qos trust
switch(config-if-Po23)#
```

### 9.1.10.30 random-detect ecn (Arad/Jericho)

The `random-detect ecn` command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field's two least significant bits:

- **00** Non ECN Capable transport.
- **10** ECN Capable transport.
- **01** ECN Capable transport.
- **11** Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked **congestion encountered**.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked **congestion encountered**. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked **Non ECN Capable**, congestion packets are dropped, not marked.

The `no random-detect ecn` and `default qos random-detect ecn` commands disables ECN marking for the shared buffer by removing the `qos random-detect ecn` command from *running-config*.

#### Command Mode

Tx-Queue configuration

#### Command Syntax

```
random-detect ecn minimum-threshold MIN maximum-threshold MAX
```

```
no random-detect ecn
```

```
default random-detect ecn
```

#### Parameters

**MIN** and **MAX** parameters must use the same data unit.

- **MIN** Minimum threshold. Options include:
  - `<1 to 256> mbytes` Megabyte units.
  - `<1 to 256000> kbytes` Kilobyte units.
  - `<1 to 256000000> bytes` Byte units.
- **MAX** Maximum threshold. Options include:
  - `<1 to 256> mbytes` Megabyte units.
  - `<1 to 256000> kbytes` Kilobyte units.
  - `<1 to 256000000> bytes` Byte units.

#### Related Command

[tx-queue \(Arad/Jericho\)](#) places the switch in tx-queue configuration mode.

<b>Example</b>
----------------

---

These commands enable ECN marking of unicast packets from *unicast transmit queue 4* of *Ethernet interface 3/5/1*, setting thresholds at **128** kbytes and **1280** kbytes.

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#tx-queue 4
switch(config-if-Et3/5/1-txq-4)#random-detect ecn minimum-thres
hold 128 kbytes
maximum-threshold 1280 kbyte
switch(config-if-Et3/5/1-txq-4)#show active
interface Ethernet3/5/1
    tx-queue 4
        random-detect ecn minimum-threshold 128 kbytes maximum-
threshold 1280 kbytes
switch(config-if-Et3/5/1-txq-4)#
```

### 9.1.10.31 random-detect ecn (Helix)

The `random-detect ecn` command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field's two least significant bits:

- **00** Non ECN Capable transport.
- **10** ECN Capable transport.
- **01** ECN Capable transport.
- **11** Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked **congestion encountered**.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked **congestion encountered**. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked Non ECN Capable, congestion packets are dropped, not marked.

Average queue length is tracked for transmit queues and the global pool independently. When either entity reaches its maximum threshold, all subsequent packets are marked.

The `no random-detect ecn` and `default random-detect ecn` commands disable ECN marking on the configuration mode queue, deleting the corresponding `random-detect ecn` command from *running-config*.

#### Command Mode

Tx-Queue configuration

#### Command Syntax

```
random-detect ecn minimum-threshold MIN maximum-threshold MAX
```

```
no random-detect ecn
```

```
default random-detect ecn
```

#### Parameters

**MIN** and **MAX** parameters must use the same data unit.

- **MIN** Minimum threshold. Options include:
  - `<1 to 46080> segments` 208-byte segments units.
  - `<1 to 9> mbytes` Megabyte units.
  - `<1 to 9584> kbytes` Kilobyte units.
  - `<1 to 9584640> bytes` Byte units.
- **MAX** Maximum threshold. Options include:
  - `<1 to 46080> segments` 208-byte segments units.
  - `<1 to 9> mbytes` Megabyte units.
  - `<1 to 9584> kbytes` Kilobyte units.
  - `<1 to 9584640> bytes` Byte units.

## Related Commands

- [tx-queue \(Helix\)](#) places the switch in tx-queue configuration mode.
- [qos random-detect ecn global-buffer \(Helix\)](#) enables ECN marking for globally shared packet memory.

## Examples

- These commands enable ECN marking of unicast packets from **transmit queue 4** of **Ethernet interface 15**, setting thresholds at **10** and **100** segments.

```
switch(config)#interface ethernet 15
switch(config-if-Et15)#uc-tx-queue 4
switch(config-if-Et15-txq-4)#random-detect ecn minimum-thres
hold 10 segments
maximum-threshold 100 segments
switch(config-if-Et15-txq-4)#show active
interface Ethernet15
    tx-queue 4
        random-detect ecn minimum-threshold 10 segments maximum-
threshold 100
segments
switch(config-if-Et15-txq-4)#exit
switch(config-if-Et15)
```

- This command disables ECN marking of unicast packets from **transmit queue 4** of **Ethernet interface 15**.

```
switch(config-if-Et15-txq-4)#no random-detect ecn
switch(config-if-Et15-txq-4)#show active
interface Ethernet15
switch(config-if-Et15-txq-4)#exit
switch(config-if-Et15)#
```

### 9.1.10.32 random-detect ecn (Trident and Tomahawk)

The `random-detect ecn` command enables ECN marking for the configuration mode unicast transmit queue and specifies threshold queue sizes. Hosts can advertise their ECN capabilities in the ToS DiffServ field's two least significant bits:

- **00** Non ECN Capable transport.
- **10** ECN Capable transport.
- **01** ECN Capable transport.
- **11** Congestion encountered.

Congestion is determined by comparing average queue size with queue thresholds. Average queue size is calculated through a formula based on the previous average and current queue size. Packets are marked based on this average size and the specified thresholds:

- Average queue size below minimum threshold: Packets are queued normally.
- Average queue size above maximum threshold: Packets are marked **congestion encountered**.
- Average queue size between minimum and maximum thresholds. Packets are queued or marked **congestion encountered**. The proportion of marked packets varies linearly with average queue size:
  - 0% are marked when average queue size is less than or equal to minimum threshold.
  - 100% are marked when average queue size is greater than or equal to maximum threshold.

When transmitted packets are marked **Non ECN Capable**, congestion packets are dropped, not marked.

Average queue length is tracked for transmit queues and the global pool independently. When either entity reaches its maximum threshold, all subsequent packets are marked.

The `no random-detect ecn` and `default random-detect ecn` commands disable ECN marking on the configuration mode queue, deleting the corresponding `random-detect ecn` command from *running-config*.

#### Command Mode

Uc-Tx-Queue configuration

#### Command Syntax

```
random-detect ecn minimum-threshold MIN maximum-threshold MAX
```

```
no random-detect ecn
```

```
default random-detect ecn
```

#### Parameters

**MIN** and **MAX** parameters must use the same data unit.

- **MIN** Minimum threshold. Options include:
  - `<1 to 46080> segments` 208-byte segments units.
  - `<1 to 9> mbytes` Megabyte units.
  - `<1 to 9584> kbytes` Kilobyte units.
  - `<1 to 9584640> bytes` Byte units.
- **MAX** Maximum threshold. Options include:
  - `<1 to 46080> segments` 208-byte segments units.
  - `<1 to 9> mbytes` Megabyte units.
  - `<1 to 9584> kbytes` Kilobyte units.
  - `<1 to 9584640> bytes` Byte units.

## Related Commands

- [uc-tx-queue](#) places the switch in uc-tx-queue configuration mode.
- [qos random-detect ecn global-buffer \(Trident and Tomahawk\)](#) enables ECN marking for globally shared packet memory.

## Examples

- These commands enable ECN marking of unicast packets from **unicast transmit queue 4** of **Ethernet interface 15**, setting thresholds at **10** and **100** segments.

```
switch(config)#interface ethernet 15
switch(config-if-Et15)#uc-tx-queue 4
switch(config-if-Et15-uc-txq-4)#random-detect ecn minimum-
threshold 10 segments
maximum-threshold 100 segments
switch(config-if-Et15-uc-txq-4)#show active
interface Ethernet15
    uc-tx-queue 4
        random-detect ecn minimum-threshold 10 segments maximum-
threshold 100
segments
switch(config-if-Et15-uc-txq-4)#exit
switch(config-if-Et15)#
```

- This command disables ECN marking of unicast packets from **unicast transmit queue 4** of **Ethernet interface 15**.

```
switch(config-if-Et15-uc-txq-4)#no random-detect ecn
switch(config-if-Et15-uc-txq-4)#show active
interface Ethernet15
switch(config-if-Et15-uc-txq-4)#exit
switch(config-if-Et15)#
```

### 9.1.10.33 service-policy type qos input

The **service-policy type qos input** command applies the specified policy map to a QoS profile. The profile is then applied to an interface in interface configuration mode using the **service-profile** command.

The **no service-policy type qos** and **default service-policy type qos** command deletes the policy map from the profile.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

QoS Profile Configuration

#### Command Syntax

```
service-policy type qos input policy_map_name
no service-policy type qos input policy_map_name
default service-policy type qos input policy_map_name
```

#### Parameter

- **policy\_map\_name** QoS policy map name.

#### Example

This command applies the policy map PM-1 to the QoS profile TP.

```
switch(config-qos-profile-TP) #service-policy type qos input PM-1
switch(config-qos-profile-TP) #
```

---

### 9.1.10.34 service-profile

The command applies the QoS profile to the configuration mode interface.

The **no service-profile** and the **default service-profile** command removes the QoS profile from the interface.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
service-profile profile_name
```

```
no service-profile profile_name
```

```
default service-profile profile_name
```

#### Parameter

***profile\_name*** QoS profile name.

#### Example

This commands applies the QoS profile TP to ***Ethernet interface 13***.

```
switch(config)#interface ethernet 13  
switch(config-if-Et13)#service-profile TP
```

### 9.1.10.35 shape rate (Interface – Arad/Jericho)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the **shape rate (Tx-queue – Arad/Jericho)** command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
shape rate byte_limit [kbps]
```

```
no shape rate
```

```
default shape rate
```

#### Parameters

**byte\_limit** Shape rate applied to interface (Kbps). Value ranges from **162** to **100000000**.

#### Example

This command configures a port shape rate of **5 Gbps** on **Ethernet interface 3/5/1**.

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#shape rate 5000000
switch(config-if-Et3/5/1)#show qos interfaces ethernet 3/5/1
```

```
Ethernet3/5/1:
```

```
Port shaping rate: 5000012 / 5000000 kbps
```

Tx Queue	Bandwidth (percent)	Shape Rate (units)	Priority	ECN
7	- / -	- / - ( - )	SP / SP	D
6	- / -	- / - ( - )	SP / SP	D
5	- / -	- / - ( - )	SP / SP	D
4	- / -	- / - ( - )	SP / SP	D
3	- / -	- / - ( - )	SP / SP	D
2	- / -	- / - ( - )	SP / SP	D
1	- / -	- / - ( - )	SP / SP	D
0	- / -	- / - ( - )	SP / SP	D

```
switch(config-if-Et3/5/1)#
```

---

### 9.1.10.36 shape rate (Interface – FM6000)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the [shape rate \(Tx-queue – FM6000\)](#) command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
shape rate byte_limit [kbps]
```

```
no shape rate
```

```
default shape rate
```

#### Parameters

**byte\_limit** Shape rate applied to interface (Kbps). Value ranges from **7000** to **10000000**.

#### Guidelines

Enabling port shaping on an FM6000 interface disables queue shaping internally. Disabling port shaping restores queue shaping as specified in *running-config*.

#### Example

This command configures a port shape rate of **5 Gbps** on **Ethernet interface 5**.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#shape rate 5000000  
switch(config-if-Et5)#
```

### 9.1.10.37 shape rate (Interface – Helix)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the **shape rate (Interface – Helix)** command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
shape rate DATA_LIMIT
```

```
no shape rate
```

```
default shape rate
```

#### Parameters

- **DATA\_LIMIT** Shape rate applied to interface. Value range varies with data unit:
  - **<8 to 4000000>** **8** to **4000000** kbytes per second.
  - **<8 to 4000000>kbps** **8** to **4000000** kbytes per second.
  - **<8 to 6000000>pps** **8** to **6000000** packets per second.

#### Guidelines

Shaping rates of at least **8** kbps are supported. At shaping rates smaller than **1** Mbps, granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

#### Example

This command configures a port shape rate of **5 Gbps** on **Ethernet interface 17**.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#shape rate 5000000 kbps
switch(config-if-Et17)#show qos interface ethernet 17/3
```

```
Ethernet17:
```

```
Trust Mode: COS
Default COS: 0
Default DSCP: 0
```

```
Port shaping rate: 5000000 / 5000000 kbps
```

Tx Queue	Bandwidth Guaranteed (units)	Shape Rate (units)	Priority
7	- / - ( - )	- / - ( - )	SP / SP
6	- / - ( - )	- / - ( - )	SP / SP

```
switch(config-if-Et17)#
```

---

### 9.1.10.38 shape rate (Interface – Petra)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the [shape rate \(Tx-queue – Petra\)](#) command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
shape rate data_limit [kbps]
```

```
no shape rate
```

```
default shape rate
```

#### Parameters

- **data\_limit** Shape rate applied to interface (Kbps). Value ranges from **100** to **10000000**.

#### Guidelines

The following port shaping rates are supported:

- 1G ports: above 100 kbps.
- 10G ports: above 7900 kbps.

Commands that specify a smaller shape rate disable port shaping on the interface.

#### Example

This command configures a port shape rate of **5 Gbps** on **Ethernet interface 3/3**.

```
switch(config)#interface ethernet 3/3
switch(config-if-Et3/3)#shape rate 5000000
switch(config-if-Et3/3)#show active
interface Ethernet3/3
    shape rate 5000000
switch(config-if-Et3/3)#
```

### 9.1.10.39 shape rate (Interface – Trident and Tomahawk)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the [shape rate \(Tx-queue – Trident and Tomahawk\)](#) command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
shape rate DATA_LIMIT
```

```
no shape rate
```

```
default shape rate
```

#### Parameters

- **DATA\_LIMIT** Shape rate applied to interface. Value range varies with data unit:
  - **<8 to 40000000>** **8** to **40000000** kbytes per second.
  - **<8 to 40000000>kbps** **8** to **40000000** kbytes per second.
  - **<8 to 60000000>pps** **8** to **60000000** packets per second.

#### Guidelines

Shaping rates of at least **8** kbps are supported. At shaping rates smaller than **1** Mbps, granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

#### Example

This command configures a port shape rate of **5 Gbps** on **Ethernet interface 5**.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#shape rate 5000000
switch(config-if-Et5)#
```

### 9.1.10.40 shape rate (Interface – Trident II)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode interface, also known as queue shaping. The shape rate for individual transmit queues is configured by the [shape rate \(Tx-queue – Trident II\)](#) command. By default, outbound transmission rate is not bounded by a shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode interface by deleting the corresponding **shape rate** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
shape rate DATA_LIMIT
```

```
no shape rate
```

```
default shape rate
```

#### Parameters

- **DATA\_LIMIT** Shape rate applied to interface. Value range varies with data unit:
  - **<8 to 4000000>** **8** to **4000000** kbytes per second.
  - **<8 to 4000000>kbps** **8** to **4000000** kbytes per second.
  - **<8 to 6000000>pps** **8** to **6000000** packets per second.

#### Guidelines

Shaping rates of at least **8** kbps are supported. At shaping rates smaller than 1 Mbps, granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

#### Example

This command configures a port shape rate of **5 Gbps** on **Ethernet interface 17/3**.

```
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#shape rate 5000000 kbps
switch(config-if-Et17/3)#show qos interface ethernet 17/3

Ethernet17/3:
  Trust Mode: COS
  Default COS: 0
  Default DSCP: 0

  Port shaping rate: 5000000 / 5000000 kbps

  Tx          Bandwidth          Shape Rate          Priority
  Queue       Guaranteed (units)      (units)
  -----
  7           - / -      ( - )              - / -      ( - )      SP / SP
  6           - / -      ( - )              - / -      ( - )      SP / SP

switch(config-if-Et17/3)#
```

### 9.1.10.41 shape rate (Tx-queue – Arad/Jericho)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the [shape rate \(Interface – Arad/Jericho\)](#) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

Shaping rates greater than **50000** kbps are supported. At lower shaping rates (less than 10 Mbps), granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode queue by deleting the corresponding **shape rate** command from **running-config**.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
shape rate byte_limit [kbps]
```

```
no shape rate
```

```
default shape rate
```

#### Parameters

**byte\_limit** Shape rate applied to interface (Kbps). Value ranges from **50000** to **100000000**.

#### Related Command

[tx-queue \(Arad/Jericho\)](#) places the switch in tx-queue configuration mode.

#### Related information

- [shape rate \(Interface – Arad/Jericho\)](#)

#### Example

These commands configure a shape rate of 1 Gbps on transmit queues **3** and **4** of **Ethernet interface 3/4/1**.

```
switch(config)#interface ethernet 3/4/1
switch(config-if-Et3/4/1)#tx-queue 4
switch(config-if-Et3/4/1-txq-4)#shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-4)#tx-queue 3
switch(config-if-Et3/4/1-txq-3)#shape rate 1000000 kbps
switch(config-if-Et3/4/1-txq-3)#show qos interface ethernet 3/4/1
```

Ethernet3/4/1:

Port shaping rate: disabled

Tx Queue	Bandwidth (percent)	Shape Rate (units)	Priority	ECN
7	- / -	- / - ( - )	SP / SP	D
6	- / -	- / - ( - )	SP / SP	D
5	- / -	- / - ( - )	SP / SP	D
4	- / -	999 / 1000 ( Mbps )	SP / SP	D
3	- / -	999 / 1000 ( Mbps )	SP / SP	D
2	- / -	- / - ( - )	SP / SP	D
1	- / -	- / - ( - )	SP / SP	D
0	- / -	- / - ( - )	SP / SP	D

---

```
switch(config-if-Et3/4/1-txq-3) #
```

### 9.1.10.42 shape rate (Tx-queue – FM6000)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the [shape rate \(Interface – FM6000\)](#) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

Queue shaping on an FM6000 port is supported only when port shaping is not enabled on the interface. Enabling port shaping on a port disables queue shaping internally. Disabling port shaping restores queue shaping as specified by **running-config**.

Shaping rates greater than 460 kbps are supported. At lower shaping rates (less than 10 Mbps), granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the transmit queue by deleting the corresponding **shape rate** command from **running-config**.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
shape rate byte_limit [kbps]
```

```
no shape rate
```

```
default shape rate
```

#### Parameters

**byte\_limit** Shape rate applied to interface (Kbps). Value ranges from **464** to **1000000**.

#### Related Commands

- [tx-queue \(FM6000\)](#) places the switch in tx-queue configuration mode.
- [shape rate \(Interface – FM6000\)](#) configures the shape rate for a configuration mode interface.

#### Example

These commands configure a shape rate of 1 Gbps (1,000,000 Kbps) on transmit queues **3** and **4** of **Ethernet interface 19**.

```
switch(config)#interface ethernet 19
switch(config-if-Et19)#tx-queue 4
switch(config-if-Et19-txq-4)#shape rate 1000000
switch(config-if-Et19-txq-4)#tx-queue 3
switch(config-if-Et19-txq-3)#shape rate 1000000
switch(config-if-Et19-txq-3)#show qos interface ethernet 19
```

Ethernet19:

Trust Mode: COS

Tx-Queue	Bandwidth (percent)	Shape Rate (Kbps)	Priority
6	N/A	disabled	strict
5	N/A	disabled	strict
4	N/A	1000000	strict
3	25	1000000	round-robin
2	25	disabled	round-robin
1	25	disabled	round-robin
0	25	disabled	round-robin

---

```
switch(config-if-Et19-txq-3) #
```

### 9.1.10.43 shape rate (Tx-queue – Helix)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the [shape rate \(Interface – Helix\)](#) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode transmit queue by deleting the corresponding **shape rate** command from *running-config*.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
shape rate byte_limit [kbps]
```

```
no shape rate
```

```
default shape rate
```

#### Parameters

- **DATA\_LIMIT** Shape rate applied to the queue. Value range varies with data unit:
  - **<8 to 40000000>** 8 to 40,000,000 kbytes per second.
  - **<8 to 40000000>kbps** 8 to 40000000 kbytes per second.
  - **<8 to 60000000>pps** 8 to 60000000 packets per second.

#### Restrictions

Queue shaping is not supported in cut-through mode.

#### Related Commands

- [tx-queue \(Helix\)](#) places the switch in tx-queue configuration mode.
- [shape rate \(Interface – Helix\)](#) configures the shape rate for a configuration mode interface.

#### Example

These commands configure a shape rate of 1 Gbps (1,000,000 Kbps) on transmit queues **3** and **4** of **Ethernet interface 17/3**.

```
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#shape rate 1000000 kbps
switch(config-if-Et17/3-txq-4)#tx-queue 3
switch(config-if-Et17/3-txq-3)#shape rate 1000000 kbps
switch(config-if-Et17/3-txq-3)#show qos interface ethernet 17/3
```

Ethernet17/3:

Tx Queue	Bandwidth Guaranteed (units)	Shape Rate (units)	Priority
7	- / - ( - )	- / - ( - )	SP / SP
6	- / - ( - )	- / - ( - )	SP / SP
5	- / - ( - )	- / - ( - )	SP / SP
4	- / - ( - )	1 / 1 ( Gbps )	SP / SP
3	- / - ( - )	1 / 1 ( Gbps )	SP / SP
2	- / - ( - )	- / - ( - )	SP / SP
1	- / - ( - )	- / - ( - )	SP / SP
0	- / - ( - )	- / - ( - )	SP / SP

---

```
switch(config-if-Et17/3-txq-3) #
```

### 9.1.10.44 shape rate (Tx-queue – Petra)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the [shape rate \(Interface – Petra\)](#) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

Queue shaping applies only to unicast traffic. Shaping rates of at least 162 Kbps are supported.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode queue by deleting the corresponding **shape rate** command from *running-config*.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
shape rate DATA_LIMIT
```

```
no shape rate
```

```
default shape rate
```

#### Parameters

- **DATA\_LIMIT** Shape rate applied to the queue. Value range varies with data unit:
  - **<8 to 4000000>** **8** to **4000000** kbytes per second.
  - **<8 to 4000000>kbps** **8** to **4000000** kbytes per second.
  - **<8 to 6000000>pps** **8** to **6000000** packets per second.

Shaping rates greater than 460 kbps are supported. At lower shaping rates (less than 10 Mbps), granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

#### Related Commands

- [tx-queue \(Petra\)](#) places the switch in tx-queue configuration mode.
- [shape rate \(Interface – Petra\)](#) configures the shape rate for a configuration mode interface.

#### Example

These commands configure a shape rate of 1 Gbps (1,000,000 Kbps) on transmit queues **3** and **4** of *Ethernet interface 3/28*.

```
switch(config)#interface ethernet 3/28
switch(config-if-Et3/28)#tx-queue 4
switch(config-if-Et3/28-txq-4)#shape rate 1000000
switch(config-if-Et3/28-txq-4)#tx-queue 3
switch(config-if-Et3/28-txq-3)#shape rate 1000000
switch(config-if-Et3/28-txq-3)#show qos interface ethernet 3/28
```

Ethernet3/28:

Tx-Queue	Bandwidth (percent)	Shape Rate (Kbps)	Priority
7	N/A	disabled	strict
6	N/A	disabled	strict
5	N/A	disabled	strict
4	N/A	1000000	strict
3	25	1000000	round-robin
2	25	disabled	round-robin
1	25	disabled	round-robin

---

```
0          25      disabled  round-robin
switch(config-if-Et3/28-txq-3) #
```

### 9.1.10.45 shape rate (Tx-queue – Trident and Tomahawk)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the [shape rate \(Interface – Trident and Tomahawk\)](#) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate limit from the configuration mode transmit queue by deleting the corresponding **shape rate** command from *running-config*.

#### Command Mode

Mc-Tx-Queue configuration

Uc-Tx-Queue configuration

#### Command Syntax

```
shape rate DATA_LIMIT
```

```
no shape rate
```

```
default shape rate
```

#### Parameters

- **DATA\_LIMIT** Shape rate applied to the queue. Value range varies with data unit:
- **<8 to 40000000>** **8** to **40000000** kbytes per second.
- **<8 to 40000000>kbps** **8** to **40000000** kbytes per second.
- **<8 to 60000000>pps** **8** to **60000000** packets per second.

#### Related Commands

- [mc-tx-queue](#) places the switch in mc-tx-queue configuration mode.
- [uc-tx-queue](#) places the switch in uc-tx-queue configuration mode.
- [shape rate \(Interface – Trident and Tomahawk\)](#) configures the shape rate for a configuration mode interface.

#### Guidelines

Shaping rates of at least 8 kbps are supported. At shaping rates smaller than 1 Mbps, granularity and rounding errors may skew the actual shaping rate by 20% from the specified rate.

When two queues source traffic from the same traffic class and the higher priority queue is shaped, that queue consumes all internal buffers, starving the lower priority queue even if bandwidth is available.

#### Example

These commands configure a shape rate of 1 Gbps (1,000,000 Kbps) on **unicast transmit queues 3** and **multicast transmit 4** of **Ethernet interface 7**.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#uc-tx-queue 3
switch(config-if-Et7-uc-txq-3)#shape rate 1000000
switch(config-if-Et7-uc-txq-3)#mc-tx-queue 2
switch(config-if-Et7-mc-txq-2)#shape rate 1000000
switch(config-if-Et7-mc-txq-2)#show qos interface ethernet 7
```

Ethernet7:	Tx-Queue	Bandwidth	Shape Rate	Priority	Priority
Group		(percent)	(Kbps)		

```
-----  
1      UC7      N/A      disabled  strict  
1      UC6      N/A      disabled  strict  
1      MC3      N/A      disabled  strict  
1      UC5      N/A      disabled  strict  
0      UC4      N/A      disabled  strict  
0      MC2      N/A      1000000  strict  
0      UC3      20      1000000  round-robin  
0      UC2      16      disabled  round-robin  
0      MC1      16      disabled  round-robin  
0      UC1      16      disabled  round-robin  
0      UC0      16      disabled  round-robin  
0      MC0      16      disabled  round-robin  
0  
switch(config-if-Et7-mc-txq-2) #
```

### 9.1.10.46 shape rate (Tx-queue – Trident II)

The **shape rate** command specifies the maximum bandwidth for outbound traffic on the configuration mode transmit queue, also known as queue shaping. The shape rate for interfaces is configured by the [shape rate \(Interface – Trident II\)](#) command. By default, the configured outbound transmission rate is not bounded by a transmit queue shape rate.

The **no shape rate** and **default shape rate** commands remove the shape rate bandwidth limit on the configuration mode transmit queue by deleting the corresponding **shape rate** command from *running-config*.

#### Command Mode

Tx-Queue Configuration

#### Command Syntax

```
shape rate byte_limit [kbps]
```

```
no shape rate
```

```
default shape rate
```

#### Parameters

- **DATA\_LIMIT** Shape rate applied to the queue. Value range varies with data unit:
  - **<8 to 40000000>** 8 to 40000000 kbytes per second.
  - **<8 to 40000000>kbps** 8 to 40000000 kbytes per second.
  - **<8 to 60000000>pps** 8 to 60000000 packets per second.

#### Restrictions

Queue shaping is not supported in cut-through mode

#### Related Commands

- [tx-queue \(Trident II\)](#) places the switch in tx-queue configuration mode.
- [shape rate \(Interface – Trident II\)](#) configures the shape rate for a configuration mode interface.

#### Example

These commands configure a shape rate of 1 Gbps (1,000,000 Kbps) on transmit queues 3 and 4 of *Ethernet interface 17/3*.

```
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#shape rate 1000000 kbps
switch(config-if-Et17/3-txq-4)#tx-queue 3
switch(config-if-Et17/3-txq-3)#shape rate 1000000 kbps
switch(config-if-Et17/3-txq-3)#show qos interface ethernet 17/3
```

Ethernet17/3:

Tx Queue	Bandwidth Guaranteed (units)	Shape Rate (units)	Priority
7	- / - ( - )	- / - ( - )	SP / SP
6	- / - ( - )	- / - ( - )	SP / SP
5	- / - ( - )	- / - ( - )	SP / SP
4	- / - ( - )	1 / 1 ( Gbps )	SP / SP
3	- / - ( - )	1 / 1 ( Gbps )	SP / SP
2	- / - ( - )	- / - ( - )	SP / SP
1	- / - ( - )	- / - ( - )	SP / SP
0	- / - ( - )	- / - ( - )	SP / SP

---

```
switch(config-if-Et17/3-txq-3) #
```

### 9.1.10.47 show platform petraA traffic-class

The **show platform petraA traffic-class** command displays the traffic class assignment on all specified Petra chips. Each chip controls eight Ethernet interfaces. The default traffic class of an interface is specified by the traffic class assigned to the chip that controls the interface.

Traffic class assignments are configured with the [platform petraA traffic-class](#) command.

Valid command options include:

- **show platform petraA traffic-class** Traffic class of all chips on all linecard.
- **show platform petraA CHIP\_NAME traffic-class** Traffic class of specified chip.
- **show platform petraA MODULE\_NAME traffic-class** Traffic class of all chips on specified linecard.

#### Command Mode

EXEC

#### Command Syntax

```
show platform petraA traffic-class
```

```
show platform petraA CHIP_NAME traffic-class
```

```
show platform petraA MODULE_NAME traffic-class
```

#### Parameters

- **CHIP\_NAME** Name of Petra chip on linecard that control Ethernet ports. Options include:
  - **petra cardX / chipY** All ports on PetraA chip **chipY** on linecard **cardX** (7500 Series).
  - **petra chipZ** All ports on PetraA chip **chipZ** (7048 Series).

#### 7500 Series

Switches can contain up to eight linecards. **cardX** varies from **3** to **10**.

Each linecard contains six PetraA chips. Each chip controls eight ports. **chipY** varies from **0** to **5**:

- 0 controls ports 1 through 8
- 1 controls ports 9 through 16
- 2 controls ports 17 through 24
- 3 controls ports 25 through 32
- 4 controls ports 33 through 40
- 5 controls ports 41 through 48

#### 7048 Series

Each switch contains two PetraA chips. **chipZ** varies from **0** to **1**:

- 0 controls ports 1 through 32
- 1 controls ports 33 through 52
- **MODULE\_NAME** Name and number of linecard (7500 Series). Options include:
  - **module linecard mod\_num** Linecard number (**3** to **10**).
  - **module mod\_num** Linecard number (**3** to **10**).

#### Related Command

[platform petraA traffic-class](#) configures the default traffic class used by all ports on a specified chip.

**Example**

---

This command displays the traffic class of all chips on **linecard 3**.

```
switch#show platform petraA module linecard 3 traffic-class
Petra3/0 traffic-class: 1
Petra3/1 traffic-class: 1
Petra3/2 traffic-class: 1
Petra3/3 traffic-class: 1
Petra3/4 traffic-class: 5
Petra3/5 traffic-class: 1
switch#
```

#### 9.1.10.48 show platform trident tcam qos detail

The `show platform trident tcam qos detail` command displays the list of all the SVIs that are sharing the TCAM entries.

##### Command Mode

EXEC

##### Command Syntax

```
show platform trident tcam qos detail
```

##### Example

This command displays the list of all the SVIs that are sharing the TCAM entries.

```
switch(config)#show platform trident tcam qos detail
=== Policy-map p01 type qos on switch Linecard0/0 ===
Interfaces : Vlan2 Vlan1
=== Interface BitMap ===
0x00000000000000000000000000000001FFFFFFE
```

---

#### 9.1.10.49 show platform trident tcam shared vlan interface-class-id

The `show platform trident tcam shared vlan interface-class-id` command displays what SVIs are currently sharing the QoS policy-map in the below output under QoS PMAP Data.

##### Command Mode

EXEC

##### Command Syntax

```
show platform trident tcam shared vlan interface-class-id
```

##### Example

This command displays what SVIs are currently sharing the QoS policy-map in the below output under QoS PMAP Data.

```
switch(config)#show platform trident tcam shared vlan interface-  
class-id  
  
=== Shared RACL Data on switch Linecard0/0 ===  
=== Shared QoS Policy-map Data on switch Linecard0/0 ===  
Interface Class Id          VLANs  
1                            1 2
```

### 9.1.10.50 show platform xp qos tcam hit

The `show platform xp qos tcam hit` command displays the TCAM entries programmed for each policy-map as well as the traffic hits. The `hits` option is used to see the TCAM entries with nonzero traffic hits.

#### Command Mode

EXEC

#### Command Syntax

```
show platform xp qos tcam hit
```

#### Example

This command displays the QoS TCAM hits on *Ethernet interface 10/1*.

```
switch#show platform xp qos tcam hit
=== Policy-map test type qos on switch 0 ===
Assigned to ports: Ethernet10/1
== Class-map test type qos ==
=== ACL test
=====

dscp|cos  |tc|PolID| | | |
=====
| 10| 0x01| | | | | |0x04| | | 4  |-  | -  | -  |91852787| | | 0 | 0x00 | | | |
|0xfb| | | | |
-----
```

---

### 9.1.10.51 show policy-map interface

The **show policy-map interface** command displays contents of the policy map applied to specified the interface.

#### Command Mode

EXEC

#### Command Syntax

```
show policy-map interface interface_name
```

#### Parameters

- ***interface\_name*** Interface for which command returns data. Options include:
  - ***no parameter*** Returns data for all interfaces.
  - **ethernet *e\_range*** Ethernet interfaces specified by ***e\_range***.
  - **port-channel *p\_range*** Port channel interfaces specified by ***p\_range***.

#### Example

This command displays the name and contents of the policy map applied to ***Ethernet interface 1***.

```
switch#show policy-map interface ethernet 1
Service-policy input: p1
Hardware programming status: Successful

Class-map: c2001 (match-any)
  Match: vlan 2001 0xffff
        set dscp 4

Class-map: c2002 (match-any)
  Match: vlan 2002 0xffff
        set dscp 8

Class-map: c2003 (match-any)
  Match: vlan 2003 0xffff
        set dscp 12
```

### 9.1.10.52 show policy-map

The `show policy-map` command displays the policy map information for the configured policy map.

#### Command Mode

EXEC

#### Command Syntax

```
show policy-map policy_map_name [counters][interface | summary]
```

#### Parameters

- ***policy\_map\_name*** QoS policy map name.
- ***counters*** Specifies the policy map traffic match count (This parameter is applicable only on DCS-7010, DCS-7050X, DCS7250X, DCS-7300X and DCS-7280(E/R), DCS-7500(E/R) series switches.)
- ***interface*** Specifies the service policy on an interface.
- ***summary*** Policy map summary.

#### Examples

- The `show policy-map` command displays the information for the policy map ***policy1***.

```
switch#show policy-map policy1
Service-policy policy1
Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes
Class-map: class-default (match-any)
```

- The `show policy-map counters` command displays the policy map traffic match count for the policy map configured.

```
switch#show policy-map policy1 counters

Service-policy input: policy1
Hardware programming status: Successful
Class-map: class1 (match-any)
  Match: vlan 20-40,1000-1250
        police rate 100 mbps burst-size 100 kbytes
        Interface: Ethernet16/1
          Conformed 28621 packets, 7098008 bytes ----- packet match
count

Class-map: class-default (match-any)
  Matched Packets: 19 ----- packet match count
```

### 9.1.10.53 show qos interfaces random-detect ecn

The `show qos interfaces random-detect ecn` command displays the Explicit Congestion Notification (ECN) configuration for each transmit queue on the specified interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show qos interfaces [INTERFACE_NAME] random-detect ecn
```

#### Parameters

- ***INTERFACE\_NAME*** Interface for which command returns data. Options include:
  - **<no parameter>** Returns data for all interfaces.

- **ethernet e\_range** Ethernet interfaces specified by **e\_range**.
- **port-channel p\_range** Port-Channel Interfaces specified by **p\_range**.

### Example

This command configures ECN parameters for transmit queues **0** through **3** on **Ethernet interface 3/5/1**, then displays that configuration.

```
switch(config)#interface ethernet 3/5/1
switch(config-if-Et3/5/1)#tx-queue 0
switch(config-if-Et3/5/1-txq-0)#random-detect ecn minimum-threshold 2560 kbytes
maximum-threshold 256000 kbytes
switch(config-if-Et3/5/1-txq-0)#tx-queue 1
switch(config-if-Et3/5/1-txq-1)#random-detect ecn minimum-threshold 25600 kbytes
maximum-threshold 128000 kbytes
switch(config-if-Et3/5/1-txq-1)#tx-queue 2
switch(config-if-Et3/5/1-txq-2)#random-detect ecn minimum-threshold 25600 bytes
maximum-threshold 128000 bytes
switch(config-if-Et3/5/1-txq-2)#tx-queue 3
switch(config-if-Et3/5/1-txq-3)#random-detect ecn minimum-threshold 25 mbytes
maximum-threshold 128 mbytes
switch(config-if-Et3/5/1-txq-3)#show qos interfaces ethernet 3/5/1 random-detect
ecn
```

Ethernet3/5/1:

Tx-Queue	Minimum Threshold	Maximum Threshold	Threshold Unit
7	-	-	-
6	-	-	-
5	-	-	-
4	-	-	-
3	25	128	mbytes
2	25600	128000	bytes
1	25600	128000	kbytes
0	2560	256000	kbytes

```
switch(config-if-Et3/5/1-txq-3)#
```

### 9.1.10.54 show qos interfaces trust

The `show qos interfaces trust` command displays the configured and operational QoS trust mode of all specified interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show qos interfaces [INTERFACE_NAME] trust
```

#### Parameters

- **INTERFACE\_NAME** Interface for which command returns data. Options include:
  - **<no parameter>** Returns data for all interfaces.
  - **ethernet e\_range** Ethernet interfaces specified by **e\_range**.
  - **port-channel p\_range** Port-Channel Interfaces specified by **p\_range**.

#### Example

These commands configure a variety of QoS trust settings on a set of interfaces, then displays the QoS trust mode on these interfaces.

```
switch(config)#interface ethernet 1/1
switch(config-if-Et1/1)#qos trust cos
switch(config-if-Et1/1)#interface ethernet 1/2
switch(config-if-Et1/2)#qos trust dscp
switch(config-if-Et1/2)#interface ethernet 1/3
switch(config-if-Et1/3)#no qos trust
switch(config-if-Et1/3)#interface ethernet 1/4
switch(config-if-Et1/4)#default qos trust
switch(config-if-Et1/4)#interface ethernet 2/1
switch(config-if-Et2/1)#no switchport
switch(config-if-Et2/1)#default qos trust
switch(config-if-Et2/1)#show qos interface ethernet 1/1 - 2/4
trust
```

Port	Trust Mode	
	Operational	Configured
Ethernet1/1	COS	COS
Ethernet1/2	DSCP	DSCP
Ethernet1/3	UNTRUSTED	UNTRUSTED
Ethernet1/4	COS	DEFAULT
Ethernet2/1	DSCP	DEFAULT
Ethernet2/2	COS	DEFAULT
Ethernet2/3	COS	DEFAULT
Ethernet2/4	COS	DEFAULT

```
switch(config-if-Et2/1)#
```

### 9.1.10.55 show qos interfaces

The **show qos interfaces** command displays the QoS, DSCP, and transmit queue configuration on a specified interface. Information provided by this command includes the ports trust setting, the default CoS value, and the DSCP value.

#### Command Mode

EXEC

#### Command Syntax

```
show qos interfaces INTERFACE_NAME
```

#### Parameters

- **INTERFACE\_NAME** Interface For which command returns data. Options include:
  - **<no parameter>** Returns data for all interfaces.
  - **ethernet e\_num** Ethernet interface specified by **e\_num**.
  - **port-channel p\_num** Port-Channel Interface specified by **p\_num**.

#### Example

This command lists the QoS configuration for **Ethernet interface 4**.

```
switch>show qos interfaces ethernet 4

Ethernet4:
  Trust Mode: COS
  Default COS: 0
  Default DSCP: 0

  Port shaping rate: 5000000Kbps

  Tx-Queue   Bandwidth   ShapeRate   Priority
            (percent)   (Kbps)
  -----
            0         50     disabled   round-robin
            1         50     disabled   round-robin
            2        N/A     disabled   strict
            3        N/A     1000000    strict
            4        N/A     1000000    strict
            5        N/A     1500000    strict
            6        N/A     2000000    strict

switch>
```

**9.1.10.56 show qos maps**

The **show qos maps** command lists the number of traffic classes that the switch supports and displays the CoS-Traffic Class, DSCP-Traffic Class, Traffic Class-CoS, and Traffic Class-Transmit Queue maps.

**Command Mode**

EXEC

**Command Syntax**show qos maps **Examples****Example**

This command displays the QoS maps that are configured on the switch.

```
switch>show qos maps
Number of Traffic Classes supported: 8
Number of Transmit Queues supported: 8
Cos Rewrite: Disabled
Dscp Rewrite: Disabled

Cos-tc map:
cos:  0  1  2  3  4  5  6  7
-----
tc:   1  0  2  3  4  5  6  7

Dscp-tc map:
d1 :  d2 0  1  2  3  4  5  6  7  8  9
-----

switch>
```

---

### 9.1.10.57 show qos profile summary

The **show qos profile summary** command displays the QoS profile summary of those which are part of the running configuration.

#### Command Mode

EXEC

#### Command Syntax

```
show qos profile summary
```

#### Example

This command shows a summary of all QoS profiles configured on the switch.

```
switch(config)#show qos profile summary  
Qos Profile: p  
Configured on: Et13,7  
Fabric  
Po12  
Qos Profile: p2  
Configured on: Et56
```

### 9.1.10.58 show qos profile

The `show qos profile` command displays the contents of the specified QoS profile or of all QoS profiles in the running configuration.

#### Command Mode

EXEC

#### Command Syntax

```
show qos profile profile_name
```

#### Parameter

- *profile\_name* QoS profile name.

#### Examples

- This command displays the contents of all QoS profiles configured on the switch.

```
switch(config)#show qos profile
qos profile p
qos cos 1
no priority-flow-control pause watchdog
priority-flow-control priority 1 no-drop
priority-flow-control priority 2 no-drop
qos profile p2
qos cos 3
priority-flow-control priority 0 no-drop
```

- This command displays the configuration attached and information specific to **QoS profile p2**.

```
switch#show qos profile p2
qos profile p2
qos cos 3
priority-flow-control priority 0 no-drop
```

---

### 9.1.10.59 show qos random-detect ecn

```
show qos random-detect ecn
```

The command displays the global Explicit Congestion Notification (ECN) configuration.

#### Command Mode

EXEC

#### Command Syntax

```
show qos random-detect ecn
```

#### Example

These commands configure global ECN parameters, then displays that configuration.

```
switch(config)#qos random-detect ecn global-buffer minimum-thres  
hold 2 mbytes  
maximum-threshold 5 mbytes  
switch(config)#show qos random-detect ecn  
  
Minimum Threshold: 2  
Maximum Threshold: 5  
Threshold Unit: mbytes  
  
switch(config)#
```

### 9.1.10.60 show run|grep sharing

The **show run|grep sharing** command displays whether the QoS policy-map sharing on SVIs is enabled or disabled.

#### Command Mode

EXEC

#### Command Syntax

```
show run|grep sharing
```

#### Example

This command displays whether the QoS policy-map sharing on SVIs is enabled or disabled.

```
switch#show run|grep sharing  
hardware access-list qos resource sharing vlan in ----  
If this message is displayed then QoS policy-map sharing on SVIs  
is enabled.
```

---

### 9.1.10.61 tx-queue (Arad/Jericho)

The **tx-queue** command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Arad and Jericho platform switches have eight queues, **0** through **7**, and all queues are exposed through the CLI. However, queue **7** is not user-configurable. Queue **7** is always mapped to traffic class **7**, which is reserved for control traffic.

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no tx-queue** and **default tx-queue** commands remove the configuration for the specified transmit queue by deleting all corresponding **tx-queue** mode statements from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
tx-queue queue_level
```

#### Parameters

- **queue\_level** The transmit queue. Values range from **0** to **7**.

#### Commands Available in tx-queue Configuration Mode

- [bandwidth percent \(Arad/Jericho\)](#)
- [priority \(Arad/Jericho\)](#)
- [shape rate \(Tx-queue – Arad/Jericho\)](#)

#### Guidelines

Arad and Jericho platform switch queues handle unicast traffic. Queues for multicast traffic are not supported.

#### Example

This command enters Tx-queue configuration mode for **transmit queue 4** of **Ethernet interface 3/3/3**.

```
switch(config)#interface ethernet 3/3/3
switch(config-if-Et3/3/3)#tx-queue 4
switch(config-if-Et3/3/3-txq-4)#
```

### 9.1.10.62 tx-queue (FM6000)

The **tx-queue** command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

FM6000 platform switches have eight queues, **0** through **7**. All queues are exposed through the CLI and are user configurable.

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no tx-queue** and **default tx-queue** commands remove the configuration for the specified transmit queue by deleting the all corresponding **tx-queue** mode commands from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
tx-queue queue_level
```

#### Parameters

**queue\_level** The transmit queue. Values range from **0** to **7**.

#### Commands Available in tx-queue Configuration Mode

- [bandwidth percent \(FM6000\)](#)
- [priority \(FM6000\)](#)
- [shape rate \(Tx-queue – FM6000\)](#)

#### Guidelines

FM6000 platform switch queues handle unicast and multicast traffic.

#### Example

This command enters Tx-queue configuration mode for **transmit queue 3** of **Ethernet interface 5**.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#tx-queue 3  
switch(config-if-Et5-txq-3)#
```

---

### 9.1.10.63 tx-queue (Helix)

The **tx-queue** command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Helix platform switches have eight unicast (UC0 – UC7) and eight multicast (MC0 – MC7) queues. Each UCx-MCx queue set is combined into a single queue group (L1.x), which is exposed to the CLI through this command.

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no tx-queue** and **default tx-queue** commands remove the configuration for the specified transmit queue by deleting the all corresponding **tx-queue** mode commands from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

**Command Syntax** `tx-queue queue_level`

#### Parameters

**queue\_level** Transmit queue group number. Values range from **0** to **7**.

#### Commands Available in tx-queue Configuration Mode

- [bandwidth guaranteed \(Helix\)](#)
- [shape rate \(Tx-queue – Helix\)](#)

#### Guidelines

Helix platform switch queues handle unicast and multicast traffic.

#### Example

This command enters Tx-queue configuration mode for **transmit queue 4** of **Ethernet interface 17/3**.

```
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#
```

### 9.1.10.64 tx-queue (Petra)

The **tx-queue** command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Petra platform switches have eight queues, **0** through **7**, and all queues are exposed through the CLI. However, queue 7 is not user-configurable. Queue 7 is always mapped to traffic class 7, which is reserved for control traffic.

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no tx-queue** and **default tx-queue** commands remove the configuration for the specified transmit queue by deleting the all corresponding **tx-queue** mode commands from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
tx-queue queue_level
```

#### Parameters

**queue\_level** The transmit queue. Values range from **0** to **7**.

#### Commands Available in tx-queue Configuration Mode

- [bandwidth percent \(Petra\)](#)
- [priority \(Petra\)](#)
- [shape rate \(Tx-queue – Petra\)](#)

#### Guidelines

Petra platform switch queues handle unicast traffic. Queues for multicast traffic are not supported.

#### Example

This command enters Tx-queue configuration mode for **transmit queue 3** of **Ethernet interface 3/3**.

```
switch(config)#interface ethernet 3/3
switch(config-if-Et3/3)#tx-queue 3
switch(config-if-Et3/3-txq-3)#
```

---

### 9.1.10.65 tx-queue (Trident II)

The **tx-queue** command places the switch in Tx-queue configuration mode to configure a transmit queue on the configuration mode interface. Tx-queue configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Trident II platform switches have eight unicast (UC0 – UC7) and eight multicast (MC0 – MC7) queues. Each UCx-MCx queue set is combined into a single queue group (L1.x), which is exposed to the CLI through this command.

The **exit** command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The **no tx-queue** and **default tx-queue** commands remove the configuration for the specified transmit queue by deleting the all corresponding **tx-queue** mode commands from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
tx-queue queue_level
```

#### Parameters

**queue\_level** Transmit queue group number. Values range from **0** to **7**.

#### Commands Available in tx-queue Configuration Mode

- [bandwidth guaranteed \(Trident II\)](#)
- [shape rate \(Tx-queue – Trident II\)](#)

Trident II platform switch queues handle unicast and multicast traffic.

#### Example

This command enters Tx-queue configuration mode for **transmit queue 4** of **Ethernet interface 17/3**.

```
switch(config)#interface ethernet 17/3
switch(config-if-Et17/3)#tx-queue 4
switch(config-if-Et17/3-txq-4)#
```

### 9.1.10.66 uc-tx-queue

The `uc-tx-queue` command places the switch in `uc-tx-queue` configuration mode to configure a unicast transmit queue on the configuration mode interface. `Uc-tx-queue` configuration mode is not a group change mode; ***running-config*** is changed immediately after commands are executed. The `exit` command does not affect the configuration.

Trident and Tomahawk switches have eight unicast queues (UC0 – UC7) and four multicast queues (MC0 – MC3), categorized into two priority groups. All queues are exposed through the CLI and are user-configurable.

- **Priority Group 1:** UC7, UC6, MC3
- **Priority Group 0:** UC5, UC4, MC2, UC3, UC2, MC1, UC1, UC0, MC0

The `exit` command returns the switch to the configuration mode for the base Ethernet or port channel interface.

The `no uc-tx-queue` and `default uc-tx-queue` commands remove the configuration for the specified transmit queue by deleting the all corresponding `uc-tx-queue` mode commands from ***running-config***.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
uc-tx-queue queue_level
```

#### Parameters

***queue\_level*** The multicast transmit queue number. Values range from *0* to *7*.

#### Commands Available in uc-tx-queue Configuration Mode

- [bandwidth percent \(Trident and Tomahawk\)](#)
- [priority \(Trident and Tomahawk\)](#)
- [shape rate \(Tx-queue – Trident and Tomahawk\)](#)

#### Related Command

[mc-tx-queue](#): Configures multicast transmit queues on Trident and Tomahawk platform switches.

#### Example

This command enters `mc-tx-queue` configuration mode for ***multicast transmit queue 4 of Ethernet interface 5***.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#uc-tx-queue 4
switch(config-if-Et5-mc-txq-4)#
```

## 9.2 Traffic Management

This chapter describes Arista's Traffic Management, including configuration instructions and command descriptions. Topics covered by this chapter include:

- [Traffic Management Conceptual Overview](#)
- [Traffic Management Configuration Arad Platform Switches](#)

- 
- [Traffic Management Configuration FM6000 Platform Switches](#)
  - [Traffic Management Configuration Petra Platform Switches](#)
  - [Traffic Management Configuration Trident Platform Switches](#)
  - [Traffic Management Configuration Trident II Platform Switches](#)
  - [Traffic Management Configuration Commands](#)

## 9.2.1 Traffic Management Conceptual Overview

Traffic is managed through policy maps that apply data shaping methods to specific data streams. A policy map is a data structure that identifies specific data streams and then defines shaping parameters that modify packets within the streams. The switch defines three types of policies:

- **Control Plane Policies:** Control plane policy maps are applied to the control plane.
- **QoS Policies:** QoS policy maps are applied to Ethernet and port channel interfaces.
- **PBR Policies:** PBR policy maps are applied to Ethernet interfaces, port channel interfaces and switch virtual interfaces (SVIs).
- **PDP Policies:** PDP policy maps are assigned to Ethernet interfaces.

**Note:** PDP is available only in EOS versions 4.19.0F and above.

A policy map consists of classes. Each class contains an eponymous class map and traffic resolution commands.

- A class map is a data structure that defines a data stream by specifying characteristics of data packets that comprise that stream. Each class map is typed as either QoS, control plane, PBR, or PDP and is available only to identically typed policy maps.
- Traffic resolution commands specify data handling methods for traffic that matches a class map. Traffic resolution options vary by policy map type.

Data packets that enter an entity to which a policy map is assigned are managed with traffic resolution commands of the first class that matches the packets.

### 9.2.1.1 Control Plane Policies

The switch defines one control plane policy map named ***copp-system-policy***. The ***copp-system-policy*** policy map is always applied to the control plane and cannot be removed from the switch. Other control plane policy maps cannot be added. ***Copp-system-policy*** consists of preconfigured classes, each containing a static class map and traffic resolution commands. Preconfigured classes cannot be removed from ***copp-system-policy***.

Static class maps are provided by the switch and cannot be modified or deleted. The naming convention of static class maps is ***copp-system-name***, where *name* differentiates the class maps. Static class maps have pre-defined internal conditions, are not based on ACLs, and are only listed in ***running-config*** as components of ***copp-system-policy***. The sequence of static class maps in the policy map is not significant. Traffic resolution commands define minimum (bandwidth) and maximum (shape) transmission rates for data streams matching the corresponding class map.

***Copp-system-policy*** can be modified through the following steps:

- Add classes consisting of an eponymous dynamic class map and traffic resolution commands.

Dynamic class maps are user created, can be edited or deleted, filter traffic with a single IPv4 ACL, and are listed in ***running-config***.

- Change traffic resolution commands for a preconfigured class.

These sections describe control plane traffic policy configuration procedures:

- [Configuring Control Plane Traffic Policies Arad Platform Switches](#)
- [Configuring Control Plane Traffic Policies FM6000 Platform Switches](#)

- [Configuring Control Plane Traffic Policies Petra Platform Switches](#)
- [Configuring Control Plane Traffic Policies Trident Platform Switches](#)

### 9.2.1.2 QoS Policies

QoS policy maps are user defined. The switch does not provide preconfigured QoS policy maps and in the default configuration, policy maps are not applied to any Ethernet or port channel interface. Policy maps and class maps are created and applied to interfaces through configuration commands.

A QoS policy map is composed of one or more classes. Each class contains an eponymous dynamic class map and traffic resolution commands. Dynamic class maps are user created, can be edited or deleted, filter traffic with a single IPv4 ACL, and are listed in *running-config*.

QoS traffic resolution commands perform one of the following:

- Set the Layer 2 CoS field
- Set the DSCP value in the ToS byte
- Specify a traffic class queue

The last class in all QoS policy maps is *class-default*, which is composed as follows:

- The *class-default* class map matches all traffic except IPv4 or IPv6 traffic and is not editable.
- By default, *class-default* class contains no traffic resolution commands. Traffic resolution commands can be added through configuration commands.

Data packets that enter an interface to which a policy map is assigned are managed with traffic resolution commands that correspond to the first class that matches the packet.

These sections describe QoS traffic policy configuration procedures:

- [Configuring QoS Traffic Policies Arad Platform Switches](#)
- [Configuring QoS Traffic Policies FM6000 Platform Switches](#)
- [Configuring QoS Traffic Policies Petra Platform Switches](#)
- [Configuring QoS Traffic Policies Trident Platform Switches](#)

### 9.2.1.3 PBR Policies

Policy-Based Routing (PBR) allows the operator to specify the next hop for selected incoming packets on an L3 interface, overriding the routing table. Incoming packets are filtered through a policy map referencing one or more ACLs, and matching packets are routed to the next hop specified.

A PBR policy map is composed of one or more classes and can include next-hop information for each class. It can also include single-line raw match statements, which have the appearance and function of a single line from an ACL. Each class contains an eponymous class map. Class maps are user-created, can be edited or deleted, filter traffic using IPv4 ACLs, and are listed in *running-config*.

These sections describe PBR policy configuration procedures:

- [Configuring PBR Policies Arad Platform Switches](#)
- [Configuring PBR Policies FM6000 Platform Switches](#)
- [Configuring PBR Policies Petra Platform Switches](#)
- [Configuring PBR Policies Trident Platform Switches](#)

### 9.2.1.4 PDP Policies

 **Note:** PDP is available only in EOS versions 4.19.0F and above.

Per-port Denial-of-service Protection (PDP) is a new, specialized, port-level packet classification and policing service, similar to the existing port-level QoS policy service, targeted specifically at identifying and rate limiting potential denial of service traffic.

---

Default policies and shared-policy support vary by platform:

**Arad and Jericho platforms** only shared policies are supported.

**FM6000 and XP** only unshared policies are supported

**Trident II, Tomahawk, and Helix4** both shared and unshared policies are supported.

Creating a PDP policy and assigning it to an interface uses procedures similar to those for QoS, but with the following commands.

- To create an unshared PDP policy, use the `policy-map type pdp` command.
- To create a shared PDP policy, use the `policy-map type pdp` command with the **shared** keyword.
- To assign a policy to an input interface, use the `service-policy type pdp (Interface mode)` command in the configuration mode for the interface.

## 9.2.2 Traffic Management Configuration Arad Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane, or to L3 interfaces for Policy-Based Routing (PBR). Policy maps contain classes, which are composed of class maps and traffic resolution commands.

[Traffic Management Conceptual Overview](#) describes traffic policies.

### 9.2.2.1 Configuring Control Plane Traffic Policies Arad Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

#### Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

#### Editing the Policy Map

The only control plane policy map is **copp-system-policy**, which cannot be deleted. In its default form, **copp-system-policy** consists of the classes listed in [copp-system-policy default classes: Arad Platform Switches](#). Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

**Table 46: copp-system-policy default classes: Arad Platform Switches**

Class Name	shape (kbps)	bandwidth (kbps)
copp-system-bgp	2500	250
copp-system-bpdu	2500	1250
copp-system-default	2500	250
copp-system-ipbroadcast	2000	200
copp-system-ipmc	2500	250

<b>Class Name</b>	<b>shape (kbps)</b>	<b>bandwidth (kbps)</b>
copp-system-ipmcmis	2500	250
copp-system-ipunicast	250000	250
copp-system-l2broadcast	2500	250
copp-system-l2unicast	250000	250
copp-system-l3destmiss	2500	250
copp-system-l3lpmoverflow	1000	200
copp-system-l3slowpath	2500	250
copp-system-l3ttl1	2500	250
copp-system-lacp	2500	1250
copp-system-linklocal	100000	250
copp-system-ldp	10000	1000
copp-system-mlag	2500	250
copp-system-multicastsnoop	2500	250
copp-system-Ospfisis	2500	250
copp-system-sflow	1000000	250
copp-system-rsvp	250000	250
copp-system-ldp	250000	250
copp-system-mpls-arp-suppress	2500	250
copp-system-arp-inspect	2500	250
copp-system-dot1x-mba	2500	250
copp-system-cfm-snoop	2500	250
copp-system-cfm	1367	98
copp-system-ptp-snoop	2500	250
copp-system-mirroring	1000000	250
copp-system-cvx-heartbeat	2500	250

Class Name	shape (kbps)	bandwidth (kbps)
copp-system-cvx	40000	1250
copp-system-mpls-label-miss	2500	250
copp-system-mpls-ttl01	2500	250
copp-system-mtu	2500	250
copp-system-mvrp	2500	250
copp-system-ntp	2500	250
copp-system-vxlan-encapsulation	200000	250
copp-system-vxlan-vtep-learn	2500	250
copp-system-aclog	2500	250
copp-system-bfd	2500	250
copp-system-igmp	2500	250

Policy maps are modified in policy-map configuration mode. The `policy-map type copp` command enters policy-map configuration mode.

### Example

This command enters policy-map configuration mode for editing copp-system-policy.

```
switch(config) #policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy) #
```

The `class (policy-map (control-plane) Arad)` command enters policy-map-class configuration mode, where traffic resolution commands are modified for the configuration mode class.

### Example

This command enters policy-map-class configuration mode for the copp-system-lacp static class.

```
switch(config-pmap-copp-system-policy) #class copp-system-lacp
switch(config-pmap-c-copp-system-policy-copp-system-lacp) #
```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- `bandwidth (policy-map-class (control-plane) Arad)` specifies the minimum bandwidth.

- `shape (policy-map-class (control-plane) Arad)` specifies the maximum bandwidth.

### Example

These commands configure a bandwidth range of 2000 to 4000 kilobits per seconds (kbps) for traffic filtered by the `copp-system-lacp` class map:

```
switch(config-pmap-c-copp-system-policy-copp-system-
lacp)#bandwidth kbps 2000
switch(config-pmap-c-copp-system-policy-copp-system-lacp)#shape
kbps 4000
switch(config-pmap-c-copp-system-policy-copp-system-lacp)#
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the modified policy map.

### Example

These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to *running-config*.

```
switch(config-pmap-c-copp-system-policy-copp-system-lacp)#exit
switch(config-pmap-copp-system-policy)#show pending
policy-map type copp copp-system-policy
  class copp-system-bpdu

  class copp-system-lldp

  class copp-system-lacp
    shape kbps 4000
    bandwidth kbps 2000

  class copp-system-l3ttl1

  class copp-system-l3slowpath

switch(config-pmap-copp-system-policy)#exit
switch(config)#
```

## Applying Policy Maps to the Control Plane

The `copp-system-policy` policy map is always applied to the control plane. No commands are available to add or remove this assignment.

## Displaying Policy Maps

The `show policy-map interface type qos` command displays the configured values of the policy maps classes and the number of packets filtered and dropped as a result of the class maps.

### Example

These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to *running-config*.

```
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
  Hardware programming status: InProgress

  Class-map: copp-system-mlag (match-any)
    shape : 10000001 kbps
    bandwidth : 10000001 kbps
    Out Packets : 0
    Drop Packets : 0

  Class-map: copp-system-bpdu (match-any)
    shape : 2604 kbps
    bandwidth : 1302 kbps
    Out Packets : 0
    Drop Packets : 0

  Class-map: copp-system-lacp (match-any)
    shape : 4230 kbps
    bandwidth : 2115 kbps
    Out Packets : 0
    Drop Packets : 0

switch(config)#

switch(config-pmap-c-copp-system-policy-copp-system-lacp)#exit
```

### 9.2.2.2 Configuring QoS Traffic Policies Arad Platform Switches.

QoS traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port channel interfaces.

#### Creating Class Maps

QoS traffic policies utilize dynamic class maps that are created and modified in class-map configuration mode. The **class-map type qos** command enters class-map configuration mode.

### Example

- This command enters class-map configuration mode to create QoS class map named Q-CMap\_1.

```
switch(config)#class-map type qos match-any Q-CMap_1
switch(config-cmap-Q-CMap_1)#
```

A class map contains one IPv4 access control list (ACL). The **match ip access-group** command assigns an ACL to the class map. Subsequent **match** commands replace the existing **match** command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

**Example**

- This command adds the IPv4 ACL named ACL\_1 to the class map.

```
switch(config-cmap-Q-CMap_1)#match ip access-group ACL_1
switch(config-cmap-Q-CMap_1)#
```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The **show active** command displays the saved version of class map. The **show pending** command displays the unsaved class map.

**Example**

- The **show active** command indicates that the configuration mode class map is not stored in *running-config*. The **show pending** command displays the class map to be stored upon exiting class-map configuration mode.

```
switch(config-cmap-Q-CMap_1)#show active
switch(config-cmap-Q-CMap_1)#show pending
class-map type qos match-any Q-CMap_1
  match ip access-group ACL_1

switch(config-cmap-Q-CMap_1)#
```

The **exit** command returns the switch to global configuration mode and saves pending class map changes. The **abort** command returns the switch to global configuration mode and discards pending changes.

**Example**

- This command exits class-map configuration mode and stores pending changes to *running-config*.

```
switch(config-cmap-CP-CMAP_1)#exit
switch(config)#show class-map type control-plane CP-CMAP_1
  Class-map: CP-CMAP_1 (match-any)
  Match: ip access-group name ACLv4_1
switch(config)#
```

**Creating Policy Maps**

Policy maps are created and modified in policy-map configuration mode. The **policy-map type quality-of-service** command enters policy-map configuration mode.

**Example**

- This command places the switch in policy-map configuration mode and creates a QoS policy map named Q-PMAP\_1.

```
switch(config)#policy-map type quality-of-service Q-PMAP_1
switch(config-pmap-Q-PMAP_1)#
```

---

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; traffic resolution commands are added or edited in policy-map-class configuration mode. The **below** command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where traffic resolution commands are added to the class.

### Example

- This command adds the Q-CMap\_1 class to the Q-PMAP\_1 policy map and places the switch in policy-map-class configuration mode.

```
switch(config-pmap-Q-PMAP_1)#class Q-CMap_1
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
```

The **set cos** commands configure traffic resolution methods for data that passes the class map:

- **set cos** sets the layer 2 CoS field.
- **set dscp** sets the DSCP value in the ToS byte.
- **set traffic class** specifies a traffic class queue.

### Example

- These commands configure the policy map to set the CoS field to 7 on packets filtered by the class map, then assigns those packets to traffic class 4.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set cos 7
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set traffic-class 4
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** and **show pending** commands display the saved and modified policy map versions, respectively.

### Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode to save the altered policy map to **running-config**.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#exit
switch(config-pmap-Q-PMAP_1)#show pending
policy-map type quality-of-service Q-PMAP_1
  class Q-CMap_1
    set cos 7
    set traffic-class 4

  class class-default

switch(config-pmap-Q-PMAP_1)#exit
switch(config)#
```

The last class in all QoS policy maps is **class-default**. The **class-default** class map matches all traffic except IPv4 or IPv6 traffic and provides no traffic resolution commands. The **class-default** class map is not editable; traffic resolution commands can be added to the **class-default** class.

To modify traffic resolution commands for the **class-default** class, enter policy-map-class configuration mode for the class, then enter the desired **set** commands.

### Example

- These commands enter policy-map-class configuration mode for **class-default**, configures the stream to enter traffic class 2, and saves the altered policy map to **running-config**.

```
switch(config)#policy-map type quality-of-service Q-PMap_1
switch(config-pmap-Q-PMap_1)#class class-default
switch(config-pmap-c-Q-PMap_1-class-default)#set traffic-class
2
switch(config-pmap-c-Q-PMap_1-class-default)#exit
switch(config-pmap-Q-PMap_1)#exit
switch(config)#show policy-map type qos Q-PMap_1
Service-policy Q-PMap_1

Class-map: Q-CMap_1 (match-any)
  Match: ipv6 access-group name ACLv6_1
    set cos 7
    set traffic-class 4

Class-map: class-default (match-any)
  set traffic-class 2

switch(config)#
```

### Applying Policy Maps to an Interface

The **service-policy type qos (Interface mode)** command applies a specified policy map to the configuration mode interface.

- These commands apply PMAP-1 policy map to Ethernet interface 8.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#show active
switch(config-if-Et8)#service-policy input PMAP-1
switch(config-if-Et8)#show active
interface Ethernet8
  service-policy type qos input PMAP-1
switch(config-if-Et8)#
```

### 9.2.2.3 Configuring PBR Policies Arad Platform Switches

Policy-Based Routing (PBR) is implemented by creating class maps and policy maps, then applying the policy maps to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

---

## Creating PBR Class Maps

PBR policies utilize class maps that are created and modified in class-map configuration mode. The `class-map type pbr` command enters class-map configuration mode.

### Example

This command enters class-map configuration mode to create a PBR class map named CMAP1.

```
switch(config)#class-map type pbr match-any CMAP1
switch(config-cmap-PBR-CMAP1)#
```

A class map contains one or more access control lists (ACLs). The `match (policy-map (pbr))` command assigns an ACL to the class map. Subsequent `match` commands add additional ACLs to the class map. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded; if a class map includes ACLs with deny rules, the configuration reverts to its previous state.

### Example

- This command adds the ACL named ACL1 to the class map.

```
switch(config-cmap-PBR-CMAP1)#match ip access-group ACL1
switch(config-cmap-PBR-CMAP1)#
```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map.

- The `show active` command indicates that the configuration mode class map is not stored in **running-config**.

```
switch(config-cmap-PBR-CMAP1)#show active
switch(config-cmap-PBR-CMAP1)#
```

The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending changes.

### Example

This command exits class-map configuration mode and stores pending changes to **running-config**.

```
switch(config-cmap-PBR-CMAP1)#exit
switch(config)#show class-map type pbr CMAP1
class-map type pbr match-any CMAP1
  10 match ip access-group ACL1
switch(config)#
```

## Creating PBR Policy Maps

Policy maps are created and modified in policy-map configuration mode. The `policy-map type pbr` command enters policy-map configuration mode.

### Example

This command enters policy-map configuration mode for creating a PBR policy map named PMAP1.

```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; next-hop commands are added or edited in policy-map-class configuration mode. The `class (policy-map (pbr))` command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where next-hop commands are added to the class.

### Example

- This command adds the CMAP1 class to the policy map and places the switch in policy-map-class configuration mode.

```
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#
```

The `set nexthop (policy-map-class pbr)` command configures the next hop for data that passes the class map.

- This command configures the policy map to set the next hop to 10.12.0.5 on packets filtered by the class map.

```
switch(config-pmap-c-PMAP1-CMAP1)#set nexthop 10.12.0.5
switch(config-pmap-c-PMAP1-CMAP1)#
```

The `set nexthop-group (policy-map-class (pbr) Arad)` command configures a nexthop group as the next hop for data that passes the class map.

- These commands configure the policy map PMAP1 to set the next hop to a nexthop group named GROUP1 for traffic defined by class map CMAP1.

```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#set nexthop-group GROUP1
switch(config-pmap-c-PMAP1-CMAP1)#
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the currently saved map version.

### Example

---

These commands exit policy-map-class configuration mode, then exit policy-map configuration mode to save the altered policy map to *running-config*.

```
switch(config-pmap-c-PMAP1-CMAP1) #exit
switch(config-pmap-PMAP1) #exit
switch(config) #
```

### Applying a PBR Policy Map to an Interface

The [service-policy type pbr \(Interface mode\)](#) command applies the specified PBR policy map to the configuration mode interface. Only one PBR service policy is supported per interface.

- These commands apply the PMAP1 PBR policy map to Ethernet interface 8.

```
switch(config) #interface ethernet 8
switch(config-if-Et8) #service-policy type pbr input PMAP1
switch(config-if-Et8) #
```

### Hardware Decapsulation

When hardware decapsulation takes place, PBR policy maps on Arad platform switches match on outer packet headers (i.e., they match based on the attributes of the packet before it is decapsulated).

## 9.2.3 Traffic Management Configuration FM6000 Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane or an interface. Policy maps contain classes, which are composed of class maps and traffic resolution commands. [Traffic Management Conceptual Overview](#) describes traffic policies.

FM6000 platform switches support the following traffic policies:

- Control plane policies manage control plane traffic.
- QoS traffic policies manage traffic on Ethernet and port channel interfaces.

These sections describe the construction and application of policy maps on FM6000 platform switches:

- [Configuring Control Plane Traffic Policies FM6000 Platform Switches](#)
- [Configuring QoS Traffic Policies FM6000 Platform Switches](#)
- [Configuring PBR Policies FM6000 Platform Switches](#)

### 9.2.3.1 Configuring Control Plane Traffic Policies FM6000 Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

#### Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

#### Editing the Policy Map

The only control plane policy map is **copp-system-policy**, which cannot be deleted. In its default form, **copp-system-policy** consists of the classes listed in [copp-system-policy default classes: FM6000 Platform Switches](#). Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

**Table 47: copp-system-policy default classes: FM6000 Platform Switches**

Class Name	shape (pps)	bandwidth (pps)
copp-system-arp	10000	1000
copp-system-default	8000	1000
copp-system-ipmcrsvd	10000	1000
copp-system-ipmcmiss	10000	1000
copp-system-igmp	10000	1000
copp-system-l2rsvd	10000	10000
copp-system-l3slowpath	10000	1000
copp-system-pim-ptp	10000	1000
copp-system-ospf-isis	10000	1000
copp-system-selfip	5000	5000
copp-system-selfip-tc6to7	5000	5000
copp-system-sflow	25000	1000

Policy maps are modified in policy-map configuration mode. The `policy-map type copp` command enters policy-map configuration mode.

**Example**

- This command enters policy-map configuration mode for editing *copp-system-policy*.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#
```

The `class (policy-map (control-plane) FM6000)` command enters policy-map-class configuration mode, where traffic resolution commands are modified for the configuration mode class.

**Example**

- This command enters policy-map-class configuration mode for the *copp-system-arp* static class.

```
switch(config-pmap-copp-system-policy)#class copp-system-arp
switch(config-pmap-c-copp-system-policy-copp-system-arp)#
```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- `bandwidth (policy-map-class (control-plane) FM6000)` specifies the minimum bandwidth.

- `shape (policy-map-class (control-plane) FM6000)` specifies the maximum bandwidth.

### Example

- These commands configure a bandwidth range of 2000 to 4000 packets per seconds (pps) for traffic filtered by the `copp-system-arp` class map:

```
switch(config-pmap-c-copp-system-policy-copp-system-arp)#bandwidth pps 2000
switch(config-pmap-c-copp-system-policy-copp-system-arp)#shape pps 4000
switch(config-pmap-c-copp-system-policy-copp-system-arp)#
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the saved version of policy map. The **show pending** command displays the modified policy map.

### Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to **running-config**.

```
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#exit
switch(config-pmap-copp-system-policy)#show pending
policy-map type copp copp-system-policy
  class CP-CMAP_1
    shape pps 4000
    bandwidth pps 2000

  class copp-system-bpdu

  class copp-system-lldp

  class copp-system-lacp

  class copp-system-arp

  class copp-system-arpresolver

  class copp-system-default

switch(config-pmap-copp-system-policy)#exit
switch(config)#
```

## Applying Policy Maps to the Control Plane

The **copp-system-policy** policy map is always applied to the control plane. No commands are available to add or remove this assignment.

### 9.2.3.2 Configuring QoS Traffic Policies FM6000 Platform Switches

QoS traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port channel interfaces.

#### Creating Class Maps

QoS traffic policies utilize dynamic class maps that are created and modified in class-map configuration mode. The `class-map type qos` command enters class-map configuration mode.

##### Example

This command enters class-map configuration mode to create QoS class map named Q-CMap\_1.

```
switch(config)#class-map type qos match-any Q-CMap_1
switch(config-cmap-Q-CMap_1)#
```

A class map contains one IPv4 access control list (ACL). The `match (class-map (qos) FM6000)` command assigns an ACL to the class map. Subsequent `match` commands replace the existing `match` command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

##### Example

This command adds the IPv4 ACL named ACL\_1 to the class map.

```
switch(config-cmap-Q-CMap_1)#match ip access-group ACL_1
switch(config-cmap-Q-CMap_1)#
```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map. The `show pending` command displays the unsaved class map.

##### Example

The `show active` command indicates that the configuration mode class map is not stored in *running-config*. The `show pending` command displays the class map to be stored upon exiting class-map configuration mode.

```
switch(config-cmap-Q-CMap_1)#show active
switch(config-cmap-Q-CMap_1)#show pending
class-map type qos match-any Q-CMap_1
  match ip access-group ACL_1

switch(config-cmap-Q-CMap_1)#
```

The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending changes.

### Example

This command exits class-map configuration mode and stores pending changes to *running-config*.

```
switch(config-cmap-CP-CMAP_1)#exit
switch(config)#show class-map type control-plane CP-CMAP_1
  Class-map: CP-CMAP_1 (match-any)
    Match: ip access-group name ACLv4_1
switch(config)#
```

## Creating Policy Maps

Policy maps are created and modified in policy-map configuration mode. The `policy-map type quality-of-service` command enters policy-map configuration mode.

### Example

This command places the switch in policy-map configuration mode and creates a QoS policy map named Q-PMAP\_1.

```
switch(config)#policy-map type quality-of-service Q-PMAP_1
switch(config-pmap-Q-PMAP_1)#
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; traffic resolution commands are added or edited in policy-map-class configuration mode. The `class (policy-map (qos) FM6000)` command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where traffic resolution commands are added to the class.

### Example

This command adds the Q-CMap\_1 class to the Q-PMAP\_1 policy map and places the switch in policy-map-class configuration mode.

```
switch(config-pmap-Q-PMAP_1)#class Q-CMap_1
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
```

`set (policy-map-class (qos) FM6000)` commands configure traffic resolution methods for data that passes the class map:

- **set cos** sets the layer 2 CoS field.
- **set dscp** sets the DSCP value in the ToS byte.
- **set traffic class** specifies a traffic class queue.

### Example

These commands configure the policy map to set the CoS field to 7 on packets filtered by the class map, then assigns those packets to traffic class 4.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set cos 7
```

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set traffic-class 4
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** and **show pending** commands display the saved and modified policy map versions, respectively.

### Example

These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode to save the altered policy map to **running-config**.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#exit
switch(config-pmap-Q-PMAP_1)#show pending
policy-map type quality-of-service Q-PMAP_1
  class Q-CMap_1
    set cos 7
    set traffic-class 4

  class class-default

switch(config-pmap-Q-PMAP_1)#exit
switch(config)#
```

The last class in all QoS policy maps is **class-default**. The **class-default** class map matches all traffic except IPv4 or IPv6 traffic and provides no traffic resolution commands. The **class-default** class map is not editable; traffic resolution commands can be added to the **class-default** class.

To modify traffic resolution commands for the **class-default** class, enter policy-map-class configuration mode for the class, then enter the desired **set** commands.

### Example

These commands enter policy-map-class configuration mode for **class-default**, configures the stream to enter traffic class 2, and saves the altered policy map to **running-config**.

```
switch(config)#policy-map type quality-of-service Q-PMap_1
switch(config-pmap-Q-PMap_1)#class class-default
switch(config-pmap-c-Q-PMap_1-class-default)#set traffic-class 2
switch(config-pmap-c-Q-PMap_1-class-default)#exit
switch(config-pmap-Q-PMap_1)#exit
switch(config)#show policy-map type qos Q-PMap_1
Service-policy Q-PMap_1

  Class-map: Q-CMap_1 (match-any)
    Match: ipv6 access-group name ACLv6_1
      set cos 7
      set traffic-class 4

  Class-map: class-default (match-any)
    set traffic-class 2
```

```
switch(config)#
```

### Applying Policy Maps to an Interface

The `service-policy type qos (Interface mode)` command applies a specified policy map to the configuration mode interface.

- These commands apply PMAP-1 policy map to Ethernet interface 8.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#show active
switch(config-if-Et8)#service-policy input PMAP-1
switch(config-if-Et8)#show active
interface Ethernet8
  service-policy type qos input PMAP-1
switch(config-if-Et8)#
```

### 9.2.3.3 Configuring PBR Policies FM6000 Platform Switches

Policy-Based Routing (PBR) is implemented by creating class maps and policy maps, then applying the policy maps to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

#### Creating PBR Class Maps

PBR policies utilize class maps that are created and modified in class-map configuration mode. The `class-map type pbr` command enters class-map configuration mode.

#### Example

- This command enters class-map configuration mode to create a PBR class map named CMAP1.

```
switch(config)#class-map type pbr match-any CMAP1
switch(config-cmap-PBR-CMAP1)#
```

A class map contains one or more IPv4 access control lists (ACLs). The `match (policy-map (pbr))` command assigns an ACL to the class map. Subsequent `match` commands add additional ACLs to the class map. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded; if a class map includes ACLs with deny rules, the configuration reverts to its previous state.

On FM6000 platform switches, counters are not supported, so a `counters per-entry (ACL configuration modes)` command in an ACL is ignored.

#### Example

- This command adds the IPv4 ACL named ACL1 to the class map.

```
switch(config-cmap-PBR-CMAP1)#match ip access-group ACL1
switch(config-cmap-PBR-CMAP1)#
```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map.

- The **show active** command indicates that the configuration mode class map is not stored in running-config.

```
switch(config-cmap-PBR-CMAP1)#show active
switch(config-cmap-PBR-CMAP1)#
```

The **exit** command returns the switch to global configuration mode and saves pending class map changes. The **abort** command returns the switch to global configuration mode and discards pending changes.

### Example

- This command exits class-map configuration mode and stores pending changes to *running-config*.

```
switch(config-cmap-PBR-CMAP1)#exit
switch(config)#show class-map type pbr CMAP1
class-map type pbr match-any CMAP1
  10 match ip access-group ACL1
switch(config)#
```

## Creating PBR Policy Maps

Policy maps are created and modified in policy-map configuration mode. The **policy-map type pbr** command enters policy-map configuration mode.

### Example

- This command enters policy-map configuration mode for creating a PBR policy map named PMAP1.

```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; next-hop commands are added or edited in policy-map-class configuration mode. The **class (policy-map (pbr))** command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where next-hop commands are added to the class.

### Example

- This command adds the CMAP1 class to the policy map and places the switch in policy-map-class configuration mode.

```
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#
```

The **set nexthop (policy-map-class pbr)** command configures the next hop for data that passes the class map.

- This command configures the policy map to set the next hop to 10.12.0.5 on packets filtered by the class map.

```
switch(config-pmap-c-PMAP1-CMAP1)#set nexthop 10.12.0.5
switch(config-pmap-c-PMAP1-CMAP1)#
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the currently saved map version.

### Example

- These commands exit policy-map-class configuration mode, then exit policy-map configuration mode to save the altered policy map to *running-config*.

```
switch(config-pmap-c-PMAP1-CMAP1)#exit
switch(config-pmap-PMAP1)#exit
switch(config)#
```

## Applying a PBR Policy Map to an Interface

The **service-policy type pbr (Interface mode)** command applies the specified PBR policy map to the configuration mode interface. Only one PBR service policy is supported per interface.

- These commands apply the PMAP1 PBR policy map to Ethernet interface 8.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#service-policy type pbr input PMAP1
switch(config-if-Et8)#
```

## Hardware Decapsulation

When hardware decapsulation takes place, PBR policy maps on FM6000 platform switches match on outer packet headers (i.e., they match based on the attributes of the packet before it is decapsulated).

## 9.2.4 Traffic Management Configuration Petra Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane. Policy maps contain classes, which are composed of class maps and traffic resolution commands. QoS traffic policies are not supported on 7500 Series switches.

[Traffic Management Conceptual Overview](#) describes traffic policies.

### 9.2.4.1 Configuring Control Plane Traffic Policies Petra Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

#### Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

## Editing the Policy Map

The only control plane policy map is **copp-system-policy**, which cannot be deleted. In its default form, **copp-system-policy** consists of the classes listed in [copp-system-policy default classes: Petra Platform Switches](#). Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

**Table 48: copp-system-policy default classes: Petra Platform Switches**

Class Name	shape (kbps)	bandwidth (kbps)
copp-system-bpdu	2500	1250
copp-system-default	2500	250
copp-system-igmp	2500	250
copp-system-ipbroadcast	2500	250
copp-system-ipmc	2500	250
copp-system-ipmcmiss	2500	250
copp-system-ipmcrsvd	2500	250
copp-system-ipunicast	NO LIMIT	250
copp-system-l3destmiss	2500	250
copp-system-l3slowpath	2500	250
copp-system-l3ttl0	2500	250
copp-system-l3ttl1	2500	250
copp-system-lacp	2500	1250
copp-system-ldp	2500	250
copp-system-unicast-arp	2500	250

Policy maps are modified in policy-map configuration mode. The `policy-map type copp` command enters policy-map configuration mode.

### Example

This command enters policy-map configuration mode for editing **copp-system-policy**.

```
switch(config) #policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy) #
```

---

The `class (policy-map (control-plane) Petra)` command enters policy-map-class configuration mode, where traffic resolution commands are modified for the configuration mode class.

### Example

- This command enters policy-map-class configuration mode for the `copp-system-lldp` static class.

```
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- `bandwidth (policy-map-class (control-plane) Petra)` specifies the minimum bandwidth.
- `shape (policy-map-class (control-plane) Petra)` specifies the maximum bandwidth.

### Example

These commands configure a bandwidth range of 2000 to 4000 kilobits per seconds (kbps) for traffic filtered by the `copp-system-arp` class map:

```
switch(config-pmap-c-copp-system-policy-copp-system-
lldp)#bandwidth kbps 2000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape
kbps 4000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the configured policy map.

Petra platform switches do not support all discrete rate values. When a `bandwidth` or `shape` command specifies a value that is not supported, the switch converts the rate to the next highest discrete value that it supports. The `show policy-map interface type qos` command displays the converted rate and not the user configured rate.

### Example

These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to *running-config*.

```
switch(config-pmap-c-copp-system-policy-copp-system-lacp)#exit
switch(config-pmap-copp-system-policy)#show pending
policy-map type copp copp-system-policy
  class copp-system-bpdu

  class copp-system-lldp
    shape kbps 4000
    bandwidth kbps 2000
```

```

class copp-system-lacp

switch(config-pmap-copp-system-policy) #exit
switch(config) #

```

Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** command displays the saved version of policy map. The **show pending** command displays the modified policy map.

### Displaying Policy Maps

The **show policy-map interface type qos** command displays the traffic resolution rates of the policy maps classes and the number of packets filtered and dropped as a result of the class maps. The shape and bandwidth rates may differ from configured values, because the switch does not support all discrete rate values.

#### Example

These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to **running-config**.

```

switch(config) #show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
Hardware programming status: InProgress

Class-map: copp-system-mlag (match-any)
  shape : 10000001 kbps
  bandwidth : 10000001 kbps
  Out Packets : 0
  Drop Packets : 0

Class-map: copp-system-lacp (match-any)
  shape : 2604 kbps
  bandwidth : 1302 kbps
  Out Packets : 0
  Drop Packets : 0

switch(config) #

```

### Applying Policy Maps to the Control Plane

The **copp-system-policy** policy map is always applied to the control plane. No commands are available to add or remove this assignment.

#### 9.2.4.2 Configuring QoS Traffic Policies – Petra Platform Switches

QoS traffic policies are not supported on Petra platform switches.

#### 9.2.4.3 Configuring PBR Policies – Petra Platform Switches

PBR policies are not supported on Petra platform switches.

---

## 9.2.5 Traffic Management Configuration Trident Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane or an interface. Policy maps contain classes, which are composed of class maps and traffic resolution commands. [Traffic Management Conceptual Overview](#) describes traffic policies.

Trident platform switches support the following traffic policies:

- Control plane policies manage control plane traffic.
- QoS traffic policies manage traffic on Ethernet and port channel interfaces.

These sections describe the construction and application of policy maps:

- [Configuring Control Plane Traffic Policies Trident Platform Switches](#)
- [Configuring QoS Traffic Policies Trident Platform Switches](#)
- [Configuring PBR Policies Trident Platform Switches](#)

### 9.2.5.1 Configuring Control Plane Traffic Policies Trident Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by creating class maps and editing the policy map to include the new class maps.

#### Creating Class Maps

Control plane traffic policies utilize static and dynamic class maps. Static class maps are provided by the switch, are not editable, and cannot be deleted. Dynamic class maps are created and modified in class-map configuration mode. The `class-map type copp` command enters class-map configuration mode.

#### Example

This command enters class-map configuration mode for creating or editing a control plane dynamic class map named CP-CMAP\_1.

```
switch(config)#class-map type copp match-any CP-CMAP_1
switch(config-cmap-CP-CMAP_1)#
```

Class maps contain one IPv4 or IPv6 access control list (ACL). The `match (class-map (control-plane) Trident)` command assigns an ACL to the class map. Subsequent `match` commands replace the existing `match` command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

#### Example

This command assigns the IPv4 ACL named ACLv4\_1 to the class map.

```
switch(config-cmap-CP-CMAP_1)#match ip access-group ACLv4_1
switch(config-cmap-CP-CMAP_1)#
```

Class-map configuration mode is a group-change mode. Changes are saved by exiting the mode. The `show active` command displays the saved version of class map. The `show pending` command displays the unsaved class map.

#### Example

The **show active** command indicates that the configuration mode class map is not stored in **running-config**. The **show pending** command displays the class map to be stored upon exiting class-map configuration mode.

```
switch(config-cmap-CP-CMAP_1)#show active
switch(config-cmap-CP-CMAP_1)#show pending
class-map type copp match-any CP-CMAP_1
    match ip access-group ACLv4_1

switch(config-cmap-CP-CMAP_1)#
```

The **exit** command returns the switch to global configuration mode and saves pending class map changes. The **abort** command returns the switch to global configuration mode and discards pending class map changes.

### Example

This command exits class-map configuration mode and stores pending changes to **running-config**.

```
switch(config-cmap-CP-CMAP_1)#exit
switch(config)#show class-map type control-plane CP-CMAP_1
Class-map: CP-CMAP_1 (match-any)
  Match: ip access-group name ACLv4_1
switch(config)#
```

### Editing the Policy Map

The only control plane policy map is **copp-system-policy**, which cannot be deleted. In its default form, **copp-system-policy** consists of the classes listed in [copp-system-policy default classes: Trident Platform Switches](#). Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

**Table 49: copp-system-policy default classes: Trident Platform Switches**

Class Name	shape (pps)	bandwidth (pps)
copp-system-bpdu	5000	5000
copp-system-lacp	5000	5000
copp-system-selfip-tc6to7	5000	5000
copp-system-selfip	5000	5000
copp-system-tc6to7	10000	1000
copp-system-ldp	10000	1000
copp-system-ipmcrsvd	10000	1000

Class Name	shape (pps)	bandwidth (pps)
copp-system-igmp	10000	1000
copp-system-ipmcmis	10000	1000
copp-system-glean	10000	1000
copp-system-tc3to5	10000	1000
copp-system-arp	10000	1000
copp-system-arpresolver	10000	1000
copp-system-l3destmiss	10000	1000
copp-system-l3slowpath	10000	1000
copp-system-l3ttl1	10000	1000
copp-system-default	8000	1000
copp-system-aclog	10000	1000
copp-system-sflow	25000	0

Policy maps are modified in policy-map configuration mode. The `policy-map type copp` command enters policy-map configuration mode.

### Example

This command enters policy-map configuration mode for editing *copp-system-policy*.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#
```

Dynamic classes are inserted in front of the static classes. Classes automatically contain their eponymous class map; traffic resolution commands are created or edited in policy-map-class configuration mode. The `class (policy-map (control-plane) Trident)` command adds a class to the policy map and places the switch in policy-map-class configuration mode, where traffic resolution commands are added to the class.

### Example

This command adds the CP-CMAP\_1 class to the copp-system-policy policy map and places the switch in policy-map-class configuration mode.

```
switch(config-pmap-copp-system-policy)#class CP-CMAP_1
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#
```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- `bandwidth (policy-map-class (control-plane) Trident)` specifies the minimum bandwidth.
- `shape (policy-map-class (control-plane) Trident)` specifies the maximum bandwidth.

### Example

These commands configure a bandwidth range of 2000 to 4000 packets per seconds (pps) for traffic filtered by the CP-CMAP\_1 class map:

```
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#bandwidth pps
2000
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#shape pps 4000
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#
```

### Example

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The **show active** command displays the saved version of policy map. The `show pending` command displays the modified policy map.

### Example

These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to **running-config**.

```
switch(config-pmap-c-copp-system-policy-CP-CMAP_1)#exit
switch(config-pmap-c-copp-system-policy)#show pending
policy-map type copp copp-system-policy
  class CP-CMAP_1
    shape pps 4000
    bandwidth pps 2000

  class copp-system-bpdu

  class copp-system-lldp

  class copp-system-lacp

  class copp-system-arp

  class copp-system-arpresolver

  class copp-system-default

switch(config-pmap-c-copp-system-policy)#exit
switch(config)#
```

### Example

To modify traffic resolution commands for a static class, enter policy-map-class configuration mode for the class, then enter the desired **bandwidth** and **shape** commands.

### Example

These commands enter policy-map-class configuration mode for copp-system-bpdu class, change the bandwidth range for the class, then save the altered policy map to **running-config**.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-bpdu
switch(config-pmap-c-copp-system-policy-copp-system-bpdu)#shape
pps 200
switch(config-pmap-c-copp-system-policy-copp-system-
bpdu)#bandwidth pps 100
switch(config-pmap-c-copp-system-policy-copp-system-bpdu)#exit
switch(config-pmap-copp-system-policy)#show pending
policy-map type copp copp-system-policy
class CP-CMAP_1
  shape pps 4000
  bandwidth pps 2000

class copp-system-bpdu
  shape pps 200
  bandwidth pps 100

class copp-system-lldp

switch(config-pmap-copp-system-policy)#exit
switch(config)#
```

## Applying Policy Maps to the Control Plane

The **copp-system-policy** policy map is always applied to the control plane. No commands are available to add or remove this assignment.

### 9.2.5.2 Configuring QoS Traffic Policies Trident Platform Switches

QoS traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port channel interfaces.

#### Creating Class Maps

QoS traffic policies utilize dynamic class maps that are created and modified in class-map configuration mode. The **class-map type qos** command enters class-map configuration mode.

### Example

- This command enters class-map configuration mode to create QoS class map named Q-CMap\_1.

```
switch(config)#class-map type qos match-any Q-CMap_1
switch(config-cmap-Q-CMap_1)#
```

A class map contains one IPv4 or IPv6 access control list (ACL). The `match (class-map (qos) Trident)` command assigns an ACL to the class map. Subsequent `match` commands replace the existing `match` command. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded.

### Example

- This command adds the IPv6 ACL named ACLv6\_1 to the class map.

```
switch(config-cmap-Q-CMap_1)#match ipv6 access-group ACLv6_1
switch(config-cmap-Q-CMap_1)#
```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map. The `show pending` command displays the unsaved class map.

### Example

- The `show active` command indicates that the configuration mode class map is not stored in *running-config*. The `show pending` command displays the class map to be stored upon exiting class-map configuration mode.

```
switch(config-cmap-Q-CMap_1)#show active
switch(config-cmap-Q-CMap_1)#show pending
class-map type qos match-any Q-CMap_1
  match ipv6 access-group ACLv6_1

switch(config-cmap-Q-CMap_1)#
```

The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending class map changes.

### Example

- This command exits class-map configuration mode and stores pending changes to *running-config*.

```
switch(config-cmap-CP-CMAP_1)#exit
switch(config)#show class-map type control-plane CP-CMAP_1
Class-map: CP-CMAP_1 (match-any)
  Match: ip access-group name ACLv4_1
switch(config)#
```

## Creating Policy Maps

Policy maps are created and modified in policy-map configuration mode. The `policy-map type quality-of-service` command enters policy-map configuration mode.

### Example

- This command enters policy-map configuration mode for creating a QoS policy map named Q-PMAP\_1.

```
switch(config)#policy-map type quality-of-service Q-PMAP_1  
switch(config-pmap-Q-PMAP_1)#
```

Policy maps are edited by adding or removing classes. A class automatically contains its eponymous class map; traffic resolution commands are added or edited in policy-map-class configuration mode. The **class (policy-map (qos) Trident)** command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where traffic resolution commands are added to the class.

### Example

- This command adds the Q-CMap\_1 class to the Q-PMAP\_1 policy map and places the switch in policy-map-class configuration mode.

```
switch(config-pmap-Q-PMAP_1)#class Q-CMap_1  
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
```

The **set (policy-map-class (qos) Trident)** command configures traffic resolution methods for data that passes the class map:

- **set cos** sets the layer 2 CoS field.
- **set dscp** sets the DSCP value in the ToS byte.
- **set traffic class** specifies a traffic class queue.

### Example

- These commands configure the policy map to set the CoS field to 7 on packets filtered by the class map, then assigns those packets to traffic class 4.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set cos 7  
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#set traffic-class 4  
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** and **show pending** commands display the saved and modified policy map versions, respectively.

### Example

- These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode to save the altered policy map to **running-config**.

```
switch(config-pmap-c-Q-PMAP_1-Q-CMap_1)#exit  
switch(config-pmap-Q-PMAP_1)#show pending
```

```

policy-map type quality-of-service Q-PMAP_1
  class Q-CMap_1
    set cos 7
    set traffic-class 4

  class class-default

switch(config-pmap-Q-PMAP_1)#exit
switch(config)#

```

The last class in all QoS policy maps is **class-default**. The **class-default** class map matches all traffic except IPv4 or IPv6 traffic and provides no traffic resolution commands. The **class-default** class map is not editable; traffic resolution commands can be added to the **class-default** class.

To modify traffic resolution commands for the **class-default** class, enter policy-map-class configuration mode for the class, then enter the desired **set** commands.

### Example

- These commands enter policy-map-class configuration mode for **class-default**, configures the stream to enter traffic class 2, and saves the altered policy map to **running-config**.

```

switch(config)#policy-map type quality-of-service Q-PMap_1
switch(config-pmap-Q-PMap_1)#class class-default
switch(config-pmap-c-Q-PMap_1-class-default)#set traffic-class
2
switch(config-pmap-c-Q-PMap_1-class-default)#exit
switch(config-pmap-Q-PMap_1)#exit
switch(config)#show policy-map type qos Q-PMap_1
Service-policy Q-PMap_1

  Class-map: Q-CMap_1 (match-any)
    Match: ipv6 access-group name ACLv6_1
      set cos 7
      set traffic-class 4

  Class-map: class-default (match-any)
    set traffic-class 2

switch(config)#

```

### Applying Policy Maps to an Interface

The **service-policy type qos (Interface mode)** command applies a specified policy map to the configuration mode interface.

### Example

- These commands apply PMAP-1 policy map to Ethernet interface 8.

```

switch(config)#interface ethernet 8
switch(config-if-Et8)#show active
switch(config-if-Et8)#service-policy input PMAP-1
switch(config-if-Et8)#show active

```

```
interface Ethernet8
  service-policy type qos input PMAP-1
switch(config-if-Et8) #
```

### 9.2.5.3 Configuring PBR Policies Trident Platform Switches

Policy-Based Routing (PBR) is implemented by creating class maps and policy maps, then applying the policy maps to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

#### Creating PBR Class Maps

PBR policies utilize class maps that are created and modified in class-map configuration mode. The `class-map type pbr` command enters class-map configuration mode.

#### Example

This command enters class-map configuration mode to create a PBR class map named CMAP1.

```
switch(config) #class-map type pbr match-any CMAP1
switch(config-cmap-PBR-CMAP1) #
```

A class map contains one or more access control lists (ACLs). The `match (policy-map (pbr))` command assigns an ACL to the class map. Subsequent `match` commands add additional ACLs to the class map. Class maps filter traffic only on ACL permit rules. Deny ACL rules are disregarded; if a class map includes ACLs with deny rules, the configuration reverts to its previous state.

#### Examples

- This command adds the ACL named ACL1 to the class map.

```
switch(config-cmap-PBR-CMAP1) #match ip access-group ACL1
switch(config-cmap-PBR-CMAP1) #
```

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map.

- The `show active` command indicates that the configuration mode class map is not stored in *running-config*.

```
switch(config-cmap-PBR-CMAP1) #show active
switch(config-cmap-PBR-CMAP1) #
```

The `exit` command returns the switch to global configuration mode and saves pending class map changes. The `abort` command returns the switch to global configuration mode and discards pending changes.

#### Example

This command exits class-map configuration mode and stores pending changes to *running-config*.

```
switch(config-cmap-PBR-CMAP1)#exit
switch(config)#show class-map type pbr CMAP1
class-map type pbr match-any CMAP1
    10 match ip access-group ACL1
switch(config)#
```

## Creating PBR Policy Maps

Policy maps are created and modified in policy-map configuration mode. The `policy-map type pbr` command enters policy-map configuration mode.

### Example

- This command enters policy-map configuration mode for creating a PBR policy map named PMAP1.

```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#
```

Policy map are edited by adding or removing classes. A class automatically contains its eponymous class map; next-hop commands are added or edited in policy-map-class configuration mode. The `class (policy-map (pbr))` command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode, where next-hop commands are added to the class.

### Example

- This command adds the CMAP1 class to the policy map and places the switch in policy-map-class configuration mode.

```
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#
```

The `set nexthop (policy-map-class pbr)` command configures the next hop for data that passes the class map.

- This command configures the policy map to set the next hop to 10.12.0.5 on packets filtered by the class map.

```
switch(config-pmap-c-PMAP1-CMAP1)#set nexthop 10.12.0.5
switch(config-pmap-c-PMAP1-CMAP1)#
```

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the currently saved map version.

- These commands exit policy-map-class configuration mode, then exit policy-map configuration mode to save the altered policy map to *running-config*.

```
switch(config-pmap-c-PMAP1-CMAP1)#exit
switch(config-pmap-PMAP1)#exit
```

```
switch(config)#
```

### Applying a PBR Policy Map to an Interface

The `service-policy type pbr (Interface mode)` command applies the specified PBR policy map to the configuration mode interface. Only one PBR service policy is supported per interface.

- These commands apply the PMAP1 PBR policy map to Ethernet interface 8.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#service-policy type pbr input PMAP1
switch(config-if-Et8)#
```

### Hardware Decapsulation

When hardware decapsulation takes place, PBR policy maps on Trident platform switches match on inner packet headers (i.e., they match based on the attributes of the decapsulated packet).

## 9.2.6 Traffic Management Configuration Trident II Platform Switches

Traffic policies are implemented by policy maps, which are applied to the control plane or an interface. Policy maps contain classes, which are composed of class maps and traffic resolution commands. [Traffic Management Conceptual Overview](#) describes traffic policies.

Trident platform switches support the following traffic policies:

- Control plane policies manage control plane traffic.
- QoS traffic policies manage traffic on Ethernet and port channel interfaces.

### 9.2.6.1 Configuring Control Plane Traffic Policies Trident II Platform Switches

Default control plane traffic policies are implemented automatically without user intervention. These policies are modified by associating traffic resolution commands with static classes that comprise the control plane policy map.

#### Static Class Maps

Control plane traffic policies utilize static class maps, which are provided by the switch, are not editable, and cannot be deleted.

#### Editing the Policy Map

The only control plane policy map is **copp-system-policy**, which cannot be deleted. In its default form, **copp-system-policy** consists of the classes listed in [copp-system-policy default classes: Trident II Platform Switches](#). Although the underlying class map of each class cannot be edited, the traffic resolution commands can be adjusted. The default classes cannot be removed from the policy map and their sequence within the policy map is not editable.

**Table 50: copp-system-policy default classes: Trident II Platform Switches**

Class Name	shape (pps)	bandwidth (pps)
copp-system-aclog	1000	10000
copp-system-arp	1000	10000

Class Name	shape (pps)	bandwidth (pps)
copp-system-arpresolver	1000	10000
copp-system-bfd	5000	10000
copp-system-bgp	5000	5000
copp-system-bpdu	5000	5000
copp-system-default	1000	8000
copp-system-glean	1000	10000
copp-system-igmp	1000	10000
copp-system-ipmcmis	1000	10000
copp-system-ipmcrsvd	1000	10000
copp-system-l3destmiss	1000	10000
copp-system-l3slowpath	1000	10000
copp-system-l3ttl1	1000	10000
copp-system-lacp	5000	5000
copp-system-ldp	1000	10000
copp-system-mlag	5000	5000
copp-system-selfip	5000	5000
copp-system-selfip-tc6to7	5000	5000
copp-system-sflow	0	25024
copp-system-tc3to5	1000	10000
copp-system-tc6to7	1000	10000
copp-system-urm	1000	10000

Policy maps are modified in policy-map configuration mode. The `policy-map type copp` command enters policy-map configuration mode.

#### Example

This command enters policy-map configuration mode for editing ***copp-system-policy***.

```
switch(config)#policy-map type copp copp-system-policy
```

```
switch(config-pmap-copp-system-policy)#
```

### Example

The `class (policy-map (control-plane) Trident II)` command enters policy-map-class configuration mode, where traffic resolution commands are modified for the configuration mode class.

### Example

This command enters policy-map-class configuration mode for the copp-system-lacp static class.

```
switch(config-pmap-copp-system-policy)#class copp-system-lacp  
switch(config-pmap-c-copp-system-policy-copp-system-lacp)#
```

Two traffic resolution commands determine bandwidth parameters for class traffic:

- `bandwidth (policy-map-class (control-plane) Trident II)` specifies the minimum bandwidth.
- `shape (policy-map-class (control-plane) Trident II)` specifies the maximum bandwidth.

### Example

These commands configure a bandwidth range of 2000 to 4000 packets per seconds (pps) for traffic filtered by the copp-system-lacp class map:

```
switch(config-pmap-c-copp-system-policy-copp-system-  
lacp)#bandwidth pps 2000  
switch(config-pmap-c-copp-system-policy-copp-system-lacp)#shape  
pps 4000  
switch(config-pmap-c-copp-system-policy-copp-system-lacp)#
```

### Example

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the `exit` command or discarded with the `abort` command. The `show active` command displays the saved version of policy map. The `show pending` command displays the modified policy map.

### Example

These commands exit policy-map-class configuration mode, display the pending policy-map, then exit policy-map configuration mode, which saves the altered policy map to *running-config*.

```
switch(config-pmap-c-copp-system-policy-copp-system-lacp)#exit
```

```
switch(config-pmap-copp-system-policy)#show pending
policy-map type copp copp-system-policy
  class copp-system-bpdu

  class copp-system-lldp

  class copp-system-lacp
    shape pps 4000
    bandwidth pps 2000

  class copp-system-arp

switch(config-pmap-copp-system-policy)#exit
switch(config)#
```

### Applying Policy Maps to the Control Plane

The **copp-system-policy** policy map is always applied to the control plane. No commands are available to add or remove this assignment.

---

## 9.2.7 Traffic Management Configuration Commands

### Traffic Policy (Control Plane) Configuration Commands

- `bandwidth (policy-map-class (control-plane) Arad)`
- `bandwidth (policy-map-class (control-plane) FM6000)`
- `bandwidth (policy-map-class (control-plane) Helix)`
- `bandwidth (policy-map-class (control-plane) Petra)`
- `bandwidth (policy-map-class (control-plane) Trident)`
- `bandwidth (policy-map-class (control-plane) Trident II)`
- `class-map type copp`
- `class (policy-map (control-plane) Arad)`
- `class (policy-map (control-plane) FM6000)`
- `class (policy-map (control-plane) Helix)`
- `class (policy-map (control-plane) Trident)`
- `class (policy-map (control-plane) Trident II)`
- `match (class-map (control-plane) Helix)`
- `match (class-map (control-plane) Trident)`
- `match (class-map (control-plane) Trident II)`
- `policy-map type copp`
- `shape (policy-map-class (control-plane) Arad)`
- `shape (policy-map-class (control-plane) FM6000)`
- `shape (policy-map-class (control-plane) Helix)`
- `shape (policy-map-class (control-plane) Petra)`
- `shape (policy-map-class (control-plane) Trident)`
- `shape (policy-map-class (control-plane) Trident II)`

### Traffic Policy (PBR) Configuration Commands

- `class (policy-map (pbr))`
- `class-map type pbr`
- `match (class-map (pbr))`
- `match (policy-map (pbr))`
- `platform arad tcam counters feature`
- `policy-map type pbr`
- `resequence (class-map (pbr))`
- `resequence (policy-map (pbr))`
- `service-policy type pbr (Interface mode)`
- `set nexthop (policy-map-class pbr)`

### Traffic Policy (PDP) Configuration Commands

- `policy-map type pdp`
- `service-policy type pdp (Interface mode)`

### CPU Traffic Policy Command

- `feature traffic-policy cpu (ipv4 | ipv6)`

### Traffic Policy (QoS) Configuration Commands

- `class-map type qos`

- class (policy-map (qos) FM6000)
- class (policy-map (qos) Helix)
- class (policy-map (qos) Trident)
- class (policy-map (qos) Trident II)
- match (class-map (qos) FM6000)
- match (class-map (qos) Helix)
- match (class-map (qos) Trident)
- match (class-map (qos) Trident II)
- policy-map type quality-of-service
- service-policy type qos (Interface mode)
- set (policy-map-class (qos) FM6000)
- set (policy-map-class (qos) Helix)
- set (policy-map-class (qos) Trident)
- set (policy-map-class (qos) Trident II)

### **Traffic Policy Display and Utility Commands**

- clear policy-map counters
- show class-map type control-plane
- show class-map type pbr
- show class-map type qos
- show policy-map type copp
- show policy-map type pbr
- show policy-map type qos
- show policy-map type qos counters
- show policy-map copp
- show policy-map interface type qos
- show policy-map interface type qos counters

### 9.2.7.1 bandwidth (policy-map-class (control-plane) Arad)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration

accessed through **class (policy-map (control-plane) Arad)**

#### Command Syntax

```
bandwidth kbps kilobits
```

```
no bandwidth
```

```
default bandwidth
```

#### Parameters

- *kilobits* Minimum data rate in kilobits per second. Value ranges from 1 to 10000000.

#### Related Commands

- **class (policy-map (control-plane) Arad)** places the switch in policy-map-class (control plane) configuration mode.
- **shape (policy-map-class (control-plane) Arad)** specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

#### Static Classes Default Bandwidth

Arad platform switches define these default bandwidths for control plane static classes:

- copp-system-bgp 250 copp-system-l3lpmoverflow 250
- copp-system-bpdu 1250 copp-system-l3slowpath 250
- copp-system-default 250 copp-system-l3ttl1 250
- copp-system-ipbroadcast 250 copp-system-lacp 1250
- copp-system-ipmc 250 copp-system-linklocal 250
- copp-system-ipmcmiss 250 copp-system-lldp 250
- copp-system-ipunicast 250 copp-system-mlag 250
- copp-system-l2broadcast 250 copp-system-multicastsnoop 250
- copp-system-l2unicast 250 copp-system-Ospfisis 250
- copp-system-l3destmiss 250 copp-system-sflow 250

#### Example

- These commands configure the minimum bandwidth of 500 kbps for data traffic specified by the class map copp-system-lldp of the default control-plane policy map.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#bandwidth
  kbps 500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-copp-system-policy)#exit
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
Hardware programming status: InProgress
```

```
Class-map: copp-system-lldp (match-any)
  shape : 2500 kbps
  bandwidth : 500 kbps
  Out Packets : 0
  Drop Packets : 0
```

```
switch(config)#
```

---

### 9.2.7.2 bandwidth (policy-map-class (control-plane) FM6000)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration

accessed through **class (policy-map (control-plane) FM6000)**

#### Command Syntax

**bandwidth** pps *packets*

**no bandwidth**

**default bandwidth**

#### Parameters

- *packets* Minimum data rate in packets per second. Value ranges from 1 to 100000.

#### Related Commands

- **class (policy-map (control-plane) FM6000)** places the switch in policy-map-class (control plane) configuration mode.
- **shape (policy-map-class (control-plane) FM6000)** specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

#### Static Classes Default Bandwidth

FM6000 platform switches define these default bandwidths for control plane static classes:

- copp-system-arp 1000 copp-system-l3slowpath 1000
- copp-system-default 1000 copp-system-pim-ntp 1000
- copp-system-ipmcrsvd 1000 copp-system-ospf-isis 1000
- copp-system-ipmcmis 1000 copp-system-selfip 5000
- copp-system-igmp 1000 copp-system-selfip-tc6to7 5000
- copp-system-l2rsvd 10000 copp-system-sflow 1000

#### Example

- These commands configure the minimum bandwidth of 1000 packets per second for data traffic specified by the class map PMAP-1 in the policy map named copp-system-policy.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)#bandwidth pps 1000
switch(config-pmap-c-copp-system-policy-PMAP-1)#
```

### 9.2.7.3 bandwidth (policy-map-class (control-plane) Helix)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration

accessed through **class (policy-map (control-plane) Helix)**

#### Command Syntax

**bandwidth** pps *packets*

**no bandwidth**

**default bandwidth**

#### Parameters

- *packets* Minimum data rate in packets per second. Value ranges from 1 to 100000.

#### Related Commands

- **class (policy-map (control-plane) Helix)** places the switch in policy-map-class (control plane) configuration mode.
- **shape (policy-map-class (control-plane) Helix)** specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

#### Static Classes Default Bandwidth

Helix platform switches define these default bandwidths for control plane static classes:

- copp-system-aclog 1000 copp-system-l3ttl1 1000
- copp-system-arp 1000 copp-system-lacp 5000
- copp-system-arpresolver 1000 copp-system-lldp 1000
- copp-system-bfd 5000 copp-system-mlag 5000
- copp-system-bgp 5000 copp-system-Ospfisis 5000
- copp-system-bpdu 5000 copp-system-selfip 5000
- copp-system-default 1000 copp-system-selfip-tc6to7 5000
- copp-system-glean 1000 copp-system-sflow 0
- copp-system-igmp 1000 copp-system-tc3to5 1000
- copp-system-ipmcmis 1000 copp-system-tc6to7 1000
- copp-system-ipmcsvd 1000 copp-system-urm 1000
- copp-system-l3destmiss 1000 copp-system-vrrp 1000
- copp-system-l3slowpath 1000

#### Example

- These commands configure the minimum bandwidth of 500 packets per second for data traffic specified by the class map copp-system-lldp.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#bandwidth pps
500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-copp-system-policy)#exit
```

---

```
switch(config)#show policy-map interface control-plan copp-system-p
olicy
Service-policy input: copp-system-policy
  Number of units programmed: 4
  Hardware programming status: Successful

  Class-map: copp-system-lldp (match-any)
    shape : 10000 pps
    bandwidth : 500 pps
    Out Packets : 304996
    Drop Packets : 0

switch(config)#
```

### 9.2.7.4 bandwidth (policy-map-class (control-plane) Petra)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration

accessed through **class (policy-map (control-plane) Petra)**

#### Command Syntax

**bandwidth** *kbps* *kilobits*

**no bandwidth**

**default bandwidth**

#### Parameters

- *kbits* Minimum data rate in kilobits per second. Value ranges from 1 to 10000000.

#### Related Commands

- **class (policy-map (control-plane) Petra)** places the switch in policy-map-class (control plane) configuration mode.
- **shape (policy-map-class (control-plane) Petra)** specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

#### Static Classes Default Bandwidth

Petra platform switches define these default bandwidths for control plane static classes:

- copp-system-bpdu 1250 copp-system-l3destmiss 250
- copp-system-default 250 copp-system-l3slowpath 250
- copp-system-igmp 250 copp-system-l3ttl0 250
- copp-system-ipbroadcast 250 copp-system-l3ttl1 250
- copp-system-ipmc 250 copp-system-lacp 1250
- copp-system-ipmcmiss 250 copp-system-lldp 250
- copp-system-ipmcrsvd 250 copp-system-unicast-arp 250
- copp-system-ipunicast 250

#### Guidelines

Petra does not support all discrete rate values. When a specified discrete value is not supported, the switch converts the rate to the next highest discrete value that it supports. The **show** command displays the converted rate and not the user-configured rate.

#### Example

- These commands configure a minimum bandwidth of 500 kbps for data traffic specified by the class map copp-system-lldp of the default control-plane policy map. Because the switch does not support the discrete value of 500 kbps, it converts the bandwidth up to 651 kbps.

```
switch(config) #policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy) #class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp) #bandwidth
kbps 500
switch(config-pmap-c-copp-system-policy-copp-system-lldp) #exit
switch(config-pmap-copp-system-policy) #exit
```

---

```
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
  Hardware programming status: InProgress

  Class-map: copp-system-lldp (match-any)
    shape : 2766 kbps
    bandwidth : 651 kbps
    Out Packets : 0
    Drop Packets : 0

switch(config)#
```

### 9.2.7.5 bandwidth (policy-map-class (control-plane) Trident II)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration

accessed through **class (policy-map (control-plane) Trident II)**

#### Command Syntax

**bandwidth** pps *packets*

**no bandwidth**

**default bandwidth**

#### Parameters

- *packets* Minimum data rate in packets per second. Value ranges from 1 to 100000.

#### Related Commands

- **class (policy-map (control-plane) Trident II)** places the switch in policy-map-class (control plane) configuration mode.
- **shape (policy-map-class (control-plane) Trident II)** specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

#### Static Classes Default Bandwidth

Trident II platform switches define these default bandwidths for control plane static classes:

- copp-system-aclog 1000 copp-system-l3slowpath 1000
- copp-system-arp 1000 copp-system-l3ttl1 1000
- copp-system-arpresolver 1000 copp-system-lacp 5000
- copp-system-bfd 5000 copp-system-lldp 1000
- copp-system-bgp 5000 copp-system-mlag 5000
- copp-system-bpdu 5000 copp-system-selfip 5000
- copp-system-default 1000 copp-system-selfip-tc6to7 5000
- copp-system-glean 1000 copp-system-sflow 0
- copp-system-igmp 1000 copp-system-tc3to5 1000
- copp-system-ipmcmis 1000 copp-system-tc6to7 1000
- copp-system-ipmcrsvd 1000 copp-system-urm 1000
- copp-system-l3destmiss 1000

#### Example

- These commands configure the minimum bandwidth of 500 packets per second for data traffic specified by the class map copp-system-lldp.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#bandwidth pps
500
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-copp-system-policy)#exit
switch(config)#show policy-map interface control-plan copp-system-p
olicy
```

---

```
Service-policy input: copp-system-policy
  Number of units programmed: 4
  Hardware programming status: Successful

  Class-map: copp-system-lldp (match-any)
    shape : 10000 pps
    bandwidth : 500 pps
    Out Packets : 304996
    Drop Packets : 0

switch(config)#
```

### 9.2.7.6 bandwidth (policy-map-class (control-plane) Trident)

The **bandwidth** command specifies the minimum bandwidth for traffic filtered by the configuration mode policy map class.

The **no bandwidth** and **default bandwidth** commands remove the minimum bandwidth guarantee for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration

accessed through **class (policy-map (control-plane) Trident)**

#### Command Syntax

**bandwidth** pps *packets*

**no bandwidth**

**default bandwidth**

#### Parameters

- *packets* Minimum data rate in packets per second. Value ranges from 1 to 100000.

#### Related Commands

- **class (policy-map (control-plane) Trident)** places the switch in policy-map-class (control plane) configuration mode.
- **shape (policy-map-class (control-plane) Trident)** specifies the maximum bandwidth for traffic defined by the associated class map in its configuration mode policy map class.

#### Static Classes Default Bandwidth

Trident platform switches define these default bandwidths for control plane static classes:

- copp-system-arp 1000 copp-system-lldp 1000
- copp-system-arpresolver 1000 copp-system-l3destmiss 1000
- copp-system-bpdu 5000 copp-system-l3slowpath 1000
- copp-system-default 1000 copp-system-l3ttl1 1000
- copp-system-glean 1000 copp-system-selfip 5000
- copp-system-igmp 1000 copp-system-selfip-tc6to7 5000
- copp-system-ipmcmis 1000 copp-system-sflow 0
- copp-system-ipmcrsvd 1000 copp-system-tc6to7 1000
- copp-system-lacp 5000 copp-system-tc3to5 1000

#### Example

- These commands configure the minimum bandwidth of 1000 packets per second for data traffic specified by the class map PMAP-1 in the policy map named copp-system-policy.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)#bandwidth pps 1000
switch(config-pmap-c-copp-system-policy-PMAP-1)#
```

---

### 9.2.7.7 class (policy-map (control-plane) Arad)

The **class** command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 20 static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **bandwidth** command defines the streams minimum transmission rate through the control plane.
- **shape** command defines the streams maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packets content. Dynamic classes are not supported for control plane policing on Arad platform switches.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until **bandwidth** rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove policy-map-class commands for the specified class assignment from the policy map.

#### Command Mode

Policy-Map (control plane) configuration

accessed through **policy-map type copp** command

#### Command Syntax

**class** *class\_name*

**no class** *class\_name*

**default class** *class\_name*

#### Parameters

- *class\_name* name of the class.

#### Static Classes

Arad platform switches provide the following static control plane classes:

- copp-system-bgp copp-system-l2broadcast copp-system-linklocal
- copp-system-bpdu copp-system-l2unicast copp-system-ldp
- copp-system-default copp-system-l3destmiss copp-system-mlag
- copp-system-ipbroadcast copp-system-l3lpmoverflow copp-system-multicastsnoop
- copp-system-ipmc copp-system-l3slowpath copp-system-Ospfisis
- copp-system-ipmcmis copp-system-l3ttl1 copp-system-sflow
- copp-system-ipunicast copp-system-lacp

#### Commands Available in Policy-map-class (control plane) Configuration Mode

- **bandwidth (policy-map-class (control-plane) Arad)**
- **shape (policy-map-class (control-plane) Arad)**
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.

### Related Commands

- `policy-map type copp` places switch in policy-map (control plane) configuration mode.

### Example

- These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named ***copp-system-lldp***.

```
switch(config)#policy-map type copp copp-system-policy  
switch(config-pmap-copp-system-policy)#class copp-system-lldp  
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```

---

### 9.2.7.8 class (policy-map (control-plane) FM6000)

The **class** command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 12 static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **bandwidth** command defines the streams minimum transmission rate through the control plane.
- **shape** command defines the streams maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packets content. Dynamic classes are not supported for control plane policing on FM6000 platform switches.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until **bandwidth** rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove policy-map-class commands for the specified class assignment from the policy map. The class is removed from the policy map if it is a dynamic class.

#### Command Mode

Policy-Map (control plane) configuration

accessed through **policy-map type copp** command

#### Command Syntax

**class** *class\_name*

**no class** *class\_name*

**default class** *class\_name*

#### Parameters

- *class\_name* name of the class.

#### Static Classes

FM6000 platform switches provide the following static control plane classes:

- copp-system-arp copp-system-igmp copp-system-PimPtp
- copp-system-default copp-system-l2rsvd copp-system-selfip
- copp-system-ipmcmis copp-system-l3slowpath copp-system-selfip-tc6to7
- copp-system-ipmcrsvd copp-system-OspfIsis copp-system-sflow

#### Commands Available in Policy-map-class (control plane) Configuration Mode

- **bandwidth (policy-map-class (control-plane) FM6000)**
- **shape (policy-map-class (control-plane) FM6000)**
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.

#### Related Commands

- `policy-map type copp` places switch in policy-map (control plane) configuration mode.

**Example**

- These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named ***copp-system-arp***.

```
switch(config)#policy-map type copp copp-system-policy  
switch(config-pmap-copp-system-policy)#class copp-system-arp  
switch(config-pmap-c-copp-system-policy-copp-system-arp)#
```

---

### 9.2.7.9 class (policy-map (control-plane) Helix)

The **class** command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 23 static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **bandwidth** command defines the streams minimum transmission rate through the control plane.
- **shape** command defines the streams maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packets content. Dynamic classes are not supported for control plane policing on Helix platform switches.

Each class corresponds to a transmission queue. Queue scheduling is strict-priority; CPU queue number determines priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove policy-map-class commands for the specified class assignment from the policy map.

#### Command Mode

Policy-Map (control plane) configuration

accessed through **policy-map type copp** command

#### Command Syntax

**class** *class\_name*

**no class** *class\_name*

**default class** *class\_name*

#### Parameters

- *class\_name* name of the class.

#### Static Classes

Helix platform switches provide the following static control plane classes:

- copp-system-aclog copp-system-ipmcmis copp-system-Ospfisis
- copp-system-arp copp-system-ipmcsvd copp-system-selfip
- copp-system-arpresolver copp-system-l3destmiss copp-system-selfip-tc6to7
- copp-system-bfd copp-system-l3slowpath copp-system-sflow
- copp-system-bgp copp-system-l3ttl1 copp-system-tc3to5
- copp-system-bpdu copp-system-lacp copp-system-tc6to7
- copp-system-default copp-system-ldp copp-system-urm
- copp-system-glean copp-system-ldp copp-system-vrrp
- copp-system-igmp copp-system-ldp

#### Commands Available in Policy-map-class (control plane) Configuration Mode

- **bandwidth (policy-map-class (control-plane) Helix)**
- **shape (policy-map-class (control-plane) Helix)**

- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.

#### Related Commands

- **policy-map type copp** places switch in policy-map (control plane) configuration mode.

#### Example

- These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named **copp-system-arp**.

```
switch(config)#policy-map
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#
```

---

### 9.2.7.10 class (policy-map (control-plane) Petra)

The **class** command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 15 static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **bandwidth** command defines the streams minimum transmission rate through the control plane.
- **shape** command defines the streams maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packets content. Dynamic classes are not supported for control plane policing on Petra platform switches.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until **bandwidth** rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove policy-map-class commands for the specified class assignment from the policy map.

#### Command Mode

Policy-Map (control plane) configuration

accessed through `policy-map type copp` command

#### Command Syntax

```
class class_name
```

```
no class class_name
```

```
default class class_name
```

#### Parameters

*class\_name* name of the class.

#### Static Classes

Petra platform switches provide the following static control plane classes:

- copp-system-bpdu copp-system-ipmcmis copp-system-l3ttl0
- copp-system-default copp-system-ipmcsvd copp-system-l3ttl1
- copp-system-igmp copp-system-ipunicast copp-system-lacp
- copp-system-ipbroadcast copp-system-l3destmiss copp-system-lldp
- copp-system-ipmc copp-system-l3slowpath copp-system-unicast-arp

#### Commands Available in Policy-map-class (control plane) Configuration Mode

- `bandwidth (policy-map-class (control-plane) Petra)`
- `shape (policy-map-class (control-plane) Petra)`
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.

#### Related Commands

`policy-map type copp` places switch in policy-map (control plane) configuration mode.

### Example

These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named ***copp-system-lldp***.

```
switch(config) #policy-map
switch(config) #policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy) #class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp) #
```

---

### 9.2.7.11 class (policy-map (control-plane) Trident II)

The **class** command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 23 static classes. Each class contains an eponymous class map and may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **bandwidth** command defines the streams minimum transmission rate through the control plane.
- **shape** command defines the streams maximum transmission rate through the control plane.

Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packets content. Dynamic classes are not supported for control plane policing on Trident II platform switches.

Each class corresponds to a transmission queue. Queue scheduling is strict-priority; CPU queue number determines priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove policy-map-class commands for the specified class assignment from the policy map.

#### Command Mode

Policy-Map (control plane) configuration

accessed through **policy-map type copp** command

#### Command Syntax

**class** *class\_name*

**no class** *class\_name*

**default class** *class\_name*

#### Parameters

- *class\_name* name of the class.

#### Static Classes

Trident II platform switches provide the following static control plane classes:

- copp-system-aclog copp-system-igmp copp-system-mlag
- copp-system-arp copp-system-ipmcmis copp-system-selfip
- copp-system-arpresolver copp-system-ipmcsvd copp-system-selfip-tc6to7
- copp-system-bfd copp-system-l3destmiss copp-system-sflow
- copp-system-bgp copp-system-l3slowpath copp-system-tc3to5
- copp-system-bpdu copp-system-l3ttl1 copp-system-tc6to7
- copp-system-default copp-system-lacp copp-system-urm
- copp-system-glean copp-system-lldp

#### Commands Available in Policy-map-class (control plane) Configuration Mode

- **bandwidth** (**policy-map-class (control-plane) Trident II**)
- **shape** (**policy-map-class (control-plane) Trident II**)
- **exit** saves pending class map changes, then returns the switch to global configuration mode.

- **abort** discards pending class map changes, then returns the switch to global configuration mode.

#### Related Commands

- **policy-map type copp** places switch in policy-map (control plane) configuration mode.

#### Example

- These commands enters policy-map-class configuration mode to modify the shape, bandwidth parameters associated with the static class named **copp-system-arp**.

```
switch(config)#policy-map  
switch(config)#policy-map type copp copp-system-policy  
switch(config-pmap-copp-system-policy)#class copp-system-lldp  
switch(config-pmap-c-copp-system-policy-copp-system-lldp) #
```

---

### 9.2.7.12 class (policy-map (control-plane) Trident)

The **class** command places the switch in policy-map-class (control plane) configuration mode, which is a group change mode for changing bandwidth and shape parameters associated with a specified class. The command adds the specified class to the policy map if it was not previously included. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. The control plane policy map contains 18 static classes and up to 30 dynamic classes. Dynamic classes contain an eponymous class map. All classes may contain **bandwidth** and **shape** commands.

- The class map identifies a data stream.
- **bandwidth** command defines the streams minimum transmission rate through the control plane.
- **shape** command defines the streams maximum transmission rate through the control plane.

Dynamic class maps identify a data stream with an ACL assigned by **match (class-map (control-plane) Trident)**. Static class maps identify a data stream by definition. Each data packet is managed by commands of the first class whose map matches the packets content.

Static classes are provided with the switch and cannot be removed from the policy map or modified by the **class** command. Dynamic classes are user defined and added to the policy map by this command. Dynamic classes are always placed in front of the static classes. Bandwidth and shape parameters are editable for all classes.

Each class corresponds to a transmission queue. Queue scheduling is round-robin until **bandwidth** rate for a queue is exceeded. Scheduling becomes strict-priority with CPU queue number determining priority until the **shape** rate is reached. Packets are dropped after the shape rate is exceeded.

The **exit** command returns the switch to policy-map configuration mode. Saving policy-map-class changes also require an exit from policy-map mode, which saves pending policy-map-class and policy-map changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove policy-map-class commands for the specified class assignment from the policy map. The class is removed from the policy map if it is a dynamic class.

#### Command Mode

Policy-Map (control plane) configuration

accessed through **policy-map type copp** command

#### Command Syntax

```
class class_name [PLACEMENT]
```

```
no class class_name [PLACEMENT]
```

```
default class class_name [PLACEMENT]
```

#### Parameters

- *class\_name* name of the class.
- PLACEMENT Specifies the class map placement. Configurable only for dynamic classes.
  - <no parameter> New classes are placed between the dynamic and static classes. Previously defined classes retain their current policy map placement.
  - **insert-before** *dynamic\_class* Class is inserted in front of the specified dynamic class.

#### Static Classes

Trident switches provide the following static control plane classes:

- copp-system-aclog copp-system-ipmcmis copp-system-ldp
- copp-system-arp copp-system-ipmcrsvd copp-system-selfip

- `copp-system-arpresolver copp-system-l3destmiss copp-system-selfip-tc6to7`
- `copp-system-bpdu copp-system-l3slowpath copp-system-sflow`
- `copp-system-glean copp-system-l3ttl1 copp-system-tc3to5`
- `copp-system-igmp copp-system-lacp copp-system-tc6to7`

#### Commands Available in Policy-map-class (control plane) Configuration Mode

- `bandwidth (policy-map-class (control-plane) Trident)`
- `shape (policy-map-class (control-plane) Trident)`
- `exit` saves pending class map changes, then returns the switch to global configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.

#### Related Commands

- `class-map type copp` places switch in class-map (control-plane) configuration mode.
- `policy-map type copp` places switch in policy-map (control plane) configuration mode.

#### Example

- These commands add CM-1 class to the `copp-system-policy` policy map.

```
switch(config)#policy-map type copp copp-system-policy  
switch(config-pmap-copp-system-policy)#class CM-1  
switch(config-pmap-c-copp-system-policy-CM-1)#
```

---

### 9.2.7.13 class (policy-map (pbr))

The **class (policy-map (pbr))** command places the switch in policy-map-class (pbr) configuration mode, which is a group change mode that modifies the specified class of the configuration mode Policy-Based Routing (PBR) policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the mode is exited, and can be canceled by using the **abort** command.

A PBR policy map is an ordered list of classes. Each class contains an eponymous class map and can contain set commands to specify next hop. Classes without set commands translate to no action being performed on that class of packets.

- The class map identifies a data stream through ACLs. Class maps are configured in class-map (pbr) configuration mode.
- **Set** commands can be used to specify the next hop for a given class. **Set** commands are configured in policy-map-class (pbr) configuration mode.

PBR policy maps can also contain one or more raw match statements which filter incoming traffic without using ACLs. Data packets are managed by commands of the first class or raw match statement matching the packets contents.

The **exit** command returns the switch to policy-map (pbr) configuration mode. However, saving policy-map-class changes also requires an exit from policy-map (pbr) configuration mode. This saves all pending policy map and policy-map-class changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from **running-config**.

#### Command Mode

Policy-Map (pbr) Configuration

accessed through **policy-map type pbr**

#### Command Syntax

```
[sequence_number] class class_name  
no [sequence_number] class class_name  
default [sequence_number] class class_name  
no [sequence_number]  
default [sequence_number]
```

#### Parameters

- *sequence\_number* Sequence number (1 to 4294967295) assigned to the rule. If no number is entered, the number is derived by adding 10 to the number of the policy maps last numbered line. To increase the distance between existing entries, use the **resequence** command.
- *class\_name* name of the class.

#### Commands Available in Policy-map-class (pbr) Configuration Mode

- **set nexthop (policy-map-class pbr)** sets next hop for the class.
- **exit** saves pending class changes and returns switch to policy-map (pbr) configuration mode.
- **abort** discards pending class changes and returns switch to policy-map (pbr) configuration mode.

#### Related Commands

- **class-map type pbr** places switch in class-map (pbr) configuration mode.
- **policy-map type pbr** places switch in policy-map (pbr) configuration mode

**Examples**

- These commands add the **CMAPI** class map to the **PMAP1** policy map, then place the switch in policy-map-class configuration mode where the next hops can be assigned to the class. Changes will not take effect until both modes are exited.

```
switch(config)#policy-map type pbr PMAP1  
switch(config-pmap-PMAP1)#class CMAPI  
switch(config-pmap-c-PMAP1-CMAPI)#
```

### 9.2.7.14 class (policy-map (qos) FM6000)

The **class** command places the switch in policy-map-class (qos) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in class-map (qos) configuration mode.
- **set** commands either modify a packets content (CoS or DSCP fields) or assigns it to a traffic class queue. **set** commands are configured in policy-map-class (qos) configuration mode.

Data packets are managed by commands of the first class whose map matches the packets content.

The **exit** command returns the switch to policy-map configuration mode. However, saving policy-map-class changes also require an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from **running-config**.

#### Command Mode

Policy-Map (qos) Configuration

accessed through **policy-map type quality-of-service**

#### Command Syntax

```
class class_name [PLACEMENT]
```

```
no class class_name [PLACEMENT]
```

```
default class class_name [PLACEMENT]
```

#### Parameters

- *class\_name* name of the class.
- PLACEMENT Specifies the map placement within the list of class maps.
  - <no parameter> Class is placed at the top of the list.
  - **insert-before existing\_class** Class is inserted in front of the specified class.

#### Commands Available in Policy-map-class (qos) Configuration Mode

- **set (policy-map-class (qos) FM6000)**
- **exit** saves pending class changes and returns switch to policy-map (qos) configuration mode.
- **abort** discards pending class changes and returns switch to policy-map (qos) configuration mode.

#### Related Commands

- **class-map type qos** places switch in class-map (qos) configuration mode.
- **policy-map type quality-of-service** places switch in policy-map (qos) configuration mode

#### Example

- These commands add the **CMAP\_1** class map to the **PMAP\_1** policy map, then places the switch in policy-map-class configuration mode.

```
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
```

```
switch(config-pmap-c-PMAP-1-CMAP-1) #
```

---

### 9.2.7.15 class (policy-map (qos) Helix)

The **class** command places the switch in policy-map-class (qos) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in class-map (qos) configuration mode.
- **set** commands either modify a packets content (CoS or DSCP fields) or assigns it to a traffic class queue. **set** commands are configured in policy-map-class (qos) configuration mode.

Data packets are managed by commands of the first class whose map matches the packets content.

The **exit** command returns the switch to policy-map configuration mode. However, saving policy-map-class changes also require an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from **running-config**.

#### Command Mode

Policy-Map (qos) Configuration

accessed through **policy-map type quality-of-service** command

#### Command Syntax

```
class class_name [PLACEMENT]
```

```
no class class_name [PLACEMENT]
```

```
default class class_name [PLACEMENT]
```

#### Parameters

- *class\_name* name of the class.
- PLACEMENT Specifies the map placement within the list of class maps.
  - <no parameter> Class is placed at the top of the list.
  - **insert-before existing\_class** Class is inserted in front of the specified class.

#### Commands Available in Policy-map-class (qos) Configuration Mode

- **set (policy-map-class (qos) Helix)**
- **exit** saves pending class changes and returns switch to policy-map (qos) configuration mode.
- **abort** discards pending class changes and returns switch to policy-map (qos) configuration mode.

#### Related Commands

- **class-map type qos** places switch in class-map (qos) configuration mode.
- **policy-map type quality-of-service** places switch in policy-map (qos) configuration mode

#### Example

- These commands add the **CMAP\_1** class map to the **PMAP\_1** policy map, then places the switch in policy-map-class configuration mode.

```
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
```

```
switch(config-pmap-c-PMAP-1-CMAP-1) #
```

### 9.2.7.16 class (policy-map (qos) Trident II)

The **class** command places the switch in policy-map-class (qos) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in class-map (qos) configuration mode.
- **set** commands either modify a packets content (CoS or DSCP fields) or assigns it to a traffic class queue. **set** commands are configured in policy-map-class (qos) configuration mode.

Data packets are managed by commands of the first class whose map matches the packets content.

The **exit** command returns the switch to policy-map configuration mode. However, saving policy-map-class changes also require an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from **running-config**.

#### Command Mode

Policy-Map (qos) Configuration

accessed through **policy-map type quality-of-service** command

#### Command Syntax

```
class class_name [PLACEMENT]
```

```
no class class_name [PLACEMENT]
```

```
default class class_name [PLACEMENT]
```

#### Parameters

- *class\_name* name of the class.
- PLACEMENT Specifies the map placement within the list of class maps.
  - <no parameter> Class is placed at the top of the list.
  - **insert-before existing\_class** Class is inserted in front of the specified class.

#### Commands Available in Policy-map-class (qos) Configuration Mode

- **set (policy-map-class (qos) Trident II)**
- **exit** saves pending class changes and returns switch to policy-map (qos) configuration mode.
- **abort** discards pending class changes and returns switch to policy-map (qos) configuration mode.

#### Related Commands

- **class-map type qos** places switch in class-map (qos) configuration mode.
- **policy-map type quality-of-service** places switch in policy-map (qos) configuration mode

#### Example

- These commands add the **CMAP\_1** class map to the **PMAP\_1** policy map, then places the switch in policy-map-class configuration mode.

```
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#
```

---

### 9.2.7.17 class (policy-map (qos) Trident)

The **class** command places the switch in policy-map-class (qos) configuration mode, which is a group change mode that modifies the specified class of the configuration mode policy map. The command adds the class to the policy map if it was not previously included in the policy map. All changes in a group change mode edit session are pending until the end of the session.

A policy map is an ordered list of classes. Each class contains an eponymous class map and at least one set command:

- The class map identifies a data stream through an ACL. Class maps are configured in class-map (qos) configuration mode.
- **set** commands either modify a packets content (CoS or DSCP fields) or assigns it to a traffic class queue. **set** commands are configured in policy-map-class (qos) configuration mode.

Data packets are managed by commands of the first class whose map matches the packets content.

The **exit** command returns the switch to policy-map configuration mode. However, saving policy-map-class changes also require an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to **running-config** and returns the switch to global configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no class** and **default class** commands remove the class assignment from the configuration mode policy map by deleting the corresponding **class** configuration from **running-config**.

#### Command Mode

Policy-Map (qos) Configuration

accessed through **policy-map type quality-of-service** command

#### Command Syntax

```
class class_name [PLACEMENT]
```

```
no class class_name [PLACEMENT]
```

```
default class class_name [PLACEMENT]
```

#### Parameters

- *class\_name* name of the class.
- PLACEMENT Specifies the map placement within the list of class maps.
  - <no parameter> Class is placed at the top of the list.
  - **insert-before existing\_class** Class is inserted in front of the specified class.

#### Commands Available in Policy-map-class (qos) Configuration Mode

- **set (policy-map-class (qos) Trident)**
- **exit** saves pending class changes and returns switch to policy-map (qos) configuration mode.
- **abort** discards pending class changes and returns switch to policy-map (qos) configuration mode.

#### Related Commands

- **class-map type qos** places switch in class-map (qos) configuration mode.
- **policy-map type quality-of-service** places switch in policy-map (qos) configuration mode

#### Example

- These commands add the **CMAP\_1** class map to the **PMAP\_1** policy map, then places the switch in policy-map-class configuration mode.

```
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
```

```
switch(config-pmap-c-PMAP-1-CMAP-1) #
```

---

### 9.2.7.18 class-map type copp

The `class-map type copp` command places the switch in Class-Map (control plane) configuration mode, which is a group change mode that modifies a control-plane dynamic class map. A dynamic class map is a data structure that uses access control lists (ACLs) to define a data stream by specifying characteristics of data packets that comprise that stream. Control-plane policy maps use class maps to specify which control plane traffic is controlled by policy map criteria.

The `exit` command saves pending class map changes to **running-config** and returns the switch to global configuration mode. Class map changes are also saved by entering a different configuration mode. The `abort` command discards pending changes and returns the switch to global configuration mode.

The `no class-map type copp` and `default class-map type copp` commands delete the specified class map by removing the corresponding `class-map type copp` command and its associated configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
class-map type copp match-any class_name
```

```
no class-map type copp [match-any] class_name
```

```
default class-map type copp [match-any] class_name
```

#### Parameters

- `class_name` Name of class map.

#### Commands Available in Class-Map (Control Plane) Configuration Mode

- `match (class-map (control-plane) Trident)`

#### Related Commands

- `policy-map type copp`
- `class (policy-map (control-plane) Trident)`
- `class-map type qos`

#### Example

- This command creates the control plane class map named CP-MAP-1 and places the switch in class-map configuration mode.

```
switch(config)#class-map type copp match-any CP-CMAP-1
switch(config-cmap-CP-CMAP-1)#
```

### 9.2.7.19 class-map type pbr

The `class-map type pbr` command places the switch in class-map (pbr) configuration mode for the specified class map, and creates the class map if one does not already exist. Class-map (pbr) configuration mode is a group change mode that modifies a class map for Policy-Based Routing (PBR). PBR class maps contain one or more **match** statements which filter incoming traffic using ACLs. PBRs can then use these class maps to set next-hop IP addresses for the traffic that matches them. (Classes without set commands translate to no action being performed on that class of packets.)

The `exit` command saves pending class map changes to **running-config**, then returns the switch to global configuration mode. Class map changes are also saved by directly entering a different configuration mode. The `abort` command discards pending changes and returns the switch to global configuration mode.

The `no class-map type pbr` and `default class-map type pbr` commands delete the specified class map by removing the corresponding `class-map type pbr` command and its associated configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
class-map type pbr match-any map_name
no class-map type pbr match-any map_name
default class-map type pbr match-any map_name
```

#### Parameters

- *map\_name* Name of class map.

#### Commands Available in Class-Map (PBR) configuration mode

- `match (class-map (pbr))`
- `resequence (class-map (pbr))`

#### Related Commands

- `policy-map type pbr`
- `class (policy-map (pbr))`

#### Example

- This command creates the PBR class map named MAP1 and places the switch in class-map (pbr) configuration mode where match criteria can be configured for the class.

```
switch(config)#class-map type pbrmatch-any MAP1
switch(config-cmap-MAP1)#
```

---

### 9.2.7.20 class-map type qos

The **class-map type qos** command places the switch in Class-Map (qos) configuration mode, which is a group change mode that modifies a QoS dynamic class map. A dynamic class map is a data structure that uses access control lists (ACLs) to define a data stream by specifying characteristics of data packets that comprise that stream. QoS policy maps use class maps to specify the traffic (to which the policy map is assigned) that is transformed by policy map criteria.

The **exit** command saves pending class map changes to **running-config**, then returns the switch to global configuration mode. Class map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes and returns the switch to global configuration mode.

The **no class-map type qos** and **default class-map type qos** commands delete the specified class map by removing the corresponding **class-map type qos** command and its associated configuration. The **class-map** and **class-map type qos** commands are equivalent.

#### Command Mode

Global Configuration

#### Command Syntax

```
class-map [type qos] match-any class_name
```

```
no class-map [type qos] match-any class_name
```

```
default class-map [type qos] match-any class_name
```

**class-map** *map\_name* and **class-map type qos** *map\_name* are identical commands.

#### Parameters

- *class\_name* Name of class map.

#### Commands Available in Class-Map (QoS) Configuration Mode

- **match (class-map (qos) FM6000)**
- **match (class-map (qos) Trident)**

#### Related Commands

- **policy-map type quality-of-service**
- **class (policy-map (qos) FM6000)**
- **class (policy-map (qos) Trident)**

#### Example

- This command creates the QoS class map named MAP-1 and places the switch in class-map configuration mode.

```
switch(config)#class-map type qos match-any MAP-1
switch(config-cmap-MAP-1)#
```

### 9.2.7.21 clear policy-map counters

The `clear policy-map` command resets the specified policy map counters to zero. Policy map counters record the quantity of packets that are filtered by the ACLs that comprise a specified policy map.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear policy-map INTERFACE_NAME counters MAP_NAME
```

#### Parameters

- `INTERFACE_NAME` Interface for which command clears table counters. Options include:
  - **interface control-plane** Control plane.
- `MAP_NAME` Policy map for which command clears counters. Options include:
  - **copp-system-policy** Name of only policy map supported for the control plane.

---

### 9.2.7.22 feature traffic-policy cpu (ipv4 | ipv6)

The **feature traffic-policy cpu** command configures the CPU traffic policy features for the IPv4 and IPv6 traffic in user-defined TCAM profile.

The **no feature traffic-policy cpu** and **default feature traffic-policy cpu** commands remove the CPU policy configurations from *running-config*.

#### Command Mode

Hardware TCAM

#### Command Syntax

```
feature traffic-policy cpu <ipv4 | ipv6>
```

```
no feature traffic-policy cpu <ipv4 | ipv6>
```

```
default feature traffic-policy cpu <ipv4 | ipv6>
```

#### Parameters

- **ipv4** CPU traffic policy for IPv4 traffic.
- **ipv6** CPU traffic policy for IPv6 traffic.

#### Example

- These commands places the switch in the hardware TCAM profile mode and configures the CPU traffic policy features for IPv4 traffic in the TCAM profile test.

```
switch(config)#hardware tcam  
switch(config-hw-tcam)#profile test  
switch(config-hw-tcam-profile-test)#feature traffic-policy cpu ipv4
```

### 9.2.7.23 match (class-map (control-plane) Helix)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4 and IPv4 standard ACLs.

A class map is assigned to a policy map by the **class (policy-map (control-plane) Helix)** command.

Class map (control plane) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

#### Command Mode

Class-Map (control plane) configuration

accessed through **class-map type copp** command

#### Command Syntax

```
match ip access-group list_name
```

```
no match ip access-group list_name
```

```
default match ip access-group list_name
```

#### Parameters

- *list\_name* name of ACL assigned to class map.

#### Related Commands

- **class-map type copp** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (control-plane) Helix)** assigns a class map to a policy map.

#### Guidelines

Static class maps cannot be modified by this command.

**Match** statements are saved to **running-config** only upon exiting Class-Map (control plane) configuration mode.

#### Example

- These commands add the IP ACL *list\_1* to the *map\_1* class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type copp map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```

## 9.2.7.24 match (class-map (control-plane) Trident II)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4 and IPv4 standard ACLs.

A class map is assigned to a policy map by the **class (policy-map (control-plane) Trident II)** command.

Class map (control plane) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

### Command Mode

Class-Map (control plane) configuration

accessed through **class-map type copp** command

### Command Syntax

```
match ip access-group list_name
```

```
no match ip access-group list_name
```

```
default match ip access-group list_name
```

### Parameters

- *list\_name* name of ACL assigned to class map.

### Related Commands

- **class-map type copp** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (control-plane) Trident II)** assigns a class map to a policy map.

### Guidelines

Static class maps cannot be modified by this command.

**Match** statements are saved to **running-config** only upon exiting Class-Map (control plane) configuration mode.

### Example

- These commands add the IP ACL *list\_1* to the *map\_1* class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type copp map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```

### 9.2.7.25 match (class-map (control-plane) Trident)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv6, IPv4 standard, and IPv6 standard ACLs.

A class map is assigned to a policy map by the **class (policy-map (control-plane) Trident)** command.

Class map (control plane) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

#### Command Mode

Class-Map (control plane) configuration

accessed through **class-map type copp** command

#### Command Syntax

```
match IP_VERSION access-group list_name
```

```
no match IP_VERSION access-group list_name
```

```
default match IP_VERSION access-group list_name
```

#### Parameters

- **IP\_VERSION** IP version of the specified ACL. Options include:
  - **ip** IPv4.
  - **ipv6** IPv6.
- **list\_name** name of ACL assigned to class map.

#### Related Commands

- **class-map type copp** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (control-plane) Trident)** assigns a class map to a policy map.

#### Guidelines

Static class maps cannot be modified by this command.

**Match** statements are saved to **running-config** only upon exiting Class-Map (control plane) configuration mode.

#### Example

- These commands add the IPv4 ACL names **list\_1** to the **map\_1** class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type copp map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```

## 9.2.7.26 match (class-map (pbr))

The **match** command assigns ACLs to the configuration mode Policy-Based Routing (PBR) class map. The command accepts IPv4, IPv4 standard, IPv6 and IPv6 standard ACLs.

Class map (pbr) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

### Note:

PBR ACLs use only permit rules to filter data; if there are deny rules in an ACL used by PBR, the configuration will be reverted.

### Command Mode

Class-map (pbr) configuration

accessed through **class-map type pbr** command

### Command Syntax

```
[sequence_number] match {ip|ipv6} access-group list_name
```

```
no [sequence_number] match {ip|ipv6} access-group list_name
```

```
default [sequence_number] match {ip|ipv6} access-group list_name
```

```
no [sequence_number]
```

```
default [sequence_number]
```

### Parameters

- *sequence\_number* Sequence number (1 to 4294967295) assigned to the rule. If no number is entered, the number is derived by adding 10 to the number of the class maps last numbered line. To increase the distance between existing entries, use the **resequence** command.
- *list\_name* name of ACL assigned to class map.

### Related Commands

- **class-map type pbr** places the switch in class-map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (pbr))** assigns a class map to a policy map.

### Example

- These commands add the IPv4 ACL named **list1** to the **map1** class map, then save the change by exiting class-map mode.

```
switch(config)#class-map type pbr map1
switch(config-cmap-map1)#match ip access-group list1
switch(config-cmap-map1)#exit
switch(config)#
```

### 9.2.7.27 match (class-map (qos) FM6000)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4 and IPv4 standard ACLs.

Class map (qos) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

#### Command Mode

Class-map (qos) configuration

accessed through **class-map type qos** command

#### Command Syntax

```
match IP_VERSION access-group list_name
```

```
no match IP_VERSION access-group list_name
```

```
default match IP_VERSION access-group list_name
```

#### Parameters

- **IP\_VERSION** IP version of the specified ACL. Options include:
  - **ip** IPv4.
- **list\_name** name of ACL assigned to class map.

#### Related Commands

- **class-map type qos** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (qos) FM6000)** assigns a class map to a policy map.

#### Example

- These commands add the IPv4 ACL named **list\_1** to the **map\_1** class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type qos map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```

### 9.2.7.28 match (class-map (qos) Helix)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv4 standard, IPv6, and IPv6 standard ACLs.

Class map (qos) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

#### Command Mode

Class-Map (qos) configuration

accessed through **class-map type qos** command

#### Command Syntax

```
match IP_VERSION access-group list_name
```

```
no match IP_VERSION access-group list_name
```

```
default match IP_VERSION access-group list_name
```

#### Parameters

- **IP\_VERSION** IP version of the specified ACL. Options include:
  - **ip** IPv4.
  - **ipv6** IPv6.
- **list\_name** name of ACL assigned to class map.

#### Related Commands

- **class-map type qos** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (qos) Helix)** assigns a class map to a policy map.

#### Example

- These commands add the IPv4 ACL named **list\_1** to the **map\_1** class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type qos map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```

### 9.2.7.29 match (class-map (qos) Trident II)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv4 standard, IPv6, and IPv6 standard ACLs.

Class map (qos) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

#### Command Mode

Class-Map (qos) configuration

accessed through **class-map type qos** command

#### Command Syntax

```
match IP_VERSION access-group list_name
```

```
no match IP_VERSION access-group list_name
```

```
default match IP_VERSION access-group list_name
```

#### Parameters

- **IP\_VERSION** IP version of the specified ACL. Options include:
  - **ip** IPv4.
  - **ipv6** IPv6.
- **list\_name** name of ACL assigned to class map.

#### Related Commands

- **class-map type qos** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (qos) Trident)** assigns a class map to a policy map.

#### Example

- These commands add the IPv4 ACL named **list\_1** to the **map\_1** class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type qos map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```

### 9.2.7.30 match (class-map (qos) Trident)

The **match** command assigns an ACL to the configuration mode class map. A class map can contain only one ACL. Class maps only use permit rules to filter data; deny rules are ignored. The command accepts IPv4, IPv4 standard, IPv6, and IPv6 standard ACLs.

Class map (qos) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the **match** statement from the configuration mode class map by deleting the corresponding command from **running-config**.

#### Command Mode

Class-Map (qos) configuration

accessed through **class-map type qos** command

#### Command Syntax

```
match IP_VERSION access-group list_name
```

```
no match IP_VERSION access-group list_name
```

```
default match IP_VERSION access-group list_name
```

#### Parameters

- **IP\_VERSION** IP version of the specified ACL. Options include:
  - **ip** IPv4.
  - **ipv6** IPv6.
- **list\_name** name of ACL assigned to class map.

#### Related Commands

- **class-map type qos** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (qos) Trident)** assigns a class map to a policy map.

#### Example

- These commands add the IPv4 ACL named **list\_1** to the **map\_1** class map, then saves the command by exiting class-map mode.

```
switch(config)#class-map type qos map_1
switch(config-cmap-map_1)#match ip access-group list_1
switch(config-cmap-map_1)#exit
switch(config)#
```

### 9.2.7.31 match (policy-map (pbr))

The **match** command creates a policy map clause entry that specifies one filtering condition. When a packet matches the filtering criteria, its next hop is set as specified. When a packets properties do not equal the statement parameters, the packet is evaluated against the next clause or class map in the policy map, as determined by sequence number. If all clauses fail to set a next hop for the packet, the packet is routed according to the FIB.

The **no match** and **default match** commands remove the **match** statement from the configuration mode policy map by deleting the corresponding command from *running-config*.

#### Command Mode

Policy-Map (pbr) Configuration

accessed through **policy-map type pbr** command

#### Command Syntax

```
[sequence_number] match ip SOURCE_ADDR DEST_ADDR [set nexthop [recursive] NH-addr_1 [NH-addr_2] ... [NH-addr_n]]
```

```
no match ip SOURCE_ADDR DEST_ADDR [set nexthop [recursive] NH-addr_1 [NH-addr_2] ... [NH-addr_n]]
```

```
no SEQ_NUM
```

```
default match match ip SOURCE_ADDR DEST_ADDR [set nexthop [recursive] NH-addr_1 [NH-addr_2] ... [NH-addr_n]]
```

```
default SEQ_NUM
```

#### Parameters

- *sequence\_number* Sequence number assigned to the rule. If no number is entered, the number is derived by adding 10 to the number of the policy maps last numbered line. To increase the distance between existing entries, use the **resequence** command.
- SOURCE\_ADDR and DEST\_ADDR source and destination address filters. Options include:
  - **network\_addr** subnet address (CIDR or address-mask).
  - **any** packets from or to all addresses are matched.
  - **host ip\_addr** IP address (dotted decimal notation).

Source and destination subnet addresses support discontinuous masks.
- **recursive** enables recursive next hop resolution.
- *NH\_addr* IP address of next hop. If multiple addresses are entered, they are treated as an ECMP group.

#### Related Commands

- **policy-map type pbr** enters policy-map (PBR) configuration mode.

#### Example

- These commands create a match rule in policy map PMAP1 which sets the next hop to 192.168.3.5 for packets received from 172.16.0.0/12 regardless of their destination, then exit the mode to save the changes.

```
switch(config) #policy-map type pbr PMAP1
switch(config-pmap-PMAP1) #match ip 172.16.0.0/12 any set nexthop
192.163.3.5
switch(config-pmap-PMAP1) #exit
switch(config) #
```

---

### 9.2.7.32 platform arad tcam counters feature

The **platform arad tcam counters feature** command enables incrementing PBR hardware counters corresponding to ACL. If counters for PBR are enabled, then counters for ACL will be automatically disabled in all cases. If counters for ACL are enabled, then counters for PBR will be automatically disabled in all cases.

The **no platform arad tcam counters feature** command disables PBR/ACL counters selection. The **default platform arad tcam counters feature** commands resets the default behavior.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform arad tcam counters feature [OPTIONS]
no platform arad tcam counters feature [OPTIONS]
default platform arad tcam counters feature [OPTIONS]
```

#### Parameters

- *OPTIONS* Assign the TCAM counters feature. Options include:
  - **pbr** assign the TCAM counters feature PBR hardware counters.
  - **acl** assign the TCAM counters feature ACL hardware counters.

#### Example

- This command enables incrementing ACL hardware counters selection.

```
switch(config)#platform arad tcam counters feature acl
switch(config)#
```

- This command disables incrementing ACL hardware counters selection.

```
switch(config)#no platform arad tcam counters feature acl
switch(config)#
```

### 9.2.7.33 policy-map type copp

The `policy-map type copp` command places the switch in Policy-Map (control plane) configuration mode, which is a group change mode that modifies a control-plane policy map. A policy map is a data structure that consists of class maps that identify a specific data stream and specify bandwidth and shaping parameters that controls its transmission. Control plane policy maps are applied to the control plane to manage traffic.

The `copp-system-policy` policy map is supplied with the switch and is always applied to the control plane. `Copp-system-policy` is the only valid control plane policy map.

The `exit` command saves pending policy map changes to `running-config` and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no policy-map type copp` and `default policy-map type copp` commands delete the specified policy map by removing the corresponding `policy-map type copp` command and its associated configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
policy-map type copp copp-system-policy
no policy-map type copp copp-system-policy
default policy-map type copp copp-system-policy
```

`copp-system-policy` is supplied with the switch and is the only valid control plane policy map.

#### Commands Available in Policy-Map Configuration Mode

- `class (policy-map (control-plane) FM6000)`
- `class (policy-map (control-plane) Trident)`

#### Related Command

`class-map type copp` enters control-plane class-map configuration mode for modifying a control-plane dynamic class map.

Only Helix and Trident platform switches support dynamic classes for control plane policing.

#### Example

This command places the switch in policy-map configuration mode to edit the `copp-system-policy` policy map.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#
```

---

### 9.2.7.34 policy-map type pbr

The `policy-map type pbr` command places the switch in policy-map (pbr) configuration mode, which is a group change mode that modifies a Policy-Based Routing (PBR) policy map. The command also creates the specified policy map if it does not already exist. A PBR policy map is a data structure that consists of class maps that identify specific packets and the next hops for those packets. Policy maps are applied to Ethernet or port channel interfaces to manage traffic.

The `exit` command saves pending policy map changes to **running-config** and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no policy-map type pbr` and `default policy-map type pbr` commands delete the specified policy map by removing the corresponding `policy-map type pbr` command and its associated configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
policy-map type pbr map_name
```

```
no policy-map type pbr map_name
```

```
default policy-map type pbr map_name
```

#### Parameters

- `map_name` Name of policy map.

#### Commands Available in Policy-Map configuration mode

- `class (policy-map (pbr))`
- `match (policy-map (pbr))`

#### Related Commands

- `class-map type pbr`
- `service-policy type pbr (Interface mode)`

#### Example

- This command creates the PBR policy map named PMAP1 and places the switch in policy-map configuration mode.

```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#
```

### 9.2.7.35 policy-map type pdp

The `policy-map type pdp` command places the switch in policy-map (pdp) configuration mode, which is a group change mode that modifies a Per-port Denial-of-service Protection (PDP) policy map. The command also creates the specified policy map if it does not already exist.

The `exit` command saves pending policy map changes to **running-config** and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no policy-map type pdp` and `default policy-map type pdp` commands delete the specified policy map by removing the corresponding `policy-map type pdp` command and its associated configuration.

**Note:**

PDP is available only in EOS versions 4.19.0F and above.

**Command Mode**

Global Configuration

**Command Syntax**

```
policy-map type pdp [shared] map_name
```

```
no policy-map type pdp [shared] map_name
```

```
default policy-map type pdp [shared] map_name
```

**Parameters**

- **shared** optional keyword designating a shared policy map.
- *map\_name* name of policy map.

**Example**

- This command creates the unshared PDP policy map named PMAP1 and places the switch in policy-map configuration mode.

```
switch(config)#policy-map type pdp PMAP1  
switch(config-pmap-PMAP1)#
```

---

### 9.2.7.36 policy-map type quality-of-service

The **policy-map type quality-of-service** command places the switch in Policy-Map (qos) configuration mode, which is a group change mode that modifies a QoS policy map. A policy map is a data structure that consists of class maps that identify a specific data stream and shaping parameters that controls its transmission. Policy maps are applied to Ethernet or port channel interfaces to manage traffic.

The **exit** command saves pending policy map changes to **running-config** and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no policy-map type quality-of-service** and **default policy-map type quality-of-service** commands delete the specified policy map by removing the corresponding **policy-map type quality-of-service** command and its associated configuration. The **policy-map** and **policy-map type quality-of-service** commands are equivalent.

#### Command Mode

Global Configuration

#### Command Syntax

```
policy-map type quality-of-service map_name
```

```
no policy-map type quality-of-service map_name
```

```
default policy-map type quality-of-service map_name
```

**policy-map map\_name** and **policy-map type quality-of-service map\_name** are identical commands.

#### Parameters

- *map\_name* Name of policy map.

#### Commands Available in Policy-Map Configuration Mode

- **class (policy-map (qos) FM6000)**
- **class (policy-map (qos) Trident)**

#### Related Commands

- **class-map type qos**
- **service-policy type qos (Interface mode)**

#### Example

- This command creates the QoS policy map named PMAP-1 and places the switch in policy-map configuration mode.

```
switch(config)#policy-map PMAP-1
switch(config-pmap-PMAP-1)#
```

### 9.2.7.37 resequence (class-map (pbr))

The **resequence** command assigns sequence numbers to rules in the configuration mode class map. Command parameters specify the number of the first rule and the numeric interval between consecutive rules. Once changed, rule numbers persist unless changed again using the **resequence** command, but the interval used for numbering new rules reverts to 10 on exiting class-map (pbr) configuration mode.

Maximum rule sequence number is 4294967295.

#### Command Mode

Class-Map (PBR) Configuration

accessed through **class-map type pbr** command

#### Command Syntax

```
resequence [start_num [inc_num]]
```

#### Parameters

- *start\_num* sequence number assigned to the first rule. Default is 10.
- *inc\_num* numeric interval between consecutive rules. Default is 10.

#### Example

- The **resequence** command renumbers the rules in CMAP1, starting the first command at number 100 and incrementing subsequent lines by 20.

```
switch(config)#class-map type pbr match-any CMAP1
switch(config-cmap-CMAP1)#show active
class-map type pbr match-any CMAP1
10 match ip access-group group1
20 match ip access-group group2
30 match ip access-group group3
switch(config-cmap-CMAP1)#resequence 100 20
switch(config-cmap-CMAP1)#exit
switch(config)#class-map type pbr match-any CMAP1
switch(config-cmap-CMAP1)#show active
class-map type pbr match-any CMAP1
100 match ip access-group group1
120 match ip access-group group2
140 match ip access-group group3
```

### 9.2.7.38 resequence (policy-map (pbr))

The **resequence** command assigns sequence numbers to rules in the configuration mode policy map. Command parameters specify the number of the first rule and the numeric interval between consecutive rules. Once changed, rule numbers persist unless changed again using the **resequence** command, but the interval used for numbering new rules reverts to 10 on exiting policy-map (pbr) configuration mode.

Maximum rule sequence number is 4294967295.

#### Command Mode

Policy-Map (PBR) Configuration

accessed through **policy-map type pbr** command

#### Command Syntax

```
resequence [start_num [inc_num]]
```

#### Parameters

- *start\_num* sequence number assigned to the first rule. Default is 10.
- *inc\_num* numeric interval between consecutive rules. Default is 10.

#### Example

- The **resequence** command renumbers the rules in PMAP1, starting the first command at number 100 and incrementing subsequent lines by 20.

```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#show active
policy-map type pbr PMAP1
10 class CMAP1
set nexthop 172.16.1.1
20 class CMAP2
set nexthop 172.16.2.2
30 class CMAP3
set nexthop 172.16.3.3
switch(config-pmap-PMAP1)#resequence 100 20
switch(config-pmap-PMAP1)#exit
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#show active
class-map type pbr PMAP1
100 class CMAP1
set nexthop 172.16.1.1
120 class CMAP2
set nexthop 172.16.2.2
140 class CMAP3
set nexthop 172.16.3.3
switch(config-pmap-PMAP1)#
```

### 9.2.7.39 service-policy type pbr (Interface mode)

The `service-policy pbr` command applies the specified Policy-Based Routing (PBR) policy map to the configuration mode interface. A PBR policy map is a data structure that consists of class maps that identify specific packets and the next hops for those packets. Policy maps are applied to Ethernet or port channel interfaces to manage traffic. Only one service policy is supported per interface.

The `no service-policy pbr` and `default service-policy pbr` commands remove the service policy assignment from the configuration mode interface by deleting the corresponding `service-policy pbr` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
service-policy type pbr TRAFFIC_DIRECTION map_name
```

```
no service-policy type pbr TRAFFIC_DIRECTION map_name
```

```
default service-policy type pbr TRAFFIC_DIRECTION map_name
```

#### Parameters

- TRAFFIC\_DIRECTION IP address or peer group name. Values include:
  - **input** Policy map applies to inbound packet streams.
- *map\_name* Name of policy map.

#### Guidelines

A policy map that is attached to a port channel interface takes precedence for member interfaces of the port channel over their individual Ethernet interface configuration. Members that are removed from a port channel revert to the policy map implementation specified by its Ethernet interface configuration.

#### Related Commands

- [policy-map type pbr](#)

#### Example

- This command applies the PBR policy map PMAP1 to Ethernet interface 8.

```
switch#config
switch(config)#interface ethernet 8
switch(config-if-Et8)#service-policy type pbr input PMAP1
switch(config-if-Et8)#
```

---

### 9.2.7.40 service-policy type pdp (Interface mode)

The **service-policy pdp** command assigns the specified Per-port Denial-of-service (PDP) policy map to the configuration mode interface.

The **no service-policy pdp** and **default service-policy pdp** commands remove the service policy assignment from the configuration mode interface by deleting the corresponding **service-policy pdp** command from *running-config*.

#### Note:

PDP is available only in EOS versions 4.19.0F and above.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
service-policy type pdp input map_name
```

```
no service-policy pdp input map_name
```

```
default service-policy pdp input map_name
```

#### Parameters

- *map\_name* name of policy map.

#### Example

- This command assigns the PDP policy map PMAP1 to Ethernet interface 8.

```
switch#config
switch(config)#interface ethernet 8
switch(config-if-Et8)#service-policy type pdp input PMAP1
switch(config-if-Et8)#
```

### 9.2.7.41 service-policy type qos (Interface mode)

The **service-policy** command applies a specified policy map to the configuration mode interface. A policy map is a data structure that identifies data traffic through class maps, then specifies actions to classify the traffic (by setting the traffic class), mark the traffic (by setting the cos and dscp values), and police the traffic (by setting the police rate) through data packet field modifications.

The **no service-policy** and **default service-policy** commands remove the service policy assignment from the configuration mode interface by deleting the corresponding **service-policy** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
service-policy [type qos] TRAFFIC_DIRECTION map_name
```

```
no service-policy [type qos] TRAFFIC_DIRECTION map_name
```

```
default service-policy [type qos] TRAFFIC_DIRECTION map_name
```

#### Parameters

- **type qos** Parameter has no functional effect.
- TRAFFIC\_DIRECTION Direction of data stream to which command applies. Options include:
  - **input** Policy map applies to inbound packet streams.
- *map\_name* Name of policy map.

#### Guidelines

A policy map that is attached to a port channel interface takes precedence for member interfaces of the port channel over their individual Ethernet interface configuration. Members that are removed from a port channel revert to the policy map implementation specified by its Ethernet interface configuration.

DCS-7500E and DCS-7280E limitations:

- A maximum of 31 QoS service policies per chip may be applied on L3 interfaces.
- Applying different QoS service policies to an SVI and its member interfaces causes unpredictable behavior.
- When an SVI on which QoS service policies are applied experiences partial failure due to limited hardware resources, a forwarding agent restart will cause unpredictable behavior.
- Policy-map programming may fail when QoS service policies are applied on two SVIs if an event causes a member interface to switch membership from one to the other. To change the VLAN membership of an interface in this case, remove the interface from one VLAN before adding it to the other.
- Outgoing COS rewrite is not supported.
- QoS policy-map counters are not supported.

DCS-7010, DCS-7050, DCS-7050X, DCS-7250X, and DCS-7300X limitations:

- When the same policy map is applied to multiple SVIs, TCAM resources are not shared.
- A policy map applied to an SVI will result in TCAM allocation on all chips whether SVI members are present or not.
- Applying different QoS service policies to an SVI and its member interfaces causes unpredictable behavior.

#### Related Commands

- 
- `policy-map type quality-of-service`

#### Example

- This command applies the PMAP-1 policy map to Ethernet interface 8.

```
switch#config
switch(config)#interface ethernet 8
switch(config-if-Et8)#show active
switch(config-if-Et8)#service-policy input PMAP-1
switch(config-if-Et8)#show active
interface Ethernet8
    service-policy type qos input PMAP-1
switch(config-if-Et8)#
```

### 9.2.7.42 set (policy-map-class (qos) FM6000)

The **set** command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos** Sets the layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class** Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The **no set** and **default set** commands remove the specified data action from the class map by deleting the associated **set** command from *running-config*.

#### Command Mode

Policy-map-class (qos) configuration

accessed through **class (policy-map (qos) FM6000)** command

#### Command Syntax

```
set QOS_TYPE value
```

```
no set QOS_TYPE
```

```
default set QOS_TYPE
```

#### Parameters

- QOS\_TYPE Specifies the data stream resolution method. Valid options include:
  - **cos** Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class** Data stream is assigned to a traffic class queue.
- *value* Specifies the data field value or traffic class queue. Valid data range depends on **QOS\_TYPE**.
  - QOS\_TYPE is **cos** Value ranges from 0 to 7.
  - QOS\_TYPE is **dscp** Value ranges from 0 to 63.
  - QOS\_TYPE is **traffic-class** Value ranges from 0 to 7.

#### Related Commands

- **policy-map type quality-of-service**
- **class (policy-map (qos) FM6000)**

#### Example

- These commands configure the policy map to set the CoS field to 7 to data traffic specified by the class map CMAP-1, then assigns that data to traffic class queue 4.

```
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)#set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1)#
```

### 9.2.7.43 set (policy-map-class (qos) Helix)

The **set** command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos** Sets the layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class** Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The **no set** and **default set** commands remove the specified data action from the class map by deleting the associated **set** command from *running-config*.

#### Command Mode

Policy-map-class (qos) configuration

accessed through **class (policy-map (qos) Helix)** command

#### Command Syntax

```
set QOS_TYPE value
```

```
no set QOS_TYPE
```

```
default set QOS_TYPE
```

#### Parameters

- QOS\_TYPE Specifies the data stream resolution method. Valid options include:
  - **cos** Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class** Data stream is assigned to a traffic class queue.
- *value* Specifies the data field value or traffic class queue. Valid data range depends on QOS type.
  - QOS\_TYPE is **cos** Value ranges from 0 to 7.
  - QOS\_TYPE is **dscp** Value ranges from 0 to 63.
  - QOS\_TYPE is **traffic-class** Value ranges from 0 to 7.

#### Related Commands

- **policy-map type quality-of-service**
- **class (policy-map (qos) Helix)**

#### Example

- These commands configure the policy map to set the CoS field to 7 to data traffic specified by the class map CMAP-1, then assigns that data to traffic class queue 4.

```
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)#set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1)#
```

### 9.2.7.44 set (policy-map-class (qos) Trident II)

The **set** command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos** Sets the layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class** Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The **no set** and **default set** commands remove the specified data action from the class map by deleting the associated **set** command from *running-config*.

#### Command Mode

Policy-map-class (qos) configuration

accessed through **class (policy-map (qos) Trident)** command

#### Command Syntax

```
set QOS_TYPE value
```

```
no set QOS_TYPE
```

```
default set QOS_TYPE
```

#### Parameters

- QOS\_TYPE Specifies the data stream resolution method. Valid options include:
  - **cos** Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class** Data stream is assigned to a traffic class queue.
- *value* Specifies the data field value or traffic class queue. Valid data range depends on QOS type.
  - QOS\_TYPE is **cos** Value ranges from 0 to 7.
  - QOS\_TYPE is **dscp** Value ranges from 0 to 63.
  - QOS\_TYPE is **traffic-class** Value ranges from 0 to 7.

#### Related Commands

- **policy-map type quality-of-service**
- **class (policy-map (qos) Trident)**

#### Example

- These commands configure the policy map to set the CoS field to 7 to data traffic specified by the class map CMAP-1, then assigns that data to traffic class queue 4.

```
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)#set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1)#
```

### 9.2.7.45 set (policy-map-class (qos) Trident)

The **set** command specifies traffic resolution methods for traffic defined by its associated class map in its configuration mode policy map class. Three set statements are available for each class:

- **cos** Sets the layer 2 class of service field.
- **dscp** Sets the differentiated services code point value in the type of service (ToS) byte.
- **traffic-class** Sets the traffic class queue for data packets.

Each type of set command can be assigned to a class, allowing for the simultaneous modification of both (cos, dscp) fields and assignment to a traffic class.

The **no set** and **default set** commands remove the specified data action from the class map by deleting the associated **set** command from *running-config*.

#### Command Mode

Policy-map-class (qos) configuration

accessed through **class (policy-map (qos) Trident)** command

#### Command Syntax

```
set QOS_TYPE value
```

```
no set QOS_TYPE
```

```
default set QOS_TYPE
```

#### Parameters

- QOS\_TYPE Specifies the data stream resolution method. Valid options include:
  - **cos** Layer 2 class of service field of outbound packet is modified.
  - **dscp** Differentiated services code point value in the ToS byte is modified.
  - **traffic-class** Data stream is assigned to a traffic class queue.
- *value* Specifies the data field value or traffic class queue. Valid data range depends on QOS type.
  - QOS\_TYPE is **cos** Value ranges from 0 to 7.
  - QOS\_TYPE is **dscp** Value ranges from 0 to 63.
  - QOS\_TYPE is **traffic-class** Value ranges from 0 to 7.

#### Related Commands

- **policy-map type quality-of-service**
- **class (policy-map (qos) Trident)**

#### Example

- These commands configure the policy map to set the CoS field to 7 to data traffic specified by the class map CMAP-1, then assigns that data to traffic class queue 4.

```
switch(config)#policy-map type quality-of-service PMAP-1
switch(config-pmap-PMAP-1)#class CMAP-1
switch(config-pmap-c-PMAP-1-CMAP-1)#set cos 7
switch(config-pmap-c-PMAP-1-CMAP-1)#set traffic-class 4
switch(config-pmap-c-PMAP-1-CMAP-1)#
```

### 9.2.7.46 set nexthop (policy-map-class pbr)

The `set nexthop` command specifies the next hop for traffic defined by its associated class map in its configuration mode policy map class.

The `no set nexthop` and `default set nexthop` commands remove the specified action from the class map by deleting the associated `set nexthop` command from *running-config*.

#### Command Mode

Policy-map-class (pbr) configuration

accessed through `class (policy-map (pbr))` command

#### Command Syntax

```
set nexthop [recursive] NH-addr_1 [NH-addr_2] ... [NH-addr_n]
```

```
no set nexthop [recursive]
```

```
default set nexthop [recursive]
```

#### Parameters

- `recursive` enables recursive next hop resolution.
- `NH_addr` IP address of next hop. If multiple addresses are entered, they are treated as an ECMP group.

#### Related Commands

- `policy-map type pbr`
- `class (policy-map (pbr))`

#### Example

- These commands configure the policy map PMAP1 to set the next hop to 192.168.5.3 for traffic defined by class map CMAP1.

```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#set nexthop 192.168.5.3
switch(config-pmap-c-PMAP1-CMAP1)#
```

---

### 9.2.7.47 set nexthop-group (policy-map-class(pbr) Arad)

The **set nexthop-group** command specifies a nexthop group as the next hop for traffic defined by its associated class map in its configuration mode policy map class.

The **no set nexthop-group** and **default set nexthop-group** commands remove the specified action from the class map by deleting the associated **set nexthop-group** command from *running-config*.

#### Command Mode

Policy-map-class (pbr) configuration accessed through `class (policy-map (pbr))` command.

#### Command Syntax

```
set nexthop-group group_name
no set nexthop-group group_name
default set nexthop-group group_name
```

#### Parameters

**group\_name** name of ECMP group to use as next hop.

#### Related Commands

- `policy-map type pbr`
- `class (policy-map (pbr))`

#### Example

These commands configure the policy map **PMAP1** to set the next hop to a nexthop group named GROUP1 for traffic defined by class map **CMAP1**.

```
switch(config)#policy-map type pbr PMAP1
switch(config-pmap-PMAP1)#class CMAP1
switch(config-pmap-c-PMAP1-CMAP1)#set nexthop-group GROUP1
switch(config-pmap-c-PMAP1-CMAP1)#
```

### 9.2.7.48 shape (policy-map-class (control-plane) Arad)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration accessed through `class (policy-map (control-plane) Arad)`

#### Command Syntax

```
shape kbps kilobits
```

```
no shape
```

```
default shape
```

#### Parameters

**kilobits** Maximum data rate in kilobits per second. Value ranges from 1 to 10000000.

#### Related Commands

- `class (policy-map (control-plane) Arad)` places the switch in policy-map-class (control plane) configuration mode.
- `bandwidth (policy-map-class (control-plane) Arad)` specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

#### Static Classes Default Shape

Arad platform switches define these default shapes for static classes:

- copp-system-bgp 2500 copp-system-l3lpmoverflow 2500
- copp-system-bpdu 2500 copp-system-l3slowpath 2500
- copp-system-default 2500 copp-system-l3ttl1 2500
- copp-system-ipbroadcast 2500 copp-system-lacp 2500
- copp-system-ipmc 2500 copp-system-linklocal 2500
- copp-system-ipmcmis 2500 copp-system-lldp 2500
- copp-system-ipunicast NO LIMIT copp-system-mlag 2500
- copp-system-l2broadcast 2500 copp-system-multicastsnoop 2500
- copp-system-l2unicast NO LIMIT copp-system-Ospfisis 2500
- copp-system-l3destmiss 2500 copp-system-sflow 2500

#### Example

These commands configure the maximum bandwidth of 2000 kbps for data traffic specified by the class map **copp-system-lldp** of the default control-plane policy map.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape kbps 2000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-copp-system-policy)#exit
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
```

```
Class-map: copp-system-lldp (match-any)
  shape : 2000 kbps
  bandwidth : 250 kbps
```

---

```
Out Packets : 0  
Drop Packets : 0
```

```
switch(config)#
```

### 9.2.7.49 shape (policy-map-class (control-plane) FM6000)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration accessed through `class (policy-map (control-plane) FM6000)`

#### Command Syntax

```
shape pps packets
```

```
no shape
```

```
default shape
```

#### Parameters

**packets** Maximum data rate in packets per second. Value ranges from 1 to 100000.

#### Related Commands

- `class (policy-map (control-plane) FM6000)` places the switch in policy-map-class (control plane) configuration mode.
- `bandwidth (policy-map-class (control-plane) FM6000)` specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

#### Static Classes Default Shape

FM6000 platform switches define these default shapes for static classes:

- `copp-system-arp 10000 copp-system-l3slowpath 10000`
- `copp-system-default 8000 copp-system-pim-ptp 10000`
- `copp-system-ipmcrsvd 10000 copp-system-ospf-isis 10000`
- `copp-system-ipmcmis 10000 copp-system-selfip 5000`
- `copp-system-igmp 10000 copp-system-selfip-tc6to7 5000`
- `copp-system-l2rsvd 10000 copp-system-sflow 25000`

#### Example

These commands configure a maximum bandwidth of 5000 packets per second for data traffic specified by the class map *PMAP-1* in the policy map named **copp-system-policy**.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)#shape pps 5000
switch(config-pmap-c-copp-system-policy-PMAP-1)#
```

### 9.2.7.50 shape (policy-map-class (control-plane) Helix)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration accessed through `class (policy-map (control-plane) Helix)`

#### Command Syntax

```
shape pps packets
```

```
no shape
```

```
default shape
```

#### Parameters

**packets** Maximum data rate in packets per second. Value ranges from 1 to 100000.

#### Static Classes Default Shape

Trident platform switches define these default shapes for static classes:

- copp-system-aclog 10000 copp-system-l3ttl1 10000
- copp-system-arp 10000 copp-system-lacp 5000
- copp-system-arpresolver 10000 copp-system-lldp 10000
- copp-system-bfd 10000 copp-system-mlag 5000
- copp-system-bgp 5000 copp-system-Ospfisis 10000
- copp-system-bpdu 5000 copp-system-selfip 5000
- copp-system-default 8000 copp-system-selfip-tc6to7 5000
- copp-system-glean 10000 copp-system-sflow 25024
- copp-system-igmp 10000 copp-system-tc3to5 10000
- copp-system-ipmcmis 10000 copp-system-tc6to7 10000
- copp-system-ipmcrsvd 10000 copp-system-urm 10000
- copp-system-l3destmiss 10000 copp-system-vrrp 5000
- copp-system-l3slowpath 10000

#### Related Commands

- `class (policy-map (control-plane) Helix)` places the switch in policy-map-class (control plane) configuration mode.
- `bandwidth (policy-map-class (control-plane) Helix)` specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

#### Example

These commands configure a maximum bandwidth of 5000 packets per second for data traffic specified by the **copp-system-lldp** of the default control-plane policy map.

```
switch(config)#policy-map type control-plan copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape pps 5000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-copp-system-policy)#exit
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy

Class-map: copp-system-lldp (match-any)
```

```
shape : 5000 pps  
bandwidth : 500 pps  
Out Packets : 305961  
Drop Packets : 0
```

```
switch(config)#
```

## 9.2.7.51 shape (policy-map-class (control-plane) Petra)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

### Command Mode

Policy-map-class (control plane) configuration accessed through `class (policy-map (control-plane) Petra)`

### Command Syntax

```
shape kbps kilobits
```

```
no shape
```

```
default shape
```

### Parameters

**kilobits** Maximum data rate in kilobits per second. Value ranges from 1 to 10000000.

### Related Commands

- `class (policy-map (control-plane) Petra)` places the switch in policy-map-class (control plane) configuration mode.
- `bandwidth (policy-map-class (control-plane) Petra)` specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

### Static Classes Default Shape

Petra platform switches define these default shapes for static classes:

- `copp-system-bpdu 2500 copp-system-l3destmiss 2500`
- `copp-system-default 2500 copp-system-l3slowpath 2500`
- `copp-system-igmp 2500 copp-system-l3ttl0 2500`
- `copp-system-ipbroadcast 2500 copp-system-l3ttl1 2500`
- `copp-system-ipmc 2500 copp-system-lacp 2500`
- `copp-system-ipmcmiss 2500 copp-system-lldp 2500`
- `copp-system-ipmcsvd 2500 copp-system-unicast-arp 2500`
- `copp-system-ipunicast No Limit`

### Guidelines

Petra does not support all discrete rate values. When a specified discrete value is not supported, the switch converts the rate to the next highest discrete value that it supports. The **show** command displays the converted rate and not the user-configured rate.

### Example

These commands configure the maximum bandwidth of 2000 kbps for data traffic specified by the class map **copp-system-lldp** of the default control-plane policy map. Because the switch does not support the discrete value of 2000 kbps, it converts the bandwidth up to 2115 kbps.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape kbps 2000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-copp-system-policy)#exit
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
```

```
Class-map: copp-system-lldp (match-any)
  shape : 2115 kbps
  bandwidth : 325 kbps
  Out Packets : 0
  Drop Packets : 0
```

```
switch(config)#
```

## 9.2.7.52 shape (policy-map-class (control-plane) Trident II)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

### Command Mode

Policy-map-class (control plane) configuration accessed through `class (policy-map (control-plane) Trident II)`

### Command Syntax

```
shape pps packets
```

```
no shape
```

```
default shape
```

### Parameters

**packets** Maximum data rate in packets per second. Value ranges from 1 to 100000.

### Static Classes Default Shape

Trident II platform switches define these default shapes for static classes:

- copp-system-aclog 10000 copp-system-l3slowpath 10000
- copp-system-arp 10000 copp-system-l3ttl1 10000
- copp-system-arpresolver 10000 copp-system-lacp 5000
- copp-system-bfd 10000 copp-system-lldp 10000
- copp-system-bgp 5000 copp-system-mlag 5000
- copp-system-bpdu 5000 copp-system-selfip 5000
- copp-system-default 8000 copp-system-selfip-tc6to7 5000
- copp-system-glean 10000 copp-system-sflow 25024
- copp-system-igmp 10000 copp-system-tc3to5 10000
- copp-system-ipmcmis 10000 copp-system-tc6to7 10000
- copp-system-ipmcrsvd 10000 copp-system-urm 10000
- copp-system-l3destmiss 10000

### Related Commands

- `class (policy-map (control-plane) Trident II)` places the switch in policy-map-class (control plane) configuration mode.
- `bandwidth (policy-map-class (control-plane) Trident II)` specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

### Example

These commands configure a maximum bandwidth of 5000 packets per second for data traffic specified by the **copp-system-lldp** of the default control-plane policy map.

```
switch(config)#policy-map type control-plan copp-system-policy
switch(config-pmap-copp-system-policy)#class copp-system-lldp
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#shape pps 5000
switch(config-pmap-c-copp-system-policy-copp-system-lldp)#exit
switch(config-pmap-copp-system-policy)#exit
switch(config)#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy

Class-map: copp-system-lldp (match-any)
  shape : 5000 pps
```

```
bandwidth : 500 pps  
Out Packets : 305961  
Drop Packets : 0
```

```
switch(config)#
```

### 9.2.7.53 shape (policy-map-class (control-plane) Trident)

The **shape** command specifies the maximum bandwidth for traffic filtered by the configuration mode policy map class.

The **no shape** and **default shape** commands remove the maximum bandwidth restriction for the configuration mode class by deleting the corresponding **bandwidth** command from *running-config*.

#### Command Mode

Policy-map-class (control plane) configuration accessed through `class (policy-map (control-plane) Trident)`

#### Command Syntax

```
shape pps packets
```

```
no shape
```

```
default shape
```

#### Parameters

**packets** Maximum data rate in packets per second. Value ranges from 1 to 100000.

#### Static Classes Default Shape

Trident platform switches define these default shapes for static classes:

- copp-system-arp 10000 copp-system-ldp 10000
- copp-system-arpresolver 10000 copp-system-l3destmiss 10000
- copp-system-bpdu 5000 copp-system-l3slowpath 10000
- copp-system-default 8000 copp-system-l3ttl1 10000
- copp-system-glean 10000 copp-system-selfip 5000
- copp-system-igmp 10000 copp-system-selfip-tc6to7 5000
- copp-system-ipmcmis 10000 copp-system-sflow 25000
- copp-system-ipmcrsvd 10000 copp-system-tc3to5 10000
- copp-system-lacp 5000 copp-system-tc6to7 10000

#### Related Commands

- `class (policy-map (control-plane) Trident)` places the switch in policy-map-class (control plane) configuration mode.
- `bandwidth (policy-map-class (control-plane) Trident)` specifies the minimum bandwidth for traffic defined by its associated class map in its configuration mode policy map class.

#### Example

These commands configure a maximum bandwidth of 5000 packets per second for data traffic specified by the class map **PMAP-1** in the policy map named **copp-system-policy**.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-copp-system-policy)#class PMAP-1
switch(config-pmap-c-copp-system-policy-PMAP-1)#shape pps 5000
switch(config-pmap-c-copp-system-policy-PMAP-1)
```

### 9.2.7.54 show class-map type control-plane

The **show class-map** command displays contents of available control-plane class maps. Control-plane class maps can be added to the copp-system-policy policy map. Control-plane class maps can be static class maps defined by the system or dynamic maps created in class-map-configuration mode.

Dynamic class maps are composed of statements that match IPv4 access control lists. Static class maps are defined by the switch and cannot be altered.

#### Command Mode

EXEC

#### Command Syntax

```
show class-map type control-plane [MAP_NAME]
```

#### Parameters

- MAP\_NAME Name of class map displayed by the command. Options include:
    - **<no parameter>** Command displays all control plane class maps.
    - **name\_text** Command displays specified control-plane class maps.
- show class-map** command displays QoS class maps.

#### Related Command

`show class-map type qos` displays control plane class maps.

#### Example

This command displays all control plane class maps.

This command displays the available control plane class maps.

```
switch#show class-map type control-plane
Class-map: CM-CP1 (match-any)
  Match: ip access-group name LIST-CP1
Class-map: copp-system-acllog (match-any)
Class-map: copp-system-arp (match-any)
Class-map: copp-system-arpresolver (match-any)
Class-map: copp-system-bpdu (match-any)
Class-map: copp-system-glean (match-any)
Class-map: copp-system-igmp (match-any)
Class-map: copp-system-ipmcmis (match-any)
Class-map: copp-system-ipmcrsvd (match-any)
Class-map: copp-system-l3destmiss (match-any)
Class-map: copp-system-l3slowpath (match-any)
Class-map: copp-system-l3ttl1 (match-any)
Class-map: copp-system-lacp (match-any)
Class-map: copp-system-lldp (match-any)
Class-map: copp-system-selfip (match-any)
Class-map: copp-system-selfip-tc6to7 (match-any)
Class-map: copp-system-sflow (match-any)
Class-map: copp-system-tc3to5 (match-any)
Class-map: copp-system-tc6to7 (match-any)
switch>
```

---

### 9.2.7.55 show class-map type pbr

The **show class-map** command displays contents of all available Policy-Based Routing (PBR) class maps, or of a specified PBR class map. PBR class maps are used by PBR policy maps. PBR class maps are dynamic maps that are created in class-map-configuration mode. Dynamic class maps are composed of statements that match IPv4 or IPv6 access control lists.

#### Command Mode

EXEC

#### Command Syntax

```
show class-map type pbr [map_name]
```

#### Parameters

**map\_name** Name of class map displayed by the command. If no parameter is entered, command show all available PBR class maps.

#### Related Command

[show policy-map type pbr](#) displays PBR policy maps.

#### Example

This command displays the contents of the PBR class map **CMAP1**.

```
switch#show class-map type pbr CMAP1
  Class-map: CMAP1 (match-any)
    Match: 10 ip access-group PBRgroup1
    Match: 20 ip access-group PBRgroup2
    Match: 30 ip access-group PBRgroup3
switch>
```

### 9.2.7.56 show class-map type qos

The **show class-map** command displays contents of all available QoS class maps. QoS class maps are used by QoS policy maps. QoS class maps are dynamic maps that are created in class-map-configuration mode. Dynamic class maps are composed of statements that match IPv4 or IPv6 access control lists.

#### Command Mode

EXEC

#### Command Syntax

```
show class-map [type qos] [MAP_NAME]
```

#### Parameters

- **MAP\_NAME** Name of class map displayed by the command.
  - **<no parameter>** Command displays all QoS class maps.
  - **name\_text** Command displays specified QoS class maps.

**show class-map** and **show class-map type qos** are identical commands.

#### Related Command

[show class-map type control-plane](#) displays control plane class maps.

#### Example

This command displays the available QoS class maps.

```
switch#show class-map type qos
Class-map: CM-Q1 (match-any)
  Match: ipv6 access-group name LIST-1
Class-map: CM-Q2 (match-any)
  Match: ip access-group name LIST-2
switch>
```

---

### 9.2.7.57 show policy-map copp

The **show policy-map copp** command displays contents of the control-plane policy map. Control-plane policy maps are applied to the control plane, and copp-system-policy is the only supported policy map.

#### Command Mode

EXEC

#### Command Syntax

```
show policy-map copp copp-system-policy
```

#### Example

This command displays the contents and throughput of the policy map applied to the control plane.

```
switch#show policy-map copp copp-system-policy
Service-policy input: copp-system-policy
  Number of units programmed: 1
  Hardware programming status: Successful

  Class-map: copp-system-bpdu (match-any)
    shape : 5000 pps
    bandwidth : 5000 pps
    Out Packets : 2
    Drop Packets : 0

  Class-map: copp-system-lacp (match-any)
    shape : 5000 pps
    bandwidth : 5000 pps
    Out Packets : 0
    Drop Packets : 0

switch>
```

### 9.2.7.58 show policy-map interface type qos counters

The `show policy-map interface` command displays the quantity of packets that are filtered by ACLs applied to a interface.

#### Command Mode

EXEC

#### Command Syntax

```
show policy-map [INTERFACE_NAME][type qos][TRAFFIC] counters
```

#### Parameters

- `INTERFACE_NAME` Filters policy map list by interfaces. Options include:
  - **<no parameter>** Displays data for all configured interfaces.
  - **interface ethernet e\_range** Ethernet ports for which command displays policy maps.
  - **interface port-channel p\_range** Port channels for which command displays policy maps.
- `TRAFFIC` Filters policy maps by the traffic they manage. Options include:
  - **<no parameter>** Policy maps that manage interfaces ingress traffic (same as **input** option).
  - **input** Policy maps that manage interfaces ingress traffic.

#### Example

This command displays the policy maps applied to Ethernet interfaces 7 and 8.

```
switch#show policy-map interface ethernet 7-8
Service-policy input: PMAP-1
  Hardware programming status: Successful

  Class-map: cmap-1 (match-any)
    Match: ip access-group name LIST-2
          set cos 6

  Class-map: class-default (match-any)

Service-policy input: PMAP-2
  Hardware programming status: Successful

  Class-map: cmap-2 (match-any)
    Match: ip access-group name LIST-2
          set dscp 10

  Class-map: class-default (match-any)

switch#
```

---

### 9.2.7.59 show policy-map interface type qos

The **show policy-map interface** command displays contents of the policy maps applied to specified interfaces or to the control plane.

#### Command Mode

EXEC

#### Command Syntax

```
show policy-map interface INTERFACE_NAME [type qos] [TRAFFIC]
```

#### Parameters

- **INTERFACE\_NAME** Filters policy map list by interfaces. Options include:
  - **ethernet e\_range** Ethernet ports for which command displays policy maps.
  - **port-channel p\_range** Port channels for which command displays policy maps.
- **TRAFFIC** Filters policy maps by the traffic they manage. Options include:
  - **<no parameter>** Policy maps that manage interfaces ingress traffic (same as **input** option).
  - **input** Policy maps that manage interfaces ingress traffic.

#### Example

This command displays the policy maps applied to Ethernet interfaces 7 and 8.

```
switch#show policy-map interface ethernet 7-8
Service-policy input: PMAP-1
  Hardware programming status: Successful

  Class-map: cmap-1 (match-any)
    Match: ip access-group name LIST-2
          set cos 6

  Class-map: class-default (match-any)

Service-policy input: PMAP-2
  Hardware programming status: Successful

  Class-map: cmap-2 (match-any)
    Match: ip access-group name LIST-2
          set dscp 10

  Class-map: class-default (match-any)

switch#
```

### 9.2.7.60 show policy-map type copp

The **show policy-map type copp** command displays contents of control plane policy maps. Control-plane policy maps are applied to the control plane; copp-system-policy is the only supported policy map.

Command options filter the output to display contents of all policy maps, contents of a specified policy map, or contents of a single class map within a specified policy map.

#### Command Mode

EXEC

#### Command Syntax

```
show policy-map type copp copp-system-policy [CMAP_NAME]
```

#### Parameters

- CMAP\_NAME Name of class map displayed by the command.
  - **<no parameter>** Command displays all class maps in specified policy map.
  - **class\_name** Command displays specified class map.

#### Example

This command displays the contents of the copp-system-bpdu class map in the copp-system-policy policy maps.

```
switch#show policy-map type copp copp-system-policy class copp-system-b
pdu
  Class-map: copp-system-bpdu (match-any)
    shape : 5000 pps
    bandwidth : 5000 pps

switch>
```

---

### 9.2.7.61 show policy-map type pbr

The **show policy-map pbr** command displays contents of Policy-Based Routing (PBR) policy maps. PBR policy maps are applied to Ethernet interfaces, port channel interfaces or switch virtual interfaces (SVIs).

Command options filter the output to either display contents of all policy maps, contents of a specified policy map, or summary contents of all or a specified policy map.

#### Command Mode

EXEC

#### Command Syntax

```
show policy-map type pbr [PMAP_NAME][DATA_LEVEL]
```

#### Parameters

- **PMAP\_NAME** Name of policy map displayed by the command.
  - *<no parameter>* Command displays all policy maps.
  - **policy-map** Command displays specified policy map.
- **DATA\_LEVEL** Type of information the command displays. Values include:
  - *<no parameter>* Command displays all class maps in specified policy map.
  - **summary** Command displays summary data for the specified policy map.

#### Example

This command displays the contents of all PBR policy maps in *running-config*.

```
switch#show policy-map type pbr
Service policy PMAP1
Configured on:
Applied on:
10: Class-map: CMAP1 (match-any)
Match: 10 ip access-group PBRgroup1
Match: 20 ip access-group PBRgroup2
Match: 30 ip access-group PBRgroup3
Configured actions: set nexthop 172.16.10.12
20: Class-map: CMAP2 (match-any)
Match: 10 ip access-group PBRgroup1
Match: 10 ip access-group PBRgroup4
Match: 20 ip access-group PBRgroup5
Configured actions: set nexthop 192.168.15.15
switch#
```

### 9.2.7.62 show policy-map type qos counters

The **show policy-map counters** command displays the quantity of packets that are filtered by the ACLs that comprise a specified QoS policy map.

#### Command Mode

EXEC

#### Command Syntax

```
show policy-map [type qos] pmap_name [TRAFFIC] counters [INFO_LEVEL]
```

#### Parameters

- *pmap\_name* Name of policy map displayed by the command.
- TRAFFIC Filters policy maps by the traffic they manage. Options include:
  - *<no parameter>* Policy maps that manage interfaces ingress traffic (same as **input** option).
  - **input** Policy maps that manage interfaces ingress traffic.
- INFO\_LEVEL amount of information that is displayed. Options include:
  - *<no parameter>* displays summarized information about the policy map.
  - **detail** displays detailed policy map information.

### 9.2.7.63 show policy-map type qos

The **show policy-map qos** command displays contents of QoS policy maps. QoS policy maps are applied to Ethernet or port channel interfaces.

Command options filter the output to either display contents of all policy maps, contents of a specified policy map, or contents of a single class map within a specified policy map.

#### Command Mode

EXEC

#### Command Syntax

```
show policy-map [type qos][PMAP_NAME [CMAP_NAME]]
```

#### Parameters

- **PMAP\_NAME** Name of policy map displayed by the command.
  - *<no parameter>* Command displays all policy maps.
  - **policy\_map** Command displays specified policy map.
- **CMAP\_NAME** Name of class map displayed by the command. This option is available only when the command includes a policy map name.
  - *<no parameter>* Command displays all class maps in specified policy map.
  - **class\_name** Command displays specified class map.

#### Example

This command displays the contents of all QoS policy maps in **running-config**.

```
switch#show policy-map type qos
Service-policy input: PMAP-1
  Hardware programming status: Successful

  Class-map: xeter (match-any)
    Match: ip access-group name LIST-1
         set cos 6

  Class-map: class-default (match-any)
Service-policy PMAP-2

  Class-map: class-default (match-any)

switch#
```

## Interface Configuration

---

This chapter describes Ethernet ports supported by Arista switches as well as channel groups, port channels, port channel interfaces, Link Aggregation Control Protocol (LACP), and Multi-Chassis Link Aggregation. This chapter contains the following sections:

- [Ethernet Ports](#)
- [Port Channels and LACP](#)
- [Multi-Chassis Link Aggregation](#)
- [Data Transfer](#)

### 10.1 Ethernet Ports

This section describes Ethernet ports supported by Arista switches. Topics covered in this section include:

- [Ethernet Ports Introduction](#)
- [Ethernet Standards](#)
- [Ethernet Physical Layer](#)
- [Interfaces](#)
- [Ethernet Configuration Procedures](#)
- [Ethernet Configuration Commands](#)

#### 10.1.1 Ethernet Ports Introduction

Arista switches support a variety of Ethernet network interfaces. This chapter describes the configuration and monitoring options available in Arista switching platforms.

#### 10.1.2 Ethernet Standards

Ethernet, standardized in IEEE 802.3, is a group of technologies used for communication over local area networks. Ethernet communication divides data streams into frames containing addresses (source and destination), payload, and cyclical redundancy check (CRC) information.

IEEE 802.3 also describes two types of optical fiber: single-mode fiber (SMF) and multi-mode fiber (MMF).

- SMF is more expensive, but can be used over longer distances (over 300 meters).
- MMF is less expensive, but can only be used over distances of less than 300 meters.

##### 10.1.2.1 100 Gigabit Ethernet

The 100 Gigabit Ethernet (100GbE) standard defines an Ethernet implementation with a nominal data rate of 100 billion bits per second over multiple 10 gigabit lanes. 100 Gigabit Ethernet implements full duplex point to point links connected by network switches. Arista switches support 100GBASE-10SR through MXP ports.

### 10.1.2.2 40 Gigabit Ethernet

The 40 Gigabit Ethernet (40GbE) standard defines an Ethernet implementation with a nominal data rate of 40 billion bits per second over multiple 10 gigabit lanes. 40 Gigabit Ethernet implements full duplex point to point links connected by network switches. 40 gigabit Ethernet standards are named **40GBASE-xyz**, as interpreted by [40GBASE-xyz Interpretation](#).

**Table 51: 40GBASE-xyz Interpretation**

x	y	z
Non-fiber media type, or fiber wavelength	PHY encoding	Number of WWDM wavelengths or XAUI Lanes
C = Copper F = Serial SMF K = Backplane L = Long (1310 nm) S = Short (850 nm)	R = LAN PHY (64B/66B)	No value = 1 (serial) 4 = 4 WWDM wavelengths or XAUI Lanes

### 10.1.2.3 10 Gigabit Ethernet

The 10 Gigabit Ethernet (10GbE) standard defines an Ethernet implementation with a nominal data rate of 10 billion bits per second. 10 Gigabit Ethernet implements full duplex point to point links connected by network switches. Half duplex operation, hubs and CSMA/CD do not exist in 10GbE. The standard encompasses several PHY standards; a networking device may support different PHY types through pluggable PHY modules. 10GbE standards are named **10GBASE-xyz**, as interpreted by [10GBASE-xyz Interpretation](#).

**Table 52: 10GBASE-xyz Interpretation**

x	y	z
media type or wavelength, if media type is fiber	PHY encoding type	Number of WWDM wavelengths or XAUI Lanes
C = Copper (twin axial) T = Twisted Pair S = Short (850 nm) L = Long (1310 nm) E = Extended (1550 nm) Z = Ultra extended (1550 nm)	R = LAN PHY (64B/66B) X = LAN PHY (8B/10B) W = WAN PHY(*) (64B/66B)	If omitted, value = 1 (serial) 4 = 4 WWDM wavelengths or XAUI Lanes

### 10.1.2.4 Gigabit Ethernet

The Gigabit Ethernet (GbE), defined by IEEE 802.3-2008, describes an Ethernet version with a nominal data rate of one billion bits per second. GbE cables and equipment are similar to those used in previous standards. While full-duplex links in switches is the typical implementation, the specification permits half-duplex links connected through hubs.

Gigabit Ethernet physical layer standards that Arista switches support include 1000BASE-X (optical fiber), 1000BASE-T (twisted pair cable), and 1000BASE-CX (balanced copper cable).

- 1000BASE-SX is a fiber optic standard that utilizes multi-mode fiber supporting 770 to 860 nm, near infrared (NIR) light wavelength to transmit data over distances ranging from 220 to 550 meters. 1000BASE-SX is typically used for intra-building links in large office buildings, co-location facilities and carrier neutral Internet exchanges.
- 1000BASE-LX is a fiber standard that utilizes a long wavelength laser (1,2701,355 nm), with a RMS spectral width of 4 nm to transmit data up to 5 km. 1000BASE-LX can run on all common types of multi-mode fiber with a maximum segment length of 550 m.

- 1000BASE-T is a standard for gigabit Ethernet over copper wiring. Each 1000BASE-T network segment can be a maximum length of 100 meters.

#### 10.1.2.5 10/100/1000 BASE-T

Arista switches provide 10/100/1000 BASE-T Mbps Ethernet out of band management ports. Auto-negotiation is enabled on these interfaces. Speed (10/100/1000), duplex (half/full), and flow control settings are available using the appropriate **speed** and **flowcontrol** commands.

#### 10.1.2.6 Power over Ethernet (PoE)

Selected Arista switches provide power over Ethernet (PoE) to power connected devices. Aristas PoE implementation is compliant with IEEE standards 802.3af and 802.3at, and includes partial support for 802.3bt.

When a standards-compliant powered device (PD) is connected to a PoE-enabled Ethernet port, it is recognized by a specific resistor signature, and its power class is determined by hardware negotiation; more granular power adjustments can then be managed by Link Layer Discovery Protocol (LLDP).

#### 10.1.2.7 Link Fault Signaling

Link Fault Signaling (LFS) is a mechanism by which remote link faults are transmitted to the peer over the link that is experiencing problems by configuring specific actions. LFS operates between the remote Reconciliation Sublayer (remote RS) and the local Reconciliation Sublayer (local RS). Faults that are detected between the remote RS and the local RS are treated by the local RS as Local Faults.

LFS enables monitoring FCS and Symbol errors on an interface and if they exceed a configured threshold, one of the following three actions are enabled.

- Disable the error on the interface
- Generate system log messages
- Generate a link fault

### 10.1.3 Ethernet Physical Layer

The Ethernet physical layer (PHY) includes hardware components connecting a switch's MAC layer to the transceiver, cable, and ultimately a peer link partner.

Data exist in digital form at the MAC layer. On the line side of the PHY, data exist as analog signals: light blips on optical fiber or voltage pulses on copper cable. Signals may be distorted while in transit and recovery may require signal processing. Ethernet physical layer components include a PHY and a transceiver.

#### 10.1.3.1 PHYs

The PHY provides translation services between the MAC layer and transceiver. It also helps to establish links between the local MAC layer and peer devices by detecting and signaling fault conditions. The PHY line-side interface receives Ethernet frames from the link partner as analog waveforms. The PHY uses signal processing to recover the encoded bits, then sends them to the MAC layer.

PHY line-side interface components and their functions include:

- Physical Medium Attachment (PMA): Framing, octet synchronization, scrambling / descrambling.
- Physical Medium Dependent (PMD): Consists of the transceiver.
- Physical Coding Sublayer (PCS): Performs auto-negotiation and coding (8B/10B or 64B/66B).

The MAC sublayer of the PHY provides a logical connection between the MAC layer and the peer device by initializing, controlling, and managing the connection with the peer.

---

Ethernet frames transmitted by the switch are received by the PHY system-side interface as a sequence of digital bits. The PHY encodes them into a media-specific waveform for transmission through the line-side interface and transceiver to the link peer. This encoding may include signal processing, such as signal pre-distortion and forward error correction.

PHY system-side interface components and their functions include:

- 10 Gigabit Attachment Unit Interface (XAUI): Connects an Ethernet MAC to a 10 G PHY.
- Serial Gigabit Media Independent Attachment (SGMII): Connects an Ethernet MAC to a 1G PHY.

### 10.1.3.2 Transceivers

A transceiver connects the PHY to an external cable (optical fiber or twisted-pair copper) and through a physical connector (LC jack for fiber or RJ-45 jack for copper).

- Optical transceivers convert the PHY signal into light pulses that are sent through optical fiber.
- Copper transceivers connect the PHY to twisted-pair copper cabling.

Arista Small Form-Factor Pluggable (SFP+) and Quad Small Form Factor Pluggable (QSFP+) modules and cables provide high-density, low-power Ethernet connectivity over fiber and copper media. Arista offers transceivers that span data rates, media types, and transmission distances.

#### **Arista 10 Gigabit Ethernet SFP+ Modules:**

- 10GBASE-SR (Short Reach)
  - Link length maximum 300 meters over multi-mode fiber.
  - Optical interoperability with 10GBASE-SRL.
- 10GBASE-SRL (Short Reach Lite)
  - Link length maximum 100 meters over multi-mode fiber.
  - Optical interoperability with 10GBASE-SR.
- 10GBASE-LRL (Long Reach Lite)
  - Link length maximum 1 km over single-mode fiber.
  - Optical interoperability with 10GBASE-LR (1 km maximum).
- 10GBASE-LR (Long Reach)
  - Link length maximum 10 km over single-mode fiber.
  - Optical interoperability with 10GBASE-LRL (1 km maximum).
- 10GBASE-LRM (Long Reach Multimode)
  - Link length maximum 220 meters over multi-mode fiber (50 um and 62.5 um).
- 10GBASE-ER (Extended Reach)
  - Link length maximum 40 km over single-mode fiber.
- 10GBASE-ZR (Ultra-Extended Reach)
  - Link length maximum 80 km over single-mode fiber.
- 10GBASE-DWDM (Dense Wavelength Division Multiplexing)
  - Link length maximum 80 km over single-mode fiber (40 color options).
  - Tunable SFP+ Optics Module, Full C-Band 50 GHz ITU Grid, up to 80km over duplex SMF.

#### **Arista 10 Gigabit Ethernet CR Cable Modules:**

- 10GBASE-CR SFP+ to SFP+ Cables
  - Link lengths of 0.5, 1, 1.5, 2, 2.5, 3, 5 and 7 meters over twinax copper cable
  - Includes SFP+ connectors on both ends
- 4 x 10GbE QSFP+ to 4 x SFP+ twinax copper cables

- Link lengths of 0.5, 1, 2, 3, and 5 meters over twinax copper cable

**Arista 25 Gigabit Ethernet Modules:**

- 25GBASE-CR SFP28 Cable
  - Capable of 10G/25G with link length of 1 to 5 meters
- AOC-S-S-25G SFP28 to SFP28 25GbE Active Optical Cable
  - Link length of 3 to 30 meters
- SFP-25G-SR SFP28 Optics Module
  - Link length up to 70m over OM3 MMF or 100m over OM4 MMF
- SFP-25G-LR SFP28 Optics Module
  - Link length up to 10 kilometers over duplex SMF

**Arista 40 Gigabit Ethernet QSFP+ Cables and Optics:**

- 40GBASE-SR4 QSFP+ Transceiver
  - Link length maximum 100 meters over parallel OM3 or 150 meters over OM4 MMF
  - Optical interoperability with 40GBASE-XSR4 (100/150 meter maximum)
- 40GBASE-XSR4 QSFP+ Transceiver
  - Link length maximum 300 meters over parallel OM3 or 450 meters over OM4 MMF
  - Optical interoperability with 40GBASE-SR4 (100/150 meter maximum)
- 40GBASE-LR4 QSFP+
  - Link length maximum 10 km over duplex single-mode fiber
- 40GBASE-CR4 QSFP+ to QSFP+ twinax copper cables
  - Link lengths of 1, 2, 3, 5 and 7 meters over twinax copper cable
- 40G-SRBD Bidirectional QSFP+ Optic
  - Link length maximum up to 100 meters over parallel OM3 or 150 meters over OM4 MMF
- 40G Univ QSFP+ Optic
  - Link length maximum up to 150 meters over duplex OM3/OM4 and 500 meters over duplex SMF
- 40GBASE-LRL QSFP+ Optic
  - Link length maximum up to 1 kilometer over duplex SMF
- 40GBASE-PLRL4 QSFP+ Optic
  - Link length maximum up to 1 kilometer over parallel SMF (4x10G LR up to 1 km)
- 40GBASE-PLR4 QSFP+ Optic
  - Link length maximum up to 1 kilometer over parallel SMF (4x10G LR up to 1 km)
- 40GBASE-ER QSFP+ Optic
  - Link length maximum up to 40 kilometers duplex SMF

**Arista Gigabit Ethernet SFP Options:**

- 1000BASE-SX (Short Haul)
  - Multi-mode fiber
  - Link length maximum 550 meter
- 1000BASE-LX (Long Haul)
  - Single-mode fiber
  - Link length maximum 10 km (single mode)

- 
- 1000BASE-T (RJ-45 Copper)
    - Category 5 cabling
    - Full duplex 1000Mbps connectivity

#### **Arista 100 Gigabit Ethernet QSFP Modules:**

- 100GBASE-SR4 QSFP transceiver
  - Link length up to 70 meters over parallel OM3 or 100 meters over OM4 multi-mode fiber.
- 100GBASE-SWDM4 QSFP transceiver
  - Link length up to 70 meters over OM3 or 100 meters over OM4 duplex multi-mode fiber.
- 100GBASE-SRBD BIDI QSFP transceiver
  - Link length up to 70 meters over OM3 or 100 meters over OM4 duplex multi-mode fiber.
- 100GBASE-PSM4 40G/100G dual speed QSFP Optics Module
  - Link length up to 500 meters over parallel single-mode fiber.
- 100GBASE-CWDM4 40G/100G dual speed QSFP Optics Module
  - Link length up to 2 km over duplex single-mode fiber.
- 100GBASE-LRL4 QSFP Optics Module
  - Link length up to 2 km over duplex single-mode fiber.
- 100GBASE-LR4 QSFP Optics Module
  - Link length up to 10 km over duplex single-mode fiber.
- 100GBASE-ERL4 QSFP Optics Module
  - Link length up to 40 km over duplex single-mode fiber.
- 100G DWDM QSFP transceiver
  - Link length up to 80 km over single-mode fiber.
- 100GBASE-CR4 QSFP to QSFP Twinax Copper Cable
  - Link length of 1 to 5 meters
- 100GBASE-CR4 QSFP to 4 x 25GbE SFP Twinax Copper Cable
  - Link length of 1 to 5 meters

#### **Internal ports**

Several Arista switches include internal ports that connect directly to an external cable through an RJ-45 jack. Internal ports available on Arista switches include:

- 100/1000BASE-T (7048T-A)
- 100/1000/10GBASE-T (7050-T)

#### **AOC cables**

- AOC-Q-Q-100G QSFP 100GbE Active Optical Cable
  - Link length of 3 to 30 meters
- AOC-Q-Q-40G QSFP+ to QSFP+ 40GbE Active Optical Cable
  - Link length of 3 to 100 meters
- AOC-S-S-25G SFP28 to SFP28 25GbE Active Optical Cable
  - Link length of 3 to 30 meters

### 10.1.3.3 MXP Ports

MXP ports provide embedded optics that operate in one of three modes: 10GbE (12 ports), 40GbE (3 ports), and 100GbE (1 port). Each mode requires a specified cable is implemented through configuration commands. MXP ports utilize multi-mode fiber to provide support over 150 meters.

- 100GbE mode requires an MTP-24 to MTP-24 cable, which uses 20 of 24 fibers to carry 100Gbe across 10 send and 10 receive channels. When connecting two 100GbE MXP ports, the TX lanes must be crossed with the RX lanes.
- 40GbE mode requires an MTP cable that provides a split into three MTP-12 ends. The cable splits the MXP port into three MTP-12 ends, each compatible with standards based 40GBASE-SR4 ports over OM3 or OM4 fiber up to 100m or 150m.
- 10GbE mode requires an MTP cable that provides a split into 12x10G with LC connectors to adapt the MXP port into 12x10GbE. The cable splits the MXP port into twelve LC ends for using SR or SRL optics over multimode OM3/OM4 cables.

### 10.1.4 Interfaces

Arista switches provide two physical interface types that receive, process, and transmit Ethernet frames: Ethernet interfaces and Management interfaces.

Each Ethernet interface is assigned a 48-bit MAC address and communicates with other interfaces by exchanging data packets. Each packet contains the MAC address of its source and destination interface. Ethernet interfaces establish link level connections by exchanging packets. Interfaces do not typically accept packets with a destination address of a different interface.

Ethernet data packets are frames. A frame begins with preamble and start fields, followed by an Ethernet header that includes source and destination MAC addresses. The middle section contains payload data, including headers for other protocols carried in the frame. The frame ends with a 32-bit cyclic redundancy check (CRC) field that interfaces use to detect data corrupted during transmission.

#### 10.1.4.1 Ethernet Interfaces

Ethernet speed and duplex configuration options depend on the media type of the interface:

- 40G QSFP+: Default operation is as four 10G ports. `speed` command options support configuration as a single 40G port.
- 10GBASE-T: Mode is autonegotiate by default, offering 10G and 1G full duplex and 100M. Default setting is 10G. Half duplex and 10M are not supported. Adjustments may be made using `sa` commands.
- 10GBASE (SFP+): Port operates as a single 10G port. `speed` commands do not affect configuration.
- 100BASE-T (copper): Mode is autonegotiate by default, offering 1G full and 100M; default setting is 1G full. Autonegotiation that offers only 100M is available through `speed auto 100full` command. Half duplex and 10M are not supported.
- 100G CFP: Default operation is 100G. It cannot be split, and its speed cannot be changed.
- 100G MXP: Default operation is as a single 100G port on the 7500 and 7280 platforms, and as three 40G ports on the 7050 platform. On the 7500 and 7280 platforms, available speed/duplex settings are a single 100G port, three 40G ports, or twelve 10G ports. On the 7050 platform, available speed/duplex settings are three 40G ports or twelve 10G ports. Adjustments are made with `speed` commands.
- 100G QSFP100: Available speeds are transceiver-dependent. The QSFP100 transceiver supports a single 100G port, four 25G ports, or two 50G ports; the QSFP+ transceiver supports one 40G port or four 10G ports; the CWDM transceiver supports all five configurations. Adjustments are made using `speed` commands.

**Note:** 7500 and 7280 families do not currently support 25G or 50G speeds.

- 
- The **SFP-1G-T** transceivers advertise one speed at a time only. Hence, the desired speed and negotiation must be configured explicitly using the following commands:
    - speed auto: auto-negotiated 1Gbps (this is because no speed is specified and we are defaulting to advertise 1G).
    - speed auto 1G full/ speed 1G: auto-negotiated 1Gbps (note that per BASE-T standard, 1G must be negotiated)
    - speed auto 100full: auto-negotiated 100Mbps
    - speed 100full: non-negotiated/true-forced 100Mbps

For information relating to transceivers, please see [Transceivers](#).

#### 10.1.4.2 Subinterfaces

Subinterfaces divide a single ethernet or port channel interface into multiple logical L3 interfaces based on the 802.1q tag (VLAN ID) of incoming traffic. Subinterfaces are commonly used in the L2/L3 boundary device, but they can also be used to isolate traffic with 802.1q tags between L3 peers by assigning each subinterface to a different VRF.

While subinterfaces can be configured on a port channel interface (the virtual interface associated with a port channel), the following restrictions apply:

- An L3 interface with subinterfaces configured on it should not be made a member of a port channel.
- An interface that is a member of a port channel should not have subinterfaces configured on it.
- A subinterface cannot be made a member of a port channel.

Subinterfaces on multiple ports can be assigned the same VLAN ID, but there is no bridging between subinterfaces (or between subinterfaces and SVIs), and each subinterface is considered to be in a separate bridge domain.

The following features are supported on subinterfaces:

- Unicast and multicast routing
- BGP, OSPF, ISIS, PIM
- ACL
- VRF
- VRRP
- SNMP
- Subinterface counters (on some platforms)
- VXLAN (on some platforms)
- MPLS (on some platforms)
- GRE (on some platforms)
- PBR (on some platforms)
- QoS (on some platforms)
- Inheriting QoS settings (trust mode and default DSCP) from the parent interface
- Inheriting MTU setting from parent interface

The following are not supported on subinterfaces:

- Per-subinterface MTU setting
- Per-subinterface SFLOW settings
- Per-subinterface mirroring settings

#### 10.1.4.3 Agile Ports

Agile Ports are a feature of the 7150S Series that allows the user to configure adjacent blocks of 4 x SFP+ interfaces as a single 40G link. The set of interfaces that can be combined to form a higher speed port is restricted by the hardware configuration. Only interfaces that pass through a common

PHY component can be combined. One interface within a combinable set is designated as the primary port.

When the primary interface is configured as a higher speed port, all configuration statements are performed on that interface. All other interfaces in the set are subsumed and not individually configurable when the primary interface is configured as the higher speed port. This feature allows the 7150S-24 to behave as a 4x40G switch (using 16 SFP+) and the remaining SFP+ provide 8 x 10Gports. On the 7150S-52 this allows up to 13x 40G (all 52 ports grouped as 40G) and on the 7150S-64 Agile Ports allows the switch to be deployed with up to 16 native 40G interfaces - 4 are QSFP+ and the remaining 12 as 4xSFP+ groups. Section [Agile Ports](#) describes the configuration of agile ports.

#### 10.1.4.4 Management Interfaces

The management interface is a layer 3 host port that is typically connected to a PC for performing out of band switch management tasks. Each switch has one or two management interfaces. Only one port is needed to manage the switch; the second port, when available, provides redundancy.

Management interfaces are 10/100/1000 BASE-T interfaces. By default, auto-negotiation is enabled on management interfaces. All combinations of speed 10/100/1000 and full or half duplex is enforceable on these interfaces through `speed` commands.

Management ports are enabled by default. The switch cannot route packets between management ports and network (Ethernet interface) ports because they are in separate routing domains. When the PC is multiple hops from the management port, packet exchanges through layer 3 devices between the management port and PC may require the enabling of routing protocols.

The Ethernet management ports are accessed remotely over a common network or locally through a directly connected PC. An IP address and static route to the default gateway must be configured to access the switch through a remote connection.

#### 10.1.4.5 Tunable SFP

Tuning of DWDM 10G SFP+ transceivers (10GBASE-DWDM) includes:

- Tuning transceiver wavelength/frequency by channel number
- Showing wavelengths/frequencies for specified channels supported by the transceiver
- Showing current wavelength/frequency settings of the transceiver interface

For information relating to tuning the transceiver wavelength/frequency by channel number, refer to the command `transceiver channel`. To show the current wavelength/frequency settings for specified channels, refer to the command `show interfaces transceiver channels`. To show the current wavelength/frequency settings of an interface, refer to the command `show interfaces transceiver hardware`.

### 10.1.5 Ethernet Configuration Procedures

These sections describe Ethernet and Management interface configuration procedures:

- [Physical Interface Configuration Modes](#)
- [Assigning a MAC Address to an Interface](#)
- [Port Groups \(QSFP+ and SFP+ Interface Selection\)](#)
- [Referencing Modular Ports](#)
- [Referencing Multi-lane Ports](#)
- [QSFP+ Ethernet Port Configuration](#)
- [QSFP100 Ethernet Port Configuration](#)
- [CFP2 Ethernet Port Configuration](#)
- [MXP Ethernet Port Configuration](#)

- [Port Speed Capabilities](#)
- [Agile Ports](#)
- [Subinterface Configuration](#)
- [Autonegotiated Settings](#)
- [Displaying Ethernet Port Properties](#)
- [Ingress Counters](#)
- [Configuring Ingress Traffic-Class Counters](#)
- [Configuring Power over Ethernet \(PoE\)](#)
- [Configuring Link Fault Signaling](#)
- [Configuring Hardware TCAM](#)

### 10.1.5.1 Physical Interface Configuration Modes

The switch provides two configuration modes for modifying Ethernet parameters:

- Interface-Ethernet mode configures parameters for specified Ethernet interfaces.
- Interface-Management mode configures parameters for specified management Ethernet interfaces.

Physical interfaces cannot be created or removed.

Multiple interfaces can be simultaneously configured. Commands are available for configuring Ethernet specific, layer 2, layer 3, and application layer parameters. Commands that modify protocol specific settings in Ethernet configuration mode are listed in the protocol chapters.

- The `interface ethernet` command places the switch in Ethernet-interface configuration mode.
- The `interface management` command places the switch in management configuration mode.

#### Examples

- This command places the switch in Ethernet-interface mode for Ethernet interfaces 5-7 and 10.

```
switch(config)#interface ethernet 5-7,10
switch(config-if-Et5-7,10)#
```

- This command places the switch in management-interface mode for management interface 1.

```
switch(config)#interface management 1
switch(config-if-Ma1)#
```

### 10.1.5.2 Assigning a MAC Address to an Interface

Ethernet and Management interfaces are assigned a MAC address when manufactured. This address is the burn-in address. The `mac-address` command assigns a MAC address to the configuration mode interface in place of the burn-in address. The `no mac-address` command reverts the interfaces current MAC address to its burn-in address.

#### Examples

- This command assigns the MAC address of `001c.2804.17e1` to Ethernet interface 7.

```
switch(config-if-Et7)#mac-address 001c.2804.17e1
```

- This command displays the MAC address of Ethernet interface 7. The active MAC address is `001c.2804.17e1`. The burn-in address is `001c.7312.02e2`.

```
switch(config-if-Et7)#show interface ethernet 7
Ethernet7 is up, line protocol is up (connected)
Hardware is Ethernet, address is 001c.2804.17e1 (bia 001c.7312.02e2)
Description: b.e45
```

```
switch(config-if-Et7) #
```

### 10.1.5.3 Port Groups (QSFP+ and SFP+ Interface Selection)

Several of Aristas fixed switches limit the number of 10G data lanes in operation through the use of port groups. A port group is a set of interfaces that can be configured as four SFP+ interfaces or a single QSFP+ interface. When configured in SFP+ mode, the port group enables 4 standalone 10GbE interfaces using SFP+ optics. When configured in QSFP+ mode, the port group enables a single QSFP+ interface (in addition to the dedicated QSFP+ ports), which can operate as a single 40GbE port, or as four 10GbE ports with the appropriate breakout cabling.

Hardware port groups are used on the following systems:

- DCS-7050Q-16
- DCS-7050QX-32S

Use the [hardware port-group](#) command to select the interface mode for the specified port group.

**Note:** The `hardware port-group` command restarts the forwarding agent, which disrupts traffic on all switch ports.

#### Example

These commands configure the DCS-7050-Q16 switch to enable four SFP+ interfaces and one extra QSFP+ interface by enabling the SFP+ interfaces in port group 1 and the QSFP+ interface in port group 2.

```
switch(config) #hardware port-group 1 select Et17-20
switch(config) #hardware port-group 2 select Et16/1-4
```

The [show hardware port-group](#) command displays the status of ports in the port groups.

#### Example

This command displays the status of the flexible ports within the two port groups on a DCS-7050Q-16 switch.

```
switch#show hardware port-group

Portgroup: 1      Active Ports: Et17-20
Port             State
-----
Ethernet17      Active
Ethernet18      Active
Ethernet19      Active
Ethernet20      Active
Ethernet15/1    ErrDisabled
Ethernet15/2    ErrDisabled
Ethernet15/3    ErrDisabled
Ethernet15/4    ErrDisabled

Portgroup: 2      Active Ports: Et16/1-4
Port             State
-----
Ethernet16/1    Active
Ethernet16/2    Active
Ethernet16/3    Active
Ethernet16/4    Active
Ethernet21      ErrDisabled
Ethernet22      ErrDisabled
Ethernet23      ErrDisabled
Ethernet24      ErrDisabled
```

### 10.1.5.3.1 DCS-7050Q-16

The DCS-7050Q-16 has 14 dedicated QSFP+ ports, plus two port groups. The port groups support either two additional QSFP+ ports or eight SFP+ ports as shown in [DCS-7050Q-16 Port Groups](#).

**Table 53: DCS-7050Q-16 Port Groups**

Port Group 1		Port Group 2	
Active Interface(s)		Active Interface(s)	
In SFP+ Mode	In QSFP+ Mode (Default)	In SFP+ Mode	In QSFP+ Mode (Default)
Et17-20 (four SFP+ ports)	Et15/1-4 (one QSFP+ port)	Et21-24 (four SFP+ ports)	Et16/1-4 (one QSFP+ port)

### 10.1.5.3.2 DCS-7050QX-32S

The DCS-7050QX-32S has 31 dedicated QSFP+ ports, plus one port group. The port group supports either one additional QSFP+ port or four SFP+ ports as shown in [DCS-7050QX-32S Port Groups](#).

**Table 54: DCS-7050QX-32S Port Groups**

Port Group 1	
Active Interface(s)	
In SFP+ Mode	In QSFP+ Mode (Default)
Et1-4 (four SFP+ ports)	Et5/1-4 (one QSFP+ port)

### 10.1.5.4 Referencing Modular Ports

Arista modular switches provide port access through installed line cards. The maximum number of line cards on a modular switch varies with the switch series and model.

Several CLI commands modify modular parameters for all ports on a specified line card or controlled by a specified chip. This manual uses these conventions to reference modular components:

- *card\_x* refers to a line card.
- *module\_y* refers to a QSFP+ module.
- *port\_z* refers to a line card or module port.

Commands that display Ethernet port status use the following conventions:

- SFP ports: : *card\_x/port\_z* to label the line card-port location of modular ports
- QSFP ports: *card\_x/module\_y/port\_z* to label the line card-port location of modular ports

[QSFP+ Ethernet Port Configuration](#) describe QSFP+ module usage.

#### Example

This command displays the status of interfaces 1 to 9 on line card 4:

```
switch#show interface ethernet 4/1-9 status
Port      Name      Status      Vlan      Duplex  Speed Type
Et4/1     Et4/1     connected   1         full    10G Not Present
Et4/2     Et4/2     connected   1         full    10G Not Present
Et4/3     Et4/3     connected   1         full    10G Not Present
```

```

Et4/4      connected 1          full 10G Not Present
Et4/5      connected 1          full 10G Not Present
Et4/6      connected 1          full 10G Not Present

### 10.1.5.5 Referencing Multi-lane Ports

EOS supports two types of Ethernet ports:

- single-lane (also called fixed-lane)
- multi-lane (also called flexible-lane)

Single-lane (or fixed-lane) ports are always modeled as a single interface within EOS. While the speed of the interface may be configurable, the physical port can never be broken out into multiple lower-speed interfaces. Single-lane ports use the following naming scheme:

- Ethernet <port #> (for fixed switches)
- Ethernet <module #>/<port #> (for modular switches)

Multi-lane (or flexible lane) ports are made up of multiple parallel lanes, each served by its own laser. Multi-lane ports can be configured to combine the lanes and operate as a single native high-speed interface (a 40GbE or 100GbE interface), or to operate each lower-speed interface independently (four 10GbE or 25GbE interfaces). Multi-lane ports use the following naming scheme:

- Ethernet <port #>/<lane #> (for fixed switches)
- Ethernet <module #>/<port #>/<lane #> (for modular switches)

The operational state displayed for each lane of a multi-lane port is determined by the configuration applied to the primary lane(s), as shown in [Lane States](#). When broken out into multiple lower-speed interfaces, all lanes will be active in parallel, and each will display its operational state as **connected** or **not connected**. In high-speed mode, only the primary lane(s) will be displayed as active, with the remaining lanes showing as **errdisabled**. The exception is the CFP2 module: when it is configured as a single 100GbE port, the primary lane is displayed as active in the CLI while the other lanes are hidden.

**Table 55: Lane States**

Parent Port Configured Mode	Primary Lane(s)	Secondary Lanes
single high-speed interface	active (connected/not connected)	inactive (errdisabled)
multi-interface breakout	active (connected/not connected)	active (connected/not connected)

A multi-lane port is configured as a single high-speed interface or multiple breakout interfaces by using the [speed](#) command on the primary lane(s) of the port. For specific configuration instructions and details regarding the primary lane(s) of a specific interface, refer to the configuration section for the appropriate interface type:

- [QSFP+ Ethernet Port Configuration](#)
- [QSFP100 Ethernet Port Configuration](#)
- [CFP2 Ethernet Port Configuration](#)
- [MXP Ethernet Port Configuration](#)

 **Note:** Use of the `speed` command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the `speed` command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

### 10.1.5.6 QSFP+ Ethernet Port Configuration

Each QSFP+ module contains four data lanes which can be used individually or combined to form a single, higher-speed interface. This allows a QSFP+ Ethernet port to be configured as a single 40GbE interface or as four 10GbE interfaces.

When the four lanes are combined to form a 40GbE interface, display commands will show lane /1 as **connected** or **not connected**, and will show lanes /2 through /4 as **errdisabled**.

The following sections describe the configuration of QSFP+ ports.

#### 10.1.5.6.1 Configuring a QSFP+ Module as a Single 40GbE Interface

To configure the port as a single 40GbE interface, combine the modules four data lanes by using the `speed` command (**speed forced 40g full**) on the ports /1 lane (the primary lane).

 **Note:** Use of the `speed` command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the `speed` command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane /1 of the QSFP+ Ethernet interface.

```
switch(config)#interface ethernet 5/1/1
```

2. Enter the `speed 40gfull` command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```
switch(config-if-Et5/1/1)#speed 40gfull
```

3. Use the `show interfaces status` command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)#show interfaces status
Port Name Status Vlan Duplex Speed Type Flags
Et1 connected 2 full 1G 10GBASE-T
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/1/1 connected 1 full 40G 40GBASE-SR4
Et5/1/2 errdisabled 1 unconf unconf 40GBASE-SR4
Et5/1/3 errdisabled 1 unconf unconf 40GBASE-SR4
Et5/1/4 errdisabled 1 unconf unconf 40GBASE-SR4
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

#### 10.1.5.6.2 Configuring a QSFP+ Module as Four 10GbE Interfaces

To configure the port as four 10GbE interfaces, use the `speed` command (**speed 10000full**) on the ports /1 lane (the primary lane).

 **Note:**

Use of the `speed` command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series

platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane /1 of the QSFP+ Ethernet interface.

```
switch(config)#interface ethernet 5/1/1
```

2. Enter the **speed 10000full** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```
switch(config-if-Et5/1/1)#speed 10000full
```

3. Use the **show interfaces status** command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)#show interfaces status
PortNameStatusVlanDuplexSpeedTypeFlags
Et1connected2full1G10GBASE-T
Et5/1/1connected1full10G40GBASE-SR4
Et5/1/2connected1full10G40GBASE-SR4
Et5/1/3connected1full10G40GBASE-SR4
Et5/1/4connected1full10G40GBASE-SR4
```

### 10.1.5.7 QSFP100 Ethernet Port Configuration

Each QSFP100 module contains four data lanes which can be used individually or combined to form a single, higher-speed interface. This allows a QSFP100 Ethernet port to be configured as a single 100GbE interface, a single 40GbE interface, or four 10GbE interfaces. The default mode is a single 100GbE interface.

The 7060X, 7260X and 7320X platforms also allow a QSFP100 port to be configured as two 50GbE interfaces or four 25GbE interfaces.

When the lanes are combined to form a higher-speed interface, display commands will show the primary lane(s) as **connected** or **not connected**, and will show the other lanes as **errdisabled**.

The following sections describe the configuration of QSFP+ ports.

#### 10.1.5.7.1 Configuring a QSFP100 Module as a Single 100GbE Interface

By default, the QSFP100 module operates as a single 100GbE interface; using the **default speed** or **no speed** command on the primary lane restores the default behavior.

To explicitly configure the port as a single 100GbE interface, combine the modules four data lanes by using the **speed** command (**speed 100gfull**) on the ports /1 lane (the primary lane).

#### Note:

Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane /1 of the QSFP100 Ethernet interface.

```
switch(config)#interface ethernet 5/1/1
```

2. Enter the **speed 100gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```
switch(config-if-Et5/1/1)#speed 100gfull
```

- Use the `show interfaces status` command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)#show interfaces status
Port      Name      Status      Vlan      Duplex      Speed      Type      Flags
Et1       connected 2           full      1G          10GBASE-T
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/1/1   connected 1           full      100G       100GBASE-SR4
Et5/1/2   errdisabled 1          unconf    unconf     100GBASE-SR4
Et5/1/3   errdisabled 1          unconf    unconf     100GBASE-SR4
Et5/1/4   errdisabled 1          unconf    unconf     100GBASE-SR4
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

### 10.1.5.7.2 Configuring a QSFP100 Module as Two 50GbE Interfaces

To configure the port as a two 50GbE interfaces, configure the modules four data lanes by using the `speed` command (**speed 50gfull**) on the ports /1 and /3 lanes. This configuration is available on 7060X, 7260X and 7320X platforms.

#### Note:

Use of the `speed` command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the `speed` command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

- Enter interface Ethernet configuration mode for lane /1 of the QSFP100 Ethernet interface.

```
switch(config)#interface ethernet 5/1/1
```

- Enter the `speed 50gfull` command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```
switch(config-if-Et5/1/1)#speed 50gfull
```

- Repeat the above steps for lane /3.

```
switch(config-if-Et5/1/1)#interface ethernet 5/1/3
switch(config-if-Et5/1/3)#speed 50gfull
```

- Use the `show interfaces status` command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)#show interfaces status
Port      Name      Status      Vlan      Duplex      Speed      Type
Flags
Et1       connected 2           full      1G          10GBASE-T
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/1/1   connected 1           full      50G         100GBASE-
SR4
Et5/1/2   errdisabled 1          unconf    unconf     100GBASE-
SR4
Et5/1/3   connected 1           full      50G         100GBASE-
SR4
Et5/1/4   errdisabled 1          unconf    unconf     100GBASE-
SR4
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

### 10.1.5.7.3 Configuring a QSFP100 Module as a Single 40GbE Interface

To configure the port as a single 40GbE interface, combine the modules four data lanes by using the `speed` command (**speed 40gfull**) on the ports /1 lane (the primary lane).

**Note:**

Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane /1 of the QSFP100 Ethernet interface.

```
switch(config)#interface ethernet 5/1/1
```

2. Enter the **speed 40gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```
switch(config-if-Et5/1/1)#speed 40gfull
```

3. Use the [show interfaces status](#) command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)#show interfaces status
Port      Name      Status      Vlan      Duplex      Speed      Type
Flags
Et1              connected    2          full       1G          10GBASE-T
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/1/1        connected    1          full       40G         100GBASE-SR4
Et5/1/2        errdisabled  1          unconf    unconf     100GBASE-SR4
Et5/1/3        errdisabled  1          unconf    unconf     100GBASE-SR4
Et5/1/4        errdisabled  1          unconf    unconf     100GBASE-SR4
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

#### 10.1.5.7.4 Configuring a QSFP100 Module as Four 10GbE Interfaces

To configure the port as four 10GbE interfaces, use the [speed](#) command (**speed 10000full**) on the ports /1 lane (the primary lane).

**Note:**

Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane /1 of the QSFP100 Ethernet interface.

```
switch(config)#interface ethernet 5/1/1
```

2. Enter the **speed 10000full** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```
switch(config-if-Et5/1/1)#speed 10000full
```

3. Use the [show interfaces status](#) command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)#show interfaces status
Port      Name      Status      Vlan      Duplex      Speed      Type
Flags
Et1              connected    2          full       1G          10GBASE-T
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/1/1        connected    1          full       10G         100GBASE-SR4
```

```

Et5/1/2      connected    1          full      10G      100GBASE-
SR4
Et5/1/3      connected    1          full      10G      100GBASE-
SR4
Et5/1/4      connected    1          full      10G      100GBASE-
SR4
<-----OUTPUT OMITTED FROM EXAMPLE----->

```

### 10.1.5.8 CFP2 Ethernet Port Configuration

Each CFP2 module contains ten data lanes. The configuration options available on the port depend on the optic inserted:

- CFP2-100G-LR4 optics operate only in 100GbE mode.
- CF2-100G-ER4 optics operate only 100GbE mode.
- CFP2-100G-XSR10 optics can be configured as a single 100GbE interface or as ten 10GbE interfaces.

When the port is configured as ten 10GbE interface, each lane is active and visible in CLI display commands. When the lanes are combined to form a single 100GbE interface, display commands will show the primary lane as **connected** or **not connected**; all other lanes will be hidden.

The following sections describe the configuration of CFP2 ports.

#### 10.1.5.8.1 Configuring a CFP2 Module as a Single 100GbE Interface

To configure the port as a single 100GbE interface (the default configuration), combine the modules ten data lanes by using the `speed` command (**speed 100gfull**) on the ports /1 lane (the primary lane).

This configuration is available for all pluggable optics.

#### Note:

Use of the `speed` command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the `speed` command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane /1 of the CFP2 Ethernet interface.

```
switch(config)#interface ethernet 5/1/1
```

2. Enter the `speed 100gfull` command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```
switch(config-if-Et5/1/1)#speed 100gfull
```

3. Use the `show interfaces status` command to confirm the change in configuration.

```

switch(config-if-Et5/1/1)#show interfaces status
Port      Name      Status      Vlan      Duplex      Speed      Type
Flags
Et1       Et1       connected   2         full        1G         10GBASE-T
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/1/1   Et5/1/1   connected   1         full        100G      100GBASE-SR1
Et5/2/1   Et5/2/1   connected   1         full        100G      100GBASE-SR1
<-----OUTPUT OMITTED FROM EXAMPLE----->

```

### 10.1.5.8.2 Configuring a CFP2 Module as Ten 10GbE Interfaces

To configure the port as four 10GbE interfaces, use the `speed` command (**speed 10000full**) on the ports /1 lane (the primary lane).

This configuration is available only for CFP2-100G-XSR10 optics.

#### Note:

Use of the `speed` command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the `speed` command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane /1 of the CFP2 Ethernet interface.

```
switch(config)#interface ethernet 5/1/1
```

2. Enter the `speed 10000full` command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```
switch(config-if-Et5/1/1)#speed 10000full
```

3. Use the `show interfaces status` command to confirm the change in configuration.

```
switch(config-if-Et5/1/1)#show interfaces status
Port      Name      Status      Vlan Duplex  Speed  Type      Flags
Et1       Et1       connected   2    full   1G     10GBASE-T
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/1/1   Et5/1/1   connected   1    full   10G    100GBASE-SR1
Et5/1/2   Et5/1/2   connected   1    full   10G    100GBASE-SR1
Et5/1/3   Et5/1/3   connected   1    full   10G    100GBASE-SR1
Et5/1/4   Et5/1/4   connected   1    full   10G    100GBASE-SR1
Et5/1/5   Et5/1/5   connected   1    full   10G    100GBASE-SR1
Et5/1/6   Et5/1/6   connected   1    full   10G    100GBASE-SR1
Et5/1/7   Et5/1/7   connected   1    full   10G    100GBASE-SR1
Et5/1/8   Et5/1/8   connected   1    full   10G    100GBASE-SR1
Et5/1/9   Et5/1/9   connected   1    full   10G    100GBASE-SR1
Et5/1/10  Et5/1/10  connected   1    full   10G    100GBASE-SR1
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

### 10.1.5.9 MXP Ethernet Port Configuration

Each MXP module contains twelve data lanes which can be used individually or combined to form one or more higher-speed interfaces. This allows an MXP Ethernet port to be configured as a single 100GbE interface, up to twelve 10GbE interfaces, or a mixture of 40GbE and 10GbE ports.

MXP ports do not use pluggable optics: instead, an MTP-24 ribbon is inserted directly into the port. The remote end of the MTP 24 ribbon must then be broken out using a splitter cable or cartridge based on the operational mode and speed of the MXP port.

When four lanes of an MXP interface are combined to form a 40GbE port, CLI commands will show the primary lane of that group as **connected or not connected** and the other three lanes as **errdisabled**.

The following sections describe the configuration of MXP interfaces.

#### 10.1.5.9.1 Configuring an MXP Module as a Single 100GbE Interface

To configure the port as a single 100GbE interface (the default configuration), enter the `speed` command (**speed 100gfull**) on the ports /1 lane (the primary lane). This combines lanes 1-10 and disables lanes 11 and 12.

Under this configuration, CLI display commands will show lane /1 as **connected** or **not connected**, and show lanes /2-/12 as **errdisabled**.

**Note:** Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for lane /1 of the MXP Ethernet interface.

```
switch(config)#interface ethernet 5/49/1
```

2. Enter the **speed 100gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```
switch(config-if-Et5/49/1)#speed 100gfull
```

3. Use the **show interfaces status** command to confirm the change in configuration.

```
switch(config-if-Et5/49/1)#show interfaces status
Port      Name      Status      Vlan      Duplex      Speed      Type
Flags
Et1
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/49/1  connected  2           full      1G          10GBASE-T
Et5/49/2  errdisabled 1           unconf    unconf     100GBASE-SR1
Et5/49/3  errdisabled 1           unconf    unconf     100GBASE-SR1
Et5/49/4  errdisabled 1           unconf    unconf     100GBASE-SR1
Et5/49/5  errdisabled 1           unconf    unconf     100GBASE-SR1
Et5/49/6  errdisabled 1           unconf    unconf     100GBASE-SR1
Et5/49/7  errdisabled 1           unconf    unconf     100GBASE-SR1
Et5/49/8  errdisabled 1           unconf    unconf     100GBASE-SR1
Et5/49/9  errdisabled 1           unconf    unconf     100GBASE-SR1
Et5/49/10 errdisabled 1           unconf    unconf     100GBASE-SR1
Et5/49/11 errdisabled 1           unconf    unconf     100GBASE-SR1
Et5/49/12 errdisabled 1           unconf    unconf     100GBASE-SR1
```

### 10.1.5.9.2 Configuring an MXP Module With 40GbE Interfaces

Each set of four lanes on the MXP module is independently configurable as a single 40GbE interface or four 10GbE interfaces. To configure four lanes as a single 40GbE interface, enter the **speed** command (**speed forced 40gfull**) on the groups primary lane (/1, /5, or /9). To revert a group of four lanes to functioning as four independent 10GbE interfaces, enter the **speed 10000full** command on the primary lane of the group.

When four lanes of an MXP interface are combined to form a 40GbE port, CLI commands will show the primary lane of that group as **connected** or **not connected** and the other three lanes as **errdisabled**. In groups of four lanes which are configured as four independent 10GbE interfaces, each lane will be displayed in the CLI as **connected** or **not connected**.

Note that a **speed forced 100gfull** command entered on the /1 lane takes precedence over **speed 40gfull** commands on the /5 and /9 lanes.

**Note:**

Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

The example below shows the steps for configuring an MXP module as three 40GbE interfaces.

1. Enter interface Ethernet configuration mode for lane /1 of the MXP Ethernet interface.

```
switch(config)#interface ethernet 5/49/1
```

2. Enter the **speed 40gfull** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```
switch(config-if-Et5/49/1)#speed 40gfull
```

3. Repeat the above steps for lanes /5 and /9.

```
switch(config-if-Et5/49/1)#interface ethernet 5/49/5
switch(config-if-Et5/49/5)#speed 40gfull
switch(config-if-Et5/49/5)#interface ethernet 5/49/9
switch(config-if-Et5/49/9)#speed 40gfull
```

4. Use the **show interfaces status** command to confirm the change in configuration.

```
switch(config-if-Et5/49/9)#show interfaces status
Port Name Status Vlan Duplex Speed Type Flags
Et1 connected 2 full 1G 10GBASE-T
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/49/1 connected 1 full 40G 100GBASE-SR1
Et5/49/2 errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/3 errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/4 errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/5 connected 1 full 40G 100GBASE-SR1
Et5/49/6 errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/7 errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/8 errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/9 connected 1 full 40G 100GBASE-SR1
Et5/49/10 errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/11 errdisabled 1 unconf unconf 100GBASE-SR1
Et5/49/12 errdisabled 1 unconf unconf 100GBASE-SR1
```

### 10.1.5.9.3 Configuring an MXP Module as Twelve 10GbE Interfaces

Each lane of an MXP port functions as a 10GbE interface when it is not included in a higher-speed interface configuration (either actively or as an **errdisabled** port).

To explicitly configure the port as twelve 10GbE interfaces, use the **speed** command (**speed 10000full**) on all twelve lanes of the port.

When each lane is configured as an independent 10GbE interface, CLI display commands show each lane as **connected** or **not connected**.

**Note:** Use of the **speed** command to configure a multi-lane port is hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, this command restarts the forwarding agent, which will result in traffic disruption. On 7160 series platforms, use of the **speed** command is hitless, but if the command changes the number of port lanes, packets may be dropped on unrelated ports.

1. Enter interface Ethernet configuration mode for all twelve lanes of the MXP Ethernet interface.

```
switch(config)#interface ethernet 5/49/1-12
```

2. Enter the **speed 10000full** command. Depending on the platform, this command may restart the forwarding agent, disrupting traffic on all ports for 60 seconds or more.

```
switch(config-if-Et5/49/1-12)#speed 10000full
```

- Use the `show interfaces status` command to confirm the change in configuration.

```
switch(config-if-Et5/49/1-12)#show interfaces status
Port      Name      Status      Vlan      Duplex      Speed      Type      Flags
Et1       Et1       connected   2         full        1G        10GBASE-T
<-----OUTPUT OMITTED FROM EXAMPLE----->
Et5/1/1   Et5/1/1   connected   1         full        10G       100GBASE-SR1
Et5/1/2   Et5/1/2   connected   1         full        10G       100GBASE-SR1
Et5/1/3   Et5/1/3   connected   1         full        10G       100GBASE-SR1
Et5/1/4   Et5/1/4   connected   1         full        10G       100GBASE-SR1
Et5/1/5   Et5/1/5   connected   1         full        10G       100GBASE-SR1
Et5/1/6   Et5/1/6   connected   1         full        10G       100GBASE-SR1
Et5/1/7   Et5/1/7   connected   1         full        10G       100GBASE-SR1
Et5/1/8   Et5/1/8   connected   1         full        10G       100GBASE-SR1
Et5/1/9   Et5/1/9   connected   1         full        10G       100GBASE-SR1
Et5/1/10  Et5/1/10  connected   1         full        10G       100GBASE-SR1
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

### 10.1.5.10 Port Speed Capabilities

The supported speeds supported on each Arista platform per interface type are described in [Supported Speeds \(GbE\)](#).

**Table 56: Supported Speeds (GbE)**

Platform	SFP+	SFP28	QSFP+	QSFP100	MXP	CFP2
7050	100M, 1, 10	N/A	1, 10, 40	N/A	N/A	N/A
7050X	100M, 1, 10	N/A	1, 10, 40	N/A	10, 40	N/A
7050X2	100M, 1, 10	N/A	1, 10, 40	N/A	N/A	N/A
7050X3	100M, 1, 10	1, 10, 25	N/A	10, 25, 40, 50, 100	N/A	N/A
7250X	N/A	N/A	1, 10, 40	N/A	N/A	N/A
7060X	100M, 1, 10	N/A	N/A	10, 25, 40, 50, 100	N/A	N/A
7060X2	100M, 1, 10	1, 10, 25	N/A	10, 25, 40, 50, 100	N/A	N/A
7260X3	100M, 1, 10	N/A	N/A	10, 25, 40, 50, 100	N/A	N/A
7300X	100M, 1, 10	N/A	1, 10, 40	N/A	N/A	N/A
7300X3	N/A	1, 10, 25	N/A	10, 25, 40, 50, 100	N/A	N/A
7320X	N/A	N/A	N/A	10, 25, 40, 50, 100	N/A	N/A
7150S	1, 10	N/A	1, 10, 40	N/A	N/A	N/A

7048T	1, 10	N/A	N/A	N/A	N/A	N/A
7500	1, 10	N/A	1, 10, 40	N/A	N/A	N/A
7500E	1, 10	N/A	1, 10, 40	10, 40, 100	10, 40, 100	100
7500R	1, 10	1, 10, 25	1, 10, 40	10, 25, 40, 50, 100	N/A	N/A
7280SE	1, 10	N/A	1, 10, 40	10, 40, 100	10, 40, 100	N/A
7280QR	N/A	N/A	1, 10, 40	10, 25, 40, 50, 100	N/A	N/A
7280SR (R2)	1, 10	1, 10, 25	N/A	10, 25, 40, 50, 100	N/A	100, 200
7280CR	N/A	N/A	N/A	10, 25, 40, 50, 100	N/A	N/A
7010T	100M, 1, 10	N/A	N/A	N/A	N/A	N/A

#### 10.1.5.11 Agile Ports

An agile port is an interface that can function as a 10G port or can subsume a predefined set of 10G interfaces to form an interface with higher speed capabilities.

The set of interfaces that can be combined to form a higher speed port is restricted by the hardware configuration. Only interfaces that pass through a common PHY component can be combined. One interface within a combinable set is designated as the primary port.

- To view the set of available agile ports and the subsumable interfaces that comprise them, enter `show platform fm6000 agileport map`.
- To configure the primary port as a higher speed port, enter `speed 40gfull` or `speed auto 40gfull`.
- To revert the primary port and its subsumed ports to 10G interfaces, enter `no speed`.

#### 10.1.5.12 Subinterface Configuration

For a subinterface to be operational on an Ethernet or port channel interface, the parent interface must be configured as a routed port and be administratively up, and a VLAN must be configured on the subinterface. If the parent interface goes down, all subinterfaces automatically go down as well, but will come back up with the same configuration once the parent interface is up.

Note that a port channel should not contain Ethernet interfaces with subinterfaces configured on them, and that subinterfaces cannot be members of a port channel.

Subinterfaces are named by adding a period followed by a unique subinterface number to the name of the parent interface. Note that the subinterface number has no relation to the ID of the VLAN corresponding to the subinterface.

Subinterfaces are available on the following platforms:

- DCS-7050X
- DCS-7060X
- DCS-7250X

- DCS-7260X
- DCS-7280E
- DCS-7300X
- DCS-7320X
- DCS-7500E

### 10.1.5.12.1 Creating a Subinterface

To create a subinterface on an Ethernet or port channel interface:

1. Bring up the parent interface and ensure that it is configured as a routed port.

```
switch(config)#interface Ethernet1/1
switch(config-if-Et1/1)#no switchport
switch(config-if-Et1/1)#no shutdown
```

2. Configure a VLAN on the subinterface. The `encapsulation dot1q vlan` command is also used for VLAN translation, but in this context it associates a VLAN with the subinterface.

```
switch(config-if-Et1/1)#interface Ethernet1/1.1
switch(config-if-Et1/1.1)#encapsulation dot1q vlan 100
```

3. Configure an IP address on the subinterface (optional) and ensure that it is up.

```
switch(config-if-Et1/1)#ip address 10.0.0.1/24
switch(config-if-Et1/1)#no shutdown
switch(config-if-Et1/1)#
```

### 10.1.5.12.2 Creating a Range of Subinterfaces

A range of subinterfaces can also be configured simultaneously. The following example configures subinterfaces 1 to 100 on Ethernet interface 1/1, and assigns VLANs 501 through 600 to them. Note that the range of interfaces must be the same size as the range of VLAN IDs.

#### Example

```
switch(config)#interface eth1/1.1-100
switch(config-if-Et1/1.1-100)#no shutdown
switch(config-if-Et1/1.1-100)#encapsulation dot1q vlan {501,600}
switch(config-if-Et1/1.1-100)#exit
switch(config)#
```

### 10.1.5.12.3 Parent Interface Configuration

For subinterfaces to function, the parent interface must be administratively up and configured as a routed port.

Some settings are inherited by subinterfaces from the parent interface. These include QoS (trust mode and default DSCP) and MTU.

Additionally, on the DCS-7050X, DCS-7250X, and DCS-7300X platforms, the parent interface may be configured with an IP address. In this case, untagged packets are treated as incoming traffic on the parent interface

### 10.1.5.12.4 Configuring Routing Features on a Subinterface

Once a subinterface is created, the following features can be configured on it:

- Unicast and multicast routing
- BGP, OSPF, ISIS, PIM
- VRF
- VRRP
- SNMP
- Inheritance of QoS (trust mode and default DSCP) and MTU settings from the parent interface

Additionally, these features can be configured on subinterfaces on Arad (DCS-7500E and DCS-7280E) platforms:

- Subinterface counters on ingress
- VXLAN
- MPLS
- GRE
- PBR
- QoS

### 10.1.5.12.5 Displaying Subinterface Information

Subinterface information is displayed using the same show commands as for other interfaces.

#### Examples

- This command displays summary information for all IP interfaces on the switch, including subinterfaces.

```
switch#show ip interfaces brief
Interface          IP Address      Status   Protocol   MTU
Ethernet1/1        10.1.1.1/24up   up       1500
Ethernet1/1.1      10.0.0.1/24up   up       1500
Ethernet1/2        unassigned      up       up         1500
```

- This command displays information for subinterface Ethernet 1/1.1.

```
switch#show interface ethernet 1/1.1
Ethernet1/1.1 is down, line protocol is lowerlayerdown (notconnect)
Hardware is Subinterface, address is 001c.735d.65dc
Internet address is 10.0.0.1/24
Broadcast address is 255.255.255.255
Address determined by manual configuration
IP MTU 1500 bytes , BW 10000000 kbit
Down 59 seconds
switch>
```

- This command displays status information for all subinterfaces configured on the switch.

```
switch#show interfaces status sub-interfaces
Port   Name      Status   Vlan   Duplex   Speed   Type              Flags
Et1.1  connect  101     full   10G     dot1q-encapsulation
Et1.2  connect  102     full   10G     dot1q-encapsulation
Et1.3  connect  103     full   10G     dot1q-encapsulation
Et1.4  connect  103     full   10G     dot1q-encapsulation
```

### 10.1.5.13 Autonegotiated Settings

In autonegotiation, the transmission speed, duplex setting, and flow control parameters used for Ethernet-based communication can be automatically negotiated between connected devices to establish optimized common settings.

### 10.1.5.13.1 Speed and Duplex

The **speed** command affects the transmission speed and duplex setting for the configuration mode interface. When a **speed** command is in effect on an interface, autonegotiation of speed and duplex settings is disabled for the interface; to enable autonegotiation, use the **speed auto** command.

The scope and effect of the **speed** command depends on the interface type; see [Ethernet Interfaces](#) and [Ethernet Configuration Procedures](#) for detailed information on the speed settings for different interfaces.

### 10.1.5.13.2 Flow Control

Flow control is a data transmission option that temporarily stops a device from sending data because of a peer data overflow condition. If a device sends data faster than the receiver can accept it, the receiver's buffer can overflow. The receiving device then sends a PAUSE frame, instructing the sending device to halt transmission for a specified period.

Flow control commands configure administrative settings for flow control packets.

- The **flowcontrol receive** command configures the port's ability to receive flow control pause frames.
  - **off**: port does not process pause frames that it receives.
  - **on**: port processes pause frames that it receives.
  - **desired**: port autonegotiates; processes pause frames if peer is set to **send** or **desired**.
- The **flowcontrol send** command configures the port's ability to transmit flow control pause frames.
  - **off**: port does not send pause frames.
  - **on**: port sends pause frames.
  - **desired**: port autonegotiates; sends pause frames if peer is set to **receive** or **desired**.

**Desired** is not an available parameter option. Ethernet data ports cannot be set to **desired**. Management ports are set to **desired** by default and with the **no flowcontrol receive** command.

The port linking process includes flow control negotiation. Ports must have compatible flow control settings to create a link. [Compatible Settings for Flow Control Negotiation](#) lists the compatible flow control settings.

**Table 57: Compatible Settings for Flow Control Negotiation**

local port	peer port
receive on	send on or send desired
receive off	send off or send desired
receive desired	send on , send off, or send desired
send on	receive on or receive desired
send off	receive off or receive desired
send desired	receive on , receive off, or receive desired

#### Example

These commands set the flow control receive and send to **on** on *Ethernet interface 5*.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#flowcontrol receive on
switch(config-if-Et5)#flowcontrol send on
switch(config-if-Et5)#
```

### 10.1.5.14 Displaying Ethernet Port Properties

Show commands are available to display various Ethernet configuration and operational status on each interface. Ethernet settings that are viewable include:

- Port Type
- PHY Status
- Negotiated Settings
- Flow Control
- Capabilities

#### Port Type

The port type is viewable from the output of [show interfaces status](#), [show interfaces hardware](#), and [show interfaces transceiver properties](#) commands.

#### Examples

- This **show interfaces status** command displays the status of Ethernet interfaces 1-5.

```
switch#show interfaces status
Port      Name      Status      Vlan      Duplex  Speed  Type
Et1       connected 1           full      10G     10GBASE-SRL
Et2       connected 1           full      10G     10GBASE-SRL
Et3       connected 1           full      10G     10GBASE-SRL
Et4       connected 1           full      10G     10GBASE-SRL
Et5       notconnect 1           full      10G     Not Present
switch>
```

- This **show interfaces hardware** command displays the speed, duplex, and flow control capabilities of Ethernet interfaces 2 and 18.

```
switch#show interfaces ethernet 2,18 hardware
Ethernet2
  Model:          DCS-7150S-64-CL
  Type:           10GBASE-CR
  Speed/Duplex:  10G/full, 40G/full, auto
  Flowcontrol:   rx-(off, on, desired), tx-(off, on, desired)
Ethernet18
  Model:          DCS-7150S-64-CL
  Type:           10GBASE-SR
  Speed/Duplex:  10G/full
  Flowcontrol:   rx-(off, on), tx-(off, on)
switch>
```

- This command displays the media type, speed, and duplex properties for Ethernet interfaces 1.

```
switch#show interfaces ethernet 1 transceiver properties
Name : Et1
Administrative Speed: 10G
Administrative Duplex: full
Operational Speed: 10G (forced)
Operational Duplex: full (forced)
Media Type: 10GBASE-SRL
```

#### PHY

PHY information for each Ethernet interface is viewed by entering the [show interfaces phy](#) command.

#### Example

This command summarizes PHY information for Ethernet interfaces 1-3.

```
switch#show interfaces ethernet 1-3 phy
```

```

Key:
U    = Link up
D    = Link down
R    = RX Fault
T    = TX Fault
B    = High BER
L    = No Block Lock
A    = No XAUI Lane Alignment
0123 = No XAUI lane sync in lane N

Port          PHY state      State Changes  Reset Count  PMA/PMD PCS  XAUI
-----
Ethernet1    linkUp        14518         1750 U..    U.... U.....
Ethernet2    linkUp        13944         1704 U..    U.... U.....
Ethernet3detectingXcvr  3            1            D..A0123
switch>

```

## Negotiated Settings

Speed, duplex, and flow control settings are displayed through the `show interfaces hardware`, PHY information for each Ethernet interface is viewed by entering the `show interfaces hardware`, `show interfaces flow-control`, and `show interfaces status` commands.

## Examples

- This command displays speed/duplex and flow control settings for Ethernet interface 1.

```

switch#show interfaces ethernet 1 hardware
Ethernet1
  Model:          DCS-7150S-64-CL
  Type:           10GBASE-SR
  Speed/Duplex:  10G/full
  Flowcontrol:    rx-(off,on),tx-(off,on)
switch>

```

- This command shows the flow control settings for Ethernet interfaces 1-2.

```

switch#show flow-control interface ethernet 1-2
Port          Send FlowControl  Receive FlowControl  RxPause  TxPause
-----
              admin    oper    admin    oper
Et1           off     off     off     off     0       0
Et2           off     off     off     off     0       0
switch>

```

- This command displays the speed type and duplex settings for management interfaces 1-2.

```

switch#show interfaces management 1-2 status
Port  Name      Status      Vlan      Duplex  Speed Type
Ma1   connected routed      a-full  a-100M 10/100/1000
Ma2   connected routed      a-full  a-1G   10/100/1000
switch>

```

### 10.1.5.15 Ingress Counters

The Ingress counters enables the switch to count the ingress traffic on the Layer 3 ports of the switch.

Any ingress traffic on Layer 3 sub-interfaces and VLAN interface with IPv4 and IPv6 addresses are accounted irrespective of the routing decision. The VLAN counters are supported on DCS- 7050x, DCS-7250x, and DCS-7300x series switches and not supported on any routed ports.

#### 10.1.5.15.1 Configuring Ingress Counters

The hardware counter feature in command enables the switch to count the ingress traffic on the Layer 3 port of the switch. Any traffic on Layer 3 sub-interfaces and VLAN interface with IPv4 and IPv6 addresses are accounted irrespective of the routing decision.

## Examples

- This command configures the ingress traffic count on the sub-interfaces. The no form of the command disable the counter configuration from the switch ports.

```
switch#hardware counter feature subinterface in
```

- This command configures the ingress traffic count on the VLAN interface. The no form of the command disable the counter configuration from the VLAN configured switch ports.

```
switch#hardware counter feature vlan-interface in
```

#### 10.1.5.15.2 Displaying the Ingress Counter Information

The show interface counters command displays the Layer 3 ingress traffic count information. Run this command to view the traffic counts on a sub-interface or VLAN interface of the switch. The clear counters command resets the counters to zero.

##### Example

- This command displays the ingress traffic count on a VLAN interface vl12.

```
switch#show interface vl12 counters incoming
L3 Interface InOctets InUcastPkts InMcastPkts
Vl12          3136          47          2
```

#### 10.1.5.16 Configuring Ingress Traffic-Class Counters

Ingress traffic class counter support is enabled in order to display per traffic-class counters on ingress interfaces, and supported on routed-ports and subinterfaces. Both packet and octet counts are displayed.

##### Examples

- This command enables traffic-class counter support.

```
switch(config)#hardware counter feature traffic-class in
```

- This command enables TCAM profile tc-counters if this profile is configured.

```
switch(config)#hardware tcam profile tc-counters
```

#### 10.1.5.17 Configuring Power over Ethernet (PoE)

Power over Ethernet (PoE) is enabled by default on all Ethernet ports of PoE-capable switches, and the switch will detect IEEE-compliant powered devices (PDs) when they are plugged into a port and supply power appropriately.

##### Limitations

- Ethernet ports will not detect non IEEE-compliant devices by default, and may not be able to detect or power them even if configured to do so.
- If attached PDs overload the switch, it will power off. This can occur when an attached PD increases its power demand via LLDP, when too many PDs are connected to the switch, or when a power supply fails on a heavily loaded dual-supply switch.
- Power-cycling the switch will cause temporary loss of power to attached PDs.
- PoE is not available on management interfaces.

---

## Disabling PoE on an Interface

On switches which support PoE, it is enabled by default on all Ethernet ports but can be disabled per-port with the [poe disabled](#) command.

### Example

- These commands disable PoE on Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#poe disabled
switch(config-if-Et5)#
```

## PoE Power Settings

When an IEEE-compliant powered device (PD) is connected to a PoE-enabled Ethernet port, it is recognized by a specific resistor signature, and its initial power needs are determined by hardware negotiation, after which further negotiation is managed through the Link Layer Discovery Protocol (LLDP). For details, see [Configuring LLDP for Power over Ethernet](#).

PoE power output can be limited on a port using the [poe limit](#) command. The power limit represents the power output at the Ethernet port; actual power delivered to the PD will be lower due to power loss along the Ethernet cable.

**Note:** LLDP uses Power Via MDI type-length-value elements (TLVs) to allow the switch to dynamically negotiate power needs with PDs. LLDP will not include Power Via MDI TLVs for the interface if a power limit has been configured on it.

### Examples

- These commands limit nominal PoE power output on Ethernet interface 5 to 10 W.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#poe limit 10 watts
switch(config-if-Et5)#
```

- These commands limit nominal PoE power output on Ethernet interface 7 to 4 W.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#poe limit class 1
switch(config-if-Et7)#
```

## Detecting Legacy PDs

IEEE-compliant powered devices (PDs) are recognized by a specific resistance signature to a test signal sent by the switch, but non-compliant (legacy or proprietary) PDs may use a capacitive signature instead. By default, legacy PD detection is disabled, and legacy devices are not powered.

To configure an interface to use hardware detection for these non-compliant PoE devices and attempt to power them, use the [poe legacy detect](#) command.

**Note:** Non IEEE-compliant PDs are not officially supported. Arista cannot guarantee compatibility with such devices, and they may not be detected even when legacy detection is enabled on the port they are connected to.

### Example

These commands configure *Ethernet interface 5* to attempt to detect and power non-compliant PDs.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#poe legacy detect
switch(config-if-Et5)#
```

## Displaying PoE Information

To display PoE information for a specific interface range or for all Ethernet interfaces, use the `show poe` command.

### Example

This command displays PoE information for *Ethernet interface 46*.

```
switch(config)#show poe interface ethernet 46
show poe interface ethernet 46
PSELLDPowerGrantedPort
Port Enabled EnabledLimitPowerStateClass Power Current Voltage Temperature
-----
46      True      True 15.40W  15.40W powered class0 1.40W 27.00mA  55.04V      41.25C
switch(config-if-Et7)#
```

### 10.1.5.18 Configuring Link Fault Signaling

As part of the Link Fault Signaling (LFS) configuration, a new configuration mode called the EOAM (Ethernet operations administration & management) mode is introduced. The EOAM profile has a link-error sub-mode wherein the threshold, action, and the period is configured for both FCS and Symbol errors. The period can be in seconds or in number of frames. The default values are threshold 0, action syslog, and period 0 seconds. If the errors exceed the threshold within the given period, the configured action is executed. The recovery time configures the recovery timeout value for link fault signaling. Only one EOAM profile is associated with a port.

The following steps enable configuring the LFS parameters:

1. Enable the EOAM mode.

```
switch(config)#monitor ethernet oam
```

2. Create an EOAM profile named as profile1.

```
switch(config-eoam)#profile profile1
```

3. Enter the EOAM link-error sub-mode.

```
switch(config-eoam-profile-profile1)#link-error
```

4. Enter the commands in the profile link-error submode to configure a specific LFS parameter.

```
switch(config-eoam-profile-profile1-link-error)#symbol action
errdisable
switch(config-eoam-profile-profile1-link-error)#symbol period 300
frames
switch(config-eoam-profile-profile1-link-error)#symbol threshold 20
switch(config-eoam-profile-profile1-link-error)#recovery-time 40
```

5. Apply the EOAM profile profile1 to the Ethernet interface 1/1.

```
switch(config)#interface ethernet 1/1
switch(config-if-Et1/1)#monitor ethernet oam profile profile1
```

### Platform Compatibility

LFS parameter configuration is supported on the following platforms:

- DCS-7020
- DCS-7050X
- DCS-7060X
- DCS-7250X

- DCS-7260X
- DCS-7280R
- DCS-7300
- DCS-7320
- DCS-7500R

**Note:**

The link fault action is not supported on the DCS-7050X, DCS-7250X, DCS-7060X, DCS-7260X, DCS-7300, DCS-7320 platforms.

### 10.1.5.19 Configuring Hardware TCAM

TCAM (ternary content-addressable memory) is a specialized type of high-speed memory that increase the speed of route look-up, packet classification, packet forwarding and access control list-based commands. The hardware tcam command is used to configure and place the switch in the TCAM mode. In this mode the user can configure few TCAM related commands such as feature, profile and system.

In the TCAM mode the feature command is used to configure the reservation of TCAM banks for the features like ACL, IPsec, flow-spec, I2-protocol, PBR, QoS, TCP-MSS-ceiling, traffic-policy. The profile command configures a new TCAM profile, or just copy the TCAM profile which is already created using the hardware tcam profile command such as default, mirroring-acl, pbr-match-nexthop-group, qos, tap-aggregation-default, tap-aggregation-extended, tc-counters, test, vxlan-routing. Similarly, the system command configures the system-wide TCAM profiles.

#### Examples

- This command places the switch in Hardware TCAM configuration mode.

```
switch(config)#hardware tcam  
switch(config-hw-tcam)#
```

These are the commands allowed to configure in Hardware TCAM mode.

- This commands allow the switch to configure the TCAM feature.

```
switch(config)#hardware tcam  
switch(config-hw-tcam)#feature
```

- This commands allow the switch to configure TCAM profile.

```
switch(config)#hardware tcam  
switch(config-hw-tcam)#profile
```

- This commands allow the switch to configure TCAM system profile.

```
switch(config)#hardware tcam  
switch(config-hw-tcam)#system
```

## 10.1.6 Ethernet Configuration Commands

### Global Configuration Commands

- hardware port-group
- hardware tcam
- hardware counter feature in (DCS-7050x, 7350x, 7300x)
- interface ethernet
- interface ethernet create
- interface management
- monitor ethernet oam
- transceiver qsfp default-mode
- transceiver channel

### Hardware TCAM Commands

- feature
- profile
- system

### Interface Configuration Commands Ethernet and Management Interfaces

- flowcontrol receive
- flowcontrol send
- link-debounce
- mac-address
- poe disabled
- poe legacy detect
- poe limit
- speed

### EOAM Configuration Commands

- link-error
- monitor ethernet oam profile
- profile

### Link-error Configuration Commands

- action
- period
- recovery-time
- threshold

### Interface Display Commands

- show hardware counter
- show hardware port-group
- show interfaces counters
- show interfaces counters bins
- show interfaces counters errors
- show interfaces counters queue
- show interfaces counters rates

- 
- show interfaces flow-control
  - show interfaces hardware
  - show interfaces hardware default
  - show interfaces negotiation
  - show interfaces phy
  - show interfaces status
  - show interfaces status errdisabled
  - show interfaces transceiver
  - show interfaces transceiver channels
  - show interfaces transceiver hardware
  - show interfaces transceiver properties
  - show monitor ethernet oam profile
  - show platform fm6000 agileport map
  - show poe

### 10.1.6.1 action

The **action** command configures the link monitoring action that is specified for the link fault signaling event.

The **no action** command removes the action type specified for the chosen link fault signaling. The **default action** command configures the link monitoring action as system log type.

#### Command Mode

Link-error Configuration

#### Command Syntax

```
{fcs | symbol} action [linkfault | errdisable | log]
no {fcs | symbol} action [linkfault | errdisable | log]
default {fcs | symbol} action [linkfault | errdisable | log]
```

#### Parameters

- **fcs** Inbound packets with frame check sequence (FCS) error.
- **symbol** Inbound packets with symbol error.
- **linkfault** The link fault action type.
- **errdisable** The errdisable action type.
- **log** The system log action type.

#### Related Commands

- [period](#)
- [threshold](#)

#### Example

- These commands set the errdisable action type for the profile profile1 in the Link-error configuration mode for symbol error.

```
switch(config)#monitor ethernet oam
switch(config-eoam)#profile profile1
switch(config-eoam-profile-profile1)#link-error
switch(config-eoam-profile-profile1-link-error)#symbol action
errdisable
```

---

### 10.1.6.2 feature

The **feature** command allows the user to reserve the number of TCAM banks for the following features such as ACL, flow-spec, IPsec, I2-protocol, PBR, QoS, TCP-MSS-ceiling, traffic-policy.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

Hardware TCAM

#### Command Syntax

**feature**

#### Example

- This commands allows the switch to configure the TCAM flow-spec feature for IPv4 ports.

```
switch(config-hw-tcam) #feature flow-spec port ipv4 bank maximum count  
12
```

- [hardware tcam](#)

### 10.1.6.3 flowcontrol receive

The **flowcontrol receive** command configures administrative settings for inbound flowcontrol packets. Ethernet ports use flow control to delay packet transmission when port buffers run out of space. Ports transmit a pause frame when their buffers are full, signaling their peer ports to delay sending packets for a specified period.

The flowcontrol receive command configures the configuration mode port's ability to receive flowcontrol pause frames.

- **off**: port does not process pause frames that it receives.
- **on**: port processes pause frames that it receives.
- **desired**: port autonegotiates flow control; processes pause frames if the peer is set to send **desired**.

**Desired** is not an available parameter option. Ethernet data ports cannot be set to desired. Management ports are set to desired by default and with the **no flowcontrol receive** command.

The port linking process includes flow control negotiation. Ports must have compatible flow control settings to create a link. The table below lists the compatible flow control settings.

**Table 58: Compatible Settings for Flow Control Negotiation – Local Port Receiving**

local port	peer port
receive on	send on or send desired
receive off	send off or send desired
receive desired	send on , send off, or send desired

The **no flowcontrol receive** and **default flowcontrol receive** commands restore the default flowcontrol setting for the configuration mode interface by removing the corresponding **flowcontrol receive** command from **running-config**. The default setting is **off** for Ethernet data ports and **desired** for Management ports.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

**flowcontrol receive STATE**

**no flowcontrol receive**

**default flowcontrol receive**

#### Parameters

- STATE flow control pause frame processing setting. Options include:
  - On
  - Off

#### Example

These commands set the flow control received on Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#flowcontrol receive on
switch(config-if-Et5)#
```

#### 10.1.6.4 flowcontrol send

The **flowcontrol send** command configures administrative settings for outbound flow control packets. Ethernet ports use flow control to delay packet transmission when port buffers run out of space. Ports transmit a pause frame when their buffers are full, signaling their peer ports to delay sending packets for a specified period.

The **flowcontrol send** command configures the configuration mode port's ability to transmit flow control pause frames.

- **off**: port does not send pause frames.
- **on**: port sends pause frames.
- **desired**: port autonegotiates flow control; sends pause frames if the peer is set to **receive desired**.

**Desired** is not an available parameter option. Ethernet data ports cannot be set to **desired**. Management ports are set to **desired** by default and with the **no flowcontrol send** command.

The port linking process includes flow control negotiation. Ports must have compatible flow control settings to create a link. [Compatible Settings for Flow Control Negotiation Local Port Transmitting](#) lists the compatible flow control settings.

**Table 59: Compatible Settings for Flow Control Negotiation Local Port Transmitting**

local port	peer port
send on	receive on or receive desired
send off	receive off or receive desired
send desired	receive on , receive off, or receive desired

The **no flowcontrol send** and **default flowcontrol send** commands restore the default flow control setting for the configuration mode interface by removing the corresponding **flowcontrol send** command from **running-config**. The default setting is **off** for Ethernet data ports and **desired** for Management ports.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
flowcontrol send STATE
```

```
no flowcontrol send
```

```
default flowcontrol send
```

#### Parameters

- **STATE** Flow control send setting. Options include:
  - **on**
  - **off**

#### Example

These commands set the flow control sent on *Ethernet interface 5*.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#flowcontrol send on
switch(config-if-Et5)#
```

### 10.1.6.5 hardware counter feature in (DCS-7050x, 7350x, 7300x)

The **hardware counter feature** command enables the switch to count the ingress traffic on the Layer 3 port of the switch. Any traffic on Layer 3 sub-interfaces and VLAN interface with IPv4 and IPv6 addresses are accounted irrespective of the routing decision.

The **no hardware counter feature in** command disable the counter configuration from the switch ports. By default the ingress counter is disabled on the switch.

#### Command Mode

Global Configuration

#### Command Syntax

```
hardware counter feature [INTERFACE] in
```

```
no hardware counter feature [INTERFACE] in
```

#### Parameters

- *INTERFACE* Layer 3 interface on the switch.
  - **subinterface** Displays the subinterface traffic count.
  - **vlan-interface** Displays the VLAN-interface traffic count.

#### Examples

- This command configures the ingress traffic count on the sub-interfaces.

```
switch#hardware counter feature subinterface in
```

- This command configures the ingress traffic count on the VLAN interface.

```
switch#hardware counter feature vlan-interface in
```

- These commands enable the QSFP+ interface in port group 1 and SFP+ interfaces in port group 2 on a DCS-7050Q-16 switch, display the port group status, and display interface status.

```
switch(config)#hardware port-group 1 select Et15/1-4
switch(config)#hardware port-group 2 select Et21-24
switch(config)#show hardware port-group

Portgroup: 1      Active Ports: Et17-20

switch(config)#

```

### 10.1.6.6 hardware port-group

The **hardware port-group** command configures a port group to activate a 40GBASE (QSFP+) interface or four 10GBASE (SFP+) interfaces, affecting QSFP+ and SFP+ availability.

The **no hardware port-group** and **default hardware port-group** commands restore a port groups default setting by removing the corresponding **hardware port-group** command from **running-config**. The QSFP+ interface is active by default in each port group.

The **hardware port-group** command is available on DCS-7050Q-16 and DCS-7050QX-32S switches, and has different parameters on each platform.

#### Command Mode

Global Configuration

#### Command Syntax

```
hardware port-group group_number select PORT_LIST
```

```
no hardware port-group group_number select PORT_LIST
```

```
default hardware port-group group_number select PORT_LIST
```

#### Parameters

- *group\_number* Label of the port group. Valid options are **1** and **2** on the 7050Q-16; only **1** is available on the 7050QX-32S.
- **PORT\_LIST** Ports activated by command. Options vary by platform and depend on *group\_number* value.
  - DCS-7050Q-16
    - **Et15/1-4** activates QSFP+ port on port group 1. Available when *group\_number* is 1.
    - **Et16/1-4** activates QSFP+ port on port group 2. Available when *group\_number* is 2.
    - **Et17-20** activates SFP+ ports on port group 1. Available when *group\_number* is 1.
    - **Et21-23** activates SFP+ ports on port group 2. Available when *group\_number* is 2.
  - DCS-7050QX-32S
    - **Et1-4** activates SFP+ ports on port group 1. Available when *group\_number* is 1.
    - **Et5/1-4** activates QSFP+ port on port group 1. Available when *group\_number* is 1.

---

### 10.1.6.7 hardware tcam

The **hardware tcam** command places the switch in Hardware TCAM configuration mode.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

**hardware tcam**

#### Example

- This command places the switch in Hardware TCAM configuration mode.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#
```

- [profile](#)
- [interface ethernet](#)

### 10.1.6.8 interface ethernet create

The **interface ethernet create** command is used to configure a range of Ethernet subinterfaces. The command places the switch in Ethernet-interface configuration mode for the specified range of subinterfaces.

#### Command Mode

Global Configuration

#### Command Syntax

```
interface ethernet create sub_range
```

#### Parameters

- **sub\_range** Range of subinterfaces to be configured. Subinterfaces are named by adding a period followed by a unique subinterface number to the name of the parent interface.

#### Example

- This command enters interface configuration mode for Ethernet subinterfaces 1/1.1-100:

```
switch(config)#interface ethernet create 1/1.100  
switch(config-if-Et1/1.1-100)#
```

---

### 10.1.6.9 interface ethernet

The **interface ethernet** command places the switch in Ethernet-interface configuration mode for the specified interfaces. The command can specify a single interface or multiple interfaces.

Ethernet interfaces are physical interfaces and are not created or removed.

Interface management commands include:

- description
- exit
- load-interval
- mtu
- shutdown (Interfaces)

Ethernet management commands include:

- flowcontrol
- mac-address
- speed

Chapters describing supported protocols and other features list additional configuration commands available from Ethernet interface configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

**interface ethernet e\_range**

#### Parameters

- **e\_range** Ethernet interfaces (number, range, or comma-delimited list of numbers and ranges). Valid Ethernet numbers depend on the switches available Ethernet interfaces.

#### Examples

- This command enters interface configuration mode for Ethernet interfaces 1 and 2:

```
switch(config)#interface ethernet 1-2
switch(config-if-Et1-2)#
```

- This command enters interface configuration mode for Ethernet interface 1:

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#
```

### 10.1.6.10 interface management

The **interface management** command places the switch in management-interface configuration mode for the specified interfaces. The list can specify a single interface or multiple interfaces if the switch contains more than one management interface.

Management interfaces are physical interfaces and are not created or removed.

Interface management commands include:

- description
- exit
- load-interval
- mtu
- shutdown (Interfaces)

Ethernet management commands include:

- flowcontrol
- mac-address
- speed

Chapters describing supported protocols and other features list additional configuration commands available from management-interface configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
interface management m_range
```

#### Parameter

- ***m\_range*** Management interfaces (number, range, or comma-delimited list of numbers and ranges).

Valid management numbers depend on the switches available management interfaces. A value of 0, where available, configures the virtual management interface on a dual-supervisor modular switch. Management interface 0 accesses management port 1 on the active supervisor of a dual-supervisor modular switch.

#### Examples

- This command enters interface configuration mode for management interfaces 1 and 2.

```
switch(config)#interface management 1-2
switch(config-if-Ma1-2)#
```

- This command enters interface configuration mode for management interface 1:

```
switch(config)#interface management 1
switch(config-if-Ma1)#
```

---

### 10.1.6.11 link-debounce

The **link-debounce** command configures the link debounce time for the configuration mode interface. Link debounce time is the time that advertisements for new link states are delayed after the link state is established. By default, debounce time is set to zero, disabling link debounce.

Debounce times for link-up and link-down transitions can be independently configured.

- Link-up debounce time: the delay before an interface advertises link down to link up transitions.
- Link-down debounce time: the delay before an interface advertises link up to link down transitions.

The **no link-debounce** and **default link-debounce** commands restore the default debounce setting for the configuration mode interface by removing the corresponding **link-debounce** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
link-debounce time WAIT_TIME
```

```
no link-debounce time WAIT_TIME
```

```
default link-debounce time WAIT_TIME
```

#### Parameters

- **WAIT\_TIME** Link debounce period (milliseconds). All debounce values range from 0 (disabled) to 30000 (30 seconds). Options include
  - < 0 - 30000 > One debounce value assigned as both link up and link down.
  - < 0 - 30000 > < 0 - 30000 > Two debounce values: link up is first, link down is second.

#### Examples

- These commands set the link-up and link-down debounce period to 10 seconds on Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#link-debounce time 10000
switch(config-if-Et5)#
```

- These commands set the link-up debounce to 10 seconds and the link-down debounce period to zero on Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#link-debounce time 10000 0
switch(config-if-Et5)#
```

- These commands set the link-up debounce to zero and the link-down debounce period to 12.5 seconds on Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#link-debounce time 0 12500
switch(config-if-Et5)#
```

### 10.1.6.12 link-error

The **link-error** command places the Ethernet operations, administration, and management (EOAM) profile in the EOAM link-error sub-mode.

The **no link-error** and **default link-error** commands exit from the EOAM link-error sub-mode.

#### Command Mode

EOAM Configuration

#### Command Syntax

```
link-error
```

```
no link-error
```

```
default link-error
```

#### Related Commands

- [monitor ethernet oam profile](#)
- [show monitor ethernet oam profile](#)

#### Example

- These commands place the EOAM profile profile1 in the link-error sub-mode.

```
switch(config)#monitor ethernet oam
switch(config-eoam)#profile profile1
switch(config-eoam-profile-profile1)#link-error
switch(config-eoam-profile-profile1-link-error)#
```

---

### 10.1.6.13 mac-address

The **mac-address** command assigns a MAC address to the configuration mode interface. An interfaces default MAC address is its burn-in address.

The **no mac-address** and **default mac-address** commands revert the interface to its default MAC address by removing the corresponding **mac-address** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

**mac-address address**

**no mac-address**

**default mac-address**

#### Parameter

- **address** MAC address assigned to the interface. Format is dotted hex notation (H.H.H). Disallowed addresses are 0.0.0 and FFFF.FFFF.FFFF.

#### Example

- This command assigns the MAC address of 001c.2804.17e1 to Ethernet interface 7, then displays interface parameters, including the assigned address.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#mac-address 001c.2804.17e1
switch(config-if-Et7)#show interface ethernet 7
Ethernet3 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.2804.17e1 (bia 001c.7312.02e2)
  Description: b.e45
  MTU 9212 bytes, BW 10000000 Kbit
  Full-duplex, 10Gb/s, auto negotiation: off
  Last clearing of "show interface" counters never
  5 seconds input rate 7.84 kbps (0.0% with framing), 10 packets/sec
  5 seconds output rate 270 kbps (0.0% with framing), 24 packets/sec
    1363799 packets input, 222736140 bytes
      Received 0 broadcasts, 290904 multicast
      0 runts, 0 giants
      0 input errors, 0 CRC, 0 alignment, 0 symbol
      0 PAUSE input
    2264927 packets output, 2348747214 bytes
      Sent 0 broadcasts, 28573 multicast
      0 output errors, 0 collisions
      0 late collision, 0 deferred
      0 PAUSE output
switch(config-if-Et7)#
```

### 10.1.6.14 monitor ethernet oam profile

The `monitor ethernet oam profile` command applies the EOAM profile to the specific interface in interface configuration mode.

The `no monitor ethernet oam profile` and `default monitor ethernet oam profile` commands remove the EOAM profile from the interface.

#### Command Mode

Interface Configuration

#### Command Syntax

```
monitor ethernet oam profile name
```

```
no monitor ethernet oam profile
```

```
default monitor ethernet oam profile
```

#### Parameters

- *name* The EOAM profile name. An EOAM profile cannot be named as summary.

#### Related Commands

- [link-error](#)
- [show monitor ethernet oam profile](#)

#### Example

- These commands apply the EOAM profile profile1 to the Ethernet interface 1/1.

```
switch(config)#interface ethernet 1/1  
switch(config-if-Et1/1)#monitor ethernet oam profile profile1
```

---

### 10.1.6.15 monitor ethernet oam

The `monitor ethernet oam` command places the switch in the Ethernet operations, administration, and management (EOAM) configuration mode.

The `no monitor ethernet oam` and `default monitor ethernet oam` commands exit from the EOAM configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor ethernet oam
```

```
no monitor ethernet oam
```

```
default monitor ethernet oam
```

#### Example

- This command places the switch in the EOAM configuration mode.

```
switch(config) #monitor ethernet oam
switch(config-eoam) #
```

### 10.1.6.16 period

The **period** command configures the link monitoring period that is specified for a link error in terms of number of frames or seconds.

The **no period** command removes the period type specified on the chosen link error. The **default period** command configures the link monitoring period as zero seconds.

#### Command Mode

Link-error Configuration

#### Command Syntax

```
{fcs | symbol} period num {seconds | frames}
no {fcs | symbol} period num {seconds | frames}
default {fcs | symbol} period num {seconds | frames}
```

#### Parameters

- **fcs** Inbound packets with frame check sequence (FCS) error.
- **symbol** Inbound packets with symbol error.
- **num** The link monitoring period in frames or seconds. The frames value ranges from 1 to 4000000000. The seconds value ranges from 2 to 200 seconds. The default value is 2 seconds.
- **seconds** The monitor errors per num seconds.
- **frames** The monitor errors per num frames.

#### Related Commands

- [action](#)
- [threshold](#)

#### Example

- These commands set the frames period type for the profile profile1 in the Link-error configuration mode for 300 frames.

```
switch(config)#monitor ethernet oam
switch(config-eoam)#profile profile1
switch(config-eoam-profile-profile1)#link-error
switch(config-eoam-profile-profile1-link-error)#symbol period 300
frames
```

---

### 10.1.6.17 poe disabled

Power over Ethernet (PoE) is enabled on all Ethernet ports by default on switches that support PoE. The **poe disabled** command disables PoE on the configuration-mode interface.

The **no poe disabled** and **default poe disabled** commands restore PoE on the interface by removing the corresponding **poe disabled** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

**poe disabled**

**no poe disabled**

**default poe disabled**

#### Example

- These commands disable PoE on Ethernet interface 7.

```
switch(config)#interface ethernet 7  
switch(config-if-Et7)#poe disabled  
switch(config-if-Et7)#
```

### 10.1.6.18 poe legacy detect

IEEE-compliant powered devices (PDs) are recognized by a specific resistance signature to a test signal sent by the switch, but non-compliant (legacy or proprietary) PDs may use a capacitive signature instead. The **poe legacy detect** command causes the configuration-mode interface to attempt to use hardware detection for these non-compliant PoE devices and power them. By default, legacy PD detection is disabled, and legacy devices are not powered.

**Note:**

Non IEEE-compliant PDs are not officially supported. Arista cannot guarantee compatibility with such devices, and they may not be detected even when legacy detection is enabled on the port they are connected to.

The **no poe legacy detect** and **default poe legacy detect** commands restore the default behavior by removing the corresponding **poe legacy detect** command from **running-config**.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
poe legacy detect
```

```
no poe legacy detect
```

```
default poe legacy detect
```

**Example**

- These commands configure Ethernet interface 7 to attempt to detect and power capacitive PDs.

```
switch(config)#interface ethernet 7  
switch(config-if-Et7)#poe legacy detect  
switch(config-if-Et7)#
```

### 10.1.6.19 poe limit

Power over Ethernet (PoE) power output is limited by the hardware-negotiated power level and by the total power capacity of the switch. The `poe limit` command sets an additional maximum power output for the configuration-mode interface. The power limit represents the power output at the Ethernet port; actual power delivered to the PD will be lower due to power loss along the Ethernet cable.

#### Note:

If a power limit is set by this command, Power Via MDI TLVs will not be sent from the interface. See [Configuring LLDP for Power over Ethernet](#) for details.

The `no poe limit` and `default poe limit` commands restore the default power limitation by removing the corresponding `poe limit` command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
poe limit {class class_num | watt_num watts}
```

```
no poe limit
```

```
default poe limit
```

#### Parameters

- **class\_num** Specifies the power output limit by power class. Values range from 0-6 as follows:
  - Class 0 = 15.4 W
  - Class 1 = 4 W
  - Class 2 = 7 W
  - Class 3 = 15.4 W
  - Class 4 = 30 W
  - Class 5 = 45 W
  - Class 6 = 60 W
- **watt\_num** Specifies the power output limit in watts. Values range from 0-60. A value of 0 watts will prevent the port from providing PoE power.

#### Examples

- These commands limit nominal PoE power output on Ethernet interface 7 to 10 W.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#poe limit 10 watts
switch(config-if-Et7)#
```

- These commands limit nominal PoE power output on Ethernet interface 7 to 4 W.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#poe limit class 1
switch(config-if-Et7)#
```

### 10.1.6.20 profile

The **profile** command creates an Ethernet operations, administration, and management (EOAM) profile in the EOAM configuration mode.

The **no profile** and **default profile** commands exit from the EOAM configuration mode.

#### Command Mode

EOAM Configuration

#### Command Syntax

**profile** *profile\_name*

**no profile** *profile\_name*

**default profile** *profile\_name*

#### Parameter

- *profile\_name* The profile name that is specified.

#### Related Commands

- [monitor ethernet oam profile](#)
- [show monitor ethernet oam profile](#)

#### Guidelines

Run the **shutdown** or **no shutdown** command to bring the port back to the normal state.

#### Example

- These commands create an EOAM profile profile1 in the EOAM configuration mode.

```
switch(config)#monitor ethernet oam
switch(config-eoam)#profile profile1
switch(config-eoam-profile-profile1)#
```

---

### 10.1.6.21 recovery-time

The **recovery-time** command configures the recovery timeout value for link fault signaling.

The **no recovery-time** command and the **default recovery-time** command removes the recovery timeout value specified for the chosen link error.

#### Command Mode

Link-error Configuration

#### Command Syntax

**recovery-time** *value*

**no recovery-time** *value*

**default recovery-time** *value*

#### Parameters

- **value** Specifies the recovery timeout value for LFS. The value ranges from 20 to 200.

#### Related Commands

- [action](#)
- [period](#)
- [threshold](#)

#### Example

- These commands set the recovery time value of 40 for the profile profile1 in the Link-error configuration mode.

```
switch(config)#monitor ethernet oam
switch(config-eoam)#profile profile1
switch(config-eoam-profile-profile1)#link-error
switch(config-eoam-profile-profile1-link-error)#recovery-time 40
```

### 10.1.6.22 show hardware counter

The **show hardware counter** command displays counter events across time intervals.

#### Command Mode

EXEC

#### Command Syntax

```
show hardware counter
```

#### Example

This command displays counter events across all time intervals, which are currently more than one standard deviation apart from a given time interval.

```
switch(config-handler-eventHandler1-counters)#show hardware counter events
-----
Interval | Event Name | Chip | First | Last | Count | Z-Score
| | Name | Occurrence | Occurrence | |
-----
5 Min | MacCounters | All | 2017-01-31 09:31:35 | 2017-01-31 09:44:32 | 5 | -6.9430
10 Min | MacCounters | All | 2017-01-31 09:39:43 | 2017-01-31 09:44:32 | 3 | -4.8123
-----
switch(config-handler-eventHandler1-counters)#
```

### 10.1.6.23 show hardware port-group

The **show hardware port-group** command displays the status of DCS-7050Q-16 port-groups. Port groups contain one QSFP+ interface and a set of four SFP+ interfaces. In each port group, either the QSFP+ interface or the SFP+ interface set is enabled. The port groups are configured independent of each other.

- Port group 1 contains interface 15 (QSFP+) and interfaces 17-20 (SFP+).
- Port group 2 contains interface 16 (QSFP+) and interfaces 21-24 (SFP+).

#### Command Mode

EXEC

#### Command Syntax

**show hardware port-group**

#### Guidelines

The **hardware port-group** command is available on on DCS-7050Q-16 switches.

#### Example

- This command displays the status of ports in the two port groups on a DCS-7050Q-16 switch.

```
switch#show hardware port-group

Portgroup: 1      Active Ports: Et15/1-4
Port              State
-----
Ethernet17        ErrDisabled
Ethernet18        ErrDisabled
Ethernet19        ErrDisabled
Ethernet20        ErrDisabled
Ethernet15/1      Active
Ethernet15/2      Active
Ethernet15/3      Active
Ethernet15/4      Active

Portgroup: 2      Active Ports: Et16/1-4
Port              State
-----
Ethernet16/1      Active
Ethernet16/2      Active
Ethernet16/3      Active
Ethernet16/4      Active
Ethernet21        ErrDisabled
Ethernet22        ErrDisabled
Ethernet23        ErrDisabled
Ethernet24        ErrDisabled
switch>
```

### 10.1.6.24 show interfaces counters bins

The **show interfaces counters bins** command displays packet counters, categorized by packet length, for the specified interfaces. Packet length counters that the command displays include:

- 64 bytes
- 65-127 bytes
- 128-255 bytes
- 256-511 bytes
- 512-1023 bytes
- 1024-1522 bytes
- larger than 1522 bytes

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] counters bins
```

#### Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - <no parameter> All interfaces.
  - **ethernet** *e\_range* Ethernet interface range specified by *e\_range*.
  - **management** *m\_range* Management interface range specified by *m\_range*.
  - **port-channel** *p\_range* Port-Channel Interface range specified by *p\_range*.

#### Related Commands

- [show interfaces counters](#)
- [show interfaces counters errors](#)
- [show interfaces counters queue](#)
- [show interfaces counters rates](#)

#### Example

This command displays packet counter results for Ethernet interfaces 1 and 2.

```
switch#show interfaces ethernet 1-2 counters bins
Input
Port          64 Byte      65-127 Byte    128-255 Byte    256-511 Byte
-----
Et1           2503          56681135       1045154         1029152
Et2            8            50216275       1518179         1086297

Port          512-1023 Byte  1024-1522 Byte  1523-MAX Byte
-----
Et1           625825        17157823       8246822
Et2           631173        27059077       5755101
switch>
```

### 10.1.6.25 show interfaces counters errors

The `show interfaces counters errors` command displays the error counters for the specified interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] counters errors
```

#### Parameters

- INTERFACE Interface type and numbers. Options include:
  - <no parameter> All interfaces.
  - **ethernet** *e\_range* Ethernet interface range specified by *e\_range*.
  - **management** *m\_range* Management interface range specified by *m\_range*.
  - **port-channel** *p\_range* Port-Channel Interface range specified by *p\_range*.

#### Display Values

- The table displays the following counters for each listed interface:
  - FCS: Inbound packets with CRC error and proper size.
  - Align: Inbound packets with improper size (undersized or oversized).
  - Symbol: Inbound packets with symbol error and proper size.
  - Rx: Total inbound error packets.
  - Runts: Outbound packets that terminated early or dropped because of underflow.
  - Giants: Outbound packets that overflowed the receiver and were dropped.
  - Tx: Total outbound error packets.

#### Related Commands

- [show interfaces counters](#)
- [show interfaces counters bins](#)
- [show interfaces counters queue](#)
- [show interfaces counters rates](#)

#### Examples

- This command displays the error packet counters on Ethernet interfaces 1-2.

```
switch#show interfaces ethernet 1-2 counters errors
Port          FCS    Align  Symbol    Rx    Runts  Giants
Tx
Et1           0      0      0         0     0      0
  0
Et2           0      0      0         0     0      0
  0
switch>
```

### 10.1.6.26 show interfaces counters queue

The `show interfaces counters queue` command displays the queue drop counters for the specified interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] counters queue
```

```
show interfaces [INTERFACE] counters queue
```

#### Parameters

- INTERFACE Interface type and numbers. Options include:
  - <no parameter> All interfaces.
  - **ethernet** *e\_range* Ethernet interface range specified by *e\_range*.
  - **management** *m\_range* Management interface range specified by *m\_range*.
  - **port-channel** *p\_range* Port-Channel Interface range specified by *p\_range*.

#### Related Commands

- [show interfaces counters](#)
- [show interfaces counters bins](#)
- [show interfaces counters errors](#)
- [show interfaces counters rates](#)

#### Example

- This command displays the queue drop counters for Ethernet interfaces 1 and 2.

```
switch#show interfaces ethernet 1-2 counters queue
Port                InDrops
Et1                  180
Et2                  169
switch>
```

### 10.1.6.27 show interfaces counters rates

The **show interfaces counters rates** command displays the received and transmitted packet rate counters for the specified interfaces. Counter rates provided include megabits per second (Mbps), kilopackets per second (Kpps) and utilization percentage.

All port rates are approximately calculated. Note that, when displaying the rate information of a port channel, the rate value of the port channel will likely differ from the sum of the rates for the member ports. The discrepancy is likely to be larger for port channels with fewer ports except for port channels with single ports. The rate values of individual member ports are less inaccurate than the rate values of the port channel as a whole.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] counters rates
```

#### Parameters

- INTERFACE Interface type and numbers. Options include:
  - <no parameter> All interfaces.
  - **ethernet** *e\_range* Ethernet interface range specified by *e\_range*.
  - **management** *m\_range* Management interface range specified by *m\_range*.
  - **port-channel** *p\_range* Port-Channel Interface range specified by *p\_range*.

#### Related Commands

- [show interfaces counters](#)
- [show interfaces counters bins](#)
- [show interfaces counters errors](#)
- [show interfaces counters queue](#)

#### Example

- This command displays rate counters for Ethernet interfaces 1 and 2.

```
switch#show interfaces ethernet 1-2 counters rates
Port      Intvl   In Mbps    %    In Kpps  Out Mbps    %    Out Kpps
Et1       0:05   53.3      0.5%    5       31.2      0.3%    2
Et2       0:05   43.3      0.4%    4        0.1      0.0%    0
switch#
```

### 10.1.6.28 show interfaces counters

The **show interface counters** command displays the Layer 3 ingress traffic count information. Run this command to view the traffic counts on a sub-interface or VLAN interface. The clear counters command resets the counters to zero. Counters displayed by the command include:

- inbound bytes
- inbound unicast packets
- inbound multicast packets
- inbound broadcast packets
- outbound bytes
- outbound unicast packets
- outbound multicast packets
- outbound broadcast packets

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] counters [ incoming ]
```

#### Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - <no parameter> All interfaces.
  - **ethernet** *e\_range* Ethernet interface range specified by *e\_range*.
  - **management** *m\_range* Management interface range specified by *m\_range*.
  - **port-channel** *p\_range* Port-Channel Interface range specified by *p\_range*.
  - **subinterface** Displays the subinterface traffic counts.
  - **vlan-interface** Displays the VLAN-interface traffic counts.
- **incoming** Displays the traffic count for the ingress port.

#### Note:

When no interface is specified, the output will start with ingress and egress counters section for regular interfaces, followed by section for the ingress L3 Interface counters.

#### Related Commands

- [show interfaces counters bins](#)
- [show interfaces counters errors](#)
- [show interfaces counters queue](#)
- [show interfaces counters rates](#)

#### Examples

- This command displays byte and packet counters for Ethernet interfaces 1 and 2.

```
switch#show interfaces ethernet 1-2 counters
Port          InOctets      InUcastPkts    InMcastPkts    InBcastPkts
Et1           99002845169   79116358       75557           2275
Et2           81289180585   76278345       86422           11

Port          OutOctets      OutUcastPkts    OutMcastPkts    OutBcastPkts
Et1           4347928323    6085482         356173          2276
Et2           4512762190    5791718         110498          15
switch>
```

- This command displays the ingress traffic count on a VLAN interface vl12.

```
switch#show interface vl12 counters incoming
L3 Interface InOctets InUcastPkts InMcastPkts
```

### 10.1.6.29 show interfaces flow-control

The **show interfaces flow-control** command displays administrative and operational flow control data for the specified interfaces. Administrative data is the parameter settings stored in **running-config** for the specified interface; the switch uses these settings to negotiate flow control with the peer switch. Operational data is the resolved flow control setting that controls the ports behavior.

#### Command Mode

EXEC

#### Command Syntax

**show**[**INTERFACE**] **flow-control**

#### Parameters

- **INTERFACE** Interface type and number for which flow control data is displayed.
  - <no parameter> All interfaces.
  - **ethernet** *e\_range* Ethernet interfaces in the specified range.
  - **management** *m\_range* Management interfaces in the specified range.

Valid *e\_range* and *m\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

#### Example

- This command shows the settings for Ethernet interfaces 1-10.

```
switch#show flow-control interface ethernet 1-10
Port          Send FlowControl  Receive FlowControl  RxPause  TxPause
             admin    oper             admin    oper
-----
Et1           off     off             off     off         0         0
Et2           off     off             off     off         0         0
Et3           off     off             off     off         0         0
Et4           off     off             off     off         0         0

switch#
```

### 10.1.6.30 show interfaces hardware default

The **show interfaces hardware default** command displays the static interface capability information of the specified interfaces. This command displays information related to the speed, auto-negotiation, error correction, and modulation capabilities (when applicable) of a system's ports. The command also provides information displayed by the **show interfaces hardware** command, such as model number, interface type, duplex mode, and flow control settings of the specific interface. Compared to the **show interfaces hardware** command, this command accounts for the capabilities of the system architecture only, and does not consider the capabilities of a transceiver.

#### Command Mode

EXEC

## Command Syntax

```
show interfaces [INTERFACE] hardware default
```

## Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - <no parameter> all interfaces.
  - **ethernet** *e\_range* Ethernet interface range specified by *e\_range*.
  - **management** *m\_range* Management interface range specified by *m\_range*.

Valid *e\_range* and *m\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

## Examples

- This command displays the static interface capability information at the default level.

```
switch>show interfaces hardware default
Ethernet1
  Model:      DCS-7020TR-48
  Type:      1000BASE-T
  Speed/Duplex: 100M/full,1G/full
  Flowcontrol: rx-(off,on,desired),tx-(off)
  Autoneg CL28: 100M/full,1G/full
  Autoneg CL37: 1G/full
switch>
```

- This command displays the static interface capability information for Ethernet interface 4/1/1.

```
switch>show interfaces ethernet 4/1/1 hardware default
Ethernet4/1/1
  Model:      7500R2AK-36CQ-LC
  Type:      40GBASE-CR4
  Speed/Duplex: 1G/full,10G/full,25G/full,40G/full,50G/full,100G/full
  Flowcontrol: rx-(off,on,desired),tx-(off)
  Autoneg CL28: 1G/full,10G/full
  Autoneg CL73:
IEEE:      25G/full,40G/full,100G/full
Consortium: 25G/full,50G/full
  Error Correction:
Reed-Solomon: 25G,50G,100G
Fire-code: 25G,50G
```

---

### 10.1.6.31 show interfaces hardware

The **show interfaces hardware** command displays the model number, interface type, duplex mode, and flow control settings of the specified interfaces. The capabilities command is available on Ethernet and management interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] hardware
```

#### Parameters

- INTERFACE Interface type and numbers. Options include:
  - <no parameter> All interfaces.
  - **ethernet** *e\_range* Ethernet interface range specified by *e\_range*.
  - **management** *m\_range* Management interface range specified by *m\_range*.

Valid *e\_range* and *m\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

#### Example

- This command displays the model number, interface type, duplex mode and flow control settings for Ethernet interfaces 2 and 18.

```
switch#show interfaces ethernet 2,18 hardware
Ethernet2
  Model:          DCS-7150S-64-CL
  Type:           10GBASE-CR
  Speed/Duplex:  10G/full, 40G/full, auto
  Flowcontrol:   rx-(off,on,desired),tx-(off,on,desired)
Ethernet18
  Model:          DCS-7150S-64-CL
  Type:           10GBASE-SR
  Speed/Duplex:  10G/full
  Flowcontrol:   rx-(off,on),tx-(off,on)
switch#
```

### 10.1.6.32 show interfaces negotiation

The **show interfaces negotiation** command displays the speed, duplex, and flow control auto-negotiation status for the specified interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] negotiation [INFO_LEVEL]
```

#### Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - <no parameter> Display information for all interfaces.
  - **ethernet** *e\_range* Ethernet interface range specified by *e\_range*.
  - **management** *m\_range* Management interface range specified by *m\_range*.

Valid *e\_range* and *m\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

- **INFO\_LEVEL** Amount of information that is displayed. Options include:
  - <no parameter> Displays status and negotiated setting of local ports.
  - **detail** Displays status and negotiated settings of local ports and their peers.

#### Examples

- This command displays the negotiated status of management 1 and 2 interfaces

```
switch#show interface management 1-2 negotiation
Port          Autoneg      Negotiated Settings
  Status      Speed        Duplex      Rx Pause    Tx Pause
-----
Ma1           success     100M        full         off         off
Ma2           success     auto        auto         off         off
switch>
```

- This command displays the negotiated status of management 1 interface and its peer interface.

```
switch#show interface management 1 negotiation detail
Management1 :

Auto-Negotiation Mode      10/100/1000 BASE-T (IEEE Clause 28)
Auto-Negotiation Status    Success

  Advertisements      Speed          Duplex          Pause
  -----
    Local              10M/100M/1G   half/full       Disabled
    Link Partner       None           None            None

  Resolution          100Mb/s       full            Rx=off,Tx=off
switch>
```

### 10.1.6.33 show interfaces phy

The **show interfaces phy** command displays physical layer characteristics for the specified interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] phy [INFO_LEVEL]
```

#### Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - <no parameter> All interfaces.
  - **ethernet e\_range** Ethernet interfaces in specified range.

Valid *e\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

- **INFO\_LEVEL** Amount of information that is displayed. Options include:
  - <no parameter> Command displays table that summarizes PHY data.
  - **detail** Command displays data block for each specified interface.

#### Examples

- This command summarizes PHY information for Ethernet interfaces 1-5.

```
switch#show interfaces ethernet 1-5 phy
Key:
U   = Link up
D   = Link down
R   = RX Fault
T   = TX Fault
B   = High BER
L   = No Block Lock
A   = No XAUI Lane Alignment
0123 = No XAUI lane sync in lane N

Port          PHY state          State Changes  Reset Count  PMA/PMD  PCS  XAUI
-----
Ethernet1     linkUp             14518         1750 U..      U.... U.....
Ethernet2     linkUp             13944         1704 U..      U.... U.....
Ethernet3     linkUp             13994         1694 U..      U.... U.....

```

### 10.1.6.34 show interfaces status errdisabled

The **show interfaces status errdisabled** command displays interfaces that are in errdisabled state, including their link status and errdisable cause.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] status errdisabled
```

#### Parameters

- **INTERFACE** Interface type and numbers. Options include:
    - **<no parameter>** Display information for all interfaces.
    - **ethernet *e\_range*** Ethernet interface range specified by *e\_range*.
    - **management *m\_range*** Management interface range specified by *m\_range*.
    - **port-channel *p\_range*** Port-Channel Interface range specified by *p\_range*.
- Valid *e\_range* and *m\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

#### Example

- This command displays the error-disabled ports.

```
switch#show interfaces status errdisabled
```

Port	Name	Status	Reason
Et49/2		errdisabled	multi-lane-intf
Et49/3		errdisabled	multi-lane-intf
Et49/4		errdisabled	multi-lane-intf

```
switch>
```

### 10.1.6.35 show interfaces status

The **show interfaces status** command displays the interface name, link status, vlan, duplex, speed, and type of the specified interfaces. When the command includes a link status, the results are filtered to display only interfaces whose link status match the specified type.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE]status [STATUS_TYPE]
```

#### Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - **<no parameter>** All existing interfaces.
  - **ethernet *e\_range*** Ethernet interfaces in the specified range.
  - **management *m\_range*** Management interfaces in the specified range.
  - **port-channel *p\_range*** All existing port-channel interfaces in the specified range.

Valid *e\_range*, *m\_range*, and *p\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

- **STATUS\_TYP** Einterface status upon which the command filters output. Options include:

- <no parameter> Command does not filter on interface status.
- **connected** Interfaces connected to another port.
- **notconnect** Unconnected interfaces that are capable of connecting to another port.
- **disabled** Interfaces that have been powered down or disabled.
- **sub-interfaces** L3 subinterfaces configured on the switch.

Command may include multiple status types (**connectednotconnectdisabled**), which can be placed in any order.

### Examples

- This command displays the status of Ethernet interfaces 1-5.

```
switch#show interfaces ethernet 1-5 status
Port      Name          Status      Vlan      Duplex  Speed  Type
Et1       10GBASE-SRL   connected   1         full    10G
Et2       10GBASE-SRL   connected   1         full    10G
Et3       10GBASE-SRL   connected   1         full    10G
Et4       10GBASE-SRL   connected   1         full    10G
Et5       10GBASE-SRL   notconnect  1         full    10G Not
Present
switch>
```

- This command displays status information for all subinterfaces configured on the switch.

```
switch#show interfaces status sub-interfaces
Port      Name          Status      Vlan      Duplex  Speed  Type
Flags
Et1.1     connect      101        full     10G     dot1q-encapsu
lation
Et1.2     connect      102        full     10G     dot1q-encapsu
lation
Et1.3     connect      103        full     10G     dot1q-encapsu
lation
Et1.4     connect      103        full     10G     dot1q-encapsu
lation
switch>
```

---

### 10.1.6.36 show interfaces transceiver channels

The **show interfaces transceiver channels** command displays current wavelength/frequency settings for the specified channels.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE e_range] transceiver channels
```

#### Parameters

- **INTERFACE** Interface type and port numbers.
  - **ethernet e\_range** Ethernet interface range specified by *e\_range*.

#### Related Commands

- [transceiver channel](#)
- [show interfaces transceiver hardware](#)

#### Example

- This command displays the supported wavelengths/frequencies and their corresponding channel numbers on Ethernet interface 4 to slot 3 through 4.

```
switch(config-as-if-Et4/1/3)#show interfaces ethernet 4 / 3 / 4
transceiver
channels
Name: Et4/3/4
100GHz- 50GHz-
Wavelength Frequency spacing spacing
(nm) (GHz) Channel Channel
-----
1567.95 191,200 1 1
1567.54 191,250 2
1567.13 191,300 2 3
1566.72 191,350 4
....
1529.16 196,050 98
1528.77 196,100 50 99
1528.38 196,150 100
switch(config-as-if-Et4/1/3)#
```

### 10.1.6.37 show interfaces transceiver hardware

The **show interfaces transceiver hardware** command displays current wavelength/frequency settings for the specified transceiver interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE e_range] transceiver hardware
```

#### Parameters

- INTERFACE Interface type and port numbers.
  - **ethernet** *e\_range* Ethernet interface range specified by *e\_range*.

#### Related Commands

- [transceiver channel](#)
- [show interfaces transceiver channels](#)

#### Example

- This command displays the current wavelength/frequency settings on Ethernet interface 4 to slot 3 through 4.

```
switch(config-as-if-Et4/1/3)#show interfaces ethernet 4 / 3 / 4
transceiver hardware
Name: Et4/3/4
Media Type: 10GBASE-DWDM
Configured Channel : 39
Configured Grid (GHz) : 50
Computed Frequency (GHz) : 193,100
Computed Wavelength (nm) : 1552.52
Operational Channel : 39 (Default)
Operational Grid (GHz) : 50 (Default)
Operational Frequency (GHz): 193,100
Operational Wavelength (nm): 1552.52
switch(config-as-if-Et4/1/3)#
```

---

### 10.1.6.38 show interfaces transceiver properties

The **show interfaces transceiver properties** command displays configuration information for the specified interfaces. Information provided by the command includes the media type, interface speed-duplex settings, speed-duplex operating state.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] transceiver properties
```

#### Parameters

- INTERFACE Interface type and numbers. Options include:
  - <no parameter> Display information for all interfaces.
  - **ethernet** *e\_range* Ethernet interface range specified by *e\_range*.
  - **management** *m\_range* Management interface range specified by *m\_range*.

Valid *e\_range* and *m\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

#### Related Commands

- [show interfaces transceiver](#)

#### Example

- This command displays the media type, speed, and duplex properties for Ethernet interfaces 1-3.

```
switch#show interfaces ethernet 1-3 transceiver properties
Name : Et1
Administrative Speed: 10G
Administrative Duplex: full
Operational Speed: 10G (forced)
Operational Duplex: full (forced)
Media Type: 10GBASE-SRL

Name : Et2
Administrative Speed: 10G
Administrative Duplex: full
Operational Speed: 10G (forced)
Operational Duplex: full (forced)
Media Type: 10GBASE-SRL

Name : Et3
Administrative Speed: 10G
Administrative Duplex: full
Operational Speed: 10G (forced)
Operational Duplex: full (forced)
Media Type: 10GBASE-SRL

switch>
```

### 10.1.6.39 show interfaces transceiver

The `show interfaces transceiver` command displays operational transceiver data for the specified interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] transceiver [DATA_FORMAT]
```

#### Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - <no parameter> All interfaces.
  - **ethernet** *e\_range* Ethernet interface range specified by *e\_range*.
  - **management** *m\_range* Management interface range specified by *m\_range*.

Valid *e\_range*, and *m\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

- **DATA\_FORMAT** format used to display the data. Options include:
  - <no parameter> table entries separated by tabs.
  - **csv** table entries separated by commas.

#### Related Commands

- [show interfaces transceiver properties](#)

#### Example

This command displays transceiver data on Ethernet interfaces 1 through 4.

```
switch#show interfaces ethernet 1-4 transceiver
If device is externally calibrated, only calibrated values are printed.
N/A: not applicable, Tx: transmit, Rx: receive.
mA: milliamperes, dBm: decibels (milliwatts).
```

Port	Temp (Celsius)	Voltage (Volts)	Bias Current (mA)	Optical Tx Power (dBm)	Optical Rx Power (dBm)	Last Update (Date Time)
Et1	34.17	3.30	6.75	-2.41	-2.83	2011-12-02 16:18:48
Et2	35.08	3.30	6.75	-2.23	-2.06	2011-12-02 16:18:42
Et3	36.72	3.30	7.20	-2.02	-2.14	2011-12-02 16:18:49
Et4	35.91	3.30	6.92	-2.20	-2.23	2011-12-02 16:18:45

```
switch#
```

---

### 10.1.6.40 show monitor ethernet oam profile

The **show monitor ethernet oam profile** command displays configuration information for the specified ethernet OAM profile name or the summary information of all configured profile names.

#### Command Mode

EXEC

**Command Syntax** `show monitor ethernet oam profile { name | summary }`

#### Parameters

- *name* The EOAM profile name.
- **summary** The EOAM summary of all profiles that are configured.

#### Related Commands

- [link-error](#)
- [monitor ethernet oam profile](#)

#### Examples

- This command displays the OAM profile configuration information for the specific profile name.

```
switch#show monitor ethernet oam profile [ <name> ]

Ethernet OAM Profile : p

Error Type : symbol

                Threshold :    20 frames
                Action    :      log
                Period    :    20 seconds

Error Type : fcs

                Threshold :    10 frames
                Action    : linkfault
                Period    :   100 frame

Recovery Timeout : 20
```

- This command displays the OAM profile configuration summary for all profiles configured.

```
switch>show monitor ethernet oam profile [ <name> ] summary

Eoam Profile : p
Configured on: Et3/1-4,5
```

### 10.1.6.41 show platform fm6000 agileport map

The `show platform fm6000 agileport map` command displays the list of Ethernet interfaces that are combinable to form a higher speed port.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show platform fm6000 agileport map
```

#### Example

- These commands displays the agile port map for the switch, then configures Ethernet interface 13 as a 40G port, subsuming Ethernet interfaces 15, 17 and 19.

```
switch#show platform fm6000 agileport map
-----
Agile Ports          |          Interfaces subsumed in 40G link
-----
Ethernet1           | Ethernet3      Ethernet5      Ethernet7
Ethernet2           | Ethernet4      Ethernet6      Ethernet8
Ethernet13          | Ethernet15     Ethernet17     Ethernet19
Ethernet14          | Ethernet16     Ethernet18     Ethernet20
switch#config
switch(config)#interface ethernet 13
switch(config-if-Et13)#speed 40gfull

WARNING!  Executing this command will cause the forwarding agent
          to be restarted. All interfaces will briefly drop links
          and forwarding on all interfaces will momentarily stop.

          Do you wish to proceed with this command? [y/N]

Ethernet13 configured for 40G.
Ethernet15, Ethernet17 and Ethernet19 are now subsumed.
switch(config-if-Et13)#
```

---

### 10.1.6.42 show poe

The `show poe` command displays PoE information for a specified port range or for all ports.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show poe [ INTERFACE]
```

#### Parameters

- INTERFACE Interface type and numbers. Options include:
  - <no parameter> Display information for all interfaces.
  - **ethernet** *e\_range* Ethernet interface range specified by *e\_range*.

#### Example

- This command displays PoE information for Ethernet interface 46.

```
switch(config)#show poe interface ethernet 46
show poe interface ethernet 46
PSELDPPowerGrantedPort
Port Enabled Enabled Limit Power State Class Power Current Voltage Temperature
-----
46      True      True 15.40W 15.40W powered class0 1.40W 27.00mA 55.04V 41.25C
switch(config-if-Et7)#
```

### 10.1.6.43 speed

The **speed** command configures the transmission speed and duplex setting for the configuration mode interface. The scope and effect of this command depends on the interface type. Interface types include:

- 40GBASE (QSFP+): Default is 4x10G-full. **Speed forced 40gfull** and **Speed auto 40gfull** configure interface as a 40G port.
- 10GBASE-T: Default is 10G-full. **Speed** command affects interface.
- 10GBASE (SFP+): Default is 10G-full. **Speed** command does not affect interface.
- 1000BASE (copper): Default is 1G-full. **speed auto 100full** affects interface.
- 1000BASE (fiber): Default is 1G-full. **Speed** command does not affect interface.
- 10/100/1000: Default is auto-negotiation. **Speed** command (10/100/1000 options) affects interface.

The **speed 40gfull** and **auto 40gfull** commands configure a QSFP+ Ethernet interface as a 40G port. The **no speed** and **no auto 40gfull** commands configure a QSFP+ Ethernet interface as four 10G ports. These commands must be applied to the /1 port. These commands are hitless on the 7050X, 7060X, 7250X, 7260X, 7280SE, 7300X, 7320X and 7500E series platforms. On all other platforms, these commands restart the forwarding agent, which will result in traffic disruption.

The **no speed** and **default speed** commands restore the default setting for the configuration mode interface by removing the corresponding **speed** command from running-config.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

**speed** **MODE**

**no speed**

**default speed**

#### Parameters

- **MODE** Transmission speed and duplex setting. Options include:
  - **speed auto** auto negotiation mode. (For SFP-1G-T, auto-negotiates 1Gbps, this is because no speed is specified, and we are defaulting to advertise 1G)
  - **speed auto 40gfull** auto negotiation mode with clause 73 auto negotiation.
  - **speed auto 1G full/ speed 1G** auto-negotiated 1Gbps (note that per BASE-T standard, 1G must be negotiated)
  - **speed auto 100full** auto-negotiated 100Mbps.
  - **speed 100full** non-negotiated and true-forced 100Mbps.

#### Note:

Interfaces using clause 73 auto negotiation must connect to a device that runs clause 73 auto negotiation.

- **sfp-1000baset auto** auto-negotiation mode (1000BASE-T interfaces only).
- **10000full** 10G full duplex.
- **1000full** 1G full duplex.
- **1000half** 1G half duplex.
- **100full** 100M full duplex.
- **100gfull** 100G full duplex.
- **100half** 100M half duplex.
- **10full** 10M full duplex.
- **10half** 10M half duplex.

- **40gfull** 40G full duplex.

On 40GBASE and 100GBASE interfaces, options that change the SFP+ and MXP interfaces (the **auto 40gfull**, the **40gfull**, and the **no speed** options) may restart the forwarding agent on some switch platforms, disrupting traffic on all ports for more than a minute.

### Guidelines

#### Note:

The **SFP-1G-T** transceivers advertise one speed at a time only. Hence, the desired speed and negotiation must be configured explicitly using the **speed auto**, **speed auto 1G full/ speed 1G**, **speed auto 100full**, and **speed 100full** commands.

### Examples

- This command configures a 40GBASE interface as a 40G port.

```
switch(config)#interface ethernet 49/1
switch(config-if-Et49/1)#speed 40gfull
switch(config-if-Et49/1)#show interface ethernet 49/1 - 49/4 status
Port      Name      Status      Vlan      Duplex  Speed  Type
Et49/1    CR4       connected   in Po999  full    40G    40GBASE-
Et49/2    CR4       errdisabled inactive   unconf unconf 40GBASE-
Et49/3    CR4       errdisabled inactive   unconf unconf 40GBASE-
Et49/4    CR4       errdisabled inactive   unconf unconf 40GBASE-
switch(config-if-Et49/1)#
```

- This command configures a 40GBASE interface as four 10G ports (default configuration).

```
switch(config-if-Et49/1)#no speed
switch(config-if-Et49/1)#show interface ethernet 49/1 - 49/4 status
Port      Name      Status      Vlan      Duplex  Speed  Type
Et49/1    SR4       connected   routed    full    10G    40GBASE-
Et49/2    SR4       connected   routed    full    10G    40GBASE-
Et49/3    SR4       connected   routed    full    10G    40GBASE-
Et49/4    SR4       notconnect  inactive  full    10G    40GBASE-
switch(config-if-Et49/1)#
```

#### 10.1.6.44 system

The **system** command allows the user to configure the system-wide TCAM profiles such as default, mirroring-acl, mpls-evpn, pbr-match-next-hop-group, qos, tap-aggregation-default, tap-aggregation-extended, tc-counters, test, vxlan-routing.

The **exit** command returns the switch to global configuration mode.

##### Command Mode

Hardware TCAM

##### Command Syntax

**system profile *name***

##### Parameter

- *name* TCAM profile name.

##### Example

- This commands allow the switch to configure the TCAM profile qos.

```
switch(config-hw-tcam) #system profile qos
```

##### Reference

- [hardware tcam](#)

---

### 10.1.6.45 threshold

The **threshold** command configures the link monitoring threshold value that is specified for a link error.

The **no threshold** and the **default threshold** commands remove the threshold value specified for the chosen link error.

#### Command Mode

Link-error Configuration

#### Command Syntax

**{fcs | symbol} threshold *threshold\_value***

**no {fcs | symbol} threshold *threshold\_value***

**default {fcs | symbol} threshold *threshold\_value***

#### Parameters

- **fcs** Inbound packets with Frame check sequence (FCS) error.
- **symbol** Inbound packets with symbol error.
- **threshold\_value** Specifies the threshold value in number of errors. The value ranges from 1 to 100.

#### Related Commands

- [action](#)
- [period](#)

#### Example

- These commands set the threshold value of 20 for the profile profile1 in the Link-error configuration mode.

```
switch(config)#monitor ethernet oam
switch(config-eoam)#profile profile1
switch(config-eoam-profile-profile1)#link-error
switch(config-eoam-profile-profile1-link-error)#symbol threshold 20
```

### 10.1.6.46 transceiver channel

The **transceiver channel** command displays transceiver wavelength/frequency by channel number. The channel numbering depends on the selected grid-spacing mode. The default grid-spacing mode is 50GHz-spacing.

- If the startup configuration does not specify the channel number for the interface, the transceiver will automatically tune to the default channel (i.e. channel-39 of 50GHz-spacing grid) when it is inserted.
- If the configured wavelength/frequency is not supported by the transceiver, the transceiver will be tuned to the default channel (i.e. channel-39 of 50GHz-spacing grid).

The interface is shutdown before the channel number is configured.

#### Command Mode

Global Configuration

#### Command Syntax

```
transceiver channel CHANNEL_NUMBER grid-spacing <SPACING_GRID>
no transceiver channel CHANNEL_NUMBER grid-spacing <SPACING_GRID>
default transceiver channel CHANNEL_NUMBER grid-spacing <SPACING_GRID>
```

#### Parameters

- **CHANNEL-NUMBER** The default channel is 39 (50GHz-spacing grid) which corresponds to a frequency of 193,100 GHz and a wavelength of 1552.52 nm.
- **GRID\_SPACING** Grid-spacing mode (optional) depends on the selected grid-spacing mode. The default grid-spacing mode is 50GHz-spacing. For example, channel 39 of 50GHz-spacing grid is equivalent to channel 20 of 100GHz-spacing grid, which corresponds to a frequency of 193,100 GHz and a wavelength of 1552.52 nm.
  - <SPACING\_GRID> default grid-spacing mode in GHz.

#### Related Commands

- [show interfaces transceiver channels](#)
- [show interfaces transceiver hardware](#)

#### Example

- This command tunes the transceiver on slot number 4 to slot 1 through 3 of 50GHz-spacing grid.

```
switch(config-as)#interface ethernet 4 / 1 / 3
switch(config-if-Et4/1/3)#transceiver channel 1 grid-spacing 50
switch(config-if-Et4/1/3)#
```

---

### 10.1.6.47 transceiver qsfp default-mode

The `transceiver qsfp default-mode` command specifies the transmission mode of all QSFP transceiver modules that are not explicitly configured.

Each QSFP+ module Ethernet interface is configurable as a single 40G port or as four 10G ports. The switch displays four ports for each interface. Each ports status depends on the interface configuration:

- The /1 port is active (connected or not connected), regardless of the interface configuration.
- The /2, /3, and /4 ports are error-disabled when the interface is configured as a single 40G port.
- all ports are active (connected or not connected), when the interface is configured as four 10G ports.

The only available default-mode value is 4x10G; QSFP modules that are not configured through a `speed` command are operated as four 10G ports.

The `no transceiver qsfp default-mode` and `default transceiver qsfp default-mode` commands restore the default-mode transceiver setting to its default value of 4x10G.

#### Command Mode

Global Configuration

#### Command Syntax

```
transceiver qsfp default-mode 4x10G
```

```
no transceiver qsfp default-mode
```

```
default transceiver qsfp default-mode
```

#### Guidelines

The `transceiver qsfp default-mode 4x10g` statement is always in `running-config` and cannot be modified or removed in the current release.

## 10.2 Port Channels and LACP

This chapter describes channel groups, port channels, port channel interfaces, and the Link Aggregation Control Protocol (LACP). This chapter contains the following sections:

- [Port Channel Introduction](#)
- [Port Channel Conceptual Overview](#)
- [Port Channel Configuration Procedures](#)
- [Load Balancing Hash Algorithms](#)
- [Port Channel and LACP Configuration Commands](#)

### 10.2.1 Port Channel Introduction

Arista's switching platforms support industry-standard link aggregation protocols. Arista switches optimize traffic throughput by using MAC addressing, IP addressing, and services fields to effectively load share traffic across aggregated links. Managers can configure multiple ports into a logical port channel, either statically or dynamically through the IEEE Link Aggregation Control Protocol (LACP). Various negotiation modes are supported to accommodate different configurations and peripheral requirements, including LACP fallback to support devices that need simple network connectivity to retrieve images or configurations prior to engaging port channel aggregation modes.

Arista's Multi-chassis Link Aggregation protocol (MLAG) supports LAGs across paired Arista switches to provide both link aggregation and active/active redundancy.

## 10.2.2 Port Channel Conceptual Overview

### 10.2.2.1 Channel Groups and Port Channels

A port channel is a communication link between two switches supported by matching channel group interfaces on each switch. A port channel is also referred to as a Link Aggregation Group (LAG). Port channels combine the bandwidth of multiple Ethernet ports into a single logical link.

A channel group is a collection of Ethernet interfaces on a single switch. A port channel interface is a virtual interface that serves a corresponding channel group and connects to a compatible interface on another switch to form a port channel. Port channel interfaces can be configured and used in a manner similar to Ethernet interfaces. Port channel interfaces are configurable as Layer 2 interfaces, Layer 3 (routable) interfaces, and VLAN members. Most Ethernet interface configuration options are also available to port channel interfaces.

### 10.2.2.2 Port Channel Subinterfaces

Port channel subinterfaces divide a single port channel interface into multiple logical L3 interfaces based on the 802.1q tag (VLAN ID) of incoming traffic. Subinterfaces are commonly used in the L2/L3 boundary device, but they can also be used to isolate traffic with 802.1q tags between L3 peers by assigning each subinterface to a different VRF.

For further details about subinterfaces, see [Subinterfaces](#).

### 10.2.2.3 Link Aggregation Control Protocol (LACP)

The Link Aggregation Control Protocol (LACP), described by IEEE 802.3ad, defines a method for two switches to automatically establish and maintain link aggregation groups (LAGs, also called channel groups or port channels). Using LACP, a switch can configure LACP-compatible ports into a dynamic LAG. The ports try to complete LACP negotiation automatically with the linked ports (also configured as a dynamic LAG) on the partner switch. The maximum number of ports per LAG varies by platform; numbers for each platform in the latest EOS release are available here: <https://www.arista.com/en/support/product-documentation/supported-features>.

#### Static LAGs

In static mode (with the channel-group mode configured as **on** on the member interfaces), the switch aggregates links without an awareness of LAGs on the partner switch and without LACP negotiation. The member ports do not send LACP packets or process inbound LACP packets on static LAGs. Packets may drop when static LAG configurations differ between switches.

#### Dynamic LAGs

Dynamic LAGs are aware of their partners' port-channel states. Interfaces configured as dynamic LAGs are designated as **active** or **passive**.

- **Active interfaces** send LACP Protocol Data Units (LACP PDUs) at a rate of one per second when forming a channel with an interface on the peer switch. An aggregate forms if the peer runs LACP in active or passive mode.
- **Passive interfaces** only send LACP PDUs in response to PDUs received from the partner. The partner switch must be in active mode and initiates negotiation by sending a LACP packet. The passive mode switch receives and responds to the packet to form a LAG.

An active interface can form port channels with passive or active partner interfaces, but port channels are not formed when the interface on each switch is passive.

[Table 12-1](#) summarizes the effect of different LACP mode combinations:

**Table 60: LACP Mode Combinations**

Switch 1	Switch 2	Comments
active	active	Links aggregate when LACP negotiation is successful.
active	passive	Links aggregate when LACP negotiation is successful.
passive	passive	Links do not aggregate because LACP negotiation is not initiated.
on (static)	on (static)	Links aggregate without LACP.
on (static)	active or passive	Links aggregate on the static switch without LACP; links do not aggregate on the other switch, and no port-channel connection is established with the partner.

During synchronization, interfaces in dynamic LAGs transmit one LACP PDU per second. After synchronization is complete, interfaces exchange one PDU every thirty seconds, facilitated by a default timeout of 30 seconds and a failure tolerance of three. Under these parameters, when the switch does not receive a LACP PDU for an interface during a ninety-second period, it records the partner interface as failed and removes the interface from the port channel.

### Fallback Mode

An active interface that is not in fallback mode does not form a LAG until it receives PDUs from, and negotiates with its peer. Fallback mode allows an active LACP interface to maintain a LAG without receiving PDUs from its peer. The fallback timer specifies the period the LAG waits to receive a peer PDU. Upon timer expiry, the port channel reverts to its configured fallback mode if one is configured.

**Static fallback:** the port channel maintains one active port while in fallback mode; all its other member ports are in standby mode until a LACP PDU is received by the port channel. All member ports send (and can receive) LACP PDUs, but only the active port sends or receives data.

**Individual fallback:** all member ports act as individual switch ports while in fallback mode. Individual port configuration (rather than port channel configuration) is active while the port channel is in fallback mode, with the exception of ACLs. This includes VLAN membership. All member ports send and receive data, and continue to send LACP PDUs. As soon as a LACP PDU is received by a member of the port channel, all ports revert to normal port-channel operation.

The switch uses a link aggregation hash algorithm to determine the forwarding path within a link aggregation group. The IP and MAC header fields can be selected as components of the hash algorithm.

## 10.2.3 Port Channel Configuration Procedures

These sections describe channel group and port channel configuration procedures:

- [Configuring a Channel Group](#)
- [Configuring a Port Channel Interface](#)
- [Configuring Port Channel Subinterfaces](#)
- [Configuring LACP](#)
- [Displaying Port Channel Information](#)

### 10.2.3.1 Configuring a Channel Group

#### Creating a Channel Group

The `channel-group` command assigns the configuration-mode Ethernet interfaces to a channel group, creates the channel group if it does not already exist, and specifies LACP attributes for the channel.

Channel groups are associated with a port channel interface immediately upon their creation. A command that creates a new channel group also creates a port channel with a matching ID. The port channel is configured in port-channel configuration mode. Configuration changes to a port channel interface propagate to all Ethernet interfaces in the corresponding channel group.

LACP is enabled on the member interfaces by setting the channel-group mode to **active** or **passive**. Setting the mode to **on** disabled LACP on the member interfaces and creates a static channel group.

#### Example:

These commands assign Ethernet interfaces **1** and **2** to channel group **10** (creating the channel group if it does not already exist), enable LACP on those interfaces, and place the channel group in a negotiating state.

```
switch(config)#interface ethernet 1-2
switch(config-if-Et1-2)#channel-group 10 mode active
switch(config-if-Et1-2)#
```

#### Adding an Interface to a Channel Group

The `channel-group` command is also used to add the configuration mode interface to an existing channel group. When adding channels to a previously created channel group, the channel-group mode for the new channel must match the mode for the existing group.

#### Example:

These commands add Ethernet interfaces **7** through **10** to previously created channel group **10**, using the channel-group mode (**active**) under which it was created.

```
switch(config)#interface ethernet 7-10
switch(config-if-Et7-10)#channel-group 10 mode active
switch(config-if-Et7-10)#
```

#### Removing an Interface from a Channel Group

The `no channel-group` command removes the configuration mode interface from the specified channel group. Deleting all members of a channel group does not remove the associated port channel interface from *running-config*.

#### Example:

These commands removes **Ethernet interface 8** from previously created channel group **10**.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#no channel-group
```

```
switch(config-if-Et8) #
```

### Deleting a Channel Group

A channel group is deleted by removing all Ethernet interfaces from the channel group. A channel group's LACP mode can be changed only by deleting the channel group and then creating an equivalent group with a different LACP mode. Deleting a channel group by removing all Ethernet interfaces from the group preserves the port channel interface and its configuration settings.

View *running-config* to verify the deletion of all Ethernet interfaces from a channel group.

## 10.2.3.2 Configuring a Port Channel Interface

### Creating a Port Channel Interface

The switch provides two methods for creating port channel interfaces:

- creating a channel group simultaneously creates an associated port channel.
- the `interface port-channel` command creates a port channel without assigning Ethernet channels to the new interface.

The `interface port-channel` command places the switch in *interface-port channel configuration mode*.

#### Example:

This command creates *port channel interface 8* and places the switch in *port channel interface configuration mode*.

```
switch(config) #interface port-channel 8  
switch(config-if-Po8) #
```

### Deleting a Port Channel Interface

The `no interface port-channel` command deletes the configuration mode port channel interface and removes the channel group assignment for each Ethernet interface assigned to the group associated with the port channel interface. Removing all Ethernet interfaces from a channel group does not remove the associated port channel interface from *running-config*.

## 10.2.3.3 Configuring Port Channel Subinterfaces

When configuring subinterfaces on a port channel interface (the virtual interface associated with a port channel), the following restrictions apply:

- An L3 interface with subinterfaces configured on it should not be made a member of a port channel.
  - An interface that is a member of a port channel should not have subinterfaces configured on it.
  - A subinterface cannot be made a member of a port channel.

Port channel subinterfaces are otherwise configured similarly to Ethernet subinterfaces. For additional information, see [Subinterfaces](#).

### 10.2.3.4 Configuring LACP

#### Configuring the Channel-group Mode

The channel-group mode is configured when a channel group is created using the `channel-group` command. A channel group's mode cannot be modified without deleting the entire channel group, but it can be modified without deleting the port channel interface associated with the channel group. The mode setting defines whether the port channel is static or dynamic, and whether a dynamic port channel is active or passive.

##### Examples:

- These commands create a dynamic channel group and place it in LACP **active** mode.

```
switch(config)#interface ethernet 1-2
switch(config-if-Et1-2)#channel-group 10 mode active
switch(config-if-Et1-2)#
```

- These commands create a static channel group.

```
switch(config)#interface ethernet 4-5
switch(config-if-Et4-5)#channel-group 11 mode on
switch(config-if-Et4-5)#
```

#### Configuring the System Priority

Each switch is assigned a globally unique system identifier by concatenating the system priority (16 bits) to the MAC address of one of its physical ports (48 bits). The system identifier is used by peer devices when forming an aggregation to verify that all links are from the same switch. The system identifier is also used when dynamically changing aggregation capabilities in response to LACP information; the system with the numerically lower system identifier is permitted to dynamically change advertised aggregation capabilities.

The `lacp system-priority` command configures the switch's LACP system priority.

##### Example:

This command assigns the system priority of **8192** to the switch.

```
switch(config)#lacp system-priority 8192
switch(config)#
```

#### Configuring Port Priority

LACP port priority determines the port that is active in a LAG in fallback mode. Numerically lower values have higher priority. Port priority is supported on port channels that are enabled with LACP physical interfaces.

The `lacp port-priority` command sets the aggregating port priority for the configuration mode interface.

##### Example:

This command assigns the port priority of **4096** to *Ethernet interface 1*.

```
switch(config-if-Et1)#lacp port-priority 4096
```

```
switch(config-if-Et1) #
```

### Configuring the LACP Packet Reception Rate

The `lACP timer` command sets the reception rate of LACP packets on the local device for the interface being configured. This command supports the following reception rates:

- **normal:** LACP packets are received at the following rates:
  - 30 seconds for synchronized interfaces.
  - One second for interfaces that are being synchronized.
- **fast:** LACP packets are received every second.

#### Example:

This command sets the LACP reception rate to one second on the **Ethernet interface 4**.

```
switch(config-if-Et4) #lACP timer fast
switch(config-if-Et4) #
```

### Configuring LACP Fallback

Fallback mode (static or individual) is configured on a port channel interface with the `port-channel lACP fallback` command. The fallback timeout interval is configured with the `port-channel lACP fallback timeout` command. Fallback timeout settings persist in **running-config** without taking effect for interfaces that are not configured into fallback mode. The default fallback timeout period is 90 seconds.

#### Examples:

- These commands enable LACP static fallback mode, then configure an LACP fallback timeout of **100** seconds on **port channel interface 13**. If LACP negotiation fails, only the member port with the lowest LACP priority will remain active until an LACP PDU is received by one of the member ports.

```
switch(config) #interface port-channel 13
switch(config-if-Po13) #port-channel lACP fallback static
switch(config-if-Po13) #port-channel lACP fallback timeout 100
switch(config-if-Po13) #show active
interface Port-Channel13
    port-channel lACP fallback static
    port-channel lACP fallback timeout 100
switch(config-if-Po13) #
```

- These commands enable LACP individual fallback mode, then configure an LACP fallback timeout of **50** seconds on **port channel interface 17**. If LACP negotiation fails, all member ports will act as individual switch ports, using port-specific configuration, until a LACP PDU is received by one of the member ports.

```
switch(config) #interface port-channel 17
switch(config-if-Po17) #port-channel lACP fallback individual
switch(config-if-Po17) #port-channel lACP fallback timeout 50
switch(config-if-Po17) #show active
interface Port-Channel17
    port-channel lACP fallback individual
    port-channel lACP fallback timeout 50
```

```
switch(config-if-Po17) #
```

## Configuring Minimum Links

The `port-channel min-links` command specifies the minimum number of interfaces that the configuration mode LAG requires to be active. If there are fewer ports than specified by this command, the port channel interface does not become active.

**Note:** In static LAGs, the min-links value must be met for the LAG to be active. The LAG will not become active until it has at least the min-links number of functioning links in the channel group. If failed links cause the number to drop below the minimum, the LAG will go down and administrator action will be required to bring it back up. In dynamic LAGs, the LACP protocol must determine that at least min-links physical ports are aggregable (they are physically compatible and have the same keys both remotely and locally) before it begins negotiating to make any ports active members of the port-channel. However once negotiation begins, an error on the partner's side or an error in programming of member interfaces can cause the LAG to become active with fewer than the minimum number of links. EOS evaluates min-links after min-links-review-timeout (linearly proportional to configured min-links) when LACP protocol collecting and/or distributing state changes. If the number of active member interfaces in a port-channel is less than configured min-links, it brings the corresponding port-channel Link Down and syslogs LAG-4-MINLINK\_INTF\_INSUFFICIENT message. If additional interfaces get programmed as collecting and distributing, EOS re-evaluates min-links on the port-channel. If sufficient number of interfaces are available to be a part of port-channel, then all interfaces of the corresponding port-channel are re-enabled for LACP negotiation and the port-channel becomes Link Up. LAG-4-MINLINK\_INTF\_NORMAL is syslogged after min-links-review-timeout if the min-links condition is satisfied; otherwise LAG-4-MINLINK\_INTF\_INSUFFICIENT is syslogged and the port-channel goes Link Down. If an interface remains in collecting state but not in distributing state for min-links-review-timeout, it is moved out of collecting state. It is periodically re-enabled after min-links-retry-timeout (which is 200 seconds) till it progresses to collecting and distributing. Meanwhile, if a port-channel becomes Link Up because sufficient number of interfaces progressed to collecting and distributing states, then this interface is enabled for LACP negotiation.

### Example:

This command sets four as the minimum number of ports required for **port channel 5** to become active.

```
switch(config-if-Po5) #port-channel min-links 4
switch(config-if-Po5) #
```

## Configuring Minimum Links Review Interval

The `port-channel min-links review interval` command enables or disables timer based min-links review feature for all port-channels. The timer based min-links feature is enabled when all of the following conditions are true. It is disabled otherwise:

- The min-links configured is greater than 1.
- LACP fallback is disabled.
- The number of interfaces configured in the port-channel is more than min-links.
- The number of active member interfaces in the port-channel is less than min-links.
- The default timer values are:
  - min-links-review-timeout = min-links-timeout-base + f (configured min-links)

- min-links-timeout-base = 180 seconds
- min-links-retry-timeout = 360 seconds

### 10.2.3.5 Displaying Port Channel Information

Port channel information is accessed using some of the **show** commands listed under Interface Display Commands. Ensure that while using the [show interfaces counters rates](#) command to view the rate information of a port channel, rate values for the individual member ports are less inaccurate than rate values of the port channel.

Both the port channel rate and the individual port rates are calculated approximations; the rate value of a port channel might vary from the total of the rates for the member ports. The discrepancy is likely to be larger for port channels with fewer ports, and will be most obvious in single-port port channels.

## 10.2.4 Load Balancing Hash Algorithms

The switch balances packet load across multiple links in a port channel by calculating a hash value based on packet header fields. The hash value determines the active member link through which the packet is transmitted. This method, in addition to balancing the load in the LAG, ensures that all packets in a data stream follow the same network path.

In network topologies that include MLAGs or multiple paths with equal cost (ECMP), programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links. This uneven distribution is avoided by performing different hash calculations on each switch routing the paths.

The [port-channel load-balance](#) command specifies the seed for hashing algorithms that balance the load across ports comprising a port channel. Available seed values vary by switch platform.

#### Example:

This command configures the hash seed of **10** on 7150 Series (FM6000 platform) switches.

```
switch(config)#port-channel load-balance fm6000 10
switch(config)#
```

Hashing algorithm inputs varies by switch platform. These sections describe hashing algorithm inputs for each platform.

- [Load Balance Hash Algorithms on 7048 and 7500 Series Switches](#)
- [Load Balance Hash Algorithms on 7500E Series Switches](#)
- [Load Balance Hash Algorithms on 7050 Series Switches](#)
- [Load Balance Hash Algorithms on 7150 Series Switches](#)

### 10.2.4.1 Load Balance Hash Algorithms on 7048 and 7500 Series Switches

One command configures the load balance hash algorithm on 7048 and 7500 Series switches:

- [port-channel load-balance petraA fields ip](#): controls the hash algorithm for IP packets by specifying the algorithm's use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets), and the entire MAC address header.

The hash algorithm for non-IP packets is not configurable and always includes the entire MAC header.

#### Example:

These commands configure the load balance algorithm for IP packets by using the entire MAC header.

```
switch(config)#port-channel load-balance petraA fields ip mac-
header
switch(config)#
```

#### 10.2.4.2 Load Balance Hash Algorithms on 7500E Series Switches

One command configures the load balance hash algorithm on 7500E Series switches:

- `port-channel load-balance arad fields ip`: controls the hash algorithm for IP packets by specifying the algorithm's use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets), and the entire MAC address header.

The hash algorithm for non-IP packets is not configurable and always includes the entire MAC header.

##### Example:

These commands configure the load balance algorithm for IP packets by using the entire MAC header.

```
switch(config)#port-channel load-balance arad fields ip mac-
header
switch(config)#
```

##### 10.2.4.2.1 Dynamic and Symmetric LAG Hashing

Dynamic LAG hashing enables high link utilization and highly even distribution among LAG members by employing a randomized hashing algorithm. Symmetric LAG hashing allows the two flows of a bidirectional communication link, even when the two flows enter the switch on different ingress ports, to be hashed to the same member of a LAG on egress.

Dynamic and symmetric LAG hashing policies are enabled via named port-channel load-balancing profiles. LAG load-balancing policies can be provisioned on per line-card basis using these profiles. Load-balancing profiles can be used to provision all LAG load-balance attributes, including hash polynomials, hash seeds, and hash fields.

When no specific LAG hashing profile is assigned to a line card, then a global LAG hashing profile can be defined and applied to all the line cards with no LAG hashing defined on them.

Note, if no profile is selected as global profile then the default profile takes the precedence and set as a global profile. The default profile is reserved and if it is set as a global profile it cannot be deleted, if the profile is deleted then the following warning message is displayed.

**Note:** When a global profile is already set and if some other profile is tried to configured as a default profile the following warning message is displayed “! A global load balancing profile myProfile is currently active. This setting will not take effect.”

##### Examples:

- These commands configure a load balance profile for symmetric hashing.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance arad profile
```

```
switch(config-sand-load-balance-profile-symmetric-profile-1)#hash symmetric
switch(config-sand-load-balance-profile-symmetric-profile-1)#show active
load-balance policies
    load-balance arad profile symmetric-profile-1
    hash symmetric
```

- These commands configure a load balance profile for dynamic hashing.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance arad profile
switch(config-sand-load-balance-profile-dynamic-hash-profile-1)#distribution
clock
switch(config-sand-load-balance-profile-dynamic-hash-profile-1)#show active
load-balance policies
    load-balance arad profile dynamic-hash-profile-1
    distribution clock
```

- This command assigns a named load-balancing profile to a linecard.

```
switch(config)#port-channel load-balance module 3-7 sand
profile Linecard5
switch(config)#
```

- This command unassigns a named load-balancing profile to a linecard.

```
switch(config)#no port-channel load-balance module 3-7 sand
profile Linecard5
switch(config)#
```

- This command configures a global profile on all line cards on which LAG hashing is not defined.

```
switch(config)#port-channel load-balance sand profile
myGlobalProfile
```

- These commands designate a default profile as a global profile, if no other profile is set as a global profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance sand profile
default
```

- These commands configure a hash seed in a profile and assign it as a global profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance sand profile
myGlobalProfile
switch(config-sand-load-balance-profile-myGlobalProfile)#hash
seed 20
switch(config)#port-channel load-balance sand profile
myGlobalProfile
```

- This command assigns a named load-balancing profile to a linecard.

```
switch(config)#port-channel load-balance module 3-7 sand
profile Linecard5
switch(config)#
```

- This command unassigns a named load-balancing profile to a linecard.

```
switch(config)#no port-channel load-balance module 3-7 sand
profile Linecard5
switch(config)#
```

### 10.2.4.3 Load Balance Hash Algorithms on 7050 Series Switches

Three commands configure the load balance hash algorithm on 7050 Series switches:

- [port-channel load-balance trident fields ip](#) controls the hash algorithm for IP packets by specifying the algorithm's use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets), and fields specified by the [port-channel load-balance trident fields mac](#) command.
- [port-channel load-balance trident fields ipv6](#) controls the hash algorithm for IPv6 packets by specifying the algorithm's use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets), and fields specified by the [port-channel load-balance trident fields mac](#) command.
- [port-channel load-balance trident fields mac](#) controls the hash algorithm for non-IP packets by specifying the algorithm's use of MAC header fields. Fields that the command can specify include the MAC source address, MAC destination address, and Ethernet type fields.

#### Example:

These commands configure the switch's port channel load balance for non IP packets by using the MAC destination and Ethernet type fields in the hashing algorithm.

```
switch(config)#port-channel load-balance trident fields mac dst-
mac eth-type
switch(config)#
```

### 10.2.4.4 Load Balance Hash Algorithms on 7150 Series Switches

Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among component ECMP routes. The switch supports 16 load balance profiles, including the default profile. The default load balance profile is configured through [port-channel load-balance fm6000 fields ip](#) and [port-channel load-balance fm6000 fields mac](#) commands.

#### 10.2.4.4.1 Load Balance Profiles

Load balance profiles are managed in **load-balance-policies configuration mode**. **load-balance-policies configuration mode** provides commands that display the contents of all configured profiles and place the switch in `load-balance-profile` command. Load balance profiles are created by entering **load-balance-profile mode** and edited while in that mode.

The [load-balance policies](#) command places the switch in **load-balance-policies configuration mode**. Load balance profiles specify the inputs used by the hashing algorithms that distribute traffic across ports comprising a port channel or among ECMP routes.

#### Examples:

- This command places the switch in **load-balance-policies configuration mode**.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#
```

- This command displays the contents of the four load balance profiles configured on the switch.

```
switch(config-load-balance-policies)#show active

load-balance policies
  load-balance fm6000 profile F-01
    port-channel hash-seed 22
    fields ip dscp
    distribution random port-channel
  !
  load-balance fm6000 profile F-02
    fields ip protocol dst-ip
    distribution random port-channel
  !
  load-balance fm6000 profile F-03
    fields ip protocol dst-ip
    fields mac dst-mac eth-type
    distribution random ecmp port-channel
  !
  load-balance fm6000 profile F-04

switch(config-load-balance-policies)#
```

### Creating a Load Balance Profile

The `load-balance fm6000 profile` command places the switch in load-balance-profile configuration mode to configure a specified load balance profile. The command specifies the name of the profile that subsequent commands modify. It creates a profile if the profile it references does not exist.

#### Example:

These commands enter **load-balance-profile configuration mode**, creates the **LB-5** profile, and lists the default settings for the profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile
LB-5
switch(config-load-balance-profile-LB-5)#show active all

load-balance policies
  load-balance fm6000 profile LB-5
    port-channel hash-seed 0
    fields mac dst-mac src-mac eth-type vlan-priority vlan-id
    fields ip protocol dst-ip dst-port src-ip src-port dscp
    no distribution symmetric-hash
    no distribution random

switch(config-load-balance-profile-LB-5)#
```

## Configuring a Load Balance Profile

These commands are available in load-balance-profile configuration mode to specify the parameters that comprise a profile.

- The `fields ip` command specifies the L3/L4 data fields used by the hash algorithm defined by the configuration mode load balance profile.
- The `fields mac` command specifies the L2 data fields used by the hash algorithm defined by the configuration mode load balance profile.
- The `distribution symmetric-hash` command enforces traffic symmetry on data distributed by the hash algorithm defined by the configuration mode load balance profile. Symmetric traffic is the flow of both directions of a data stream across the same physical link.
- The `distribution random` command specifies the random distribution of data packets handled by the hash algorithm defined by the configuration mode load balance profile.

### Example:

These commands configure the following components of the hash algorithm defined by the LB-7 load balance profile:

- L2 header fields: MAC destination address, VLAN priority.
- L3/L4 header fields: Source IP address, protocol field.
- Symmetric hash distribution of IP and non-IP packets.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000
profile LB-7
switch(config-load-balance-profile-LB-7)#fields ip src-ip
protocol
switch(config-load-balance-profile-LB-7)#fields mac dst-mac
vlan-priority
switch(config-load-balance-profile-LB-7)#distribution
symmetric-hash mac-ip
switch(config-load-balance-profile-LB-7)#show active
load-balance policies
  load-balance fm6000 profile LB-7
  fields mac dst-mac vlan-priority
  fields ip protocol src-ip
  distribution symmetric-hash mac-ip
switch(config-load-balance-profile-LB-7)#exit
switch(config-load-balance-policies)#exit
switch(config)#exit
```

## Assigning a Load Balance Profile to an Interface

The `ingress load-balance profile` command applies a specified load-balance profile to the configuration mode interface. Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among ECMP routes. The switch supports 16 load balance profiles, including the default profile.

### Example:

This command applies the **LB-1** load balance profile to **port channel interface 100**.

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#ingress load-balance profile LB-1
switch(config-if-Po100)#show active
```

```
interface Port-Channel100
  ingress load-balance profile LB-1
switch(config-if-Po100) #
```

#### 10.2.4.4.2 Default Load Balance Profile

Two commands configure the load balance default profile on 7150 Series switches:

- `port-channel load-balance fm6000 fields ip` controls the hash algorithm for IP packets by specifying the algorithm's use of IP and MAC header fields. Fields that the command can specify include source and destination IP addresses, source and destination port fields (for TCP and UDP packets).
- `port-channel load-balance fm6000 fields mac` controls the hash algorithm for non-IP packets by specifying the algorithm's use of MAC header fields. Fields that the command can specify include the MAC source address, MAC destination address, and Ethernet type, VLAN-ID, and VLAN-priority fields.

##### Examples:

- These commands configure the load balance default profile for IP packets by using source and destination IP address fields, along with source and destination port fields for TCP, and UDP packets.

```
switch(config) #port-channel load-balance fm6000 fields ip ip-  
tcp-udp-header  
switch(config) #
```

- This command applies the default load balance profile to **port channel interface 100**.

```
switch(config) #interface port-channel 100  
switch(config-if-Po100) #no ingress load-balance profile  
switch(config-if-Po100) #show active  
interface Port-Channel100  
switch(config-if-Po100) #
```

## 10.2.5 Port Channel and LACP Configuration Commands

### Global Port Channel and LACP Configuration Commands

- `interface port-channel`
- `lacp system-priority`

### Interface Configuration Commands – Ethernet Interface

- `channel-group`
- `lacp port-priority`
- `lacp timer`
- `port-channel lacp fallback`
- `port-channel lacp fallback timeout`
- `port-channel min-links`
- `port-channel min-links review interval`

### Load Balance (Default) Commands

- `port-channel load-balance`
- `port-channel load-balance arad fields ip`
- `port-channel load-balance fm6000 fields ip`
- `port-channel load-balance fm6000 fields mac`
- `port-channel load-balance sand profile (7500E/7500R)`
- `port-channel load-balance module`
- `port-channel load-balance petraA fields ip`
- `port-channel load-balance trident fields ip`
- `port-channel load-balance trident fields ipv6`
- `port-channel load-balance trident fields mac`

### Load Balance Policies Commands

- `distribution random`
- `distribution symmetric-hash`
- `fields ip`
- `fields mac`
- `hash-seed`
- `load-balance sand profile (7500E/7500R)`
- `ingress load-balance profile`
- `load-balance fm6000 profile`
- `load-balance policies`
- `port-channel hash-seed`

### EXEC Commands

- `show lacp aggregates`
- `show lacp counters`
- `show lacp interface`
- `show lacp internal`
- `show lacp peer`
- `show lacp sys-id`
- `show load-balance profile`

- 
- `show port-channel`
  - `show port-channel dense`
  - `show port-channel limits`
  - `show port-channel load-balance`
  - `show port-channel load-balance fields`

### 10.2.5.1 channel-group

The **channel-group** command assigns the configuration mode Ethernet interfaces to a channel group, creates the group if it does not already exist, and sets the port-channel mode for the group. When adding interfaces to a previously created channel group, the port-channel mode for the newly added interfaces must match the mode for the existing group.

Channel groups are associated with a port channel interface immediately upon their creation. A command that creates a new channel group also creates a port channel with a matching ID. The port channel is configured in Port-channel Configuration Mode. Configuration changes to a port channel interface propagate to all Ethernet interfaces in the corresponding channel group. The [interface port-channel](#) command places the switch in Interface-port-channel Configuration Mode.

The **no channel-group** and **default channel group** commands remove the configuration-mode interface from the specified channel group.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
channel-group number mode group_mode
```

```
no channel-group
```

```
default channel-group
```

#### Parameters

- **number** Specifies a channel group ID. Values range from 1 through 2000.
- **group\_mode** Specifies the channel-group mode for the channel group. Values include:
  - **on** Port channel is static and LACP is disabled on member interfaces. Port neither verifies nor negotiates port channel membership.
  - **active** Port channel is dynamic and member interfaces are active LACP ports that transmit and receive LACP negotiation packets.
  - **passive** Port channel is dynamic and member interfaces are passive LACP ports that respond to LACP negotiation packets but do not generate them.

#### Guidelines: Port Channels

You can configure a port channel to contain many ports, but only a subset may be active at a time. All active ports in a port channel must be compatible. Compatibility includes many factors and is platform-specific. For example, compatibility may require identical operating parameters such as speed and maximum transmission unit (MTU). Compatibility may only be possible between specific ports because of the internal organization of the switch.

#### Guidelines: MLAG Configurations

Static LAG is not recommended in MLAG configurations. However, these considerations apply when the channel group mode is **on** while configuring static MLAG:

- When configuring multiple interfaces on the same static port channel:
  - all interfaces must physically connect to the same neighboring switch.
  - the neighboring switch must configure all interfaces into the same port channel.

The switches are misconfigured when these conditions are not met.

Disable the static port channel membership before moving any cables connected to these interfaces or changing a static port channel membership on the remote switch.

#### Examples:

- 
- These commands assign Ethernet interfaces 8 and 9 to channel group 10, and enable LACP in negotiating mode.

```
switch(config)#interface ethernet 8-9
switch(config-if-Et8-9)#channel-group 10 mode active
switch(config-if-Et8-9)#show active
interface Ethernet8
    channel-group 10 mode active
interface Ethernet9
    channel-group 10 mode active
switch(config-if-Et8-9)#
```

- These commands assign Ethernet interfaces 12 and 13 to static channel group 11. LACP is disabled on these interfaces.

```
switch(config)#interface ethernet 12-13
switch(config-if-Et12-13)#channel-group 11 mode on
switch(config-if-Et12-13)#show active
interface Ethernet12
    channel-group 11 mode on
interface Ethernet13
    channel-group 11 mode on
switch(config-if-Et12-13)#
```

### 10.2.5.2 distribution random

The **distribution random** command specifies the random distribution of data packets handled by the hash algorithm defined by the configuration mode load balance profile. All data fields and hash seeds that are configured for the profile are used as seeds for the random number generator that defines the distribution of individual packets.

Command options allow for the random distribution of traffic across port channel links and ECMP routes. Random distribution can be enabled for either, both, or neither.

The **no distribution random** and **default distribution random** commands remove random distribution on the configuration mode load balance profile by deleting the corresponding **distribution random** command from the configuration.

#### Command Mode

Load-balance-profile Configuration

#### Command Syntax

```
distribution random BALANCE_TYPE
```

```
no distribution random
```

```
default distribution random
```

#### Parameters

- **SCOPE** Specifies use of random distribution for port channels and ECMP routes. Options include:
  - **<no parameter>** Random distribution is enabled for ECMP routes and port channel links.
  - **ecmp** Random distribution is enabled for ECMP routes.
  - **port-channel** Random distribution is enabled for port channel links.
  - **ecmp port-channel** Random distribution is enabled for ECMP routes and port channel links.
  - **port-channel ecmp** Random distribution is enabled for ECMP routes and port channel links.

#### Guidelines

The **distribution random** command takes precedence over the [distribution symmetric-hash](#) command when both methods are simultaneously enabled.

#### Related Commands

- [load-balance fm6000 profile](#) places the switch in *load-balance-profile configuration mode*.

#### Example:

These commands configure symmetric hashing on all traffic distributed through the algorithm defined by the **LB-1** load balance profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile
  LB-1
switch(config-load-balance-profile-LB-1)#distribution random ecmp
  port-channel
switch(config-load-balance-profile-LB-1)#show active
load-balance policies
  load-balance fm6000 profile LB-1
    distribution random ecmp port-channel
switch(config-load-balance-profile-LB-1)#
```

### 10.2.5.3 distribution symmetric-hash

The `distribution symmetric-hash` command enforces traffic symmetry on data distributed by the hash algorithm defined by the configuration mode load balance profile. Symmetric traffic is the flow of both directions of a data stream across the same physical link.

Two symmetric-hash options specify the traffic upon which symmetry is enforced:

- `distribution symmetric-hash mac` specifies that only non-IP traffic is hashed symmetrically. IP traffic is hashed normally without regard to symmetry.
- `distribution symmetric-hash mac-ip` specifies that all traffic is hashed symmetrically.

The `no distribution symmetric-hash` and `default distribution symmetric-hash` commands remove the specified hashing symmetry restriction on the configuration mode load balance profile by deleting the corresponding `distribution symmetric-hash` command from *running-config*.

#### Command Mode

Load-balance-profile Configuration

#### Command Syntax

```
distribution symmetric-hash FIELD_TYPE
no distribution symmetric-hash
default distribution symmetric-hash
```

#### Parameters

- **FIELD\_TYPE** Fields the hashing algorithm uses for Layer 3 routing. Options include:
  - **mac** Non-IP traffic is hashed symmetrically.
  - **mac-ip** All traffic is hashed symmetrically.

#### Guidelines

The `distribution random` command takes precedence over the `distribution symmetric-hash` command when both methods are simultaneously enabled.

#### Related Commands

- `load-balance fm6000 profile` places the switch in load-balance-profile configuration mode.

#### Example:

These commands configure symmetric hashing on all traffic distributed through the algorithm defined by the **LB-1** load balance profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile
  LB-1
switch(config-load-balance-profile-LB-1)#distribution symmetric-
hash mac-ip
switch(config-load-balance-profile-LB-1)#show active
load-balance policies
  load-balance fm6000 profile LB-1
    distribution symmetric-hash mac-ip
switch(config-load-balance-profile-LB-1)#
```

### 10.2.5.4 fields ip

The **fields ip** command specifies the L3/L4 data fields used by the hash algorithm defined by the configuration mode load balance profile. When a load balance profile is assigned to a port channel or Ethernet interface, its associated hash algorithm determines the distribution of packets that ingress the interface. Profile algorithms can load balance packets across port channel links or ECMP routes.

The switch calculates a hash value by using the packet header fields to balance packets across links. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no fields ip** configures the algorithm not to use L3/L4 data fields. The **default fields ip** command restores the default data L3/L4 fields to the load balancing algorithm defined by the configuration mode profile by removing the corresponding **fields ip** or **no fields ip** command from *running-config*.

#### Command Mode

Load-balance-profile Configuration

#### Command Syntax

```
fields ip IP_FIELD
```

```
no fields ip
```

```
default fields ip
```

#### Parameters

- **IP\_FIELD** Specifies the L3/L4 fields the hashing algorithm uses. Options include:
  - **dscp** Algorithm uses dscp field.
  - **dst-ip** Algorithm uses destination IP address field.
  - **dst-port** Algorithm uses destination TCP/UDP port field.
  - **protocol** Algorithm uses protocol field.
  - **src-ip** Algorithm uses source IP address field.
  - **src-port** Algorithm uses source TCP/UDP port field.

Command may include from one to six fields, in any combination and listed in any order. The default setting is the selection of all fields.

#### Related Commands

- [load-balance fm6000 profile](#) places the switch in *load-balance-profile configuration mode*.

#### Example:

These commands specify the IP source and protocol fields as components of the hash algorithm defined by the **LB-1** load balance profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile
LB-1
switch(config-load-balance-profile-LB-1)#fields ip src-ip
protocol
switch(config-load-balance-profile-LB-1)#show active
load-balance policies
```

---

```
load-balance fm6000 profile LB-1
  fields ip protocol src-ip
switch(config-load-balance-profile-LB-1)#
```

### 10.2.5.5 fields mac

The **fields mac** command specifies the L2 data fields used by the hash algorithm defined by the configuration mode load balance profile. When a load balance profile is assigned to a port channel or Ethernet interface, its associated hash algorithm determines the distribution of packets that ingress the interface. Profile algorithms can load balance packets across port channel links or ECMP routes.

The switch calculates a hash value using the packet header fields to balance packets across links. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no fields mac** configures the algorithm not to use L2 data fields. The **default fields mac** command restores the default data L2 fields to the load balancing algorithm defined by the configuration mode profile by removing the corresponding **fields mac** or **no fields mac** command from *running-config*.

#### Command Mode

Load-balance-profile Configuration

#### Command Syntax

```
fields mac MAC_FIELD
```

```
no fields mac
```

```
default fields mac
```

#### Parameters

- **MAC\_FIELD** Specifies the L2 fields the hashing algorithm uses. Options include:
  - **dst-mac** Algorithm uses MAC destination field.
  - **eth-type** Algorithm uses MAC destination field.
  - **src-mac** Algorithm uses MAC source field.
  - **vlan-id** Algorithm uses VLAN ID field.
  - **vlan-priority** Algorithm uses VLAN priority field.

#### Related Commands

[load-balance fm6000 profile](#) places the switch in load-balance-profile configuration mode.

#### Example:

These commands specify the MAC destination and VLAN priority fields as components of the hash algorithm defined by the **LB-1** load balance profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile
  LB-1
switch(config-load-balance-profile-LB-1)#fields mac dst-mac vlan-
priority
switch(config-load-balance-profile-LB-1)#show active
load-balance policies
  load-balance fm6000 profile LB-1
    fields mac dst-mac vlan-priority
```

---

```
switch(config-load-balance-profile-LB-1) #
```

### 10.2.5.6 hash-seed

The **hash-seed** command specifies the seed used by the hash algorithm defined by the configuration mode load balance profile. Profile algorithms can load balance packets across port channel links or ECMP routes.

The **no hash-seed** and **default hash-seed** commands restore the default hash seed value of 0 to the load balancing algorithm defined by the configuration mode profile by removing the corresponding **hash-seed** command from *running-config*.

#### Command Mode

Load-balance-profile Configuration

#### Command Syntax

hash-seed *number*

no hash-seed *number*

default hash-seed *number*

#### Parameters

- **number** Specifies the value of the hash seed. Value ranges from **0** to **39**.

#### Example:

These commands configure the **hash seed 20** in a profile and assign it as the global profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance sand profile
myGlobalProfile
switch(config-sand-load-balance-profile-myGlobalProfile)#hash-
seed 20
switch(config)#port-channel load-balance sand profile
myGlobalProfile
```

---

### 10.2.5.7 ingress load-balance profile

The **ingress load-balance profile** command applies the specified load-balance profile to the configuration mode interface. Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among ECMP routes. The switch supports 16 load balance profiles, including the default profile.

Load balance profiles can be assigned to Ethernet and port channel interfaces. Profiles define the distribution method of traffic that ingresses the interface among the ports comprising a port channel or routes comprising an ECMP.

The default load balance profile is configured through [port-channel load-balance fm6000 fields ip](#) and [port-channel load-balance fm6000 fields mac](#) commands.

The **no ingress load-balance profile** and **default ingress load-balance profile** commands restore the default load balance profile for the configuration mode interface by removing the corresponding **ingress load-balance profile** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
ingress load-balance profile profile_name
```

```
no ingress load-balance profile
```

```
default ingress load-balance profile
```

#### Parameters

- **profile\_name** Name of profile assigned to interface.

#### Example:

This command applies the **LB-1** load balance profile to port channel interface 100.

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#show active
interface Port-Channel100

switch(config-if-Po100)#ingress load-balance profile LB-1
switch(config-if-Po100)#
interface Port-Channel100
    ingress load-balance profile LB-1

switch(config-if-Po100)#
```

### 10.2.5.8 interface port-channel

The **interface port-channel** command places the switch in port-channel interface configuration mode for modifying parameters of specified link aggregation (LAG) interfaces. When entering configuration mode to modify existing port channel interfaces, the command can specify multiple interfaces.

The command creates a port channel interface if the specified interface does not exist prior to issuing the command. When creating an interface, the command can only specify a single interface.

The **no interface port-channel** and **default interface port-channel** commands delete the specified LAG interfaces from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
interface port-channel p_range
no interface port-channel p_range
default interface port-channel p_range
```

#### Parameter

- ***p\_range*** Port channel interfaces (number, range, or comma-delimited list of numbers and ranges).

Port channel numbers range from **1** to **2000**.

#### Guidelines

When configuring a port channel, you do not need to issue the **interface port-channel** command before assigning a port to the port channel (see the [channel-group](#) command). The port channel number is implicitly created when a port is added to the specified port channel with the **channel-group number** command.

To display ports that are members of a port channel, enter [show port-channel](#). To view information about hardware limitations for a port channel, enter [show port-channel limits](#).

All active ports in a port channel must be compatible. Compatibility comprises many factors and is specific to a given platform. For example, compatibility may require identical operating parameters such as speed and/or maximum transmission unit (MTU). Compatibility may only be possible between specific ports because of internal organization of the switch.

You can configure a port channel with a set of ports such that more than one subset of the member ports are mutually compatible. Port channels in EOS are designed to activate the compatible subset of ports with the largest aggregate capacity. A subset with two 40 Gbps ports (aggregate capacity 80 Gbps) has preference to a subset with five active 10 Gbps ports (aggregate capacity 50 Gbps).

#### Example:

This example creates **port channel interface 3**:

```
switch(config)#interface port-channel 3
switch(config-if-Po3)#
```

---

### 10.2.5.9 lacp port-priority

The **lacp port-priority** command sets the aggregating port priority for the configuration mode interface. Priority is supported on port channels with LACP-enabled physical interfaces. LACP port priority determines the port that is active in a LAG in fallback mode. Numerically lower values have higher priority.

Each port in an aggregation is assigned a 32-bit port identifier by prepending the port priority (16 bits) to the port number (16 bits). Port priority determines the ports that are placed in standby mode when hardware limitations prevent a single aggregation of all compatible ports.

Priority numbers range from **0** to **65535**. The default is **32768**. Interfaces with higher priority numbers are placed in standby mode before interfaces with lower priority numbers.

The **no lacp port-priority** and **default lacp port-priority** commands restore the default port-priority to the configuration mode interface by removing the corresponding **lacp port-priority** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
lacp port-priority priority_value
```

```
no lacp port-priority
```

```
default lacp port-priority
```

#### Parameters

- **priority\_level** Port priority. Values range from **0** to **65535**. Default is **32768**

#### Example:

These commands assign the port priority of **4096** to **Ethernet interface 8**.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#lacp port-priority 4096
switch(config-if-Et8)#show active
interface Ethernet8
    lacp port-priority 4096
switch(config-if-Et8)#
```

### 10.2.5.10 lacp system-priority

The **lacp system-priority** command configures the switch's LACP system priority. Values range between **0** and **65535**. Default value is **32768**.

Each switch is assigned a globally unique 64-bit system identifier by prepending the system priority (16 bits) to the MAC address of one of its physical ports (48 bits). Peer devices use the system identifier when forming an aggregation to verify that all links are from the same switch. The system identifier is also used when dynamically changing aggregation capabilities resulting from LACP data; the system with the numerically lower system identifier can dynamically change advertised aggregation parameters.

The **no lacp system-priority** and **default lacp system-priority** commands restore the default system priority by removing the **lacp system-priority** command from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
lacp system-priority priority_value
```

```
no lacp system-priority
```

```
default lacp system-priority
```

#### Parameters

- **priority\_value** System priority number. Values range from **0** to **65535**. Default is **32768**.

#### Example:

This command assigns the system priority of **8192** to the switch.

```
switch(config)#lacp system-priority 8192  
switch(config)#
```

---

### 10.2.5.11 lacp timer

The **lacp timer** command configures the LACP reception interval on the configuration mode interface. The LACP timeout specifies the reception rate of LACP packets at interfaces supporting LACP. Supported rates include:

- **normal**: 30 seconds with synchronized interfaces; one second while interfaces are synchronizing.
- **fast**: one second.

This command is supported on LACP-enabled interfaces. The default value is **normal**.

The **no lacp timer** and **default lacp timer** commands restore the default value of **normal** on the configuration mode interface by deleting the corresponding **lacp timer** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
lacp timer RATE_LEVEL
```

```
no lacp timer
```

```
default lacp timer
```

#### Parameters

- **RATE\_LEVEL** LACP reception interval. Options include:
  - **fast** One second.
  - **normal** 30 seconds for synchronized interfaces; one second while interfaces synchronize.

#### Example:

This command sets the LACP timer to one second on **Ethernet interface 4**.

```
switch(config-if-Et4)#lacp timer fast  
switch(config-if-Et4)#
```

### 10.2.5.12 load-balance fm6000 profile

The `load-balance fm6000 profile` command places the switch in load-balance-profile configuration mode to configure a specified load balance profile. The command specifies the name of the profile that subsequent commands modify. It creates a profile if the profile it references does not exist.

Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among component ECMP routes. The switch supports 16 load balance profiles, including the default profile. The default load balance profile is configured through `port-channel load-balance fm6000 fields ip` and `port-channel load-balance fm6000 fields mac` commands.

The load balance profile name is referenced when it is applied to an interface. The default profile is not associated with a name and is applied to an interface in the absence of a named profile assignment.

The `no load-balance fm6000 profile` and `default load-balance fm6000 profile` commands delete the specified load balance profile from *running-config*. Profiles that are assigned to an interface cannot be deleted. Attempts to delete an assigned profile generate a `profile in use` error messages.

The `load-balance fm6000 profile` command is accessible from *load-balance-policies configuration mode*. *Load-balance-profile configuration mode* is not a group change mode; *running-config* is changed immediately upon entering commands. Exiting *load-balance-policies configuration mode* does not affect the configuration. The `exit` command returns the switch to *load-balance-policies configuration mode*.

#### Command Mode

Load-balance-policies Configuration

#### Command Syntax

```
load-balance fm6000 profile profile_name
no load-balance fm6000 profile profile_name
default load-balance fm6000 profile profile_name
```

#### Parameters

- ***profile\_name*** Name of the load-balance profile.

#### Commands Available in Load-balance-profile Configuration Mode

- `fields ip`
- `fields mac`
- `distribution random`
- `distribution symmetric-hash`
- `port-channel hash-seed`
- `show active` displays the contents of the configuration mode profile.

#### Related Commands

- `load-balance policies` places the switch in *load-balance-policies configuration mode*.
- `ingress load-balance profile` applies a load-balance profile to an Ethernet or port channel interface.
- `show load-balance profile` displays the contents of load balance profiles.

#### Example:

These commands enter *load-balance-profile configuration mode*, creates the `LB-1` profile, and lists the default settings for the profile.

```
switch(config)#load-balance policies
```

---

```
switch(config-load-balance-policies)#load-balance fm6000 profile
LB-1
switch(config-load-balance-profile-LB-1)#show active all
load-balance policies
    load-balance fm6000 profile LB-1
        port-channel hash-seed 0
        fields mac dst-mac src-mac eth-type vlan-priority vlan-id
        fields ip protocol dst-ip dst-port src-ip src-port dscp
        no distribution symmetric-hash
        no distribution random
switch(config-load-balance-profile-LB-1)#
```

### 10.2.5.13 load-balance policies

The **load-balance policies** command places the switch in load-balance-policies configuration mode. Load-balance-policies configuration mode provides commands for managing load-balance profiles. Load balance profiles specify the inputs used by the hashing algorithms that distribute traffic across ports comprising a port channel or among ECMP routes.

The **no load-balance policies** and **default load-balance policies** commands delete all load balance profiles from **running-config**. The command generates an error message when at least one profile is assigned to an interface.

Load-balance-policies configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting **load-balance-policies configuration mode** does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
load-balance policies
no load-balance policies
default load-balance policies
```

#### Commands Available in Load-balance-policies Configuration Mode

- [load-balance fm6000 profile](#) places the switch in **load-balance-profile configuration mode**.
- **show active** displays contents of all load balance profiles.

#### Related Commands

- [ingress load-balance profile](#) applies a load-balance profile to an Ethernet or port channel interface.
- [show load-balance profile](#) displays the contents of load balance profiles.

#### Examples:

- This command places the switch in **load-balance-policies configuration mode**.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#
```

- This command displays the contents of the three configured load balance profiles.

```
switch(config-load-balance-policies)#show active

load-balance policies
  load-balance fm6000 profile F-01
    port-channel hash-seed 22
    fields ip dscp
    distribution random port-channel
  !
  load-balance fm6000 profile F-02
    fields ip protocol dst-ip
    fields mac dst-mac eth-type
    distribution random ecmp port-channel
  !
  load-balance fm6000 profile F-03

switch(config-load-balance-policies)#
```

### 10.2.5.14 load-balance sand profile (7500E/7500R)

The **load-balance sand profile** command configures a load-balance profile on a sand module switch. A default profile is designated as a global profile when no other profile is set as global profile. Note, a warning message is displayed when a profile is entered or deleted.

If **no load-balance sand profile** command is executed when the profile set is default then the following warning message is displayed:

```
! profile default is a reserved profile and cannot be deleted
```

#### Command Mode

Global Configuration

#### Command Syntax

```
load-balance sand profile profile_name
```

```
no load-balance sand profile profile_name
```

#### Parameter

***profile\_name*** Name of the profile assigned to the selected module.

#### Examples:

- These commands designate a default profile as a global profile on sand module platform switch. Note, a warning message is displayed when a profile is entered or deleted.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance sand profile
default
! profile default is a reserved profile
! profile default is the current global profile
```

- When no form of the command is executed it displays the following warning message.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#no load-balance sand
profile default
! profile default is a reserved profile and cannot be deleted
```

### 10.2.5.15 port-channel hash-seed

The **port-channel hash-seed** command specifies the seed used by the hash algorithm defined by the configuration mode load balance profile when distributing the load across ports comprising a port channel. When a load balance profile is assigned to a port channel or Ethernet interface, its associated hash algorithm determines the distribution of packets that ingress the interface. Profile algorithms can load balance packets across port channel links or ECMP routes.

The hash seed that the algorithm uses to select port channel links or ECMP routes is configured by the [ip load-sharing](#) command.

The **no port-channel hash-seed** and **default port-channel hash-seed** commands restore the default hash seed value of **0** to the load balancing algorithm defined by the configuration mode profile by removing the corresponding **port-channel hash-seed** command from **running-config**.

#### Command Mode

Load-balance-profile Configuration

#### Command Syntax

```
port-channel hash-seed number
no port-channel hash-seed
default port-channel hash-seed
```

#### Parameters

- **number** The hash seed. Value ranges from **0** to **39**.

#### Related Commands

- [load-balance fm6000 profile](#) places the switch in load-balance-profile configuration mode.

#### Example:

These commands configure the port-channel hash seed of **22** for the hash algorithm defined by the **LB-1** load balance profile.

```
switch(config)#load-balance policies
switch(config-load-balance-policies)#load-balance fm6000 profile
  LB-1
switch(config-load-balance-profile-LB-1)#port-channel hash-seed
  22
switch(config-load-balance-profile-LB-1)#show active
load-balance policies
  load-balance fm6000 profile LB-1
    port-channel hash-seed 22
switch(config-load-balance-profile-LB-1)#
```

### 10.2.5.16 port-channel lacp fallback timeout

The `port-channel lacp fallback timeout` command specifies the fallback timeout period for the configuration mode interface.

Fallback timeout settings persist in *running-config* without taking effect for interfaces that are not configured into fallback mode. The default fallback timeout period is **90** seconds.

The `no port-channel lacp fallback timeout` and `default port-channel lacp fallback timeout` commands restore the default fallback timeout of **90** seconds for the configuration mode interface by removing the corresponding `port-channel lacp fallback timeout` command from *running-config*.

#### Command Mode

Interface-Port-Channel Configuration

#### Command Syntax

```
port-channel lacp fallback timeout period
no port-channel lacp fallback timeout
default port-channel lacp fallback timeout
```

#### Parameters

- ***period*** Maximum interval between receipt of LACP PDU packets (seconds). Value ranges from **1** to **300** seconds. Default value is **90**.

#### Related Commands

[port-channel lacp fallback](#) configures fallback mode for a port channel interface.

#### Guidelines

The fallback timeout period should not be shorter than the LACP reception interval ([lacp timer](#)). The default LACP reception interval is **30** seconds.

#### Example:

This command enables LACP fallback mode, then configures an LACP fallback timeout of **100** seconds on **port channel interface 13**.

```
switch(config)#interface port-channel 13
switch(config-if-Po13)#port-channel lacp fallback
switch(config-if-Po13)#port-channel lacp fallback timeout 100
switch(config-if-Po13)#show active
interface Port-Channel13
  port-channel lacp fallback
  port-channel lacp fallback timeout 100
switch(config-if-Po13)#
```

### 10.2.5.17 port-channel lacp fallback

The `port-channel lacp fallback` command enables the LACP fallback mode on the interface.

LACP fallback is unconfigured and disabled by default. An LACP interface without fallback enabled does not form a LAG until it receives PDUs from its peer.

LACP fallback can be configured on an interface in static or individual mode:

- **static mode** The port channel member with the lowest LACP port priority is active and maintains contact with the peer (sending and receiving data) while other port channel members remain in standby mode until a LACP PDU is received. All members continue to send (and can receive) LACP PDUs.
- **individual mode** All port channel members act as individual ports, reverting to their port-specific configuration while the channel is in fallback mode, and continue to send and receive data. All members continue to send LACP PDUs until a LACP PDU is received by one of the member ports.

The `no port-channel lacp fallback` and `default port-channel lacp fallback` commands disable LACP fallback mode on the configuration mode interface by removing the corresponding `port-channel lacp fallback` command from *running-config*.

#### Command Mode

Interface-Port-Channel Configuration

#### Command Syntax

```
port-channel lacp fallback [MODE]
```

```
no port-channel lacp fallback
```

```
default port-channel lacp fallback
```

#### Parameters

- **MODE** LACP fallback mode. Options include:
  - **<no parameter>** Enables static LACP fallback mode.
  - **static** Enables static LACP fallback mode.
  - **individual** Enables individual LACP fallback mode.

#### Related Commands

- [port-channel lacp fallback timeout](#) configures the fallback timeout period for a port channel interface. The default LACP fallback timeout period is **90** seconds.
- [lacp port-priority](#) configures the port priority for an individual interface.

#### Examples:

- These commands enable LACP static fallback mode, then configure an LACP fallback timeout of 100 seconds on **port channel interface 13**. If LACP negotiation fails, only the member port with the lowest LACP priority will remain active until an LACP PDU is received by one of the member ports.

```
switch(config)#interface port-channel 13
switch(config-if-Po13)#port-channel lacp fallback static
switch(config-if-Po13)#port-channel lacp fallback timeout 100
switch(config-if-Po13)#show active
interface Port-Channel13
  port-channel lacp fallback static
  port-channel lacp fallback timeout 100
switch(config-if-Po13)#
```

- 
- These commands enable LACP individual fallback mode, then configure an LACP fallback timeout of **50** seconds on **port channel interface 17**. If LACP negotiation fails, all member ports will act as individual switch ports, using port-specific configuration, until a LACP PDU is received by one of the member ports.

```
switch(config)#interface port-channel 17
switch(config-if-Po17)#port-channel lacp fallback individual
switch(config-if-Po17)#port-channel lacp fallback timeout 50
switch(config-if-Po17)#show active
interface Port-Channel17
    port-channel lacp fallback individual
    port-channel lacp fallback timeout 50
switch(config-if-Po17)#
```

### 10.2.5.18 port-channel load-balance arad fields ip

The **port-channel load-balance arad fields ip** command specifies the data fields that the port channel load balance hash algorithm uses for distributing IP packets on Arad platform switches. The hashing algorithm fields used for IP packets differ from the fields used for non-IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The **no port-channel load-balance arad fields ip** and **default port-channel load-balance arad fields ip** commands restore the default data fields for the IP packet load balancing algorithm by removing the **port-channel load-balance arad A fields ip** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
port-channel load-balance arad fields ip IP_FIELD_NAME
```

```
no port-channel load-balance arad fields ip
```

```
default port-channel load-balance arad fields ip
```

#### Parameters

- **IP\_FIELD\_NAME** Fields the hashing algorithm uses for Layer 3 routing. Options include:
  - **ip-tcp-udp-header** Algorithm uses source and destination IP address fields. Source and destination port fields are included for TCP and UDP packets.
  - **mac-header** Algorithm uses entire MAC header.

A command can only specify one option. The default setting is **ip-tcp-udp-header**.

#### Guidelines

The port channel hash algorithm for non-IP packets is not configurable and always includes the entire MAC header.

#### Related Commands

- [port-channel load-balance](#) configures the hash seed for the algorithm.

#### Example:

These commands configure the switch's port channel load balance hash algorithm for IP packets to use source and destination IP address (and port) fields.

```
switch(config)#port-channel load-balance fm6000 fields ip ip-tcp-
udp-header
switch(config)#
```

### 10.2.5.19 port-channel load-balance fm6000 fields ip

The `port-channel load-balance fm6000 fields ip` command specifies the data fields that the port channel load balance hash algorithm uses for distributing IP packets on FM6000 platform switches. The hashing algorithm fields used for IP packets differ from the fields used for non-IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The `no port-channel load-balance fm6000 fields ip` and `default port-channel load-balance fm6000 fields ip` commands restore the default data fields for the IP packet load balancing algorithm by removing the `port-channel load-balance fm6000 fields ip` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
port-channel load-balance fm6000 fields ip IP_FIELD_NAME
```

```
no port-channel load-balance fm6000 fields ip
```

```
default port-channel load-balance fm6000 fields ip
```

#### Parameters

- **IP\_FIELD\_NAME** Specifies fields the hashing algorithm uses for layer 3 routing. Options include:
  - **ip-tcp-udp-header** Algorithm uses source and destination IP address fields. Source and destination port fields are included for TCP and UDP packets.

A command can only specify one option. The default setting is **ip-tcp-udp-header**.

#### Related Commands

- [port-channel load-balance](#) configures the hash seed for the algorithm.
- [port-channel load-balance fm6000 fields mac](#) controls the hash algorithm for non-IP packets.

#### Example:

These commands configure the switch's port channel load balance for IP packets by source and destination IP address and port fields.

```
switch(config)#port-channel load-balance fm6000 fields ip ip-tcp-  
udp-header  
switch(config)#
```

### 10.2.5.20 port-channel load-balance fm6000 fields mac

The `port-channel load-balance fm6000 fields mac` command specifies data fields that configure the port channel load balance hash algorithm for non-IP packets on FM6000 platform switches. The hashing algorithm fields used for balancing non-IP packets differ from the fields used for IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The `no port-channel load-balance fm6000 fields mac` and `default port-channel load-balance fm6000 fields mac` commands restore the default data fields for the non-IP packet load balancing algorithm by removing the `port-channel load-balance fm6000 fields mac` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
port-channel load-balance fm6000 fields mac MAC_FIELD_NAME
```

```
no port-channel load-balance fm6000 fields mac
```

```
default port-channel load-balance fm6000 fields mac
```

#### Parameters

- **MAC\_FIELD\_NAME** Fields the hashing algorithm uses for Layer 2 routing. Options include:
  - **dst-mac** MAC destination field.
  - **eth-type** EtherType field.
  - **src-mac** MAC source field.
  - **vlan-id** VLAN ID field.
  - **vlan-priority** VLAN priority field.

Command may include from one to five fields, in any combination and listed in any order. The default setting is the selection of all fields.

#### Related Commands

- [port-channel load-balance](#) configures the hash seed for the algorithm.
- [port-channel load-balance fm6000 fields ip](#) controls the hash algorithm for IP packets.

#### Example:

These commands configure the switch's port channel load balance for non-IP packets by using the MAC destination and Ethernet type fields in the hashing algorithm.

```
switch(config)#port-channel load-balance fm6000 fields mac dst-  
mac eth-type  
switch(config)#
```

---

### 10.2.5.21 port-channel load-balance module

The `port-channel load-balance module` command assigns a named load-balancing profile to a linecard.

**Note:** Available on the 7500E platform.

The `no port-channel load-balance module` and `default port-channel load-balance module` commands unassigns the load balancing module, or restores the default data fields for the load balancing module.

#### Command Mode

Global Configuration

#### Command Syntax

```
port-channel load-balance module LINECARD_RANGE sand profile PROFILE_NAME
```

```
no port-channel load-balance module LINECARD_RANGE sand profile PROFILE_NAME
```

```
default port-channel load-balance module LINECARD_RANGE sand profile PROFILE_NAME
```

#### Parameters

- **LINECARD\_RANGE** Linecard number range includes:
  - **<3-10>** Linecard number range.
- **PROFILE\_NAME** Load-balance profile name.

#### Examples:

- This command assigns a named load-balancing profile to a linecard.

```
switch(config)#port-channel load-balance module 3-7 sand
profile Linecard5
switch(config)#
```

- This command unassigns a named load-balancing profile to a linecard.

```
switch(config)#no port-channel load-balance module 3-7 sand
profile Linecard5
switch(config)#
```

### 10.2.5.22 port-channel load-balance petraA fields ip

The `port-channel load-balance petraA fields ip` command specifies the data fields that the port channel load balance hash algorithm uses for distributing IP packets on Petra platform switches. The hashing algorithm fields used for IP packets differ from the fields used for non-IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The `no port-channel load-balance petraA fields ip` and `default port-channel load-balance petraA fields ip` commands restore the default data fields for the IP packet load balancing algorithm by removing the `port-channel load-balance petraA fields ip` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
port-channel load-balance petraA fields ip IP_FIELD_NAME
```

```
no port-channel load-balance petraA fields ip
```

```
default port-channel load-balance petraA fields ip
```

#### Parameters

- **IP\_FIELD\_NAME** Fields the hashing algorithm uses for Layer 3 routing. Options include:
  - **ip-tcp-udp-header** Algorithm uses source and destination IP address fields. Source and destination port fields are included for TCP and UDP packets.
  - **mac-header** Algorithm uses entire MAC header.

A command can only specify one option. The default setting is **ip-tcp-udp-header**.

#### Guidelines

The port channel hash algorithm for non-IP packets is not configurable and always includes the entire MAC header.

#### Related Commands

- [port-channel load-balance](#) configures the hash seed for the algorithm.

#### Example:

These commands configure the switch's port channel load balance hash algorithm for IP packets to use source and destination IP address (and port) fields.

```
switch(config)#port-channel load-balance fm6000 fields ip ip-tcp-
udp-header
switch(config)#
```

---

### 10.2.5.23 port-channel load-balance sand profile (7500E/7500R)

The `port-channel load-balance sand profile` command configures a global LAG hashing profile on the port channel interface. A default profile is set as a global profile when no other profile is set as global.

The `no port-channel load-balance sand profile` command removes the active profile from the `port-channel load-balance` command from *running-config*, restoring the default profile.

#### Command Mode

Global Configuration

#### Command Syntax

```
port-channel load-balance sand profile profile_name
```

```
no port-channel load-balance sand profile profile_name
```

#### Parameter

***profile\_name*** Name of the profile assigned to the selected module.

#### Example:

This command configures a global LAG hashing profile on 7500 series platform switch.

```
switch(config)#port-channel load-balance sand profile  
myGlobalProfile  
switch(config)#
```

### 10.2.5.24 port-channel load-balance trident fields ip

The `port-channel load-balance trident fields ip` command specifies the data fields that the port channel load balance hash algorithm uses for distributing IP packets on Trident platform switches. The hashing algorithm fields used for IP packets differ from the fields used for non-IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The `no port-channel load-balance trident fields ip` and `default port-channel load-balance trident fields ip` commands restore the default data fields for the IP packet load balancing algorithm by removing the `port-channel load-balance trident fields ip` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
port-channel load-balance trident fields ip IP_FIELD_NAME
```

```
no port-channel load-balance trident fields ip
```

```
default port-channel load-balance trident fields ip
```

#### Parameters

- **IP\_FIELD\_NAME** Specifies fields the hashing algorithm uses for Layer 3 routing. Options include:
- Command may include from one to four of the following four options, in any combination and listed in any order.
  - **destination-ip** Algorithm uses destination IP address field.
  - **source-ip** Algorithm uses source IP address field.
  - **destination-port** Algorithm uses destination TCP/UDP port field.
  - **source-port** Algorithm uses source TCP/UDP port field.
  - **ip-tcp-udp-header** Algorithm uses source and destination IP address fields. Source and destination port fields are included for TCP and UDP packets.
    - 📄 **Note:** This option can't be used in combination with any other option.
  - **mac-header** Algorithm uses fields specified by `port-channel load-balance trident fields mac`.
    - 📄 **Note:** This option can't be used in combination with any other option.
- 

Default setting is **ip-tcp-udp-header**

#### Related Commands

- `port-channel load-balance` configures the hash seed for the algorithm.
- `port-channel load-balance trident fields ipv6` controls the hash algorithm for IPv6 packets.
- `port-channel load-balance trident fields mac` controls the hash algorithm for non-IP/IPv6 packets.

**Example:**

---

These commands configure the switch's port channel load balance for IP packets by using the IPv6 destination field in the hashing algorithm.

```
switch(config)#port-channel load-balance trident fields ip  
destination-ip  
switch(config)#
```

### 10.2.5.25 port-channel load-balance trident fields ipv6

The `port-channel load-balance trident fields ipv6` command specifies the data fields that the port channel load balance hash algorithm uses for distributing IPv6 packets on Trident platform switches. The hashing algorithm fields used for IPv6 packets differ from the fields used for non-IPv6 packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The `no port-channel load-balance trident fields ipv6` and `default port-channel load-balance trident fields ipv6` commands restore the default data fields for the IPv6 packet load balancing algorithm by removing the `port-channel load-balance trident fields ipv6` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
port-channel load-balance trident fields ipv6 IP_FIELD_NAME
```

```
no port-channel load-balance trident fields ipv6
```

```
default port-channel load-balance trident fields ipv6
```

#### Parameters

- **IP\_FIELD\_NAME** Specifies fields the hashing algorithm uses for Layer 3 routing. Options include:  
Command may include from one to four of the following four options, in any combination and listed in any order.
  - **destination-ip** Algorithm uses destination IPv6 address field.
  - **source-ip** Algorithm uses source IPv6 address field.
  - **destination-port** Algorithm uses destination TCP/UDP port field.
  - **source-port** Algorithm uses source TCP/UDP port field.
  - **ip-tcp-udp-header** Algorithm uses source and destination IPv6 address fields. Source and destination port fields are included for TCP and UDP packets.
    -  **Note:** This option can't be used in combination with any other option.
  - **mac-header** Algorithm uses fields specified by [port-channel load-balance trident fields mac](#).
    -  **Note:** This option can't be used in combination with any other option.

Default setting is **ip-tcp-udp-header**

#### Related Commands

- [port-channel load-balance](#) configures the hash seed for the algorithm.
- [port-channel load-balance trident fields ipv6](#) controls the hash algorithm for non-IP packets.
- [port-channel load-balance trident fields mac](#) controls the hash algorithm for non-IP packets.

**Example:**

---

These commands configure the switch's port channel load balance for IP packets by using the IPv6 source field in the hashing algorithm.

```
switch(config)#port-channel load-balance trident fields ipv6  
source-ip  
switch(config)#
```

### 10.2.5.26 port-channel load-balance trident fields mac

The `port-channel load-balance trident fields mac` command specifies data fields that the port channel load balance hash algorithm uses for distributing non-IP packets on Trident platform switches. The hashing algorithm fields used for non-IP packets differ from the fields used for IP packets.

The switch calculates a hash value using the packet header fields to load balance packets across links in a port channel. The hash value determines the link through which the packet is transmitted. This method also ensures that all packets in a flow follow the same network path. Packet flow is modified by changing the inputs to the port channel hash algorithm.

In network topologies that include MLAGs, programming all switches to perform the same hash calculation increases the risk of hash polarization, which leads to uneven load distribution among LAG and MLAG member links in MLAG switches. This problem is avoided by performing different hash calculations between the MLAG switch, and a non-peer switch connected to it.

The `no port-channel load-balance trident fields mac` and `default port-channel load-balance trident fields mac` commands restore the default data fields for the non-IP packet load balancing algorithm by removing the `port-channel load-balance trident fields mac` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
port-channel load-balance trident fields mac MAC_FIELD_NAME
```

```
no port-channel load-balance trident fields mac
```

```
default port-channel load-balance trident fields mac
```

#### Parameters

- **MAC\_FIELD\_NAME** Fields the hashing algorithm uses for Layer 2 routing. Options include:
  - **dst-mac** MAC destination field.
  - **eth-type** EtherType field.
  - **src-mac** MAC source field.

Command may include from one to three fields, in any combination and listed in any order. The default setting is the selection of all fields.

#### Related Commands

- [port-channel load-balance](#) configures the hash seed for the algorithm.
- [port-channel load-balance trident fields ip](#) controls the hash algorithm for IP packets.
- [port-channel load-balance trident fields ipv6](#) controls the hash algorithm for IP packets.

#### Example:

These commands configure the switch's port channel load balance for non-IP packets by using the MAC destination and Ethernet type fields in the hashing algorithm.

```
switch(config) #port-channel load-balance trident fields mac dst-  
mac eth-type  
switch(config) #
```

---

### 10.2.5.27 port-channel load-balance

The `port-channel load-balance` command specifies the seed in the hashing algorithm that balances the load across ports comprising a port channel. Available seed values vary by switch platform.

The `no port-channel load-balance` and `default port-channel load-balance` commands remove the `port-channel load-balance` command from *running-config*, restoring the default hash seed value of `0`.

#### Command Mode

Global Configuration

#### Command Syntax

```
port-channel load-balance platform {hash_seed | fields ip fields | hash hash_function }
```

```
no port-channel load-balance platform [hash_seed]
```

```
default port-channel load-balance platform [hash_seed]
```

#### Parameters

 **Note:** Parameter options vary by switch model. Verify available options with the `?` command.

- ***platform*** ASIC switching device. Value depends on the switch model.
- ***hash\_seed*** The numerical seed for the hash function. Value range varies by switch platform:
  - **arad** `0` to **65535**.
  - **fm6000** `0` to **39**.
  - **petraA** Uses field inputs only.
  - **trident** `0` to **47**.

For trident platform switches, algorithms using hash seeds between `0` and `15` typically result in more effective distribution of data streams across the port channels.

- ***fields*** Which fields will be used as inputs to the port channel hash.
  - **gre** Configure which GRE fields are inputs to the hash.
  - **ip** Configure which fields are inputs to the hash for IPv4 packets.
  - **ipv6** Configure which fields are inputs to the hash for IPv6 packets.
  - **mac** Configure which MAC fields are inputs to the hash.
  - **mac-in-mac** Configure which MAC-in-MAC fields are inputs to the hash.
  - **mpls** Configure which MPLS fields are inputs to the hash.
  - **destination-ip** Use the Layer 3 IP destination address in the hash.
  - **destination-port** Use the Layer 4 TCP/UDP destination port in the hash.
  - **dst-ip** Use the destination IP address in the hash.
  - **dst-mac** Use the destination Payload MAC in the hash (or the destination MAC address in the MAC hash).
  - **eth-type** Use the Ethernet type in the MAC hash.
  - **ip-in-ip** Use the outer IP header in the hash for IPv4 over IPv4 GRE tunnel.
  - **ip-in-ipv6** Use the outer IP header in the hash for IPv4 over IPv6 GRE tunnel.
  - **ipv6-in-ip** Use the outer IP header in the hash for IPv6 over IPv4 GRE tunnel.
  - **ipv6-in-ipv6** Use the outer IP header in the hash for IPv6 over IPv6 GRE tunnel.
  - **ip-tcp-udp-header** Use the Layer 3 and Layer 4 hashes.
  - **isid** Use the MAC-in-MAC ISID in the hash.
  - **label** Use the MPLS label in the hash.
  - **mac-header** Use the MAC hash.
  - **outer-mac** Use the outer MAC of source and destination in the hash.

- **source-ip** Use the Layer 3 IP source address in the hash.
- **src-ip** Use the source IP address in the hash.
- **source-port** Use Layer 4 TCP/UDP source port in the hash.
- **src-mac** Use the source payload MAC in the hash (or the source MAC address in the MAC hash).
- **hash\_function** Specifies the hash polynomial function. Values range from **0-2**.

**Example:**

This command configures a hash seed of **10** on an FM6000 platform switch.

```
switch(config)#port-channel load-balance fm6000 10  
switch(config)#
```

---

### 10.2.5.28 port-channel min-links review interval

The `port-channel min-links review interval` command enables or disables timer based min-links review feature for all port-channels.

The `no port-channel min-links review interval` and `default port-channel min-links review interval` commands restore the default min-links-timeout-base to 180 seconds by removing the corresponding `port-channel min-links review interval` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
port-channel min-links review interval timeout(seconds)
```

```
no port-channel min-links review interval
```

```
default port-channel min-links review interval
```

#### Guidelines

The min-links-timeout-base interval for port-channels can be set within the range of **0** to **600** seconds. When setting the review interval to zero, the command will have the following effect:

- Disables the timer-based min-links review feature for all port-channels.
  - For LACP port-channels, it prevents the port-channel from bringing link up (even after one or more member ports were negotiated to collect or distribute (rx or tx)) until there are sufficient member interfaces ready to join the port-channel. Meanwhile, the partner can enable the port-channel link with fewer than required member interfaces. This configuration does not impact port-channels without min-links configuration.

#### Related Commands

- [port-channel min-links](#)

#### Example:

This command sets the port-channel min-links interval to **200** seconds.

```
switch(config)#port-channel min-links review interval 200
```

### 10.2.5.29 port-channel min-links

The `port-channel min-links` command specifies the minimum number of interfaces that the configuration mode LAG requires to become active. If there are fewer ports than specified by this command, the port channel interface does not become active. The default min-links value is `0`.

The `no port-channel min-links` and `default port-channel min-links` commands restore the default min-links setting for the configuration mode LAG by removing the corresponding `port-channel min-links` command from the configuration.

**Note:** In static LAGs, the min-links value must be met for the LAG to be active. The LAG will not become active until it has at least the min-links number of functioning links in the channel group. If failed links cause the number to drop below the minimum, the LAG will go down and administrator action will be required to bring it back up. In dynamic LAGs, the LACP protocol must determine that at least min-links physical ports are aggregable (they are physically compatible and have the same keys both remotely and locally) before it begins negotiating to make any ports active members of the port-channel. However once negotiation begins, an error on the partner's side or an error in programming of member interfaces can cause the LAG to become active with fewer than the minimum number of links. EOS evaluates min-links after min-links-review-timeout (linearly proportional to configured min-links) when LACP protocol collecting and/or distributing state changes. If the number of active member interfaces in a port-channel is less than configured min-links, it brings the corresponding port-channel Link Down and syslogs LAG-4-MINLINK\_INTF\_INSUFFICIENT message. If additional interfaces get programmed as collecting and distributing, EOS re-evaluates min-links on the port-channel. If sufficient number of interfaces are available to be a part of port-channel, then all interfaces of the corresponding port-channel are re-enabled for LACP negotiation and the port-channel becomes Link Up. LAG-4-MINLINK\_INTF\_NORMAL is syslogged after min-links-review-timeout if the min-links condition is satisfied; otherwise LAG-4-MINLINK\_INTF\_INSUFFICIENT is syslogged and the port-channel goes Link Down. If an interface remains in collecting state but not in distributing state for min-links-review-timeout, it is moved out of collecting state. It is periodically re-enabled after min-links-retry-timeout (which is 200 seconds) till it progresses to collecting and distributing. Meanwhile, if a port-channel becomes Link Up because sufficient number of interfaces progressed to collecting and distributing states, then this interface is enabled for LACP negotiation.

#### Command Mode

Interface-Port-Channel Configuration

#### Command Syntax

```
port-channel min-links quantity
no port-channel min-links
default port-channel min-links
```

#### Parameters

- ***quantity*** Minimum number of interfaces. Value range varies by platform. Default value is `0`.

#### Example:

These commands set `4` as the minimum number of ports required for **port channel 13** to become active.

```
switch(config)#interface port-channel 13
switch(config-if-Po13)#port-channel min-links 4
switch(config-if-Po13)#show active
interface Port-Channel13
    port-channel min-links 4
```

---

```
switch(config-if-Po13) #
```

### 10.2.5.30 show lacp aggregates

The `show lacp aggregates` command displays aggregate IDs and the list of bundled ports for all specified port channels.

#### Command Mode

EXEC

#### Command Syntax

```
show lacp [PORT_LIST] aggregates [PORT_LEVEL] [INFO_LEVEL]
```

**Note:** `PORT_LEVEL` and `INFO_LEVEL` parameters can be placed in any order.

#### Parameters

- **PORT\_LIST** Port channels for which aggregate information is displayed. Options include:
  - **<no parameter>** All configured port channels.
  - **c\_range** Channel list (number, range, or comma-delimited list of numbers and ranges).
- **PORT\_LEVEL** Ports displayed, in terms of aggregation status. Options include:
  - **<no parameter>** Ports bundled by LACP into the port channel.
  - **all-ports** All channel group ports, including channel group members not bundled into the port channel interface.
- **INFO\_LEVEL** Amount of information that is displayed. Options include:
  - **<no parameter>** Aggregate ID and bundled ports for each channel.
  - **brief** Aggregate ID and bundled ports for each channel.
  - **detailed** Aggregate ID and bundled ports for each channel.

#### Example:

This command lists aggregate information for all configured port channels.

```
switch>show lacp aggregates

Port Channel Port-Channel1:
Aggregate ID:
[(8000,00-1c-73-04-36-d7,0001,0000,0000),(8000,00-1c-73-09-a0-f3,0001,0000,0000)]
Bundled Ports: Ethernet43 Ethernet44 Ethernet45 Ethernet46
Port Channel Port-Channel2:
Aggregate ID:
[(8000,00-1c-73-01-02-1e,0002,0000,0000),(8000,00-1c-73-04-36-d7,0002,0000,0000)]
Bundled Ports: Ethernet47 Ethernet48
Port Channel Port-Channel3:
Aggregate ID:
[(8000,00-1c-73-04-36-d7,0003,0000,0000),(8000,00-1c-73-0c-02-7d,0001,0000,0000)]
Bundled Ports: Ethernet3 Ethernet4
Port Channel Port-Channel4:
Aggregate ID:
[(0001,00-22-b0-57-23-be,0031,0000,0000),(8000,00-1c-73-04-36-d7,0004,0000,0000)]
Bundled Ports: Ethernet1 Ethernet2
Port Channel Port-Channel5:
Aggregate ID:
[(0001,00-22-b0-5a-0c-51,0033,0000,0000),(8000,00-1c-73-04-36-d7,0005,0000,0000)]
Bundled Ports: Ethernet41
switch>
```

### 10.2.5.31 show lacp counters

The `show lacp counters` command displays LACP traffic statistics.

#### Command Mode

EXEC

#### Command Syntax

```
show lacp [PORT_LIST] counters [PORT_LEVEL] [INFO_LEVEL]
```

**Note:** `PORT_LEVEL` and `INFO_LEVEL` parameters can be placed in any order.

#### Parameters

- **PORT\_LIST** Ports for which port information is displayed. Options include:
  - **<no parameter>** All configured port channels.
  - **c\_range** Ports in specified channel list (number, number range, or list of numbers and ranges).
  - **interface** Ports on all interfaces.
  - **interface ethernet e\_num** Port on Ethernet interface specified by **e\_num**.
  - **interface port-channel p\_num** Port on port channel interface specified by **p\_num**.
- **PORT\_LEVEL** Ports displayed, in terms of aggregation status. Options include:
  - **<no parameter>** Only ports bundled by LACP into an aggregate.
  - **all-ports** All ports, including LACP candidates that are not bundled.
- **INFO\_LEVEL** Amount of information that is displayed. Options include:
  - **<no parameter>** Displays packet transmission (TX and RX) statistics.
  - **brief** Displays packet transmission (TX and RX) statistics.
  - **detailed** Displays packet transmission (TX and RX) statistics and actor-partner statistics.

#### Example:

This command displays transmission statistics for all configured port channels.

```
switch>show lacp counters brief
```

Port	Status	LACPDUs		Markers		Marker Response		
		RX	TX	RX	TX	RX	TX	
Illegal								
-----								
-----								
Port Channel Port-Channel1:								
Et43	Bundled	396979	396959	0	0	0	0	0
Et44	Bundled	396979	396959	0	0	0	0	0
Et45	Bundled	396979	396959	0	0	0	0	0
Et46	Bundled	396979	396959	0	0	0	0	0
Port Channel Port-Channel2:								
Et47	Bundled	396836	396883	0	0	0	0	0
Et48	Bundled	396838	396883	0	0	0	0	0

```
switch>
```

### 10.2.5.32 show lacp interface

The `show lacp interface` command displays port status for all port channels that include the specified interfaces. Within the displays for each listed port channel, the output displays sys-id, partner port, state, actor port, and port priority for each interface in the channel.

#### Command Mode

EXEC

#### Command Syntax

```
show lacp interface [INTERFACE_PORT] [PORT_LEVEL] [INFO_LEVEL]
```

**Note:** `INTERFACE_PORT` is listed first when present. Other parameters can be listed in any order.

#### Parameters

- **INTERFACE\_PORT** Interfaces for which information is displayed. Options include:
  - **<no parameter>** All interfaces in channel groups.
  - **ethernet e\_num** Ethernet interface specified by **e\_num**.
  - **port-channel p\_num** Port channel interface specified by **p\_num**.
- **PORT\_LEVEL** Ports displayed, in terms of aggregation status. Options include:
  - **<no parameter>** Command lists data for ports bundled by LACP into the aggregate.
  - **all-ports** Command lists data for all ports, including LACP candidates that are not bundled.
- **INFO\_LEVEL** Amount of information that is displayed. Options include:
  - **<no parameter>** Displays same information as **brief** option.
  - **brief** Displays LACP configuration data, including sys-id, actor, priorities, and keys.
  - **detailed** Includes **brief** option information plus state machine data.

#### Example:

This command displays LACP configuration information for all ethernet interfaces.

```
switch>show lacp interface
State: A = Active, P = Passive; S=ShortTimeout, L=LongTimeout;
       G = Aggregable, I = Individual; s+=InSync, s-=OutOfSync;
       C = Collecting, X = state machine expired,
       D = Distributing, d = default neighbor state
```

Port	Status	Sys-id	Partner Port#	State	OperKey	PortPri	Actor Port#
-----							
Port Channel	Port-Channel1:

```
switch>
```

### 10.2.5.33 show lacp internal

The **show lacp internal** command displays the local LACP state for all specified channels. Local state data includes the state machines and LACP protocol information.

#### Command Mode

EXEC

#### Command Syntax

```
show lacp [PORT_LIST] internal [PORT_LEVEL] [INFO_LEVEL]
```

#### Parameters

- **PORT\_LIST** Interface for which port information is displayed. Options include:
  - **<no parameter>** All configured port channels.
  - **c\_range** Ports in specified channel list (number, number range, or list of numbers and ranges).
  - **interface** Ports on all interfaces.
  - **interface ethernet e\_num** Ethernet interface specified by **e\_num**.
  - **interface port-channel p\_num** Port channel interface specified by **p\_num**.
- **PORT\_LEVEL** Ports displayed, in terms of aggregation status. Options include:
  - **<no parameter>** Command lists data for ports bundled by LACP into an aggregate.
  - **all-ports** Command lists data for all ports, including LACP candidates that are not bundled.
- **INFO\_LEVEL** Amount of information that is displayed. Options include:
  - **<no parameter>** Displays same information as **brief** option.
  - **brief** Displays LACP configuration data, including sys-id, actor, priorities, and keys.
  - **detailed** Includes **brief** option information plus state machine data.

**Note:** **PORT\_LEVEL** and **INFO\_LEVEL** parameters can be placed in any order.

#### Example:

This command displays internal data for all configured port channels.

```
switch>show lacp internal

LACP System-identifier: 8000,00-1c-73-04-36-d7
State: A = Active, P = Passive; S=ShortTimeout, L=LongTimeout;
      G = Aggregable, I = Individual; s+=InSync, s-=OutOfSync;
      C = Collecting, X = state machine expired,
      D = Distributing, d = default neighbor state
      |Partner
Port Status | Sys-id          Port#  State   Actor  PortPriority
-----|-----
Port Channel Port-Channell:
Et43 Bundled | 8000,00-1c-73-09-a0-f3  43  ALGs+CD  0x0001  32768
Et44 Bundled | 8000,00-1c-73-09-a0-f3  44  ALGs+CD  0x0001  32768
Et45 Bundled | 8000,00-1c-73-09-a0-f3  45  ALGs+CD  0x0001  32768
Et46 Bundled | 8000,00-1c-73-09-a0-f3  46  ALGs+CD  0x0001  32768
```

### 10.2.5.34 show lacp peer

The `show lacp peer` command displays the LACP protocol state of the remote neighbor for all specified port channels.

#### Command Mode

EXEC

#### Command Syntax

```
show lacp [PORT_LIST] peer [PORT_LEVEL] [INFO_LEVEL]
```

**Note:** `PORT_LEVEL` and `INFO_LEVEL` parameters can be placed in any order.

#### Parameters

- **PORT\_LIST** Interface for which port information is displayed. Options include:
  - **<no parameter>** Displays information for all configured port channels.
  - **c\_range** Ports in specified channel list (number, number range, or list of numbers and ranges).
  - **interface** Ports on all interfaces.
  - **interface ethernet e\_num** Ethernet interface specified by **e\_num**.
  - **interface port-channel p\_num** Port channel interface specified by **p\_num**.
- **PORT\_LEVEL** Ports displayed, in terms of aggregation status. Options include:
  - **<no parameter>** Command lists data for ports bundled by LACP into an aggregate.
  - **all-ports** Command lists data for all ports, including LACP candidates that are not bundled.
- **INFO\_LEVEL** Amount of information that is displayed. Options include:
  - **<no parameter>** Displays same information as **brief** option.
  - **brief** Displays LACP configuration data, including sys-id, actor, priorities, and keys.
  - **detailed** Includes **brief** option information plus state machine data.

#### Example:

This command displays the LACP protocol state of the remote neighbor for all port channels.

```
switch>show lacp peer

State: A = Active, P = Passive; S=ShortTimeout, L=LongTimeout;
      G = Aggregable, I = Individual; s+=InSync, s-=OutOfSync;
      C = Collecting, X = state machine expired,
      D = Distributing, d = default neighbor state

Port  Status | Sys-id                Partner
      |              |              | Port#  State   OperKey  PortPri
-----|-----|-----|-----|-----|-----|-----
Port Channel Port-Channel1:
Et1   Bundled | 8000,00-1c-73-00-13-19  1   ALGs+CD  0x0001  32768
Et2   Bundled | 8000,00-1c-73-00-13-19  2   ALGs+CD  0x0001  32768
Port Channel Port-Channel2:
Et23  Bundled | 8000,00-1c-73-04-36-d7  47  ALGs+CD  0x0002  32768
Et24  Bundled | 8000,00-1c-73-04-36-d7  48  ALGs+CD  0x0002  32768
Port Channel Port-Channel4*:
Et3   Bundled | 8000,00-1c-73-0b-a8-0e  45  ALGs+CD  0x0001  32768
Et4   Bundled | 8000,00-1c-73-0b-a8-0e  46  ALGs+CD  0x0001  32768
Port Channel Port-Channel5*:

Port Channel Port-Channel8*:
Et10  Bundled | 8000,00-1c-73-10-40-fa  51  ALGs+CD  0x0001  32768

* - Only local interfaces for MLAGs are displayed. Connect to the peer to
   see the state for peer interfaces.
```

```
switch>
```

---

### 10.2.5.35 show lacp sys-id

The `show lacp sys-id` command displays the System Identifier the switch uses when negotiating remote LACP implementations.

#### Command Mode

EXEC

#### Command Syntax

```
show lacp sys-id [INFO_LEVEL]
```

#### Parameters

- **INFO\_LEVEL** Amount of information that is displayed. Options include:
  - **<no parameter>** Displays system identifier.
  - **brief** Displays system identifier.
  - **detailed** Displays system identifier and system priority, including the MAC address.

#### Examples:

- This command displays the system identifier.

```
switch>show lacp sys-id brief
8000,00-1c-73-04-36-d7
```

- This command displays the system identifier and system priority.

```
switch>show lacp sys-id detailed
System Identifier used by LACP:
System priority: 32768 Switch MAC Address: 00:1c:73:04:36:d7
802.11.43 representation: 8000,00-1c-73-04-36-d7
```

### 10.2.5.36 show load-balance profile

The **show load-balance profile** command displays the contents of the specified load balance profiles. Load balance profiles specify parameters used by hashing algorithms that distribute traffic across ports comprising a port channel or among component ECMP routes.

#### Command Mode

EXEC

#### Command Syntax

```
show load-balance profile [PROFILES]
```

#### Parameters

- **PROFILES** Load balance profiles for which command displays contents. Options include:
  - **<no parameter>** Displays all load balance profiles.
  - **profile\_name** Displays specified profile.

#### Related Commands

- [load-balance policies](#) places the switch in **load-balance-policies configuration mode**.
- [ingress load-balance profile](#) applies a load-balance profile to an Ethernet or port channel interface.

#### Example:

This command displays the contents of the **LB-1** load balance profile.

```
switch>show load-balance profile LB-1

----- LB-1 -----

Source MAC address hashing          ON
Destination MAC address hashing     ON
Ethernet type hashing               ON
VLAN ID hashing                     ON
IP protocol field hashing           ON
DSCP field hashing is               ON
Symmetric hashing for non-IP packets OFF
Symmetric hashing for IP packets    OFF
Random distribution for port-channel ON
Random distribution for ecmp        ON

Profile LB-1 is applied on the following
  Port-Channel100

----- myGlobalProfile (global) -----
L3 hashing is ON
Symmetric hashing is OFF
Hashing mode is flow-based
Hash polynomial is 3
Hash seed is 0
Profile myGlobalProfile (global) is applied on the following
Linecard3
Linecard4
Linecard5
Linecard6

switch>
```

### 10.2.5.37 show port-channel dense

The **show port-channel dense** command displays the port-channels on the switch and lists their component interfaces, LACP status, and set flags.

#### Command Mode

EXEC

#### Command Syntax

```
show port-channel dense
```

#### Example:

This command displays **show port-channel dense** output:

```
switch>show port-channel dense

      Flags
-----
a - LACP Active          p - LACP Passive
U - In Use              D - Down
+ - In-Sync             - - Out-of-Sync       i - incompatible with agg
P - bundled in Po       s - suspended          G - Aggregable
I - Individual          S - ShortTimeout       w - wait for agg

Number of channels in use: 2
Number of aggregators:2

      Port-Channel      Protocol      Ports
-----
Po1 (U)                LACP (a)     Et47 (PG+) Et48 (PG+)
Po2 (U)                LACP (a)     Et39 (PG+) Et40 (PG+)
```

•

### 10.2.5.38 show port-channel limits

The **show port-channel limits** command displays groups of ports that are compatible and may be joined into port channels. Each group of compatible ports is called a LAG group. For each LAG group, the command also displays **Max interfaces** and **Max ports per interface**.

- **Max interfaces** defines the maximum number of active port channels that may be formed out of these ports.
- **Max ports per interface** defines the maximum number of active ports allowed in a port channel from the compatibility group.

All active ports in a port channel must be compatible. Compatibility comprises many factors and is specific to a given platform. For example, compatibility may require identical operating parameters such as speed and/or maximum transmission unit (MTU). Compatibility may only be possible between specific ports because of internal organization of the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show port-channel limits
```

#### Example:

This command displays **show port-channel list** output:

```
switch>show port-channel limits
LAG Group: focalpoint
-----
Max port-channels per group: 24, Max ports per port-channel: 16
24 compatible ports: Ethernet1 Ethernet2 Ethernet3 Ethernet4
                    Ethernet5 Ethernet6 Ethernet7 Ethernet8
                    Ethernet9 Ethernet10 Ethernet11 Ethernet12
                    Ethernet13 Ethernet14 Ethernet15 Ethernet16
                    Ethernet17 Ethernet18 Ethernet19 Ethernet20
                    Ethernet21 Ethernet22 Ethernet23 Ethernet24
-----
```

---

### 10.2.5.39 show port-channel load-balance fields

The **show port-channel load-balance fields** command displays the fields that the hashing algorithm uses to distribute traffic across the interfaces that comprise the port channels.

#### Command Mode

EXEC

#### Command Syntax

```
show port-channel load-balance HARDWARE fields
```

#### Parameters

- **HARDWARE** ASIC switching device. Selection options depend on the switch model and include:
  - **arad**
  - **fm6000**
  - **petraA**
  - **trident**

#### Example:

This command displays the hashing fields used for balancing port channel traffic.

```
switch>show port-channel load-balance fm6000 fields

Source MAC address hashing for non-IP packets is ON
Destination MAC address hashing for non-IP packets is ON
Ethernet type hashing for non-IP packets is ON
VLAN ID hashing for non-IP packets is ON
VLAN priority hashing for non-IP packets is ON
Source MAC address hashing for IP packets is ON
Destination MAC address hashing for IP packets is ON
Ethernet type hashing for IP packets is ON
VLAN ID hashing for IP packets is ON
VLAN priority hashing for IP packets is ON
IP source address hashing is ON
IP destination address hashing is ON
IP protocol field hashing is ON
TCP/UDP source port hashing is ON
TCP/UDP destination port hashing is ON

switch>
```

### 10.2.5.40 show port-channel load-balance

The **show port-channel load-balance** command displays the traffic distribution between the member ports of the specified port channels. The command displays distribution for unicast, multicast, and broadcast streams.

The distribution values displayed are based on the total interface counters which start from zero at boot time or when the counters are cleared. For more current traffic distribution values, clear the interface counters of the member interfaces using the [clear counters](#) command.

#### Command Mode

EXEC

#### Command Syntax

```
show port-channel load-balance [MEMBERS]
```

#### Parameters

- **MEMBERS** list of port channels for which information is displayed. Options include:
  - `<no parameter>` all configured port channels.
  - `c_range` ports in specified channel list (number, number range, or list of numbers and ranges).

#### Examples

- This command displays traffic distribution for all configured port channels.

```
switch>show port-channel load-balance
ChanId      Port  Rx-Ucst  Tx-Ucst  Rx-Mcst  Tx-Mcst  Rx-Bcst  Tx-Bcst
-----
      8      Et10 100.00% 100.00% 100.00% 100.00%   0.00% 100.00%
-----
      1      Et1  13.97%  42.37%  47.71%  30.94%   0.43%  99.84%
      1      Et2  86.03%  57.63%  52.29%  69.06%  99.57%   0.16%
-----
      2      Et23  48.27%  50.71%  26.79%  73.22%   0.00% 100.00%
      2      Et24  51.73%  49.29%  73.21%  26.78%   0.00%   0.00%
-----
      4      Et3  55.97%  63.29%  51.32%  73.49%   0.00%   0.00%
      4      Et4  44.03%  36.71%  48.68%  26.51%   0.00%   0.00%
-----
      5      Et19  39.64%  37.71%  50.00%  90.71%   0.00%   0.00%
      5      Et20  60.36%  62.29%  50.00%   9.29%   0.00% 100.00%
-----
      6      Et6 100.00% 100.00% 100.00% 100.00%   0.00% 100.00%
-----
      7      Et5 100.00%   0.00% 100.00% 100.00%   0.00%   0.00%
switch>
```

### 10.2.5.41 show port-channel

The `show port-channel` command displays information about members the specified port channels.

#### Command Mode

EXEC

#### Command Syntax

```
show port-channel [MEMBERS] [PORT_LIST] [INFO_LEVEL]
```

#### Parameters

- **MEMBERS** List of port channels for which information is displayed. Options include:
  - **<no parameter>** All configured port channels.
  - **p\_range** Ports in specified channel list (number, number range, or list of numbers and ranges).
- **PORT\_LEVEL** Ports displayed, in terms of aggregation status. Options include:
  - **<no parameter>** Displays information on ports that are active members of the LAG.
  - **active-ports** Displays information on ports that are active members of the LAG.
  - **all-ports** Displays information on all ports (active or inactive) configured for LAG.
- **INFO\_LEVEL** Amount of information that is displayed. Options include:
  - **<no parameter>** Displays information at the brief level.
  - **brief** Displays information at the brief level.
  - **detailed** Displays information at the detail level.

#### Display Values

- **Port Channel** Type and name of the port channel.
- **Time became active** Time when the port channel came up.
- **Protocol** Protocol operating on the port channel.
- **Mode** Status of the Ethernet interface on the port. The status value is Active or Inactive.
- **No active ports** Number of active ports on the port channel.
- **Configured but inactive ports** Ports configured but that are not actively up.
- **Reason unconfigured** Reason why the port is not part of the LAG.

#### Guidelines

You can configure a port channel to contain many ports, but only a subset may be active at a time. All active ports in a port channel must be compatible. Compatibility includes many factors and is platform specific. For example, compatibility may require identical operating parameters such as speed and maximum transmission unit (MTU). Compatibility may only be possible between specific ports because of the internal organization of the switch.

#### Examples:

- This command displays output from the `show port-channel` command.

```
switch>show port-channel 3
Port Channel Port-Channel3:
  Active Ports:
    Port                               Time became active      Protocol  Mode
    -----
    Ethernet3                           15:33:41                LACP     Active
    PeerEthernet3                       15:33:41                LACP     Active
```

- This command displays output from the `show port-channel active-ports` command.

```
switch>show port-channel active-ports
```

```

Port Channel Port-Channel3:
  No Active Ports
Port Channel Port-Channel11:
  No Active Ports
switch>

```

- This command displays output from the **show port-channel all-ports** command.

```

switch>show port-channel all-ports
Port Channel Port-Channel3:
  No Active Ports
  Configured, but inactive ports:
    Port                Time became inactive    Reason unconfigured
    -----
    Ethernet3           Always                   not compatible with aggregate

Port Channel Port-Channel11:
  No Active Ports
  Configured, but inactive ports:
    Port                Time became inactive    Reason unconfigured
    -----
    Ethernet25          Always                   not compatible with aggregate
    Ethernet26          Always                   not compatible with aggregate

```

## 10.3 Multi-Chassis Link Aggregation

Arista switches support Multi-Chassis Link Aggregation (MLAG) to logically aggregate ports across two switches. For example, two 10-gigabit Ethernet ports, one each from two MLAG configured switches, can connect to two 10-gigabit ports on a host, switch, or network device to create a link that appears as a single 20-gigabit port. MLAG-configured ports provide Layer 2 multipathing, increased bandwidth, higher availability, and other improvements on traditional active-passive or Spanning Tree governed infrastructures.

The Multi-Chassis Link Aggregation section contains these topics:

- [MLAG Introduction](#)
- [MLAG Conceptual Overview](#)
- [MLAG Maintenance](#)
- [Configuring MLAG](#)
- [MLAG Implementation Example](#)
- [MLAG Commands](#)

### 10.3.1 MLAG Introduction

High availability data center topologies typically provide redundancy protection at the expense of over-subscription by connecting top-of-rack (TOR) switches and servers to dual aggregation switches. In these topologies, Spanning Tree Protocol prevents network loops by blocking half of the links to the aggregation switches. This reduces the available bandwidth by 50%.

Deploying MLAG removes over-subscription by configuring an MLAG link between two aggregation switches to create a single logical switching instance that utilizes all connections to the switches. Interfaces on both devices participate in a distributed port channel, enabling all active paths to carry data traffic while maintaining the integrity of the Spanning Tree topology.

MLAG provides these benefits:

- Aggregates multiple Ethernet ports across two switches.
- Provides higher bandwidth links as network traffic increases.
- Utilizes bandwidth more efficiently with fewer links blocked by STP.

- 
- Connects to other switches and servers by static LAG or LACP without other proprietary protocols.
  - Supports normal STP operation to prevent loops.
  - Supports active-active Layer-2 redundancy.

**Note:** PTP (precision timing protocol) is not supported with MLAG.

**Note:** The global STP configuration is derived from the primary peer device while the secondary device parameters are ignored. When STP is disabled on the primary device, the secondary device will not contain any STP configuration information from the primary device. As a result, the secondary device will not be able to decide on the port roles or states, and will remain in the default state which is the discarding state. This is an expected behavior.

**Note:** It is highly recommended that both MLAG peer switches are identical platforms and run identical EOS images. Running different images/platform may result in a failure to form an association with the MLAG peer or see discrepancy in behavior.

## 10.3.2 MLAG Conceptual Overview

### 10.3.2.1 MLAG Operation Process

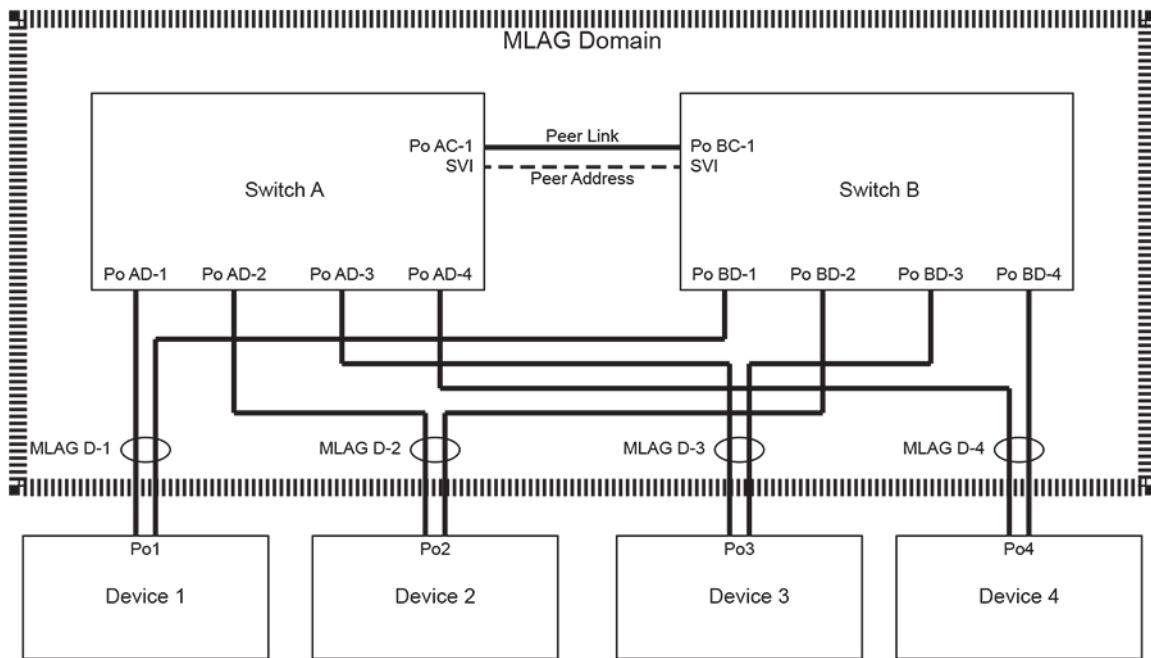

A multi-chassis link aggregation group (MLAG) is a pair of links that terminate on two cooperating switches and appear as an ordinary link aggregation group (LAG). The cooperating switches are MLAG peer switches and communicate through an interface called a peer link. While the peer link's primary purpose is exchanging MLAG control information between peer switches, it also carries data traffic from devices that are attached to only one MLAG peer and have no alternative path. An MLAG domain consists of the peer switches and the control links that connect the switches.

In the figure below, Switch A and Switch B are peer switches in the MLAG domain and connect to each other through the peer link. Each peer switch uses the peer address to form and maintain the peer link.

The MLAG domain ID is a text string configured in each peer switch. MLAG switches use this string to identify their peers. The MLAG System ID (MSI) is the MLAG domain's MAC address. The MSI is automatically derived when the MLAG forms and does not match the bridge MAC address of either peer. Each peer uses the MSI in STP and LACP PDUs.

The topology shown below contains four MLAGs: one MLAG connects each device to the MLAG domain. Each peer switch connects to the four servers through MLAG link interfaces.

In a conventional topology, with dually-attaching devices to multiple switches for redundancy, Spanning Tree Protocol (STP) blocks half of the switch-device links. In the MLAG topology, STP does not block any portion because it views the MLAG Domain as a single switch and each MLAG as a single port. The MLAG protocol facilitates the balancing of device traffic between the peer switches.

**Figure 8: MLAG Domain Topology**

When MLAG is disabled, peer switches revert to their independent state. MLAG is disabled by any of the following:

- MLAG configuration changes.
- The TCP connection breaks.
- The peer-link or local-interface goes down.
- A switch does not receive a response to a keep alive message from its peer within a specified period.

### 10.3.2.2 MLAG Interoperability with Other Features

The following sections describe MLAG interaction with other switch features.

#### 10.3.2.2.1 VLANs

VLAN parameters must be configured identically on each peer for the LAGs comprising the peer link and MLAGs. These parameters include the switchport access VLAN, switchport mode, trunk-allowed VLANs, the trunk native VLAN, and switchport trunk groups.

Configuration discrepancies may result in traffic loss in certain failure scenarios. Port-specific bridging configuration originates on the switch where the port is physically located.

#### 10.3.2.2.2 LACP

Link Aggregation Control Protocol (LACP) should be used on all MLAG interfaces, including the peer-link. LACP control packets reference the MLAG system ID.

#### 10.3.2.2.3 Static MAC Addresses

A static MAC address configured on an MLAG interface is automatically configured on the peer's corresponding interface. Configuring static MAC addresses on both peers prevents undesired flooding if an MLAG peer relationship fails.

If the MLAG peering relationship is disabled, the static MAC previously learned from peer is removed.

---

#### 10.3.2.2.4 STP

When implementing MLAG in a spanning tree network, spanning tree must be configured globally and on port-channels configured with an MLAG ID. Port specific spanning tree configuration comes from the switch where the port physically resides. This includes spanning-tree PortFast BPDU Guard and BPDU filter.

#### 10.3.2.2.5 Port Mirroring

A port channel which is a member of an MLAG *must not* be used as the destination port for a port mirroring (port monitoring) session.

#### 10.3.2.3 IPv6 Flow Label Hashing

Arista switches use the hashing algorithm to load-balance traffic among LAG members and Layer 3 ECMP (equal cost multipath) paths. For IP and IPv6 traffic, the hashing algorithm includes (if so configured for LAG) the IP packet fields such as source and destination IP addresses as well as source and destination ports for UDP and TCP traffic.

To improve traffic distribution for IPv6 traffic, IPv6 Flow Label field has been added to the hashing algorithm for both LAG and ECMP.

**Note:** IPv6 Flow Label is included in the LAG hashing algorithm only when the MAC header hashing is not enabled for IPv6 traffic.

### 10.3.3 MLAG Maintenance

These sections describe tasks required for MLAG to operate on the switch:

- [Ensuring Control Plane ACL Compatibility](#)
- [MLAG Availability through a Single Functional Peer](#)
- [Upgrading MLAG Peers](#)

#### 10.3.3.1 Ensuring Control Plane ACL Compatibility

The control plane access control list (ACL) on any interface participating in the MLAG must be configured to allow only the peer link neighbor to generate MLAG control traffic. The required rules are included in the default control plane ACL for Ethernet ports.

Any custom control plane ACL applied to a participating port must include these three rules:

```
permit tcp any any eq mlag ttl eq 255
permit udp any any eq mlag ttl eq 255
permit tcp any eq mlag any ttl eq 255
```

MLAG peers that function as routers must each have routing enabled.

#### 10.3.3.2 MLAG Availability through a Single Functional Peer

MLAG high availability advantages are fully realized when all devices that connect to one MLAG switch also connect to the peer switch. A switch can continue supporting MLAG when its peer is offline if the STP agent is restartable. When one peer is offline, data traffic flows from the devices through the MLAG component link that connects to the functioning switch. When a switch is offline, its interfaces and ports do not appear in `show mlag` and `show spanning tree protocol` commands of the functioning peer.

To view the restartability status of the STP agent, use the **detail** option of the **show spanning-tree instance** command:

```
switch-1#show spanning-tree instance detail | grep agent
Stp agent restartable           :                True
```

STP agent restartability requires consistent configuration between the peers of STP, LACP, MLAG, and switchport parameters. Events triggering an STP state machine change may also briefly prevent the STP agent from being restartable.

### 10.3.3.2.1 Reload Delay

If an MLAG peer reboots, all ports except those in the peer-link port-channel remain in **errdisabled** state for a specified time, called the reload-delay period. This period allows all topology states to stabilize before the switch begins forwarding traffic. Each Arista switch defaults to the recommended reload-delay value, which varies by switch platform:

- **Fixed configuration switches:** 300 seconds
- **Trident II modular switches:** 1200 seconds
  - 7304
  - 7308
  - 7316
  - 7300X series
- **Sand platform fixed configuration switches:** 600 seconds
  - 7280 series
- **Sand platform modular switches:** 1800 seconds
  - 7504
  - 7508
  - 7500E series
  - 7548S

In those cases where network topology requires additional time to stabilize or where a shorter delay can be tolerated, the reload-delay period can be configured using the [reload-delay mlag](#) command.

Severing the physical connection (cable) that establishes the peer-link between MLAG peers may result in a **split brain** state where each peer independently enters spanning tree state to prevent topology loops. Sessions established through one interface of a dual attached device may fail if its path is disrupted by the STP reconvergence, possibly resulting in temporarily lost connectivity. Sessions can be reestablished if permitted by the resulting topology.

### 10.3.3.3 Upgrading MLAG Peers

MLAG ISSU (In-Service Software Upgrade) upgrades EOS software on one MLAG peer with minimal traffic disruptions on active MLAG interfaces and without changing the network topology.

#### 10.3.3.3.1 Verifying Configuration Compatibility

A seamless EOS upgrade on an MLAG peer requires that the following features are configured consistently on each switch:

- VLANs
- Switchport configuration on port channel interfaces that are configured with an MLAG ID
- STP configuration (global)

### 10.3.3.3.2 Version Compatibility

A switch running MLAG can be upgraded without disrupting MLAG traffic when the upgrade EOS version is compatible with the version on the peer switch. Refer to the Release Notes for a list of compatible EOS versions.

### 10.3.3.3.3 Reload Warning Conditions

Entering an EOS reload command while MLAG is active generates warning messages if conditions that can result in packet loss during the upgrade are present. All warnings should be resolved before confirming the reload request. The following table displays the reload conditions and a common resolution method for each condition.

**Table 61: Reload Warning Resolutions**

Reload Condition	Resolution Method
Compatibility check	Refer to the Release Notes to verify that the new version is compatible with the currently installed version.
Active-partial MLAG warning	Bring up the remote port-channel. If the MLAG is not actively used, then this warning can be ignored.
STP is not restartable	Wait for STP to be restartable: typically 30 seconds, up to 120 seconds for a newly started STP agent. Refer to <a href="#">MLAG Availability through a Single Functional Peer</a> for information on checking restartability.
Reload delay too low	Configure a reload delay value greater than or equal to the default. Recommend delay is 300 seconds for TOR switches, 900 seconds for modular switches, and 600 seconds for Sand platform fixed configuration switches (7280 series).
Peer has error-disabled interfaces	Wait for reload-delay to expire on the peer.

#### Example

- The following `reload` command generates MLAG warning conditions that should be addressed before confirming the ***proceed with reload*** prompt.

```
switch(config)#reload
If you are performing an upgrade, and the Release Notes for the
new version of EOS indicate that MLAG is not backwards-compatible
with the currently installed version (4.9.2), the upgrade will
result in packet loss.

The following MLAGs are not in Active mode. Traffic to or from these ports will
be lost during the upgrade process.

  mlag      desc          state      local      remote      local/remote
-----
  14         active-partial      Po14      Po14      up/down
  15         active-partial      Po15      Po15      up/down

Stp is not restartable. Topology changes will occur during the upgrade process.

The configured reload delay of 100 seconds is below the default
value of 300 seconds. A longer reload delay allows more time to
rollback an unsuccessful upgrade due to incompatibility.

The other MLAG peer has errdisabled interfaces. Traffic loss will occur during
the upgrade process.

Proceed with reload? [confirm]
```

#### 10.3.3.3.4 Performing an MLAG ISSU Upgrade

The following procedure performs an MLAG ISSU upgrade:

1. Verify configuration consistency on each peer ([Verifying Configuration Compatibility](#)).
2. Verify version compatibility between the new and existing images ([Version Compatibility](#)).
3. Configure `reload-delay mlag` ([MLAG Availability through a Single Functional Peer](#)) if needed. Recommended delay period varies by switch type, and each switch defaults to its recommended delay period.
4. Install the new image onto one of the peers:
  - a. Upload the new image to the switch.
  - b. Set the boot path to the new image.
  - c. Enter the `reload` command.
5. Resolve all reload warnings.
6. Confirm the reload.
7. Wait for MLAG peers to renegotiate to the active state and reload-delay expiry on rebooted peer; until reload-delay period has expired, ports on the rebooted peer (except the peer-link) will be in **errdisabled** state with err-disabled reason being **mlag-issu**.

Avoid configuration changes on both peers until after this step.

8. Repeat the upgrade process for the other peer.

When upgrading modular switches with dual supervisors, upgrade the standby supervisors first, then upgrade the active supervisors.

### 10.3.4 Configuring MLAG

These sections describe the basic MLAG configuration steps:

- [Configuring the MLAG Peers](#)
- [Configuring MLAG Services](#)

#### 10.3.4.1 Configuring the MLAG Peers

Connecting two switches as MLAG peers requires the establishment of the peer link and an SVI that defines local and peer IP addresses on each switch.

The peer link is composed of a LAG between the switches. When all devices that connect to the MLAG domain are dually connected to the switches through an MLAG, a peer link of two Ethernet interfaces is sufficient to handle MLAG control data and provide N+1 redundancy. When the domain connects to devices through only one MLAG peer, the peer link may require additional Ethernet interfaces to manage data traffic.

Disruptions to peer link connectivity due to forwarding agent restarts may cause an extended MLAG outage. Forwarding agent restart event include some configuration changes, such as port speed change or UFT mode change). The following precautions can reduce the risk of losing peer-link connectivity:

- all switches: constructing peer-links from port-channels in preference to a single Ethernet interface.
- modular systems: peer-link port-channel members should span multiple line cards.
- multi-chip systems: peer-link port-channel member should span multiple chips.

[Managing Switch Configuration Settings](#) describes modular systems.

The steps that configure two switches as MLAG peers include:

- [Configuring the Port Channels, VLAN Interfaces, and IP addresses](#)
- [Configuring Peer Parameters](#)
- [Configuring MLAG Peer Gateway](#)

### 10.3.4.1.1 Configuring the Port Channels, VLAN Interfaces, and IP addresses

The peer link is a normal port channel. The local address is the SVI that maps to the peer link port channel. The port channel and SVI must be configured on each peer switch. The port channel should be an active LACP port. The local and peer addresses must be located on the same IP address subnet. Autostate should be disabled on the SVI configured as the local interface.

#### Examples

- These commands create an active mode LACP port channel interface from two Ethernet interfaces and configure it as part of a trunk group on each switch.

The `switchport mode trunk` command permits all VLANs on the interface by default, so all VLANs are permitted on port channel 10 in the following example. The configuration of a trunk group for a VLAN restricts only that specific VLAN to the associated ports: VLAN 4094 is only permitted on port channel 10, and not on any other ports on the switch. It is important to remember that all VLANs must be permitted between the peers on the peer link for correct operation.

Switch 1

```
switch1#config
switch1 (config) #vlan 4094
switch1 (config-vlan-4094) #trunk group mlpeer
switch1#config
switch1 (config) #interface ethernet 1-2
switch1 (config-if-et1-2) #channel-group 10 mode active
switch1 (config-if-et1-2) #interface port-channel 10
switch1 (config-if-po10) #switchport mode trunk
switch1 (config-if-po10) #switchport trunk group mlpeer
switch1 (config-if-po10) #exit
switch1 (config) #
```

Switch 2

```
switch2#config
switch2 (config) #vlan 4094
switch2 (config-vlan-4094) #trunk group mlpeer
switch2 (config-vlan-4094) #exit
switch2 (config) #interface ethernet 1-2
switch2 (config-if-et1-2) #channel-group 10 mode active
switch2 (config-if-et1-2) #interface port-channel 10
switch2 (config-if-po10) #switchport mode trunk
switch2 (config-if-po10) #switchport trunk group mlpeer
switch2 (config-if-po10) #exit
switch2 (config) #
```

- These commands create an SVI for the local interface and associate it to the trunk group assigned to the peer link port channel.

The SVI creates a Layer 3 endpoint in the switch and enables MLAG processes to communicate via TCP. The IP address can be any unicast address that does not conflict with other SVIs. STP is disabled for the peer link VLAN 4094 to prevent any potential STP disruption of inter peer communications. Recall that the VLAN has been restricted to port-channel 10 by the earlier trunk group configuration thus preventing potential Layer 2 loop conditions within VLAN 4094.

Switch 1

```
switch1#config
switch1 (config) #interface vlan 4094
switch1 (config-if-vl4094) #ip address 10.0.0.1/30
switch1 (config-if-vl4094) #no autostate
```

```
switch1(config-if-vl4094)#exit
switch1(config)#no spanning-tree vlan-id 4094
switch1(config)#
```

#### Switch 2

```
switch2#config
switch2(config)#interface vlan 4094
switch2(config-if-vl4094)#ip address 10.0.0.2/30
switch2(config-if-vl4094)#no autostate
switch2(config-if-vl4094)#exit
switch2(config)#no spanning-tree vlan-id 4094
switch2(config)#
```

### 10.3.4.1.2 Configuring Peer Parameters

Peer connection parameters configure the connection between the MLAG peer switches. This section describes the following peer configuration parameters.

- [MLAG Configuration Mode](#)
- [Local VLAN Interface](#)
- [Peer Address](#)
- [Peer Link](#)
- [Domain ID](#)
- [Heartbeat Interval and Timeout](#)
- [Reload Delay Period](#)
- [Shutdown](#)

#### 10.3.4.1.2.1 MLAG Configuration Mode

Peer connection parameters are configured in MLAG-configuration mode. The [mlag configuration \(global configuration\)](#) command places the switch in MLAG configuration mode.

##### Example

This command places the switch in MLAG configuration mode.

```
switch(config)#mlag configuration
switch(config-mlag)#
```

#### 10.3.4.1.2.2 Local VLAN Interface

The local interface specifies the SVI upon which the switch sends MLAG control traffic. The local IP address is specified within the definition of the VLAN associated with the local interface. The Peer Address configures the control traffic destination on the peer switch.

The `local-interface` command specifies a VLAN interface as the peer link SVI.

##### Example

This command configures VLAN 4094 as the local interface.

```
switch(config-mlag)#local-interface vlan 4094
switch(config-mlag)#
```

#### 10.3.4.1.2.3 Peer Address

---

The peer address is the destination address on the peer switch for MLAG control traffic. If the peer IP address is unreachable, MLAG peering fails and both peer switches revert to their independent state.

The `peer-address` command specifies the peer address.

### Example

This command configures a peer address of 10.0.0.2.

```
switch(config-mlag) #peer-address 10.0.0.2
switch(config-mlag) #
```

#### 10.3.4.1.2.4 Peer Link

An MLAG is formed by connecting two switches through an interface called a peer link. The peer link carries MLAG advertisements, keepalive messages, and data traffic between the switches. This information keeps the two switches working together as one. While interfaces comprising the peer links on each switch must be compatible, they need not use the same interface number. Ethernet and Port-channel interfaces can be configured as peer links.

The `peer-link` command specifies the interface the switch uses to communicate MLAG control traffic.

### Example

- This command configures port-channel 10 as the peer link.

```
switch(config-mlag) #peer-link port-channel 10
switch(config-mlag) #
```

#### 10.3.4.1.2.5 Domain ID

The MLAG domain ID is a unique identifier for an MLAG domain. The MLAG domain ID must be the identical on each switch to facilitate MLAG communication.

The `domain-id` command configures the MLAG domain ID.

### Example

This command configures *mlagDomain* as the domain ID:

```
switch(config-mlag) #domain-id mlagDomain
switch(config-mlag) #
```

#### 10.3.4.1.2.6 Heartbeat Interval and Timeout

The heartbeat interval specifies the period between the transmission of successive keepalive messages. Each MLAG switch transmits keepalive messages and monitors message reception from its peer. The heartbeat timeout is reset when the switch receives a keepalive message. If the heartbeat timeout expires, the switch disables MLAG under the premise that the peer switch is not functioning.

The `heartbeat-interval (MLAG)` command configures the heartbeat interval between 1 and 30 seconds, with a default value of 2 seconds. The heartbeat timeout expiry is 30 seconds.

**Note:** On 7500 and 7500E Series Switches, Arista recommends setting the heartbeat interval to 10 seconds.

### Example

This command configures the heartbeat interval as 2.5 seconds (2500 ms).

```
switch(config-mlag) #heartbeat-interval 2500
```

```
switch(config-mlag) #
```

#### 10.3.4.1.2.7 Reload Delay Period

The reload delay period specifies the interval that non-peer links are disabled after an MLAG peer reboots. This interval allows non-peer links to learn multicast and OSPF states and synchronize ARP caches before the ports start handling traffic. Each Arista switch defaults to the recommended reload-delay value, which varies by switch platform.

- Fixed configuration switches: 300 seconds (five minutes)
- Trident II platform modular switches: 1200 seconds (twenty minutes)
- Sand platform fixed configuration switches (7280 series): 600 seconds (ten minutes)
- Sand platform modular switches: 1800 seconds (thirty minutes)

In those cases where network topology requires additional time to stabilize or where a shorter delay can be tolerated, the reload-delay period can be configured using the [reload-delay mlag](#) command.

#### Example

This command configures the reload delay interval as 2.5 minutes (150 seconds).

```
switch(config-mlag) #reload-delay 150
switch(config-mlag) #
```

#### 10.3.4.1.2.8 Shutdown

The [shutdown \(MLAG\)](#) command disables MLAG operations without disrupting the MLAG configuration. The `no mlag configuration` command (global configuration mode) disables MLAG and removes the MLAG configuration. The `no shutdown` command resumes MLAG activity.

#### Examples

- This command disables MLAG activity on the switch.

```
switch(config-mlag) #shutdown
switch(config-mlag) #
```

- This command resumes MLAG activity on the switch.

```
switch(config-mlag) #no shutdown
switch(config-mlag) #
```

#### 10.3.4.1.3 Configuring MLAG Peer Gateway

In an MLAG setup, routing on a MLAG peer switch is possible using its own bridge system MAC, VARP MAC, or VRRP MAC. On a peer receiving an IP packet with destination MAC set to one of these MACs, a packet gets routed if its hardware has enough information to route the packet. Configuring sending traffic to a cached MAC involves routing the session table and MLAG peer traffic if packets are received with the MAC peer.

#### Examples

- This command enables the MLAG peer gateway.

```
switch(config) #ip virtual-router mac-address mlag-peer
switch1(config) #
```

- This command disables the MLAG peer gateway.

```
switch(config)#no ip virtual-router mac-address mlag-peer
switch1(config)#
```

#### 10.3.4.1.4 Configuring Ingress Replication to LAGs

Hardware support for ingress replication to LAGs is enabled by default when the user configures ingress replication. When multicast traffic is sent over the LAG, the hardware uses its built-in algorithm, based on the L2/L3/L4 headers, to load balance traffic over ports in the LAG. When a port goes down in a LAG, the hardware quickly hashes the multicast traffic over the remaining ports in the LAG, resulting in fewer drops than software based LAG support.

#### Examples

- This command enables ingress replication.

```
switch(config)#platform sand multicast replication default ingress
switch(config)#
```

- This command configures the maximum members (within a range of 1 through 64) for ingress only replication in a multicast group.

```
switch(config)#platform sand multicast replication ingress maximum 32
switch(config)#
```

#### 10.3.4.2 Configuring MLAG Services

An MLAG is a pair of links that originate on a network attached device and terminate on the two MLAG peer switches. The MLAG switches coordinate traffic to the device through a common [mlag \(port-channel interface configuration\)](#) command on the interfaces that connect to the device.

The MLAG ID differs from the MLAG domain ID. The MLAG domain ID is assigned globally per switch in MLAG configuration mode, and the same MLAG domain ID must be on both switches.

It is not recommended that MLAGs are used with static LAGs. Configure the downstream switch or router connected to the MLAG peers to negotiate a LAG with LACP. For Arista Networks switches, this is in respect to a configuration such as `channel-group group-number mode on`.

Port channels configured as an MLAG must have identical port channel numbers. Although the MLAG ID is a distinct parameter from the port channel number, best practices recommend assigning the MLAG ID to match the port channel number.

The following example does not follow this convention to emphasize the parameters that are distinct. The example in [MLAG Implementation Example](#) follows the best practices convention.

#### Examples

- These Switch1 commands bundle Ethernet interfaces 3 and 4 in port channel 20, then associate that port channel with MLAG 12.

```
switch1(config)#interface ethernet 3-4
switch1(config-if-et3-4)#channel-group 20 mode active
switch1(config-if-et3-4)#interface port-channel 20
switch1(config-if-po20)#mlag 12
switch1(config-if-po20)#exit
switch1(config)#
```

- These Switch2 commands bundle Ethernet interfaces 9 and 10 in port channel 20, then associate that port channel with MLAG 12.

```
switch2(config)#interface ethernet 9-10
switch2(config-if-et9-10)#channel-group 20 mode active
switch2(config-if-et9-10)#interface port-channel 20
switch2(config-if-po20)#mlag 12
switch2(config-if-po20)#exit
switch2(config)#
```

- These commands configure the port channels that attach to the MLAG on network attached device:

```
NAD(config)#interface ethernet 1-4
NAD(config-if-Et1-4)#channel-group 1 mode active
NAD(config-if-Et1-4)#exit
NAD(config)#
```

The following figure displays the result of the interface MLAG configuration.

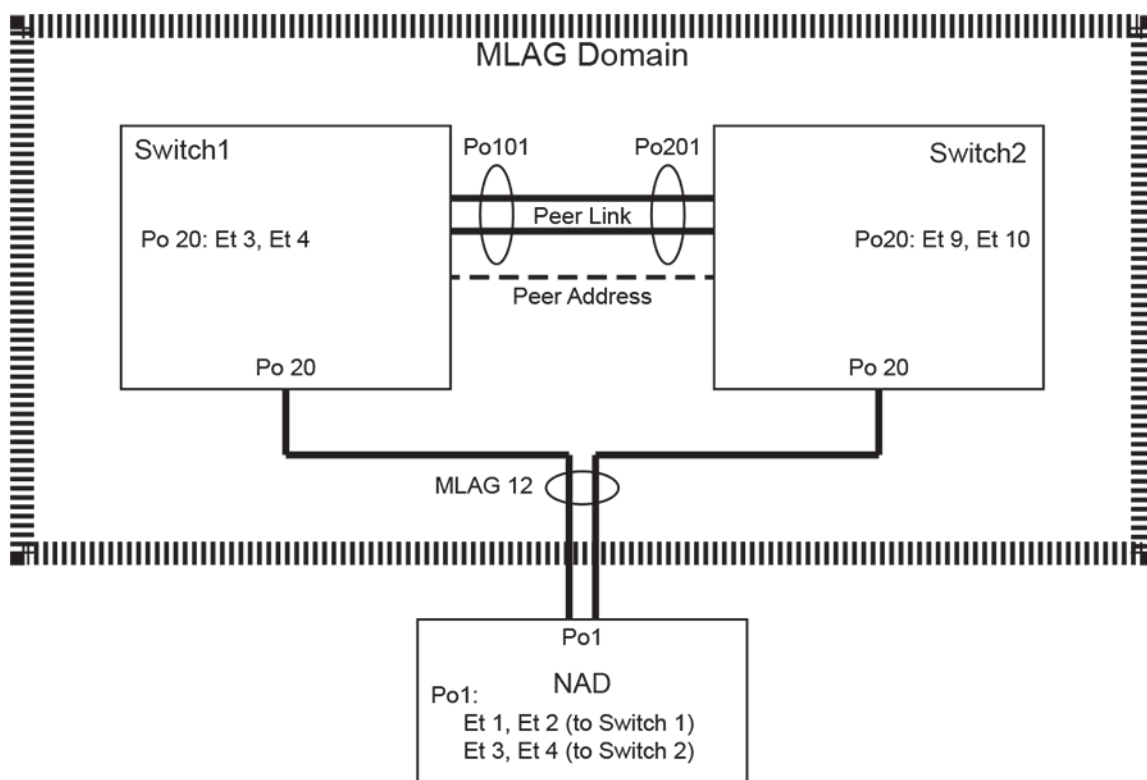

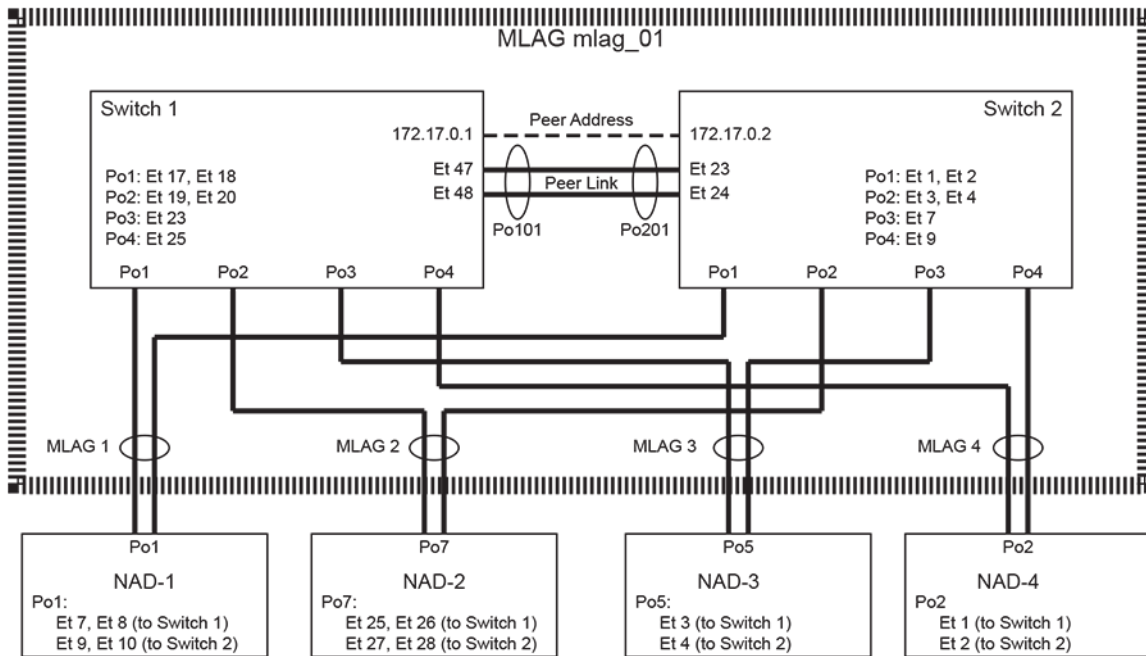

Figure 9: MLAG Interface Configuration

### 10.3.5 MLAG Implementation Example

This example creates an MLAG Domain, then configures MLAG connections between the peer switches and four Network Attached Devices (NADs). The MLAG switches connect through a LAG and communicate with the NADs through MLAGs. Although the NADs can be any device that supports LACP LAGs, the devices in this example are Arista switches.

**Figure 10: MLAG Implementation Example**

### 10.3.5.1 Topology

[Figure 10: MLAG Implementation Example](#) displays the MLAG topology. Switch 1 and Switch 2 are MLAG peers that logically represent a single Layer 2 switch. The peer link between the switches contains the following interfaces:

- Switch 1: Ethernet 47, Ethernet 48
- Switch 2: Ethernet 23, Ethernet 24

The example configures MLAGs from the MLAG Domain to four network attached devices (NAD-1, NAD-2, NAD-3, NAD-4).

### 10.3.5.2 Configuring the Peer Switch Connections

To configure the switches in the described topology, perform the tasks in these sections:

- [Configuring the Peer Switch Port Channels](#)
- [Configuring the Peer Switch SVIs](#)
- [Configuring the Peer Links](#)

#### 10.3.5.2.1 Configuring the Peer Switch Port Channels

These commands create the port channels the switches use to establish the peer link.

**These commands create port channels on Switch1**

```
switch1 (config) #interface ethernet 47-48
switch1 (config-if-et47-48) #channel-group 101 mode active
switch1 (config-if-et47-48) #interface port-channel 101
switch1 (config-if-po101) #switchport mode trunk
switch1 (config-if-po101) #switchport trunk group peertrunk
switch1 (config-if-po101) #exit
switch1 (config) #
```

### These commands create port channels on Switch2

```
switch2(config)#interface ethernet 23-24
switch2(config-if-et23-24)#channel-group 201 mode active
switch2(config-if-et23-24)#interface port-channel 201
switch2(config-if-po201)#switchport mode trunk
switch2(config-if-po201)#switchport trunk group trunkpeer
switch2(config-if-po201)#exit
switch2(config)#
```

#### 10.3.5.2.2 Configuring the Peer Switch SVIs

For each peer switch, these commands create an SVI and associate it to the trunk group assigned to the peer link port channel. STP is disabled on the VLAN.

#### These commands configure the SVI on Switch1

```
switch1(config)#vlan 4094
switch1(config-vlan-4094)#trunk group peertrunk
switch1(config-vlan-4094)#interface vlan 4094
switch1(config-if-vl4094)#ip address 172.17.0.1/30
switch1(config-if-vl4094)#no autostate
switch1(config-if-vl4094)#exit
switch1(config)#no spanning-tree vlan-id 4094
switch1(config)#
```

#### These commands configure the SVI on Switch2

```
switch2(config)#vlan 4094
switch2(config-vlan-4094)#trunk group trunkpeer
switch2(config-vlan-4094)#interface vlan 4094
switch2(config-if-vl4094)#ip address 172.17.0.2/30
switch2(config-if-vl4094)#no autostate
switch2(config-if-vl4094)#exit
switch2(config)#no spanning-tree vlan-id 4094
switch2(config)#
```

#### 10.3.5.2.3 Configuring the Peer Links

These commands create the peer links on each MLAG switch.

#### These commands create peer links on Switch1

```
switch1(config)#mlog configuration
switch1(config-mlog)#local-interface vlan 4094
switch1(config-mlog)#peer-address 172.17.0.2
switch1(config-mlog)#peer-link port-channel 101
switch1(config-mlog)#domain-id mlag_01
switch1(config-mlog)#heartbeat-interval 2500
switch1(config-mlog)#reload-delay 150
switch1(config-mlog)#exit
switch2(config)#
```

#### These commands create peer links on Switch2

```
switch2(config)#mlog configuration
```

```
switch2 (config-mlag) #local-interface vlan 4094
switch2 (config-mlag) #peer-address 172.17.0.1
switch2 (config-mlag) #peer-link port-channel 201
switch2 (config-mlag) #domain-id mlag_01
switch2 (config-mlag) #heartbeat-interval 2500
switch2 (config-mlag) #reload-delay 150
switch2 (config-mlag) #exit
switch2 (config) #
```

### 10.3.5.3 Configuring Peer Switch MLAGs

These commands create the MLAGs that connect the MLAG domain to the network attached devices.

#### These commands configure MLAG 1 on Switch1

```
switch1 (config) #interface ethernet 17-18
switch1 (config-if-et17-18) #channel-group 1 mode active
switch1 (config-if-et17-18) #interface port-channel 1
switch1 (config-if-po1) #mlag 1
switch1 (config-if-po1) #exit
switch1 (config) #
```

#### These commands configure MLAG 1 on Switch2

```
switch2 (config) #interface ethernet 1-2
switch2 (config-if-et1-2) #channel-group 1 mode active
switch2 (config-if-et1-2) #interface port-channel 1
switch2 (config-if-po1) #mlag 1
switch2 (config-if-po1) #exit
switch2 (config) #
```

#### These commands configure MLAG 2 on Switch1

```
switch1 (config) #interface ethernet 19-20
switch1 (config-if-et19-20) #channel-group 2 mode active
switch1 (config-if-et19-20) #interface port-channel 2
switch1 (config-if-po2) #mlag 2
switch1 (config-if-po2) #exit
switch1 (config) #
```

#### These commands configure MLAG 2 on Switch2

```
switch2 (config) #interface ethernet 3-4
switch2 (config-if-et3-4) #channel-group 2 mode active
switch2 (config-if-et3-4) #interface port-channel 2
switch2 (config-if-po2) #mlag 2
switch2 (config-if-po2) #exit
switch2 (config) #
```

#### These commands configure MLAG 3 on Switch1

```
switch1 (config) #interface ethernet 23
switch1 (config-if-et23) #channel-group 3 mode active
switch1 (config-if-et23) #interface port-channel 3
switch1 (config-if-po3) #mlag 3
switch1 (config-if-po3) #exit
```

```
switch1(config)#
```

### These commands configure MLAG 3 on Switch2

```
switch2(config)#interface ethernet 7
switch2(config-if-et7)#channel-group 3 mode active
switch2(config-if-et7)#interface port-channel 3
switch2(config-if-po3)#mlag 3
switch2(config-if-po3)#exit
switch2(config)#
```

### These commands configure MLAG 4 on Switch1

```
switch1(config)#interface ethernet 25
switch1(config-if-et25)#channel-group 4 mode active
switch1(config-if-et25)#interface port-channel 4
switch1(config-if-po4)#mlag 4
switch1(config-if-po4)#exit
switch1(config)#
```

### These commands configure MLAG 4 on Switch2

```
switch2(config)#interface ethernet 9
switch2(config-if-et9)#channel-group 4 mode active
switch2(config-if-et9)#interface port-channel 4
switch2(config-if-po4)#mlag 4
switch2(config-if-po4)#exit
switch2(config)#
```

#### 10.3.5.4 Configuring the Network Attached Devices

These commands create the LAGs on the Network Attached Devices that connect to the MLAG domain.

#### These commands configure the port channels on NAD-1

```
NAD-1(config)#interface ethernet 7-10
NAD-1(config-if-Et7-10)#channel-group 1 mode active
NAD-1(config-if-Et7-10)#exit
NAD-1(config)#
```

#### These commands configure the port channels on NAD-2

```
NAD-2(config)#interface ethernet 25-28
NAD-2(config-if-Et25-28)#channel-group 7 mode active
NAD-2(config-if-Et25-28)#exit
NAD-2(config)#
```

#### These commands configure the port channels on NAD-3

```
NAD-3(config)#interface ethernet 3-4
NAD-3(config-if-Et3-4)#channel-group 5 mode active
NAD-3(config-if-Et3-4)#exit
NAD-3(config)#
```

---

## These commands configure the port channels on NAD-4

```
NAD-4 (config) #interface ethernet 1-2
NAD-4 (config-if-Et1-2) #channel-group 2 mode active
NAD-4 (config-if-Et1-2) #exit
NAD-4 (config) #
```

### 10.3.5.5 Verification

The following tasks verify the MLAG peer and connection configuration:

- [Verify the Peer Switch Connection](#)
- [Verify the MLAGs](#)
- [Verify Spanning Tree Protocol \(STP\)](#)
- [Verify the MLAG Port Channel](#)
- [Verify the VLAN Membership](#)

#### 10.3.5.5.1 Verify the Peer Switch Connection

To display the MLAG configuration and the MLAG status on Switch 1, use the [show mlag](#) command:

```
Switch1#show mlag
MLAG Configuration:
domain-id           :          mlag_01
local-interface     :          Vlan4094
peer-address        :          172.17.0.2
peer-link           :          Port-Channel101

MLAG Status:
state               :          Active
peer-link status    :          Up
local-int status    :          Up
system-id           :          02:1c:FF:00:15:38

MLAG Ports:
Disabled            :          0
Configured          :          0
Inactive            :          0
Active-partial      :          0
Active-full         :          4
```

To display the MLAG configuration and the MLAG status on Switch 2, use the [show mlag](#) command:

```
Switch2#show mlag
MLAG Configuration:
domain-id           :          mlag_01
local-interface     :          Vlan4094
peer-address        :          172.17.0.1
peer-link           :          Port-Channel102

MLAG Status:
state               :          Active
peer-link status    :          Up
local-int status    :          Up
system-id           :          02:1c:FF:00:15:41

MLAG Ports:
Disabled            :          0
Configured          :          0
Inactive            :          0
```

```
Active-partial : 0
Active-full    : 4
```

### 10.3.5.5.2 Verify the MLAGs

The `show mlag interfaces` command displays MLAG connections between the MLAG switches and the Network Attached Devices.

- This `show mlag interfaces` command displays MLAG connections between the MLAG peer Switch 1 and the network attached devices:

```
switch1#show mlag interfaces
```

mlag	desc	state	local	remote	local/remote status
1	sw1.po1	active-full	Po1	Po1	up/up
2	sw1.po2	active-full	Po2	Po2	up/up
3	sw1.po3	active-full	Po3	Po3	up/up
4	sw1.po4	active-full	Po4	Po4	up/up

- The following `show mlag interfaces` command, with the detail option, displays MLAG connections between the MLAG peer Switch 1 and the network attached devices

```
Switch2#show mlag interfaces detail
```

mlag	state	local	remote	oper	config	last change	changes
1	active-full	Po1	Po1	up/up	ena/ena	6 days, 2:08:28 ago	5
2	active-full	Po2	Po2	up/up	ena/ena	6 days, 2:08:30 ago	5
3	active-full	Po3	Po3	up/up	ena/ena	6 days, 2:08:33 ago	5
4	active-full	Po4	Po4	up/up	ena/ena	6 days, 2:08:41 ago	5

### 10.3.5.5.3 Verify Spanning Tree Protocol (STP)

STP functions can be displayed from each peer switch. MLAG interfaces are displayed as a single entry. Configured interfaces on each switch that are not included in an MLAG are displayed. Local interfaces have the normal notation; remote interfaces are preceded by **P** or **Peer**.

#### VLAN Output 1: Assume VLAN 3903 includes MLAG 1

```
switch1#show spanning-tree vlan 3903
Spanning tree instance for vlan 3903
VL3903
  Spanning tree enabled protocol rapid-pvst
  Root ID    Priority    36671
             Address    001c.730c.3009
             Cost        1999 (Ext) 0 (Int)
             Port        105 (Port-Channel5)
             Hello Time  2.000 sec  Max Age 20 sec  Forward Delay 15 sec

  Bridge ID  Priority    36671 (priority 32768 sys-id-ext 3903)
             Address    021c.7300.1319
             Hello Time  2.000 sec  Max Age 20 sec  Forward Delay 15 sec

Interface    Role      State      Cost      Prio.Nbr Type
-----
Po1          root     forwarding 1999      128.105 P2p
switch1#
```

The output displays MLAG 1 under its local interface name (Po1). A peer interface is not displayed because spanning tree considers the local and remote Port Channels as a single MLAG interface.

#### VLAN Output 2: Assume VLAN 3908 does not include any MLAGs

```
switch1#show spanning-tree vlan 3908
Spanning tree instance for vlan 3908
```

```

VL3908
Spanning tree enabled protocol rapid-pvst
Root ID    Priority    36676
           Address    021c.7300.1319
           This bridge is the root

Bridge ID  Priority    36676 (priority 32768 sys-id-ext 3908)
Address    021c.7300.1319
Hello Time 2.000 sec Max Age 20 sec Forward Delay 15 sec

Interface      Role        State        Cost        Prio.Nbr Type
-----
Et17           designated forwarding 2000         128.217 P2p
Et18           designated forwarding 2000         128.218 P2p
PEt17          designated forwarding 2000         128.17  P2p
PEt18          designated forwarding 2000         128.18  P2p

```

The output displays all interfaces from both switches. Each interface is explicitly displayed because they are individual units that STP must consider when selecting ports to block.

- Et17 and Et18 are located on the switch where the **show spanning-tree** command is issued.
- PEt17 and PEt18 are located on the remote switch from where the command was issued

An identical command issued on the peer switch displays similar information.

#### Verify the MLAG does not create topology loops (show spanning-tree blocked)

```

switch1#show spanning-tree blocked
Name          Blocked Interfaces List
-----
Number of blocked ports (segments) in the system : 0
switch1#

```

#### 10.3.5.5.4 Verify the MLAG Port Channel

Issue the command **show port-channel** for channels 1-4 from Switch 1:

```

Switch#show port-channel 1-4
Port Channel Port-Channel1:
  Active Ports: Ethernet17      Ethernet18      PeerEthernet1 PeerEthernet2
Port Channel Port-Channel2:
  Active Ports: Ethernet19      Ethernet20      Ethernet21     Ethernet22
                  PeerEthernet3 PeerEthernet4 PeerEthernet5 PeerEthernet6
Port Channel Port-Channel3:
  Active Ports: Ethernet23      Ethernet24      PeerEthernet7 PeerEthernet8
Port Channel Port-Channel4:
  Active Ports: Ethernet25      Ethernet26      PeerEthernet9 PeerEthernet1
0

```

Issue the command **show port-channel load-balance fields detailed** command for channel 1 from Switch 2:

```

Switch#show port-channel 1 detailed
Port Channel Port-Channel1:
  Active Ports:
    Port                Time became active          Protocol  Mode
    -----
    Ethernet17          7/7/11 15:27:36             LACP     Active
    Ethernet18          7/7/11 15:27:36             LACP     Active
    PeerEthernet1       7/7/11 15:27:36             LACP     Active
    PeerEthernet2       7/7/11 15:27:36             LACP     Active

```

### 10.3.5.5.5 Verify the VLAN Membership

The **show vlan** command displays VLAN member ports, including MLAG ports and ports on each peer not bundled in an MLAG.

```
Switch1#show vlan 3903, 3908
VLAN  Name                               Status  Ports
-----  -----
3903  ar.mg.rn.172.17.254.16/29             active  Cpu, Po1
3908  po.ra.ar.mg.172.17.254.64/29         active  Cpu, Et17, Et18, PEt17, PEt18
```

---

## 10.3.6 MLAG Commands

### MLAG and Port Channel Commands – Global Configuration Mode

- [mlag configuration \(global configuration\)](#)

### Interface Configuration Commands – Interface Configuration Mode

- [mlag \(port-channel interface configuration\)](#)

### MLAG Configuration Commands

- [domain-id](#)
- [heartbeat-interval \(MLAG\)](#)
- [local-interface](#)
- [peer-address](#)
- [peer-link](#)
- [reload-delay mlag](#)
- [reload-delay mode](#)
- [reload-delay non-mlag](#)
- [shutdown \(MLAG\)](#)

### Display Commands

- [show mlag](#)
- [show mlag interfaces](#)
- [show mlag interfaces members](#)
- [show mlag interfaces states](#)
- [show mlag issu warnings](#)

### 10.3.6.1 domain-id

The **domain-id** command specifies a name for the multi-chassis link aggregation (MLAG) domain.

The **no domain-id** and **default domain-id** commands remove the MLAG domain name by deleting the **domain-id** statement from *running-config*.

#### Command Mode

MLAG Configuration

#### Command Syntax

```
domain-id identifier
```

```
no domain-id
```

```
default domain-id
```

#### Parameters

*identifier* alphanumeric string that names the MLAG domain.

#### Example

This command names the MLAG domain *mlag1*.

```
switch(config) #mlag  
switch(config-mlag) #domain-id mlag1  
switch(config-mlag) #
```

---

### 10.3.6.2 heartbeat-interval (MLAG)

The `heartbeat-interval` command configures the interval at which heartbeat messages are issued in a multi-chassis link aggregation (MLAG) configuration.

The `no heartbeat-interval` and `default heartbeat-interval` commands revert the heartbeat interval to the default setting by removing the `heartbeat-interval` command from *running-config*.

#### Command Mode

MLAG Configuration

#### Command Syntax

```
heartbeat-interval period
no heartbeat-interval
default heartbeat-interval
```

#### Parameters

*period* Interval duration (ms). Value ranges from 1000 through 30000 milliseconds. Default interval is 2000 milliseconds.

#### Guidelines

Heartbeat messages flow independently in both directions between the MLAG peers. If a peer stops receiving heartbeat messages within the expected time frame (30 seconds), the other peer can assume it no longer functions and without intervention or repair, the MLAG becomes disabled. Both switches revert to their independent state.

**Note:** On 7500 and 7500E Series Switches, Arista recommends setting the heartbeat interval to 10 seconds.

#### Example

This command configures the heartbeat interval to 15000 milliseconds:

```
switch(config) #mlag
switch(config-mlag) #heartbeat-interval 15000
switch(config-mlag) #
```

### 10.3.6.3 local-interface

The **local-interface** command assigns a VLAN interface for use in multi-chassis link aggregation (MLAG) configurations. The VLAN interface is used for both directions of communication between the MLAG peers.

The **no local-interface** and **default local-interface** commands delete the VLAN interface assignment by removing the **local-interface** command from *running-config*.

#### Command Mode

MLAG Configuration

#### Command Syntax

```
local-interface vlan vlan_number
```

```
no local-interface
```

```
default local-interface
```

#### Parameters

*vlan\_number* VLAN number, in the range from 1 through 4094.

#### Guidelines

When configuring the local interface, the VLAN interface must exist already. To configure a VLAN interface, issue the command **interface vlan**.

#### Example

This command assigns VLAN 4094 as the local interface.

```
switch(config) #mlag
switch(config-mlag) #local-interface vlan 4094
switch(config-mlag) #
```

---

#### 10.3.6.4 mlag (port-channel interface configuration)

The **mlag** command assigns an MLAG ID to a port-channel. MLAG peer switches form an MLAG when each switch configures the same MLAG ID to a port-channel interface. Only one MLAG ID can be assigned to an interface. An individual MLAG number cannot be assigned to more than one interface.

The **no mlag** and **default mlag** commands remove the MLAG ID assignment from the configuration mode interface by deleting the corresponding **mlag** command from **running-config**.

##### Command Mode

Interface-Port Channel Configuration

##### Command Syntax

**mlag** *number*

**no mlag**

**default mlag**

##### Parameters

*number* Number used as MLAG ID. Value ranges from 1 to 2000.

##### Example

These commands configures a port channel and assigns it MLAG 4.

```
switch(config)#interface ethernet 5-10
switch(config-if-Et5-10)#channel-group 1 mode active
switch(config-if-Et5-10)#interface port-channel 4
switch(config-if-Po4)#switchport trunk group group4
switch(config-if-Po4)#mlag 4
switch(config-if-Po4)#exit
switch(config)#
```

### 10.3.6.5 peer-address

The **peer-address** command specifies the peer IPv4 address for a multi-chassis link aggregation (MLAG) domain. MLAG control traffic, including keepalive messages, is sent to the peer IPv4 address. If the peer IPv4 address is unreachable, then MLAG peering fails and both peer switches revert to their independent state.

The **no peer-address** and **default peer-address** commands remove the MLAG peer's IPv4 address assignment by deleting the peer-address command from **running-config**.

#### Command Mode

MLAG Configuration

#### Command Syntax

```
peer-address ipv4_addr
```

```
no peer-address
```

```
default peer-address
```

#### Parameters

*ipv4\_addr* MLAG peer IPv4 address.

#### Example

These commands configure the MLAG peer address.

```
switch(config) #m1ag
switch(config-m1ag) #peer-address 10.0.0.2
switch(config-m1ag) #
```

---

### 10.3.6.6 peer-link

The **peer-link** command specifies the interface that connects multi-chassis link aggregation (MLAG) peers. To form an MLAG, two switches are connected through an interface called a peer link. The peer link carries control and data traffic between the two switches. Control traffic includes MLAG-related advertisements and keepalive messages. This information keeps the two switches working as one.

The **no peer-link** and **default peer-link** command remove the peer link by deleting the **peer-link** command from *running-config*.

#### Command Mode

MLAG Configuration

#### Command Syntax

```
peer-link INT_NAME
```

```
no peer-link
```

```
default peer-link
```

#### Parameters

INT\_NAME denotes the interface type and number of the interface. Values include:

- ethernet *e\_num* Ethernet interface range specified by *e\_num*.
- port-channel *p\_num* Channel group interface range specified by *p\_num*.

#### Example

These commands creates a peer link.

```
switch(config)#mlag configuration  
switch(config-mlag)#peer-link port-channel 10  
switch(config-mlag)
```

### 10.3.6.7 mlag configuration (global configuration)

The **mlag configuration** command enters MLAG configuration mode to configure multi-chassis link aggregation (MLAG) features. MLAG configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The **no mlag configuration** and **default mlag configuration** commands remove all MLAG configuration commands from **running-config**.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
mlag [configuration]
no mlag configuration
default mlag configuration
```

**mlag** and **mlag configuration** are identical commands.

#### Guidelines

An MLAG is formed by connecting two switches through an interface called a peer link. The peer link carries control and data traffic between the switches, including advertisements and keepalive messages. This information coordinates the switches. Functioning peers are in the **active** state.

Each peer switch uses IP-level connectivity between their local addresses and the MLAG peer IP address to form and maintain the peer link.

#### Commands Available in MLAG Configuration Mode

- [domain-id](#)
- [heartbeat-interval \(MLAG\)](#)
- [local-interface](#)
- [peer-address](#)
- [peer-link](#)
- [reload-delay mlag](#)
- [shutdown \(MLAG\)](#)

#### Example

These commands enter MLAG configuration mode and configure MLAG parameters:

```
• switch(config)#mlag
switch(config-mlag)#local-interface vlan 4094
switch(config-mlag)#peer-address 10.0.0.2
switch(config-mlag)#peer-link port-channel 10
switch(config-mlag)#domain-id mlagDomain
switch(config-mlag)#heartbeat-interval 2500
switch(config-mlag)#reload-delay 2000
switch(config-mlag)#exit
switch(config)#
```

---

### 10.3.6.8 reload-delay mlag

The `reload-delay mlag` command configures the reload delay period for MLAG links. The command also specifies the reload delay period for non-MLAG links when the [reload-delay non-mlag](#) command is not configured.

Each Arista switch defaults to the recommended reload-delay value, which varies by switch platform:

- **Fixed configuration switches:** 300 seconds
- **Trident II modular switches:** 1200 seconds
  - 7304
  - 7308
  - 7316
  - 7300X series
- **Sand platform fixed configuration switches:** 600 seconds
  - 7280 series
- **Sand platform modular switches:** 1800 seconds
  - 7504
  - 7508
  - 7500E series
  - 7548S

The `no reload-delay mlag` and `default reload-delay mlag` commands restore the default value by deleting the `reload-delay mlag` statement from *running-config*.

#### Command Mode

MLAG Configuration

#### Command Syntax

```
reload-delay [mlag] PERIOD
no reload-delay [mlag]
default reload-delay [mlag]
```

#### Parameters

- **PERIOD** Period that non-peer links are disabled after an MLAG peer reboots. Options include:
  - `infinity` link is not enabled after reboot.
  - `<0 to 86400>` disabled link interval (seconds). Default varies by switch platform as described above.

#### Guidelines

The `reload-delay` and `reload-delay mlag` commands are equivalent.

#### Example

These commands configure the reload-delay interval to 15 minutes.

```
switch(config)#mlag configuration
switch(config-mlag)#reload-delay mlag 900
switch(config-mlag)#
```

### 10.3.6.9 reload-delay mode

The **reload-delay mode** command specifies the state of LACP LAG ports during the MLAG reload delay period. By default, MLAG ports remain in the errdisabled state during reload delay. This command configures MLAG ports to come up to standby mode before the expiration of the reload delay period.

The **no reload-delay mode** and **default reload-delay mode** commands restore the default behavior of MLAG ports by deleting the **reload-delay mode** statement from **running-config**. The default behavior is for the MLAG ports to remain in the errdisabled state until the expiration of the reload delay period

#### Command Mode

MLAG Configuration

#### Command Syntax

```
reload-delay mode lacp standby
```

```
no reload-delay mode
```

```
default reload-delay mode
```

#### Related Commands

**reload-delay mlag** configures the MLAG reload delay period.

#### Example

These commands configure the MLAG port to come up to standby state before the end of the reload delay period.

```
switch(config)#mlag configuration  
switch(config-mlag)#reload-delay mode lacp standby  
switch(config-mlag)#
```

---

### 10.3.6.10 reload-delay non-mlag

The `reload-delay non-mlag` command specifies the period that non-MLAG links are disabled after an MLAG peer reboots. This interval allows non-peer links to learn multicast and OSPF states before the ports start handling traffic. The recommended minimum value required to ensure the forwarding hardware is initialized with the topology state depends on the switch platform:

- Fixed configuration switches: 300 seconds (five minutes)
- Sand platform fixed configuration switches (7280 series): 600 seconds (ten minutes)
- Modular switches: 1200 seconds (twenty minutes)

When the `reload-delay non-mlag` command is not configured, the `reload-delay mlag` command specifies the reload delay time for non-MLAG and MLAG links.

The `no reload-delay non-mlag` and `default reload-delay non-mlag` command restores the default behavior by deleting the `reload-delay non-mlag` statement from *running-config*.

#### Command Mode

MLAG Configuration

#### Command Syntax

```
reload-delay non-mlag PERIOD
no reload-delay non-mlag
default reload-delay non-mlag
```

#### Parameters

- **PERIOD** Period that non-MLAG links are disabled after an MLAG peer reboots. Options include:
  - `infinity` links are not enabled after reboot.
  - `<0 to 86400>` disabled link interval (seconds). Values range from 0 to 86400 (24 hours).

#### Example

These commands configure the reload-delay interval of non-MLAG links to 20 minutes.

```
switch(config)#mlag configuration
switch(config-mlag)#reload-delay non-mlag 1200
switch(config-mlag)#
```

### 10.3.6.11 show mlag interfaces members

The **show mlag interfaces members** command displays information about the multi-chassis link aggregation (MLAG) members on bridged Ethernet interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show mlag interfaces members
```

#### Example

This command displays the MLAG interface members.

```
switch#show mlag interface members
Mlag4 is Port-Channel4
  Active Ports: Ethernet3 PeerEthernet3
Mlag5 is Port-Channel5
  Active Ports: Ethernet14
Mlag7 is Port-Channel7
  Active Ports: Ethernet5 PeerEthernet5
Mlag8 is Port-Channel8
  Active Ports: Ethernet10 PeerEthernet10
Mlag9 is Port-Channel9
  Active Ports: Ethernet15 Ethernet21 PeerEthernet19 PeerEthernet20
Mlag10 is Port-Channel10
  Active Ports: Ethernet19 Ethernet20 PeerEthernet21 PeerEthernet22
switch#
```

### 10.3.6.12 show mlag interfaces states

The **show mlag interfaces states** command displays information about the multi-chassis link aggregation (MLAG) states on bridged Ethernet interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show mlag interfaces [MLAGS] states [ STATE_NAMES][INFO_LEVEL]
```

#### Parameters

**MLAGS** MLAG channels for which command displays data. Options include:

- *<no parameter>* command displays data for all MLAGs.
- *mlag\_id* specifies MLAG for which command displays data. Value ranges from 1 to 2000.
- **STATE\_NAMES** MLAG channels for which command displays data. Parameter may specify more than one name, which can be listed in any order. Valid state names include:
  - **active-full** includes active-full interfaces.
  - **active-partial** includes active-partial interfaces.
  - **configured** includes configured interfaces.
  - **disabled** includes disabled interfaces.
  - **inactive** includes inactive interfaces.
- **INFO\_LEVEL** specifies information displayed by command. Options include:
  - *<no parameter>* command displays basic MLAG interface parameters
  - **detail** command displays detailed MLAG interface state parameters.

#### Example

This command displays the MLAG interface states that are active-full.

```
switch#show mlag interfaces states active-full
```

mlag	desc	state	local	remote	local/remote status
4	b.po1	active-full	Po4	Po4	up/up
7	ar.mg.au.po1	active-full	Po7	Po7	up/up
8	co.po1	active-full	Po8	Po8	up/up
9	k.po5	active-full	Po9	Po9	up/up
10	ar.mg.pt.ir.po10	active-full	Po10	Po10	up/up

```
switch#
```

### 10.3.6.13 show mlag interfaces

The **show mlag interfaces** command displays information about the multi-chassis link aggregation (MLAG) configuration on bridged Ethernet interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show mlag interfaces [MLAGS][INFO_LEVEL]
```

#### Parameters

- **MLAGS** MLAG channels for which command displays data. Options include:
  - *<no parameter>* command displays data for all MLAGs.
  - *mlag\_id* specifies MLAG for which command displays data. Value ranges from 1 to 2000.
- **INFO\_LEVEL** specifies information displayed by command. Options include:
  - *<no parameter>* command displays basic MLAG interface parameters
  - *detail* command displays detailed MLAG interface parameters.

#### Example

This command displays output from the **show mlag interfaces detail** command:

```
switch>show mlag interfaces detail
```

mlag	state	local	remote	local/remote oper	config	last change	changes
4	active-full	Po4	Po4	up/up	ena/ena	6 days, 1:19:26 ago	5
5	active-full	Po5	Po5	up/up	ena/ena	6 days, 1:19:24 ago	5
6	active-full	Po6	Po6	up/up	ena/ena	6 days, 1:19:23 ago	5
7	active-full	Po7	Po7	up/up	ena/ena	6 days, 1:19:23 ago	5

---

### 10.3.6.14 show mlag issu warnings

The **show mlag issu warnings** command displays a warning message regarding the backward-compatibility of this feature before you upgrade.

#### Command Mode

EXEC

#### Command Syntax

```
show mlag issu warnings
```

#### Example

This command displays the MLAG backward-compatibility warning message. Refer to the latest version of the release notes for additional information before you upgrade.

```
switch##show mlag issu warnings  
If you are performing an upgrade, and the Release Notes for the new  
version of EOS indicate that MLAG is not backwards-compatible with the  
currently installed version, the upgrade will result in packet loss.  
  
Stp is not restartable. Topology changes will occur during the upgrade  
process.  
  
switch#
```

### 10.3.6.15 show mlag

The **show mlag** command displays information about the multi-chassis link aggregation (MLAG) configuration on bridged Ethernet interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show mlag [INFO_LEVEL]
```

#### Parameters

INFO\_LEVEL specifies information displayed by command. Options include:

- *<no parameter>* command displays MLAG configuration, status, and ports.
- detail command displays MLAG configuration, status, ports, and detailed status.

#### Example

This command displays output from the **show mlag** command:

```
switch>show mlag
MLAG Configuration:
domain-id       :          ar.mg.mlag
local-interface :          Vlan3901
peer-address    :          172.17.254.2
peer-link       :          Port-Channel1

MLAG Status:
state           :          Active
peer-link status :          Up
local-int status :          Up
system-id       :          02:1c:73:00:13:19

MLAG Ports:
Disabled        :          0
Configured      :          0
Inactive        :          0
Active-partial  :          0
Active-full     :          5
switch>
```

---

### 10.3.6.16 shutdown (MLAG)

The **shutdown** command disables MLAG on the switch without modifying the MLAG configuration.

The **no shutdown** and **default shutdown** commands re-enable MLAG by removing the **shutdown** command from *running-config*.

#### Command Mode

MLAG Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

#### Example

These commands disable MLAG on the switch.

```
switch(config)#mlag configuration
switch(config-mlag)#shutdown
switch(config-mlag)#
```

## 10.4 Data Transfer

Arista switches support the transfer of packets (network layer) and frames (data link layer). This chapter describes concepts and processes that are referenced by routing and switching protocols that Arista switches support.

Sections in this chapter include:

- [Data Transfer Introduction](#)
- [Data Transfer Methods](#)
- [MAC Address Table](#)
- [Configuring Ports](#)
- [Monitoring Links](#)
- [Data Transfer Commands](#)

### 10.4.1 Data Transfer Introduction

Arista switches transfer data through switching, routing, and layer 3 switching. This chapter provides an introduction to these transfer methods.

Data structures and processes that support data transfer methods and referenced in specific protocol chapters are also described, including:

- routed ports
- switched ports
- MAC address table
- port mirroring
- storm control
- loopback interfaces
- route redistribution
- null0 interfaces
- MTUs

## 10.4.2 Data Transfer Methods

This section describes these data transfer methods:

- [Switching and Bridging](#)
- [Routing](#)
- [Layer 3 Switching](#)

### 10.4.2.1 Switching and Bridging

Switching and bridging operations transmit data link layer frames between devices within a single subnet. Each port is assigned a 48 bit Media Access Control (MAC) address. Frames arriving at a hub are bridged, or sent to all other ports on the subnet. Switches can associate ports with their MAC addresses, obviating the need to flood the subnet when sending a frame.

Subnets in the switch are defined by VLANs. A virtual local area network (VLAN) is a group of devices that are configured to communicate as if they are attached to the same network regardless of their physical location. **VLANs** describes VLANs.

Four MAC address types identify the scope of LAN interfaces that an address represents:

- unicast: represents a single interface.
- broadcast: represents all interfaces.
- multicast: represents a subset of all interfaces.
- reserved: assigned to nodes that have no configured MAC address.

The Individual/Group (I/G) bit distinguishes unicast MAC addresses from multicast addresses. As shown in [Figure 11: MAC Address Format](#), the I/G bit is the least significant bit of the most significant byte in a MAC address.

#### 10.4.2.1.1 MAC Address Format

**Figure 11: MAC Address Format**

- Unicast address: the I/G bit is 0: 1234.1111.1111 is a unicast MAC address (the most significant byte is an even number).
  - Reserved address: all bits set to 0 (0000.0000.0000).
- Multicast address: the I/G bit is 1: 1134.1111.1111 is a multicast MAC address (the most significant byte is an odd number).
- Broadcast address: all bits set to 1 (FFFF.FFFF.FFFF).

#### Example

- The following are unicast MAC addresses:

```
0200.0000.0000
1400.0000.0000
```

- 
- The following are multicast MAC addresses:

```
0300.0000.0000
2500.0000.0000
```

The following sections describe MAC address functions and data structures:

- [Assigning a MAC Address to an Interface](#)
- [MAC Address Table](#)

## 10.4.2.2 Routing

Routing transmits network layer packets over connected independent subnets. Each subnet is assigned an IP address range and each device on the subnet is assigned an IP address from that range. Connected subnets have IP address ranges that do not overlap. A router connects multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets' destination address.

IPv4 and IPv6 are internet layer protocols that facilitate packet-switched networking, including transmissions across multiple networks.

These chapters describe available IP features:

- [IPv4](#)
- [IPv6](#)

### 10.4.2.2.1 Static Routing

Static routes are entered through the CLI and are typically used when dynamic protocols are unable to establish routes to a specified destination prefix. Static routes are also useful when dynamic routing protocols are not available or appropriate.

Creating a static route associates a destination IP address with a local interface. The routing table refers to these routes as **connected** routes that are available for redistribution into routing domains defined by dynamic routing protocols.

These sections describe static route configuration commands:

- [IPv4 Address Configuration](#)
- [Configuring Default and Static IPv6 Routes](#)

### 10.4.2.2.2 Dynamic Routing

Dynamic routes are established by dynamic routing protocols. These protocols also maintain the routing table and modify routes to adjust for topology or traffic changes. Routing protocols assist the switch in communicating with other devices to exchange network information, maintaining routing tables, and establishing data paths.

The switch supports these dynamic routing protocols:

- [Open Shortest Path First – Version 2](#)
- [Open Shortest Path First – Version 3](#)
- [Border Gateway Protocol \(BGP\)](#)
- [Routing Information Protocol](#)
- [IS-IS](#)

### 10.4.2.3 Layer 3 Switching

Layer 3 switches establish data paths through routing processes (Layer 3) and transfer data as a switch (Layer 2) through speed-optimized hardware. Layer 3 switches use a control plane (routing) and data plane (switching) to manage these processes.

#### 10.4.2.3.1 Control plane

The control plane builds and maintains the IP routing table, which identifies IP packet routes in terms of destination addresses. The routing table defines a route by its next hop address and the egress interface that accesses the next hop.

The control plane derives routing information from three sources:

- Status of physical and virtual interfaces on the switch.
- Static routes entered through the CLI.
- Routes established through dynamic routing protocols.

#### Applying an ACL to the Control Plane

The control plane supports routing and management functions, handling packets that are addressed to the switch without regard to any switch interface.

To apply an IP ACL to the control plane, enter [ip access-group \(Control Plane mode\)](#) in control-plane mode. The [system control-plane](#) command places the switch in control-plane mode.

ACLs and Route Maps describes access control lists.

#### Example

These commands place the switch in control-plane mode and assigns *CP-Test1* to the control plane.

```
switch(config)#system control-plane
switch(config-system-cp)#ip access-group CP-Test1 in
switch(config-system-cp)#
```

#### 10.4.2.3.2 Data plane

The data plane routes IP packets based on information derived by the control plane. Each packet's path includes Layer 2 addresses that reach its next hop destination. The data plane also performs other operations required by IP routing, such as recalculating IP header checksums and decrementing the time-to-live (TTL) field.

Arista data planes support these packet forwarding modes:

- Store and forward: the switch accumulates entire packets before forwarding them.
- Cut through: the switch begins forwarding frames before their reception is complete.

Cut through mode reduces switch latency at the risk of decreased reliability. Packet transmissions can begin immediately after the destination address is processed. Corrupted frames may be forwarded because packet transmissions begin before CRC bytes are received.

Packet forwarding mode availability varies by switch platform:

- Arad: store and forward mode only
- FM6000: both modes are available.
- Petra: store and forward mode only
- Trident: both modes are available.
- Trident II: both modes are available.

The data plane is also referred to as the forwarding plane.

---

## Data Plane Forwarding Mode Configuration

The [switch forwarding-mode](#) command specifies the forwarding mode of the switch's data plane. This command is available on Trident, Trident II, and FM6000 platform switches. The forwarding mode is **store-and-forward** on Arad and Petra platform switches.

### Example

This command changes the forwarding mode to **store-and-forward**.

```
switch(config)#switch forwarding-mode store-and-forward
switch(config)#
```

The [show switch forwarding-mode](#) command displays the switch's forwarding mode.

### Example

This command displays the switch's forwarding mode.

```
switch(config)#show switch forwarding-mode
Current switching mode:   store and forward
Available switching modes: cut through, store and forward
```

## 10.4.3 MAC Address Table

The switch maintains a MAC address table for switching frames efficiently between ports. The MAC address table contains static and dynamic MAC addresses.

- Static MAC addresses are entered into the table through a CLI command.
- Dynamic MAC addresses are entered into the table when the switch receives a frame whose source address is not listed in the MAC address table. The switch builds the table dynamically by referencing the source address of frames it receives.

### 10.4.3.1 MAC Address Table Configuration

These sections describe MAC address table configuration tasks.

- [Static MAC Address Table Entries](#)
- [Dynamic MAC Address Table Entries](#)

#### 10.4.3.1.1 Static MAC Address Table Entries

The MAC address table accepts static MAC addresses, including multicast entries. Each table entry references a MAC address, a VLAN, and a list of layer 2 (Ethernet or port channel) ports. The table supports three entry types: unicast drop, unicast, and multicast.

- A drop entry does not include a port.
- A unicast entry includes one port.
- A multicast entry includes at least one port.

Packets with a MAC address (source or destination) and VLAN specified by a drop entry are dropped. Drop entries are valid for only unicast MAC addresses.

The [mac address-table static](#) command adds a static entry to the MAC address table.

## Examples

- This command adds a static entry for unicast MAC address 0012.3694.03ec to the MAC address table.

```
switch(config)#mac address-table static 0012.3694.03ec vlan 3 interface
Ethernet
7
switch(config)#show mac address-table static
Mac Address Table
-----
Vlan    Mac Address      Type    Ports    Moves    Last Move
----    -
3       0012.3694.03ec  STATIC Et7
Total Mac Addresses for this criterion: 1

Multicast Mac Address Table
-----
Vlan    Mac Address      Type    Ports
----    -
Total Mac Addresses for this criterion: 0

switch(config)#
```

- This command adds the static entry for the multicast MAC address 0112.3057.8423 to the MAC address table.

```
switch(config)#mac address-table static 0112.3057.8423 vlan 4
interface
port-channel 10 port-channel 12
switch(config)#show mac address-table
Mac Address Table
-----
Vlan    Mac Address      Type    Ports    Moves    Last Move
----    -
Total Mac Addresses for this criterion: 0

Multicast Mac Address Table
-----
Vlan    Mac Address      Type    Ports
----    -
4       0112.3057.8423  STATIC Po10 Po12
Total Mac Addresses for this criterion: 1
switch(config)#
```

### 10.4.3.1.2 Dynamic MAC Address Table Entries

#### Learning Mode

The switch maintains a MAC address table for switching frames efficiently between VLAN ports. When the switch receives a frame, it associates the MAC address of the transmitting interface with the recipient VLAN and port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is not enabled, the entry is not added to the table.

---

The [switchport mac address learning](#) command enables MAC address learning for the configuration mode interface. MAC address learning is enabled by default on all Ethernet and port channel interfaces.

### Example

These commands disables MAC address learning for Ethernet interface 8, then displays the active configuration for the interface.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#no switchport mac address learning
switch(config-if-Et8)#show active
interface Ethernet8
no switchport mac address learning
switch(config-if-Et8)#
```

### Aging Time

Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry's VLAN from the specified MAC address. The switch removes entries when their presence in the MAC address table exceeds the aging time.

Aging time ranges from 10 to 1,000,000 seconds with a default of 300 seconds (five minutes).

### Example

This command sets the MAC address table aging time to two minutes (120 seconds).

```
switch(config)#mac address-table aging-time 120
switch(config)#
```

The [mac address-table aging-time](#) command configures the aging time for MAC address table dynamic entries. Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry's VLAN from the specified MAC address. The switch removes entries when their presence in the MAC address table exceeds the aging time.

### Clearing Dynamic Addresses

The [clear mac address-table dynamic](#) command removes specified dynamic entries from the MAC address table. Entries are identified by their VLAN and layer 2 (Ethernet or port channel) interface.

### Example

This command clears all dynamic mac address table entries for port channel 5 on VLAN 34.

```
switch(config)#clear mac address-table dynamic vlan 34 interface port-
channel 5
switch(config)
```

#### 10.4.3.2 Displaying the MAC Address Table

The [show mac address-table](#) command displays the specified MAC address table entries.

### Example

This command displays the MAC address table.

```
switch#show mac address-table
Mac Address Table
```

Vlan	Mac Address	Type	Ports	Moves	Last Move
101	001c.8224.36d7	DYNAMIC	Po2	1	9 days, 15:57:28 ago
102	001c.8220.1319	STATIC	Po1		
102	001c.8229.a0f3	DYNAMIC	Po1	1	0:05:05 ago
661	001c.8220.1319	STATIC	Po1		
661	001c.822f.6b22	DYNAMIC	Po7	1	0:20:10 ago
3000	001c.8220.1319	STATIC	Po1		
3000	0050.56a8.0016	DYNAMIC	Po1	1	0:07:38 ago
3909	001c.8220.1319	STATIC	Po1		
3909	001c.822f.6a80	DYNAMIC	Po1	1	0:07:08 ago
3911	001c.8220.1319	STATIC	Po1		
3911	001c.8220.40fa	DYNAMIC	Po8	1	1:19:58 ago
3912	001c.822b.033e	DYNAMIC	Et11	1	9 days, 15:57:23 ago
3913	001c.8220.1319	STATIC	Po1		
3913	001c.822b.033e	DYNAMIC	Po1	1	0:04:35 ago
3984	001c.8220.178f	DYNAMIC	Et8	1	4 days, 15:07:29 ago
3992	001c.8220.1319	STATIC	Po1		
3992	001c.8221.07b9	DYNAMIC	Po6	1	4 days, 15:13:15 ago
Total Mac Addresses for this criterion: 24					
----- Multicast Mac Address Table -----					
Vlan	Mac Address	Type	Ports		
Total Mac Addresses for this criterion: 0					

### 10.4.3.3 MAC Address Learning Per-VLAN

MAC address learning per-VLAN enables or disables MAC address learning per-VLAN instead of per-port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is disabled, the entry is not added to the table.

#### 10.4.3.3.1 Platform Compatibility

- DCS-7500E
- DCS-7280

#### 10.4.3.3.2 MAC Address Learning Configuration

The `mac address learning` command enables MAC address learning on a VLAN interface. By default, MAC address learning on a VLAN is enabled.

The switch maintains a MAC address table for switching frames between VLAN ports. When the switch receives a frame, it associates the MAC address of the transmitting interface with the recipient VLAN and port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is not enabled, the entry is not added to the table.

To disable MAC learning on a particular VLAN, use `no mac address learning` command on a VLAN configuration.

#### Examples

- These commands enable MAC address learning on *VLAN 10* configuration.

```
switch(config)#vlan 10
switch(config-vlan-10)#mac address learning
```

- These commands disable MAC address learning on *VLAN 10* configuration.

```
switch(config)#vlan 10
switch(config-vlan-10)#no mac address learning
```

---

## 10.4.4 Configuring Ports

This section describes these port properties:

- [Port Mirroring](#)
- [Storm Control](#)
- [Switched and Routed Ports](#)
- [Loopback Ports](#)
- [MAC Security](#)
- [Null0 Interface](#)
- [Maximum Transmission Units \(MTU\)](#)

### 10.4.4.1 Port Mirroring

Port mirroring, also known as port monitoring, is the duplication of traffic from a collection of source ports to a destination port. A mirror session correlates a set of source ports to a destination port.

Valid mirror sources are Ethernet or port channel interfaces, including port channels which are part of an MLAG. Mirror destination ports are usually Ethernet interfaces; port channel destination ports are also supported on some platforms.

**Note:** On platforms which support the use of port channels as mirror destinations, a port channel *must not* be used as a mirror destination if it is a member of an MLAG.

Layer 2 control protocols do not run on destination ports. An interface cannot be in more than one mirror session and cannot simultaneously be a source and destination. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from only one direction.

- **Ingress Mirroring:** Packets received by a source port are duplicated, including all valid data frames and L2 control PDUs. Ports mirror data before forwarding logic is applied. Packets subsequently dropped because of forwarding decisions are mirrored.
- **Egress Mirroring:** Packets transmitted by a source port are duplicated, with these exceptions:
  - **Flooded/Multicast Packets:** Packets sent to multiple mirror ports generate one copy, except in multi-chip devices when the mirror source and destination ports are on different chips; in this case, an extra copy is generated.
  - **Dropped Packets:** Packets dropped by forwarding decisions (such as output STP state checks) on egress sources are not duplicated. Packets dropped because of congestion may be duplicated.
- **Filtered Mirroring:** Specific packets are selected for mirroring based on PERMIT and DENY configurations.
- **Mirroring to GRE Tunnel:** Mirrored packets are encapsulated with GRE protocols for transiting Layer 3 network.

VLAN tags on duplicate packets from an egress source are identical to tags on inbound source packets.

When a packet's path through the switch includes multiple mirror source ports in different mirror sessions, the traffic is duplicated once and sent to the destination of the highest numbered session.

#### 10.4.4.1.1 Port Mirroring Capacity

Port mirroring capacity varies by platform. This section describes session limits for each platform.

##### FM6000 Platform Switches

- **Maximum Number of Sessions:** 4
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number)

- **Session Destinations:** Ethernet interfaces (any number), Port channel interfaces (any number), CPU
- Egress IP ACL on destination port is not supported

Sessions can mirror Rx, Tx, or both ways without impacting the number of available sessions.

Implementing any of the following reduces the number available sessions by one: ACL Logging, MLAG Peer Link, sFlow, VTEP Learning (VXLAN), LANZ Sampling

#### Arad Platform Switches

- **Maximum Number of Sessions:** 14
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number)
- **Session Destinations:** Ethernet interfaces (one)
- Egress IP ACL on destination port is not supported

Sessions can mirror Rx, Tx, or both ways without impacting number of available sessions.

Although the number of configured source interfaces is unlimited, the number of interfaces that can be effectively mirrored is restricted by the destination port speed.

#### Petra Platform Switches

- **Maximum Number of Sessions:** 16
- **Session Sources:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways)
- **Session Destinations:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways)
- Egress IP ACL on destination port is not supported

Sessions can mirror Rx, Tx, or both ways without impacting number of available sessions.

#### Trident Platform Switches

- **Maximum Number of Sessions:** 4
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number)
- **Session Destinations:** Ethernet interfaces (one)
- Egress IP ACL on destination port is supported

Mirroring Rx or Tx requires one session. Mirroring both ways requires two sessions.

#### Trident II Platform Switches

- **Maximum Number of Sessions:** 4 per chip
- **Session Sources:** Ethernet interfaces (any number), Port channel interfaces (any number)
- **Session Destinations:** Ethernet interfaces (one)
- Egress IP ACL on Destination Port is supported

Mirroring Rx or Tx requires one session. Mirroring both ways requires two sessions.

#### 10.4.4.1.2 Configuring Mirror Ports

Mirror sessions associate a set of source ports to a destination port using the [monitor session source](#) and [monitor session destination](#) commands. An interface cannot be used in more than one mirror session and cannot be simultaneously a source and a destination. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from one direction. On Trident and Trident II platform switches (DCS-7050, DCS-7050X, DCS-7250X, and DCS-7300X series), all frames mirrored on egress are prefixed with an 802.1Q VLAN tag, even when the egress port is configured as an access port. If the capture device cannot process VLAN tags properly, mirroring should be configured exclusively for ingress traffic by specifying `rx` in the [monitor session source](#) command.

---

Filtering on TX traffic in a mirror session is not supported.

### Example

These commands configure *Ethernet interface 7* as the source port and *Ethernet interface 8* as the destination port for the *redirect\_1* mirroring session. The session mirrors ingress and egress traffic.

```
switch(config)#monitor session redirect_1 source ethernet 7
switch(config)#monitor session redirect_1 destination ethernet 8
```

The [show monitor session](#) command displays the configuration of the specified port mirroring session.

### Example

This command shows the configuration of the *redirect\_1* mirroring session.

```
switch(config)#show monitor session

Session redirect_1
-----

Source Ports

  Both:          Et7

Destination Port: Et8

switch(config)#
```

The [monitor session ip access-group](#) command configures an ACL to filter the traffic being mirrored to the destination port.

### Example

These commands create an ACL and apply it to filter the traffic mirrored to the destination port by session "*redirect\_1*."

```
switch(config)#ip access-list allow-host
switch(config-acl-allow-host)#10 permit ip host 192.168.11.24 host
10.0.215.23
switch(config-acl-allow-host)#20 deny ip any any
switch(config-acl-allow-host)#exit
switch(config)#monitor session redirect_1 ip access-group allow-host
switch(config)#
```

#### 10.4.4.1.3 Configuring Filtered Mirroring

Filtered mirroring allows for configuring IPv4, IPv6, and MAC access lists and then updating a monitor session with corresponding configuration changes. EOS mirrors the packets that match permit statements. EOS does not select those packets for mirroring that match deny statements.

 **Note:** EOS supports all standard IPv4, IPv6, and MAC qualifiers.

On Strata series platforms, packets from a single monitor source can be mirrored in multiple sessions that use the same access-list. You can attach multiple monitor sources with various access-lists to a monitor session. Each monitor session should contain one access-list type only. Hence, IPv4, IPv6, and MAC access-lists from the same monitor source must appear in different monitor sessions.

When multiple IPv6 monitor sessions share the same monitor source, only one of the monitor sessions remains active and others are automatically inactivated. When the active monitor session is removed from the monitor source, the system automatically activates the inactive monitor sessions.

Packets matching both IP and MAC access lists behave differently on various platforms.

Platform Series	Behavior of Filtered Mirroring
<b>DCS-7050/7050X, DCS-7250X, and DCS-7300X</b>	When entry packets match both IPv4 and MAC access-lists, mirrored copies are created for both IPv4 and MAC access-lists; and forwarded to configured destinations.
<b>DCS-7280SE and DCS-7500E</b>	When entry packets match both IPv4 and MAC access-lists, a mirrored copy is created only for IPv4 access-list. The behavior of filtered mirroring varies in the following ways when a packet matches an entry in both access-list types: <ul style="list-style-type: none"> <li>• Mirroring is permitted when a packet contradicts with permit and deny configurations.</li> <li>• Mirroring is denied when an entry packet matches deny configurations in both.</li> <li>• IP access-list is prioritized over MAC access-list when an entry packet matches permit configurations in both.</li> </ul>

 **Note:** User-Defined Field (UDF) qualifiers in filtered mirroring access-lists allow matching packets using arbitrary user-defined patterns.

Use the `system profile` command to enable the Mirroring ACL profile that supports matching on IPv6, MAC and UDFs.

The following table provides the matching types supported in default and Mirroring ACL profiles.

Profiles	IPv4	IPv6	MAC	UDF
<b>Default</b>	Yes	No	No	No
<b>Mirroring ACL</b>	Yes	Yes	Yes	Yes

 **Note:** MAC mirroring-ACLs do not accept routed IPv4/IPv6 packets and bridged IPv6 packets.

### Examples

- These commands create an IPv4 access-list and then attach the access-list to monitor sessions.

```
switch(config)#ip access-list acl1
switch(config-acl-acl1)#10 permit tcp any any rst
switch(config-acl-acl1)#20 permit tcp any any syn
switch(config-acl-acl1)#30 permit tcp any any ack

switch(config)#monitor session 1 source Ethernet1 rx ip access-group
acl1
switch(config)#monitor session 1 source Ethernet2 rx ip access-group
acl1
switch(config)#monitor session 1 destination <destination>
```

- These commands create an IPv6 access-list and then attach the access-list to monitor sessions.

```
Arista(config)#ipv6 access-list acl2
Arista(config-ipv6-acl-acl2)#10 permit ipv6 any any
```

```
Arista(config)#monitor session 2 source Ethernet4 rx ipv6 access-group
acl2
Arista(config)#monitor session 2 destination Ethernet5
```

- These commands configure the same monitor source in multiple monitor sessions.

```
switch(config)#monitor session 1 source Ethernet1 rx ip access-group
acl1
switch(config)#monitor session 1 destination <destination 1>

switch(config)#monitor session 2 source Ethernet1 rx ip access-group
acl2
switch(config)#monitor session 2 destination <destination 2>
```

- This command configures access-list priorities for dictating the matching order across multiple access-lists that are attached to the same monitor source.

```
switch(config)#monitor session 1 source Ethernet1 rx ip access-group
acl1
priority 1
switch(config)#monitor session 1 destination <destination 1>

switch(config)#monitor session 2 source Ethernet1 rx ip access-group
acl2
priority 2
switch(config)#monitor session 2 destination <destination 2>
```

- This command enables the Mirroring ACL profile.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#system profile mirroring-acl
switch(config-hw-tcam)#show hardware tcam profile
Configuration      Status
FixedSystem        mirroring-acl      mirroring-acl
switch(config-hw-tcam)#
```

#### 10.4.4.1.4 Filtered Mirroring to CPU

Filtered mirroring to CPU adds a special destination to port mirroring that allows mirrored traffic to be sent to the switch supervisor. The traffic can then be monitored and analyzed locally without the need of a remote port analyzer. Filtered mirroring to CPU can also be used for debugging and troubleshooting configured to mirror RX traffic, TX traffic or both, with up to 14 mirroring profiles used simultaneously. In addition, mirroring to CPU uses control plane protection to limit the rate of the traffic sent to the CPU.

#### Examples

- These commands configure the source for normal mirroring and the destination to CPU.

```
switch(config)#monitor session mySession source ethernet 3/1 both
switch(config)#monitor session mySession destination cpu
switch(config)#
```

- These commands configure reserved bandwidth and shape rate of mirrored traffic.

```
switch(config)#policy-map type copp copp-system-policy
switch(config-pmap-control-plane-copp-system-policy)#class
copp-system-mirroring
switch(config-pmap-c-copp-system-policy-copp-system-
mirroring)#bandwidth kbps
```

```

2000
switch(config-pmap-c-copp-system-policy-copp-system-mirroring)#shape
kbps 4000
switch(config-pmap-c-copp-system-policy-copp-system-mirroring)#

```

- These commands show the current status of mirroring to CPU from the CLI, and display the control plane protection configuration for mirroring to CPU.

```

switch(config)#show monitor session

          Session mySession
          -----
          Source Ports:

          Both : Et3/1

          Destination Ports:

          Cpu : active (mirror0)

switch(config)#

```

- These commands show the current status of mirroring to CPU from the CLI, and display the control plane protection configuration for mirroring to CPU.

```

switch(config)#show policy-map type copp copp-system-policy class
cop-system-mirroring

          Class-map: copp-system-mirroring (match-any)

          shape : None

          bandwidth : None

switch(config)#

```

#### 10.4.4.1.5 Configuring Filtered Mirroring to GRE Tunnel

The [monitor session source](#) and [monitor session destination](#) commands configure source and destination ports to the specified port mirroring session in a GRE tunnel.

DCS-7050/7050X, DCS-7250X, and 7300X devices support forwarding-drop destination, a special GRE tunnel destination for mirroring ingress packets that are dropped during ASIC forwarding. The [monitor session forwarding-drop](#) command configures forwarding-drop sessions.

**Note:** Forwarding-drop sessions are the sessions corresponding to forwarding-drop destinations.

#### Examples

- These commands configure ingress filtered mirroring to a GRE tunnel.

```

switch(config)#monitor session abc source Ethernet1 rx ip access-group
acl1
switch(config)#monitor session abc destination tunnel mode gre source
1.1.1.1
destination 2.2.2.2 ttl 128 dscp 0 protocol 0x88be

```

- This command configures forwarding-drop sessions.

```

switch(config)#monitor session 1 forwarding-drop destination tunnel

```

```
mode gre source 1.1.1.1 destination 2.2.2.2
```

#### 10.4.4.2 Storm Control

A traffic storm is a flood of packets entering a network, resulting in excessive traffic and degraded performance. Storm control prevents network disruptions by limiting traffic beyond specified thresholds on individual physical LAN interfaces.

Storm control monitors inbound traffic levels over one-second intervals and compares the traffic level with a specified benchmark.

Storm control has three modes:

- **Storm control all:** When inbound traffic exceeds the specified threshold within a one-second control interval, all traffic is dropped until the end of the interval.
- **Storm control broadcast:** When inbound broadcast traffic exceeds the specified threshold within a one-second control interval, broadcast traffic is dropped until the end of the interval.
- **Storm control multicast:** When inbound multicast traffic exceeds the specified threshold within a one-second control interval, multicast traffic is dropped until the end of the interval.

Broadcast and multicast storm control are independent features and can be enabled simultaneously. The **storm control all** threshold overrides broadcast and multicast thresholds.

#### Storm Control Configuration

The `storm-control` command configures and enables broadcast or multicast storm control on the configuration mode interface. The command provides three mode options:

- **storm-control all** unicast, multicast, and broadcast inbound packet control.
- **storm-control broadcast** broadcast inbound packet control.
- **storm-control multicast** multicast inbound packet control.

An interface configuration can contain three storm-control statements, one with each mode setting. The `storm-control all` threshold overrides broadcast and multicast thresholds.

When storm control is enabled, the switch monitors inbound traffic levels over one second intervals and compares the traffic level with a specified threshold. The threshold is a percentage of the total available port bandwidth and is configurable on each interface for each transmission mode.

#### Examples

- These commands enable multicast storm control on Ethernet interfaces 2 through 4 and set a threshold of 65%. During each one second interval, the interface drops inbound multicast traffic in excess of 65% of capacity.

```
switch(config)#interface ethernet 2 / 3 / 4
switch(config-if-Et4/4/4)#storm-control multicast level 65
switch(config-if-Et4/4/4)#
```

- These commands clear multicast storm control on Ethernet interfaces 2 through 4.

```
switch(config)#interface ethernet 2 / 3 / 4
switch(config-if-Et2/3/4)#no storm-control multicast
switch(config-if-Et2/3/4)#
```

- These commands enable broadcast storm control on Ethernet interfaces 2 through 4 and set broadcast traffic to 50%. During each one second interval, the interface drops inbound multicast traffic in excess of 50% of capacity.

```
switch(config)#interface ethernet 2 / 3 / 4
switch(config-if-Et2/3/4)#storm-control broadcast level 50
```

```
switch(config-if-Et2/3/4) #
```

- These commands enable broadcast storm control on Ethernet interfaces 2 through 4 and set a threshold of 5000 packets per second (pps).

```
switch(config) #interface ethernet 2 / 3 / 4
switch(config-if-Et2/3/4) #storm-control broadcast level pps 5000
switch(config-if-Et2/3/4) #
```

- These commands clear broadcast storm control on Ethernet interfaces 2 through 4.

```
switch(config) #interface ethernet 2 / 3 / 4
switch(config-if-Et2/3/4) #no storm-control broadcast
switch(config-if-Et2/3/4) #
```

The `show storm-control` command displays the storm-control level and interface inbound packet capacity for the specified interface.

### Example

This command displays the storm control configuration for Ethernet ports 2 through 4.

```
switch(config-if-Et2/3/4) #show storm-control
Port          Type      Level   Units  Rate (Mbps)  Status  Drops  Reason
Et2/3/4      all       75.00   %      7500         active   0
              multicast 55.00   %      5500         active   0
              broadcast 50.00   %      5000         active   0
switch(config-if-Et2/3/4) #
```

#### 10.4.4.3 Switched and Routed Ports

A switched port is an Ethernet or port channel interface that is configured as a layer 2 interface. Switched ports bridge frames and are assigned to at least one VLAN. Switched ports are not associated with any IP addresses. By default, Ethernet and port channel interfaces are in switched port mode.

A routed port is an Ethernet or port channel interface that is configured as a layer 3 interface. Routed ports do not bridge frames and are not members of any VLANs. Routed ports can have IP addresses assigned to them and packets are routed directly to and from the port.

Configuring an interface as a routed port is similar to creating a VLAN with spanning-tree disabled, making the port the only member of that VLAN and configuring the IP address on the switch virtual interface (SVI) associated with the VLAN.

All IP-level interface configuration commands, except **autostate** and **ip virtual-router**, can be used to configure a routed interface. If the interface is reverted to switched port mode, **running-config** maintains IP level interface configuration statements. These changes become active again if the interface is configured back to routed port mode.

A LAG that is created with the **channel-group** command inherits the mode of the member port. A LAG created from a routed port becomes a routed LAG. IP-level configuration is not propagated to the LAG from its component members.

The broadcast queue towards the CPU is shared among all interfaces of the forwarding chip. Broadcast storm on a single port adversely impacts other interfaces of the same chip by potentially dropping even low rate broadcast frames. Routed port storm control attempts to mitigate this effect by performing storm control on the broadcast frames for routed ports.

---

## Routed Port Configuration

The switching-routing configuration of Ethernet and port channel interfaces is specified by the `switchport` and `no switchport` commands. These commands only toggle the interface between switched and routed modes. They have no effect on other configuration states.

The `no switchport` command places the configuration mode interface in `routed port` mode. Routed ports behave as Layer 3 interfaces. They do not bridge packets and are not VLAN members. An IP address can be assigned to a routed port for the direct routing of packets to and from the interface.

When an interface is configured as a routed port, the switch transparently allocates an internal VLAN whose only member is the routed interface. Internal VLANs are created in the range from 1006 to 4094. VLANs that are allocated internally for a routed interface cannot be directly created or configured. [Allocating Internal VLANs](#) describes VLAN allocation configuration procedures.

### Example

This command places Ethernet interface 5 in routed port mode.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no switchport
```

## Switched Port Configuration

The `switchport` command places the configuration mode interface in `switched port (Layer 2)` mode. Switched ports are configurable as members of one or more VLANs through other `switchport` commands. Switched ports ignore all IP level configuration commands, including IP address assignments. By default, Ethernet and port channel interfaces are switched ports.

### Example

This command places Ethernet interface 5 in switched port mode.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport
```

The `switchport default mode routed` command places the configuration mode interface for a switch with all ports in `switched port (Layer 3) routed` mode, changing the switch with all ports from `switchport default mode access`.

### Examples

- This command places a switch with all ports in routed mode.

```
switch(config)#switchport default mode routed
```

- This command places a switch with all ports in access mode.

```
switch(config)#switchport default mode access
```

#### 10.4.4.4 Loopback Ports

A loopback interface is a virtual network interface implemented in software and does not connect to any hardware. Traffic sent to the loopback interface is immediately received on the sending interface. The switch provides loopback configuration mode for creating loopback interfaces and modifying their operating parameters.

Internet protocols reserve specific addresses for loopback network segments:

- IPv4 designates 127/8 as loopback subnet, which includes 127.0.0.0 through 127.255.255.255.
- IPv6 designates ::1/128 as the loopback address, which includes 0:0:0:0:0:0:0:1 (also written as ::1).

Arista switches support the configuration of 1001 loopback interfaces, numbered from 0 to 1000.

### Loopback Interface Configuration

Loopback ports are instantiated by entering loopback interface mode for the desired port number. Loopback interface mode also provides access to loopback configuration commands. Previously instantiated ports are edited by entering loopback interface mode for the specified port.

The `interface loopback` command places the switch in interface-loopback configuration mode for the specified interfaces, creating loopback interfaces for each specified port not previously created.

### Example

These commands instantiate *loopback interface 2* and assigns it IP address *10.1.1.42/24*.

```
switch(config)#interface loopback 2
switch(config-if-Lo2)#ip address 10.1.1.42
switch(config-if-Lo2)#show active
interface Loopback2
  ip address 10.1.1.42/24
switch(config-if-Lo2)#
```

## 10.4.4.5 MAC Security

MAC security restricts input to a switched port by limiting the number of MAC addresses that can access the port. Ports with MAC security enabled restrict traffic to a limited number of hosts, as determined by their MAC addresses. When the limit is exceeded, the port becomes errdisabled.

### Port Security Configuration

MAC address security is enabled by `switchport port-security`. The default MAC address limit on an interface where port security is enabled is one; to change that default limit, use the `switchport port-security mac-address maximum` command.

### Example

These commands enable MAC security on *Ethernet interface 7*, set the maximum number of assigned MAC addresses to 2, assign two static MAC addresses to the interface, and clear the dynamic MAC addresses for the interface.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#switchport port-security
switch(config-if-Et7)#switchport port-security mac-address maximum 2
switch(config-if-Et7)#exit
switch(config)#mac address-table static 0034.24c2.8f11 vlan 10 interface ethernet
7
switch(config)#mac address-table static 4464.842d.17ce vlan 10 interface ethernet
7
switch(config)#clear mac address-table dynamic interface ethernet 7
switch(config)#show port-security
Secure Port      MaxSecureAddr  CurrentAddr    SecurityViolation  Security Action
              (Count)          (Count)          (Count)
-----
Et7                2                2                0                Shutdown
-----
Total Addresses in System: 1
switch(config)#show port-security mac-address
Secure Mac Address Table
-----
Vlan    Mac Address      Type          Ports    Remaining Age
```

```

-----
----- (mins)
-----
10 0034.24c2.8f11 SecureConfigured Et7 N/A
10 4464.842d.17ce SecureConfigured Et7 N/A
-----
Total Mac Addresses for this criterion: 2
switch(config)#

```

#### 10.4.4.6 Null0 Interface

The null0 interface is a virtual interface that drops all inbound packets. A null0 route is a network route whose destination is **null0 interface**. Inbound packets to a null0 interface are not forwarded to any valid address. Many interface configuration commands provide **null0** as an interface option.

#### 10.4.4.7 Maximum Transmission Units (MTU)

The MTU of a communications protocol refers to the size in bytes of the largest frame (Ethernet) or packet (IP) that can be sent on the network.

Different protocols support a variety of MTU sizes. Most IP over Ethernet implementations use the Ethernet V2 frame format, which specifies an MTU of 1500 bytes. Jumbo frames are Ethernet frames containing more than 1500 bytes.

##### 10.4.4.7.1 Switching interface MTU size

On Arista devices, layer two interfaces (either trunk or access ports) are set with a default ethernet MTU of 9236 bytes. This value cannot be changed and is derived as follows: 9214 + 6 (source MAC) + 6 (dst MAC) + 4 (VLAN tag) + 2 (ether type) + 4 (crc) totals 9236 bytes.

The output of a [show interfaces](#) command for a layer two interface displays the following:

##### Trunk

```

Ethernet1 is up, line protocol is up (connected)
Hardware is Ethernet, address is 001c.731c.5073 (bia 001c.731c.5073)
Ethernet MTU 9214 bytes , BW 1000000 kbit

```

##### Access

```

Ethernet3 is up, line protocol is up (connected)
Hardware is Ethernet, address is 001c.731c.5075 (bia 001c.731c.5075)
Ethernet MTU 9214 bytes , BW 1000000 kbit

```

##### 10.4.4.7.2 Routing Interface MTU Size

The MTU size on layer 3 interfaces varies between a minimum of 68 to the maximum 9214 bytes. The default size is 1500 bytes. The **show interface** output for a layer three interface displays the following:

##### VLAN routed interface

```

Vlan100 is up, line protocol is up (connected)
Hardware is Vlan, address is 001c.731c.5072 (bia 001c.731c.5072)
Internet address is 10.1.1.2/24
Broadcast address is 255.255.255.255
Address determined by manual configuration
IP MTU 9214 bytes

```

## Physical routed interface

```
Ethernet4 is down, line protocol is down (connect)
Hardware is Ethernet, address is 001c.731c.5072
Internet address is 10.10.10.10/24
Broadcast address is 255.255.255.255
Address determined by manual configuration
IP MTU 9214 bytes
```

A routed interface fragments packets that exceed the configured IP MTU on the interface. For example, if a 2000 byte packet is received on routed interface 1 and is forwarded from routed interface 2 then routed interface 2 fragments the packet into a 1500 byte packet plus an additional packet containing the remaining data. This fragmentation should be avoided by configuring a consistent IP MTU across all systems within the operational domain.

The IP MTU set on a routed interface is valid for both IPv4 and IPv6 packets.

## MTU Configuration

The `mtu` command configures the IPv4 and IPv6 Maximum Transmission Unit (MTU) size for the configuration mode interface. An interface's MTU value is displayed with the `show interface` command. The command is valid for all routable interfaces.

## Examples

- This command sets the MTU size of 1492 bytes on VLAN interface 20.

```
switch(config-if-Vl20)#mtu 1492
switch(config-if-Vl20)#
```

- This command displays status for a routed interface.

```
switch(config-if-Et3)#show interface e3
Ethernet3 is up, line protocol is up (connected)
Hardware is Ethernet, address is 001c.731c.5072
Internet address is 10.1.1.2/24
Broadcast address is 255.255.255.255
Address determined by manual configuration
IP MTU 1500 bytes , BW 1000000 kbit
Full-duplex, 1Gb/s, auto negotiation: on, uni-link: unknown
Up 22 days, 7 hours, 47 minutes, 58 seconds
switch(config)#
```

- Using ping on a Linux host, you can test the maximum transmission through the interface.

```
[user@linux ~]$ ping -M do -s 1472 10.1.1.2
PING 10.1.1.2 (10.1.1.2) 1472(1500) bytes of data.
1480 bytes from 10.1.1.2: icmp_seq=1 ttl=64 time=0.206 ms
1480 bytes from 10.1.1.2: icmp_seq=2 ttl=64 time=0.191 ms
--- 10.1.1.2 ping statistics ---
2 packets transmitted, 2 received, 0% packet loss, time 999ms
rtt min/avg/max/mdev = 0.191/0.198/0.206/0.015 ms
```

The size 1472 has 8 bytes of ICMP information added and 20 bytes of IP headers added, generating a total packet size of 1500 bytes.

- The option '-M do' specifies that fragmentation is prohibited for this test.
- The option '-s' specifies the size of the packet being generated.
- A capture of the frame displays total length of 1514 bytes on the wire which includes the Ethernet headers and type field.

---

## 10.4.5 Monitoring Links

This section describes link monitoring and object tracking processes:

- [Object Tracking](#)
- [Errdisabled Ports](#)
- [Link Flap Monitoring](#)
- [Fabric Link Monitoring](#)
- [Rapid Automated Indication of Link-Loss](#)

### 10.4.5.1 Object Tracking

Object tracking makes it possible for the switch to take action in response to changes in specific switch properties by creating an object to track those properties. When the tracked property changes, the object then changes state, allowing configured agents to react accordingly.

#### Object Tracking Configuration

The [track](#) command creates an object that changes state to reflect changes in a specific switch property. Agents configured to track that object are then able to react to the change.

#### Example

These commands create an object that tracks the line protocol state on Ethernet interface 8, then configures Ethernet interface 5 to disable VRRP when that tracked object changes state to **down**.

```
switch(config)#track ETH8 interface ethernet 8 line-protocol
switch(config)#interface ethernet 5
switch(config-if-Et5)#vrrp 1 tracked-object ETH8 shutdown
switch(config-if-Et5)#
```

These commands use object tracking:

- [link tracking group](#)
- [vrrp tracked-object](#)

### 10.4.5.2 Errdisabled Ports

The switch places an Ethernet or management interface in **error-disabled** state when it detects an error on the interface. **Error-disabled** is an operational state that is similar to link-down state. Conditions that error-disable an interface include:

- bpduguard
- link-flap
- no-internal-vlan
- portchannelguard
- portsec
- tapagg
- uplink-failure-detection
- xcvr\_unsupported

Most conditions are programmed by the configuration of other features, such as Spanning Tree protocol (bpduguard). Link flap error-disabling is configured through errdisable commands or link flap monitor commands ([Link Flap Monitoring](#)).

Error-disabled interfaces are recovered either through manual or automated methods.

To manually recover an interface, enter its configuration mode and execute **shutdown** and **no shutdown** commands.

### Example

These commands manually recover Ethernet interface 30 from the errdisable state.

```
switch(config)#interface ethernet 30
switch(config-if-Et30)#shutdown
switch(config-if-Et30)#no shutdown
switch(config-if-Et30)#
```

Automated recovery of Ethernet interfaces that are error-disabled by a specified condition is enabled by [errdisable recovery cause](#) . The [errdisable recovery interval](#) specifies the period that an interface remains disabled until it is enabled and begins operating normally. When the disabling condition persists, recovered interfaces eventually return to the error-disabled state.

### Example

These commands configure automated recovery for all interfaces that are error-disabled from link flap and bpduguard conditions. Automated recovery begins five minutes after the port is disabled.

```
switch(config)#errdisable recovery cause link-flap
switch(config)#errdisable recovery cause bpduguard
switch(config)#errdisable recovery interval 300
switch(config)#
```

## 10.4.5.3 Link Flap Monitoring

Link flap frequency is the quantity of link flaps (connection state changes) over a specified period. Excessive link flaps result in network stability issues, including spanning tree and routing recalculations. Link flaps are often caused by layer 1 issues, such as a bad cable or duplex mismatch. Link flap monitoring specifies link flap thresholds and disables a port when a threshold is exceeded.

Link flap monitoring can be enabled on all interfaces through errdisable link flap commands or on individual interfaces with the link flap monitor.

### 10.4.5.3.1 Global Link Flap Monitor

Global link flap detection is configured through two global configuration mode commands:

- [errdisable flap-setting cause link-flap](#) configures the link-flap frequency that defines link-flap errors on an Ethernet interface.
- [errdisable detect cause link-change](#) enables the error-disabling of Ethernet interfaces that exceed the threshold link flap frequency.

Link-flap detection is enabled by default.

### Example

These commands sets the link flap error criteria of 15 connection state changes over a 30 second period, then enables error detection on all interfaces.

```
switch(config)#errdisable flap-setting cause link-flap max-flaps 15 time
30
switch(config)#errdisable detect cause link-change
switch(config)#
```

### 10.4.5.3.2 Interface Link Flap Monitor

An interface is monitored for link flap errors with link flap profiles. A link flap profile specifies conditions that define a link-flap error. Profiles are assigned to Ethernet interfaces. Multiple profiles can be assigned to an interface to monitor a set of error conditions.

The global link flap monitor is used by interfaces that are not individually monitored for link flap errors.

#### Configuring Link Flap Profiles

Link flap profiles are configuration statements that define a link flap error in terms of these criteria:

- **flaps** Threshold number of interface state changes.
- **period** Interval when link flaps accumulate to trigger an error condition.
- **violations** Number of link flap errors (threshold exceeded over specified period).
- **intervals** Quantity of periods.

The `monitor link-flap policy` command places the switch in link-flap configuration mode for configuring link flap profiles and compiling a default-profile set. The `profile max-flaps (Link Flap Configuration)` command configures link flap profiles.

The default-profile set is a list of link-flap profiles that define error-disable criteria for interfaces where link flap monitoring is enabled but link-flap profiles are not assigned. The default-profile set may contain zero, one, or multiple profiles. When the default-profile set is empty, `errdisable flap-setting cause link-flap` specifies default error-disable criteria. When the default-profile set contains multiple profiles, the criteria is satisfied when conditions match any profile.

#### Example

These commands enter link flap configuration mode and create four link flap profiles.

```
switch(config)#monitor link-flap policy
switch(config-link-flap)#profile LF01 max-flaps 15 time 60
switch(config-link-flap)#profile LF02 max-flaps 10 time 30 violations 5
intervals 10
switch(config-link-flap)#profile LF03 max-flaps 20 time 75 violations 2
intervals 6
switch(config-link-flap)#profile LF04 max-flaps 30 time 100 violations 4
intervals 7
switch(config-link-flap)#show active
monitor link-flap policy
  profile LF01 max-flaps 15 time 60 violations 1 intervals 1
  profile LF02 max-flaps 10 time 30 violations 5 intervals 10
  profile LF02 max-flaps 20 time 75 violations 2 intervals 6
  profile LF02 max-flaps 30 time 100 violations 4 intervals 7
switch(config-link-flap)#
```

The `default-profiles` command specifies the set of link-flap profiles that define error-disable criteria for interfaces where link flap monitoring is enabled without a link flap profile assignment. Entering a `default-profile` command replaces the current default-profile statement in **running-config**.

The default-profile set may contain zero, one, or multiple profiles. When the default-profile set is empty, `errdisable flap-setting cause link-flap` specifies default error-disable criteria. When the default-profile set contains multiple profiles, error-disable criteria is satisfied when conditions match any profile. Multiple profiles are assigned to the default-profile set through a single `default-profiles` command.

#### Example

This command assigns configures LF01 and LF02 as the default-profile set.

```
switch(config)#monitor link-flap policy
```

```
switch(config-link-flap) #default-profiles LF01 LF02
switch(config-link-flap) #show active
monitor link-flap policy
  profile LF01 max-flaps 15 time 60 violations 1 intervals 1
  profile LF02 max-flaps 10 time 30 violations 5 intervals 10
  profile LF02 max-flaps 20 time 75 violations 2 intervals 6
  profile LF02 max-flaps 30 time 100 violations 4 intervals 7
  default-profiles LF01 LF02
switch(config-link-flap) #
```

## Interface Link Flap Profile Assignments

Link flap monitoring is enabled on individual Ethernet interfaces and can optionally specify one or more profiles to define link-flap error-disabling criteria. When link flap monitoring is enabled on an interface, the link-flap conditions determine when the interface is error-disabled. Multiple profiles can be assigned to an interface to monitor a set of error conditions; a port is disabled when conditions match any of the profiles assigned to an interface.

The [monitor link-flap profiles](#) command controls link-flap monitoring on a configuration mode interface. The command provides these link flap detection options:

- **monitor link-flap (no profiles listed):** Interface detects link flaps using default-profile set criteria.
- **monitor link-flap (at least one profile listed):** Interface detects link flaps using listed profile criteria.
- **default monitor link-flap:** The interface uses global link flap monitor commands ([Global Link Flap Monitor](#)).
- **no monitor link-flap:** The interface does not detect link flaps.

## Examples

- This command assigns LF03 and LF04 link flap profiles to **Ethernet interface 33**.

```
switch(config) #interface ethernet 33
switch(config-if-Et33) #monitor link-flap profiles LF03 LF04
switch(config-if-Et33) #show active
interface Ethernet33
  monitor link-flap profiles LF04 LF03
switch(config-if-Et33) #
```

- This command disables link-flap monitoring on **Ethernet interface 34**.

```
switch(config) #interface ethernet 34
switch(config-if-Et34) #no monitor link-flap
switch(config-if-Et34) #show active
interface Ethernet34
  no monitor link-flap
switch(config-if-Et34) #
```

- This command assigns the default-profile set to **Ethernet interface 35**.

```
switch(config) #interface ethernet 35
switch(config-if-Et35) #monitor link-flap
switch(config-if-Et35) #show active
interface Ethernet35
  monitor link-flap
switch(config-if-Et35) #
```

- This command configures **Ethernet interface 36** to use the global link flap monitoring commands

```
switch(config) #interface ethernet 36
switch(config-if-Et36) #default monitor link-flap
```

```
switch(config-if-Et36) #show active
interface Ethernet36
switch(config-if-Et36) #
```

#### 10.4.5.4 Fabric Link Monitoring

Fabric link monitoring enables EOS to monitor low error rate errors on all fabric links for long durations, and automatically isolates fabric links on consistent error detection over an extended time interval. Isolated fabric links are restored when the error rate drops below a configured threshold.

The error rate over each configurable polling interval is derived by comparing the number of cells with CRC errors against the total number of received cells. Links are automatically isolated when the error rate is above the configured threshold for the configured consecutive number of polling intervals.

On an isolated fabric link, control cells (but not data cells) are sent. Once the error rate drops below a set threshold for the configured consecutive number of polling intervals, EOS revives the fabric link to continue sending data traffic.

##### 10.4.5.4.1 Configuring Fabric Link Monitoring

Configuration mode commands globally enable and disable fabric link monitoring and syslog messages for the settings described below.

The **no platform sand monitor** command disables fabric link monitoring.

#### Generate Serdes Error Syslog

The [platform sand monitor serdes error log](#) command generates syslog fabric link monitoring for serdes error logging.

#### Example

This command enables the serdes error log for fabric link monitoring.

```
switch(config) #platform sand monitor serdes error log
switch(config) #
```

The following syslog messages are not enabled by default. Fabric link monitoring syslog is enabled by configuring the [platform sand monitor serdes error log](#) command.

#### Examples

- The following syslog message is generated when a fabric link for serdes is automatically withdrawn:

```
%SAND-4-SERDES_WITHDRAWN_FROM_FABRIC: Serdes withdrawn from the switch
fabric.
```

- Here is another instance where a syslog message is generated when a fabric link is automatically withdrawn:

```
%SAND-4-SERDES_WITHDRAWN_FROM_FABRIC: Serdes Arad10/5-FabricSerdes-11
withdrawn from the switch fabric.
```

- The following syslog message is generated when a fabric link is restored:

```
%SAND-4-SERDES_RESTORED_TO_FABRIC: Serdes restored to the switch
fabric.
```

- Here is another instance where a syslog message is generated when a fabric link is restored:

```
%SAND-4-SERDES_RESTORED_TO_FABRIC: Serdes Arad10/5-FabricSerdes-11
restored to the switch fabric.
```

### Generate Serdes Error Threshold

The [platform sand monitor serdes error threshold](#) command generates a fabric link monitoring serdes error threshold.

#### Example

This command monitors serdes error thresholds over the specified number of received cells, resulting in the isolation of a fabric link between 200 and 30,000 received cells.

```
switch(config)#platform sand monitor serdes error threshold 200 30000
switch(config)#
```

### Enable Serdes Poll Period

The [platform sand monitor serdes poll period](#) command sets the serdes poll period.

#### Example

This command changes the serdes polling period for fabric link monitoring to 6 seconds.

```
switch(config)#platform sand monitor serdes poll period 6
switch(config)#
```

### Monitor Serdes Poll Threshold Isolation

The [platform sand monitor serdes poll threshold isolation](#) command sets and enables fabric link monitoring for serdes poll threshold isolation.

#### Example

This command changes the number of consecutive polls in which the threshold needs to be detected to isolate a link. In this case the number is 5 consecutive polls.

```
switch(config)#platform sand monitor serdes poll threshold isolation 5
switch(config)#
```

### Monitor Serdes Poll Threshold Recovery

The [platform sand monitor serdes poll threshold recovery](#) command sets and enables fabric link monitoring for serdes poll threshold recovery.

#### Example

This command changes the number of consecutive serdes polls used for threshold recovery to 6 seconds.

```
switch(config)#platform sand monitor serdes poll threshold recovery 6
switch(config)#
```

---

## Show Fabric Monitoring Health

The `show fabric monitoring health` command displays the fabric monitoring connected state status with isolated links.

### Example

When fabric links are isolated, their connected state status is shown with isolated links.

```
switch(config)#show platform sand health
Fabric serdes isolated by fabric monitoring: (36 total)

Arad5/0 serdes [0-1, 10-19, 2, 20-29, 3, 30-35, 4-9]

Top fabric serdes list by number of times isolated by monitoring:
Arad5/0 serdes 0: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 1: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 10: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 11: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 12: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 13: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 14: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 15: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 16: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 17: 1 (last occurred: 0:01:04 ago)

switch(config)#
```

### 10.4.5.5 Rapid Automated Indication of Link-Loss

Rapid Automated Indication of Link-Loss (RAIL) is a software feature that reduces the wait time of applications on hosts that are blocked due to a failed link. When a link goes down because of link-flapping or the unavailability of a directly connected server, the switch drops all traffic to servers whose next-hop destination was learned on the port connected to the link. Applications that drive the traffic (clients on source hosts) are blocked because of the dropped edge-switch traffic. Connection timeout varies by application and is usually measured in seconds or minutes.

RAIL is functional on a switch if it is routing-enabled and available for servers that set the switch as the default router.

#### 10.4.5.5.1 RAIL Method

When a link monitored by RAIL goes down, the switch performs these steps for servers that the switch proxies:

1. IP addresses of servers on the failed link are extracted from ARP cache. The interface that accesses the server is determined by searching for the MAC address in the hardware MAC address tables.
2. Upon link shutdown, a dynamic MAC entry is added in the MAC address table for each server that was learned on the failed interface. Each new entry lists its interface as **CPU**.

The figure below titled **RAIL Scenarios** depicts three switch-server scenarios: link is up, link is down with RAIL disabled, and link is down with RAIL enabled. A failed link with RAIL enabled results in these behaviors:

1. All ingress packets whose destination MAC address matches an address added to the MAC address table are sent to the CPU.
2. For packets scheduled to be forwarded to the source address, the switch sends one of the following, based on the type of received segment:
  - TCP: TCP RST segment to the source IP address and port.

- UDP: ICMP unreachable segment to the source IP address and port.
3. The client closes the socket associated with the transmitted segment and notifies the application. The application reacts immediately instead of maintaining the block until connection timeout expiry.

Figure 12: RAIL Scenarios

#### 10.4.5.5.2 RAIL Implementation

RAIL defines a state machine that manages the RAIL activity level relative to a specified server. The state machine consists of four states:

- **Up:** Transitions to this state from *Inactive* when ARP and MAC entries are added for the server.
- **Proxying:** Transitions to this state from *Up* when Link Down is detected and RAIL proxying is enabled. The switch is a proxy for messages to the server.
- **Down:** Transitions to this state from *Up* when Link Down is detected and RAIL proxying is not enabled. Messages from the client remain unanswered and the application recovers only after timeout expiry.
- **Inactive:** Transitions to this state upon any of the following conditions:
  - Server's MAC address or ARP entry is deleted (from any state).
  - Proxy timeout expiry (from *Proxying* state)
  - Link down timeout expiry (from *Down* state).

#### 10.4.5.5.3 RAIL Configuration

Server-failure configuration mode commands globally enable RAIL and configure RAIL parameters. RAIL is functional on individual interfaces only when it is globally enabled and enabled on the interface. RAIL monitors an interface for link errors when RAIL is globally enabled and enabled on the interface.

##### Entering Server-failure Configuration Mode

The `monitor server-failure` command places the switch in server-failure configuration mode. The `exit` command returns the switch to global configuration mode. Server-failure mode is not a group change mode; *running-config* is changed when commands are entered and not affected by exiting the mode.

The `no monitor server-failure` deletes all server-failure mode commands from *running-config*.

##### Examples

- These commands place the switch in server-failure configuration mode.

```
switch(config)#monitor server-failure
switch(config-server-failure)#
```

- This command deletes all server-failure configuration mode commands from *running-config*.

```
switch(config)#no monitor server-failure
switch(config)#
```

### Enabling RAIL on the Switch

RAIL is disabled by default and is enabled by `no shutdown (server-failure configuration mode)`. The `shutdown` command disables RAIL without removing RAIL commands from *running-config*.

### Examples

- These commands enable RAIL globally.

```
switch(config)#monitor server
switch(config-server-failure)#no shutdown
switch(config-server-failure)#show active
monitor server-failure
  no shutdown
switch(config-server-failure)#
```

- This command disables RAIL globally.

```
switch(config-server-failure)#shutdown
switch(config-server-failure)#
```

### Enabling Proxy Mode

The `proxy (server-failure configuration mode)` command sets the RAIL proxy setting to *enabled* and specifies the interval that RAIL responds to messages sent to servers on failed links. The proxy timeout is measured individually for each server whose link has failed. The switch enters RAIL proxy state only when the proxy setting is enabled.

When RAIL is enabled but the proxy setting is disabled, the switch maintains a list of unavailable servers without responding to messages sent to the servers. The RAIL proxy setting is *disabled* by default. When RAIL proxy is enabled, the default period is three minutes.

The `no proxy` and `default proxy` commands return the RAIL proxy setting to *disabled*. The `no proxy lifetime` and `default proxy lifetime` commands set the proxy timeout to its default of three minutes if the RAIL proxy setting is *enabled*. The lifetime commands have no effect if RAIL proxy is *disabled*.

### Examples

- These commands enable the RAIL proxy and sets the proxy timeout period of 10 minutes.

```
switch(config)#monitor server
switch(config-server-failure)#proxy lifetime 10
switch(config-server-failure)#show active
monitor server-failure
  proxy lifetime 10
switch(config-server-failure)#
```

- This command sets the proxy timeout period to its default value of 3 minutes.

```
switch(config-server-failure)#no proxy lifetime
switch(config-server-failure)#show active
monitor server-failure
  proxy
```

```
switch(config-server-failure) #
```

- This command disables the RAIL proxy.

```
switch(config-server-failure) #no proxy
switch(config-server-failure) #show active
switch(config-server-failure) #
```

### Selecting Networks to Monitor

The `network (server-failure configuration mode)` command specifies the IPv4 network space that Rapid Automated Indication of Link-Loss (RAIL) monitors for failed links to connected servers. **Running-config** can contain multiple `network` statements, allowing RAIL to monitor multiple disjoint network spaces.

When a server on the specified network is blocked because of a failed Ethernet or port channel link, the switch becomes a proxy for the unavailable server and responds with **TCP RST** or **ICMP Unreachable** segments to devices sending packets to the unavailable server.

### Example

These commands specify two IPv4 network spaces that RAIL monitors for server failures.

```
switch(config) #monitor server
switch(config-server-failure) #network 10.1.1.0/24
switch(config-server-failure) #network 10.2.1.96/28
switch(config-server-failure) #show active
monitor server-failure
    network 10.2.1.96/28
    network 10.1.1.0/24
switch(config-server-failure) #
```

### Enabling RAIL on an Interface

RAIL monitors an interface for link errors only when RAIL is globally enabled and enabled for the interface. The `monitor server-failure link` command enables RAIL on the configuration mode interface. Configuration settings are effective for all Ethernet and port channel interfaces that enable RAIL.

### Example

These commands enable RAIL on port channel interface 100.

```
switch(config) #interface port-channel 100
switch(config-if-Po100) #monitor server-failure link
switch(config-if-Po100) #show active
interface Port-Channel100
    monitor server-failure link
switch(config-if-Po100) #
```

#### 10.4.5.5.4 Displaying RAIL Status

The switch provides commands to display RAIL configuration and status information:

##### Displaying RAIL Configuration settings

The `show monitor server-failure` command displays Rapid Automated Indication of Link-Loss (RAIL) configuration settings and the number of servers on each monitored network.

## Example

This command displays RAIL configuration status and lists the number of servers that are on each monitored network.

```
switch>show monitor server-failure
Server-failure monitor is enabled
Proxy service: disabled
Networks being monitored: 3
 10.2.1.96/28      : 0 servers
 10.1.1.0/24      : 0 servers
 10.3.0.0/16      : 3 servers
switch>
```

## Displaying RAIL History for All Connected Servers

The `show monitor server-failure history` command displays the time of all link failures detected by Rapid Automated Indication of Link-Loss (RAIL) and includes the interface name for each failure.

## Example

This command displays the link failure history from the time RAIL is instantiated on the switch.

```
switch>show monitor server-failure history
Total server failures: 4

Server IP      Server MAC      Interface      Last Failed
-----
10.1.67.92    01:22:ab:cd:ee:ff  Ethernet17    2013-02-02
 11:26:22
44.11.11.7    ad:3e:5f:dd:64:cf  Ethernet23    2013-02-10
 00:07:56
10.1.1.1      01:22:df:42:78:cd  Port-Channel6 2013-02-09
 19:36:09
10.1.8.13     01:33:df:ee:39:91  Port-Channel5 2013-02-10
 00:03:39

switch>
```

## Displaying Server Configuration and Status

The `show monitor server-failure servers` command displays status and configuration data about each server that RAIL monitors. The display format depends on the parameter specified by the command:

## Examples

This command displays RAIL information for the server at IP address 10.11.11.7

- ```
switch>show monitor server-failure servers 10.11.11.7
Server information:
Server Ip Address      : 10.11.11.7
MAC Address           : ad:3e:5f:dd:64:cf
Current state         : down
Interface             : Ethernet23
Last Discovered       : 2013-01-06 06:47:39
Last Failed           : 2013-02-10 00:07:56
Last Proxied          : 2013-02-10 00:08:33
Last Inactive         : 2013-02-09 23:52:21
Number of times failed : 3
Number of times proxied : 1
Number of times inactive : 18
```

```
switch>
```

- This command displays RAIL information for the all servers on configured interfaces.

```
switch>show monitor server-failure servers all
```

```
Total servers monitored: 5
```

| Server IP   | Server MAC        | Interface     | State    | Last Failed          |
|-------------|-------------------|---------------|----------|----------------------|
| 10.1.67.92  | 01:22:ab:cd:ee:ff | Ethernet17    | inactive | 7 days, 12:47:48 ago |
| 44.11.11.7  | ad:3e:5f:dd:64:cf | Ethernet23    | down     | 0:06:14 ago          |
| 10.1.1.1    | 01:22:df:42:78:cd | Port-Channel6 | up       | 4:38:01 ago          |
| 10.1.8.13   | 01:33:df:ee:39:91 | Port-Channel5 | proxying | 0:10:31 ago          |
| 132.23.23.1 | 00:11:aa:bb:32:ad | Ethernet1     | up       | never                |

```
switch>
```

---

## 10.4.6 Data Transfer Commands

### Control Plane and Data Plane Commands

- `ip access-group` (Control Plane mode)
- `switch forwarding-mode`
- `show switch forwarding-mode`
- `system control-plane`

### Errdisable Commands

- `errdisable detect cause link-change`
- `errdisable flap-setting cause link-flap`
- `errdisable recovery cause`
- `errdisable recovery interval`

### Fabric Link Monitoring Commands

- `platform sand monitor serdes error log`
- `platform sand monitor serdes error threshold`
- `platform sand monitor serdes poll period`
- `platform sand monitor serdes poll threshold isolation`
- `platform sand monitor serdes poll threshold recovery`
- `show fabric monitoring health`
- `show platform trident mirroring`

### RAIL Commands

- `clear server-failure servers inactive`
- `monitor server-failure`
- `monitor server-failure link`
- `network` (server-failure configuration mode)
- `proxy` (server-failure configuration mode)
- `show monitor server-failure`
- `show monitor server-failure history`
- `show monitor server-failure servers`
- `shutdown` (server-failure configuration mode)

### Link Flap Monitor Commands

- `default-profiles`
- `monitor link-flap policy`
- `monitor link-flap profiles`
- `profile max-flaps` (Link Flap Configuration)

### MAC Address Table Commands

- `clear mac address-table dynamic`
- `mac address-table aging-time`
- `mac address-table static`
- `show bridge mac-address-table aging timeout`
- `show mac address-table`
- `show mac address-table count`

- `show mac address-table mlag-peer`
- `show mac address-table multicast`
- `show mac address-table multicast brief`
- `switchport mac address learning`

### Port Configuration Commands

- `clear counters`
- `description`
- `interface loopback`
- `load interval`
- `switchport`
- `mtu`
- `show interfaces`
- `show interfaces description`
- `switchport default mode access`
- `switchport default mode routed`

### Port Mirroring Commands

- `monitor session destination`
- `monitor session destination cpu`
- `monitor session forwarding-drop`
- `monitor session ip access-group`
- `monitor session source`
- `monitor session source ip access-group`
- `monitor session truncate`
- `no monitor session`
- `show monitor session`

### Port Security Commands

- `switchport port-security`
- `switchport port-security mac-address maximum`
- `switchport port-security violation`
- `show port-security`
- `show port-security interface`
- `show port-security mac-address`

### Storm Control Commands

- `storm-control`
- `show storm-control`

### Tracking Commands

- `interface loopback`
- `links minimum`
- `link tracking group (interface)`
- `link tracking group`
- `show link tracking group`
- `show track`
- `track`

- [traffic-loopback](#)

### 10.4.6.1 clear counters

The `clear counters` command resets the counters to zero for the specified interfaces. The command provides the following options:

- **No parameter:** When no option is selected, the counters are reset on the switch.
- **Session parameter:** The command resets the counters in software for the current CLI session, establishing a baseline upon which subsequent `show interfaces` or `show interfaces counters` commands are relative. Counters are not affected for other CLI sessions.

**Note:** The `clear counters` command (and other commands that reset counters to zero) do not reset SNMP counters (such as IF-MIB::ifInOctets). As specified in RFC 2578, sections 7.1.6 and 7.1.10, a single value of a counter in SNMP has no information content. Instead, meaningful information is given by the difference between two separate fetches of a particular counter. SNMP counters automatically reset to zero when they reach their maximum values.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear counters [INTERFACE][SCOPE]
```

#### Parameters

- **INTERFACE** Interface type and number. Options include:
  - `<no parameter>` Display information for all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `loopback l_range` Loopback interface specified by `l_range`.
  - `management m_range` Management interface range specified by `m_range`.
  - `port-channel p_range` Port-Channel Interface range specified by `p_range`.
  - `vlan v_range` VLAN interface range specified by `v_range`.
  - `vxlan vx_range` VXLAN interface range specified by `vx_range`.

Valid `e_range`, `l_range`, `m_range`, `p_range`, `v_range`, and `vx_range` formats include number, number range, or comma-delimited list of numbers and ranges.

- **SCOPE** Duration of the reset results. Options include:
  - `<no parameter>` counters are cleared on the switch.
  - `session` counters are reset only for the current session.

#### Example

These commands display interface counters, clear the counters, then display the counters again.

```
switch#show interfaces ethernet 1
Ethernet1 is up, line protocol is up (connected)
Hardware is Ethernet, address is 001c.7302.2fff (bia 001c.7302.2fff)
MTU 9212 bytes, BW 10000000 Kbit
Full-duplex, 10Gb/s, auto negotiation: off
Last clearing of "show interface" counters never
5 minutes input rate 301 bps (0.0% with framing), 0 packets/sec
5 minutes output rate 0 bps (0.0% with framing), 0 packets/sec
 2285370854005 packets input, 225028582832583 bytes
  Received 29769609741 broadcasts, 3073437605 multicast

| Et3  | 0         | 0            | 0            | 0            |
| Et4  | 0         | 0            | 0            | 0            |
| Et5  | 0         | 0            | 0            | 0            |

switch#

---

### 10.4.6.2 clear mac address-table dynamic

The **clear mac address-table dynamic** command removes specified dynamic entries from the MAC address table. Entries are identified by their VLAN and layer 2 (Ethernet or port channel) interface.

- To remove a specific entry, include its VLAN and interface in the command.
- To remove all dynamic entries for a VLAN, do not specify an interface.
- To remove all dynamic entries for an interface, do not specify a VLAN.
- To remove all dynamic entries, do not specify a VLAN or an interface.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear mac address-table dynamic [VLANS][INTERFACE]
```

#### Parameters

- **VLANS** Table entries are cleared for specified VLANs. Options include:
  - *<no parameter>* all VLANs.
  - *vlan v\_num* VLAN specified by *v\_num*.
- **INTERFACE** Table entries are cleared for specified interfaces. Options include:
  - *<no parameter>* all Ethernet and port channel interfaces.
  - *interface ethernet e\_range* Ethernet interfaces specified by *e\_range*.
  - *interface port-channel p\_range* port channel interfaces specified by *p\_range*.
  - *vxlan vx\_range* VXLAN interfaces specified by *vx\_range*.

Valid *range* formats include number, range, or comma-delimited list of numbers and ranges.

#### Example

This command clears all dynamic mac address table entries for *port channel 5* on *VLAN 34*.

```
switch#clear mac address-table dynamic vlan 34 interface port-channel 5
switch#
```

### 10.4.6.3 clear server-failure servers inactive

The **clear server-failure servers inactive** command removes all inactive server entries from the server failed history list. The switch maintains this list, even after a server's ARP entry is removed, to maintain a list of servers that are connected to the switch and log the most recent time of the failure of the link that connects the switch to the server.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear server-failure servers inactive
```

#### Related Command

[show monitor server-failure history](#)

#### Example

This command clears the inactive servers from the server failed history list.

```
switch#clear server-failure servers inactive  
switch#
```

#### 10.4.6.4 default-profiles

The **default-profiles** command specifies the set of link-flap profiles that define error-disable criteria for interfaces where link flap monitoring is enabled without a link flap profile assignment. Entering a **default-profile** command replaces the current default-profile statement in **running-config**.

The default-profile set may contain zero, one, or multiple profiles. When the default-profile set is empty, [errdisable flap-setting cause link-flap](#) specifies default error-disable criteria. When the default-profile set contains multiple profiles, error-disable criteria is satisfied when conditions match any profile. Multiple profiles are assigned to the default-profile set through a single **default-profiles** command.

The **no default-profiles** and **default default-profiles** commands restore the empty default-profile set by deleting the **default-profiles** command from **running-config**.

##### Command Mode

Link-flap Configuration

##### Command Syntax

```
default-profiles [LF_PROFILES]
```

```
no default-profiles
```

```
default default-profiles
```

##### Parameters

- **LF\_PROFILES** Name of link-flap profiles assigned to default profile set. Parameter may contain zero, one, or multiple link-flap profile names:
  - *<no parameter>* default-profile set is empty.
  - *profile* name of single link-flap profile.
  - *profile\_1 profile\_2 ... profile\_N* list of link-flap profile names.

##### Related Commands

- [monitor link-flap policy](#) places the switch in link-flap-profiles configuration mode.
- [profile max-flaps \(Link Flap Configuration\)](#) configures link flap profiles.

##### Guidelines

The [errdisable flap-setting cause link-flap](#) statement is also configurable through the [profile max-flaps \(Link Flap Configuration\)](#) command.

##### Example

This command assigns configures LF01 and LF02 as the default-profile set.

```
switch(config)#monitor link-flap policy
switch(config-link-flap)#default-profiles LF01 LF02
switch(config-link-flap)#show active
monitor link-flap policy
  profile LF01 max-flaps 15 time 60 violations 1 intervals 1
  profile LF02 max-flaps 10 time 30 violations 5 intervals 10
  profile LF03 max-flaps 25 time 100 violations 2 intervals 12
  profile LF04 max-flaps 5 time 15 violations 1 intervals 3
  default-profiles LF01 LF02
switch(config-link-flap)#
```

### 10.4.6.5 description

The **description** command adds comment text for the configuration mode interface. The text provides information about the interface and has no effect on interface functions. The [show interfaces description](#) command displays interface description text.

The **no description** command removes the description text for the configuration mode interface from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Interface-VXLAN Configuration

#### Command Syntax

```
description label_text
```

```
no description
```

```
default description
```

#### Parameters

*label\_text* character string assigned to description attribute.

#### Example

These commands add description text to Ethernet interface 23, then displays the text through a [show interfaces description](#) command.

```
switch(config)#interface ethernet 23
switch(config-if-Et23)#description external line
switch(config-if-Et23)#show interfaces ethernet 23 description
Interface          Status      Protocol   Description
Et23               up         up         external line
```

---

### 10.4.6.6 errdisable detect cause link-change

The **errdisable detect cause link-change** command enables the error-disabling of Ethernet interfaces when the switch detects a link flap error on the interface. The [errdisable flap-setting cause link-flap](#) command defines a link flap error in terms of the frequency of connection state changes.

The switch places an interface in **error-disabled** state when it detects an error on the interface. **Error-disabled** is an operational state that is similar to link-down state. To re-enable an error-disabled interface, enter **shutdown** and **no shutdown** command in the configuration mode for the interface.

By default, link flap detection is enabled. The **no errdisable detect cause link-change** command disables the triggering of error-disable actions. The **errdisable detect cause link-change** and **default errdisable detect cause link-change** commands enable the triggering of error-disable actions by removing the **no errdisable detect cause link-change** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
errdisable detect cause link-change
no errdisable detect cause link-change
default errdisable detect cause link-change
```

#### Examples

- This command disables error detection on the switch.

```
switch(config)#no errdisable detect cause link-change
switch(config)#
```

- These commands sets the link flap error criteria of 15 connection state changes over a 30 second period, then enables error detection on the switch.

```
switch(config)#errdisable flap-setting cause link-flap max-flaps 15
time 30
switch(config)#errdisable detect cause link-change
switch(config)#
```

### 10.4.6.7 errdisable flap-setting cause link-flap

The **errdisable flap-setting cause link-flap** command configures the link-flap frequency that defines a link-flap error on an Ethernet interface. The [errdisable detect cause link-change](#) command uses this criteria to trigger an error-disable action.

The link-flap frequency is defined by the quantity of link flaps (connection state changes) over a specified period. The default settings are five link flaps and ten seconds.

The **no errdisable flap-setting cause link-flap** and **default errdisable flap-setting cause link-flap** commands restore the default link flap cause settings by removing the **errdisable flap-setting cause link-flap** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
errdisable flap-setting cause link-flap max-flaps quantity time period
```

```
no errdisable flap-setting cause link-flap
```

```
default errdisable flap-setting cause link-flap
```

#### Parameters

- *quantity* Number of link flaps. Value ranges from 1 to 100. Default value is 5.
- *period* Interval over which link flaps accumulate to trigger an error condition (seconds). Value ranges from 1 to 1800. Default value is 10.

#### Example

This command sets the link flap error criteria of 15 connection state changes over 30 second periods.

```
switch(config)#errdisable flap-setting cause link-flap max-flaps 15 time  
30  
switch(config)#
```

---

### 10.4.6.8 errdisable recovery cause

The **errdisable recovery cause** command enables the automated recovery of error-disabled Ethernet interfaces. An interface that is disabled as a result of a specified condition attempts normal operation after a specified interval. When the disabling condition persists, recovered interfaces eventually return to the error-disabled state.

When automated recovery is not enabled, interfaces are recovered manually by entering **shutdown** and **no shutdown** from the interface's configuration mode.

**Running-config** can simultaneously store **errdisable recovery cause** statements for each error-disable condition. By default, error-disable recovery is disabled for all conditions.

The **no errdisable recovery cause** and **default errdisable recovery cause** commands disable automated recovery for interfaces disabled by the specified condition by removing the corresponding **errdisable recovery cause** command from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
errdisable recovery cause CONDITION
no errdisable recovery cause CONDITION
default errdisable recovery cause CONDITION
```

#### Parameters

- **CONDITION** Disabling condition for which command automates recovery. Options include:
  - arp-inspection
  - bpduguard
  - link-flap
  - no-internal-vlan
  - portchannelguard
  - portsec
  - tapagg
  - uplink-failure-detection
  - xcvr\_unsupported

#### Related Command

[errdisable recovery interval](#) configures the period that an ethernet interface remains disabled before automated recovery begins.

#### Example

This command enables error-disable recovery for interfaces that are disabled by link-flap and bpduguard conditions and sets the errdisable recovery period at 10 minutes.

```
switch(config)#errdisable recovery cause bpduguard
switch(config)#errdisable recovery cause link-flap
switch(config)#errdisable recovery interval 600
switch(config)#show running-config
! Command: show running-config

errdisable recovery cause bpduguard
errdisable recovery cause link-flap
errdisable recovery interval 600
!
```

```
switch(config)#
```

---

### 10.4.6.9 errdisable recovery interval

The **errdisable recovery interval** command specifies the period that an error-disabled Ethernet interface remains disabled before automated errdisable recovery begins. This command affects only interfaces whose automated recovery is enabled for the disabling condition ([errdisable recovery cause](#)). When automated recovery is not enabled, interfaces are recovered manually by entering **shutdown** and **no shutdown** from the interface's configuration mode.

The **no errdisable recovery interval** and **default errdisable recovery interval** commands restore the default error recovery period of 300 seconds by removing the **errdisable recovery interval** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
errdisable recovery interval period
no errdisable recovery interval
default errdisable recovery interval
```

#### Parameters

*period* Error disable recovery period (seconds). Value ranges from 30 to 86400. Default value is 300

#### Related Command

[errdisable recovery cause](#) enables the automated recovery of error-disabled Ethernet interfaces.

#### Example

This command enables error-disable recovery for interfaces that are disabled by link-flap conditions and sets the errdisable recovery period at 10 minutes.

```
switch(config)#errdisable recovery cause link-flap
switch(config)#errdisable recovery interval 600
switch(config)#show running-config
! Command: show running-config

!
errdisable recovery cause link-flap
errdisable recovery interval 600
!

!
i
switch(config)#
```

### 10.4.6.10 interface loopback

The **interface loopback** command places the switch in loopback-interface configuration mode for the specified interfaces. The command creates loopback interfaces for previously unconfigured interfaces.

The command can specify a single interface or multiple interfaces:

- **Single interface:** Command creates an interface if it specifies one that was not previously created.
- **Multiple interfaces:** Command is valid only if all specified interfaces were previously created.

The **no interface loopback** command removes the specified interfaces from **running-config**, including all interface configuration statements. The **default interface loopback** command removes all configuration statements for the specified loopback interface without deleting the loopback interface from **running-config**.

The following commands are available in loopback configuration mode:

- **description**
- **exit**
- **ip address**
- **ip proxy-arp**
- **ipv6 address**
- **ipv6 enable**
- **load interval**
- **logging event**
- **mtu**
- **shutdown (Interfaces)**
- **snmp trap**

#### Command Mode

Global Configuration

#### Command Syntax

```
interface loopback l_range
```

```
no interface loopback l_range
```

```
default interface loopback l_range
```

#### Parameters

*l\_range* Loopback interfaces (number, range, or comma-delimited list of numbers and ranges).

Loopback number ranges from 0 to 1000.

#### Examples

- This command enters interface configuration mode for loopback interfaces 1 through 5.

```
switch(config)#interface loopback 1-5
switch(config-if-Lo1-5)#
```

- This command creates interface 23 and enters interface configuration mode:

```
switch(config)#interface loopback 23
switch(config-if-Lo23)#
```

- This command removes loopback interfaces 5 through 7 from **running-config**.

```
switch(config)#no interface loopback 5-7
switch(config)#
```

### 10.4.6.11 ip access-group (Control Plane mode)

The `ip access-group` command applies an IPv4 or standard IPv4 access control list (ACL) to the control plane.

The `no ip access-group` and `default ip access-group` commands remove the corresponding `ip access-group` command from *running-config*.

#### Command Mode

Control-plane Configuration

#### Command Syntax

```
ip access-group list_name [VRF_INSTANCE] DIRECTION
```

```
no ip access-group [list_name][VRF_INSTANCE] DIRECTION
```

```
default ip access-group [list_name][VRF_INSTANCE] DIRECTION
```

#### Parameters

- *list\_name* name of ACL assigned to interface.
- VRF\_INSTANCE specifies the VRF instance being modified.
  - *<no parameter>* changes are made to the default VRF.
  - *vrf vrf\_name* changes are made to the specified user-defined VRF.
- DIRECTION transmission direction of packets, relative to interface. Valid options include:
  - *in* inbound packets.

#### Example

These commands apply the IPv4 ACL named *test2* to the control plane.

```
switch(config)#system control-plane  
switch(config-system-cp)#ip access-group test2 in  
switch(config-system-cp)#
```

---

### 10.4.6.12 link tracking group (interface)

The **link tracking group** command adds the configuration mode interface to a link-state group and specifies whether it is upstream or downstream.

The **no link tracking group** and **default link tracking group** commands remove the specified link-state group assignment for the configuration mode interface.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Interface-VXLAN Configuration

#### Command Syntax

```
link tracking group group_name DIRECTION
```

```
no link tracking group [group_name]
```

```
default link tracking group [group_name]
```

#### Parameters

- *group\_name* link tracking group name.
- DIRECTION position of the interface in the link-state group. Valid options include:
  - upstream
  - downstream

#### Example

These commands create link-state group “xyz” and add VLAN interface 100 to the group as an upstream interface.

```
switch(config)#link tracking group xyz
switch(config-link-state-xyz)#show active
link tracking group xyz
switch(config-link-state-xyz)#exit
switch(config)#interface vlan 100
switch(config-if-Vl100)#link tracking group xyz upstream
switch(config-if-Vl100)#show active
interface Vlan100
  link state group xyz upstream
switch(config-if-Vl100)#
```

### 10.4.6.13 link tracking group

The **link tracking group** command creates and enables a link-state group and places the switch in link-state-group configuration mode. A link-state group consists of “upstream” interfaces (connections to servers) and “downstream” interfaces (connections to switches and clients). In the event of a failure of all upstream interfaces in the link-state group, the downstream interfaces are shut down.

The **no link tracking group** and **default link tracking group** commands delete the link tracking group from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
link tracking group group_name
no link tracking group group_name
default link tracking group group_name
```

#### Parameters

*group\_name* link-state group name.

#### Commands available in link-state Configuration Mode

[links minimum](#) configures the minimum number of links that the link-state group requires.

#### Example

This command creates and enables *link-state group 1*.

```
switch(config)#link tracking group 1
switch(config-link-state-1)#
```

---

#### 10.4.6.14 links minimum

The **links minimum** command specifies the minimum number of links the configuration mode link-state group requires.

The **no links minimum** and **default links minimum** commands restore the default minimum value of 1 by deleting the corresponding **links minimum** statement from **running-config**.

##### Command Mode

Link-State Configuration

##### Command Syntax

```
links minimum quantity
no links minimum
default links minimum
```

##### Parameters

*quantity* Minimum number of links. Value ranges from 1 to 100000. Default value is 1.

##### Related Commands

- [link tracking group](#) creates and enables a link-state group and places the switch in link-state configuration mode.
- [link tracking group \(interface\)](#) adds the configuration mode interface to the specified link-state group.

##### Example

These commands configure link-state tracking group *link-a* to have at least 60 links.

```
switch(config)#link tracking group link-a
switch(config-link-state-link-a)links minimum 60
switch(config-link-state-link-a)
```

### 10.4.6.15 load interval

The **load-interval** command changes the load interval for the configuration mode interface. Load interval is the time period over which data is used to compute interface rate counters. Interface rates are exponentially weighted moving averages; recent data samples have greater influence than older samples. Statistics calculated with shorter load intervals are usually more sensitive to short traffic bursts.

The **no load-interval** and **default load-interval** commands restore the default value of 300 seconds by removing the corresponding **load-interval** statement from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

Interface-VXLAN Configuration

#### Command Syntax

```
load-interval delay
```

```
no load-interval
```

```
default load-interval
```

#### Parameters

*delay* Load interval delay. Values range from 5 to 600 (seconds). Default value is 300 (five minutes).

#### Example

These commands set the load interval for Ethernet interface 7 at 60 seconds.

```
switch(config)#interface ethernet 7  
switch(config-if-Et7)#load-interval 60  
switch(config-if-Et7)#
```

---

#### 10.4.6.16 mac address learning

The **mac address learning** command enables MAC address learning on a VLAN configuration mode. By default, MAC address learning is enabled by on a VLAN.

The **no mac address learning** command disables MAC address learning for the VLAN configuration mode. The **mac address learning** and **default mac address learning** commands enable MAC address learning for the VLAN configuration mode by deleting the corresponding **no mac address learning** command from the *running-config*.

##### Command Mode

Interface-VLAN Configuration

##### Command Syntax

```
mac address learning
```

```
no mac address learning
```

```
default mac address learning
```

##### Examples

- These commands enable MAC address learning on *VLAN 10* configuration.

```
switch(config)#vlan 10
switch(config-vlan-10)#mac address learning
```

- These commands disable MAC address learning on *VLAN 10* configuration.

```
switch(config)#vlan 10
switch(config-vlan-10)#no mac address learning
```

### 10.4.6.17 mac address-table aging-time

The **mac address-table aging-time** command configures the aging time for MAC address table dynamic entries. Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry's VLAN from the specified MAC address. The switch removes entries when their presence in the MAC address table exceeds the aging time.

Aging time ranges from 10 to 1,000,000 seconds with a default of 300 seconds (five minutes).

The **no mac address-table aging-time** and **default mac address-table aging-time** commands reset the aging time to its default by removing the **mac address-table aging-time** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
mac-address-table aging-time period
no mac-address-table aging-time
default mac-address-table aging-time
```

#### Parameters

- *period* MAC address table aging time. Default is 300 seconds. Options include:
  - 0 disables deletion of table entries on the basis of aging time.
  - 10 through 1000000 (one million) aging period (seconds).

#### Example

This command sets the MAC address table aging time to two minutes (120 seconds).

```
switch(config)#mac address-table aging-time 120
switch(config)#
```

### 10.4.6.18 mac address-table static

The **mac address-table static** command adds a static entry to the MAC address table. Each table entry references a MAC address, a VLAN, and a list of layer 2 (Ethernet or port channel) ports. The table supports three entry types: unicast drop, unicast, and multicast.

- A drop entry does not include a port.
- A unicast entry includes one port.
- A multicast entry includes at least one port.

Packets with a MAC address (source or destination) and VLAN specified by a drop entry are dropped. Drop entries are valid for only unicast MAC addresses.

The command replaces existing dynamic or static table entries with the same VLAN-MAC address. Static entries are not removed by aging ([mac address-table aging-time](#)). Static MAC entries for mirror destinations or LAG members are typically avoided.

The most important byte of a MAC address distinguishes it as a unicast or multicast address:

- **Unicast:** most significant byte is an even number. Examples: 0200.0000.0000 1400.0000.0000
- **Multicast:** most significant byte is an odd number. Examples: 0300.0000.0000 2500.0000.0000

The **no mac address-table static** and **default mac address-table static** commands remove corresponding **mac address-table static** commands from **running-config** and MAC address table entries.

#### Command Mode

Global Configuration

#### Command Syntax

```
mac address-table static mac_address vlan v_num [DESTINATION]
```

```
no mac address-table static mac_address vlan v_num [DESTINATION]
```

```
default mac address-table static mac_address vlan v_num [DESTINATION]
```

#### Parameters

- *mac\_address* Table entry's MAC address (dotted hex notation – H.H.H).
- *v\_num* Table entry's VLAN.
- DESTINATION Table entry's port list.

For multicast MAC address entries, the command may contain multiple ports, listed in any order. The CLI accepts only one interface for unicast entries.

- drop creates drop entry in table. Valid only for unicast addresses.
  - interface ethernet *e\_range* Ethernet interfaces specified by *e\_range*.
  - interface port-channel *p\_range* Port channel interfaces specified by *p\_range*.
  - <no parameter> Valid for **no** and **default** commands that remove multiple table entries.

*e\_range* and *p\_range* formats include number, range, comma-delimited list of numbers and ranges.

#### Examples

- This command adds a static entry for unicast MAC address 0012.3694.03ec to the MAC address table.

```
switch(config)#mac address-table static 0012.3694.03ec vlan 3
interface
Ethernet 7
switch(config)#show mac address-table static
Mac Address Table
-----
```

```

Vlan      Mac Address      Type      Ports      Moves      Last Move
----      -
3         0012.3694.03ec   STATIC    Et7
Total Mac Addresses for this criterion: 1

      Multicast Mac Address Table
-----

Vlan      Mac Address      Type      Ports
----      -
Total Mac Addresses for this criterion: 0

switch(config)#

```

- These commands adds a static drop entry for MAC address 0012.3694.03ec to the MAC address table, then displays the entry in the MAC address table.

```

switch(config)#mac address-table static 0012.3694.03ec vlan 3 drop
switch(config)#show mac address-table static
      Mac Address Table
-----

Vlan      Mac Address      Type      Ports      Moves      Last Move
----      -
1         0012.3694.03ec   STATIC
Total Mac Addresses for this criterion: 1

      Multicast Mac Address Table
-----

Vlan      Mac Address      Type      Ports
----      -
Total Mac Addresses for this criterion: 0

switch(config)#

```

- This command adds a static entry for the multicast MAC address 0112.3057.8423 to the MAC address table.

```

switch(config)#mac address-table static 0112.3057.8423 vlan 4
interface
port-channel 10 port-channel 12
switch(config)#show mac address-table
      Mac Address Table
-----

Vlan      Mac Address      Type      Ports      Moves      Last Move
----      -
Total Mac Addresses for this criterion: 0

      Multicast Mac Address Table
-----

Vlan      Mac Address      Type      Ports
----      -
4         0112.3057.8423   STATIC    Po10 Po12
Total Mac Addresses for this criterion: 1
switch(config)#

```

---

### 10.4.6.19 monitor link-flap policy

The **monitor link-flap policy** command places the switch in link-flap configuration mode for configuring link flap profiles and compiling a default-profile set. Link-flap configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

Link flap profiles are assigned to Ethernet interfaces and specify conditions that define a link-flap error. When link flap monitoring is enabled on an interface, the link-flap conditions determine when the interface is error-disabled. Multiple profiles can be assigned to an interface to monitor a set of error conditions.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor link-flap policy
```

#### Commands Available in link-flap Configuration Mode

- [default-profiles](#) configures the set of profiles that define the default-profile set.
- [profile max-flaps \(Link Flap Configuration\)](#) configures a link-flap profile

#### Examples

- These commands place the switch in link-flap configuration mode.

```
switch(config) #monitor link-flap policy  
switch(config-link-flap) #
```

- This command returns the switch to global configuration mode.

```
switch(config-link-flap) #exit  
switch(config) #
```

### 10.4.6.20 monitor link-flap profiles

The **monitor link-flap profiles** command enables link-flap monitoring on the configuration mode interface and specifies the error-disable criteria for the interface. Entering a **monitor link-flap profiles** command replaces the corresponding statement in *running-config*.

The command enables the following link flap detection options:

- **monitor link-flap (no profiles listed)**: The interface detects link flaps using the criteria defined by the default-profile set ( **default-profiles** ).
- **monitor link-flap profiles (at least one profile listed)**: The interface detects link flaps using the criteria of the listed profiles. Error-disable criteria require conditions that match at least one profile.
- **default monitor link-flap**: The interface detects link flaps using the **errdisable flap-setting cause link-flap** and **errdisable recovery cause** commands.
- **no monitor link-flap**: The interface does not detect link flaps.

**Default monitor link flap** is the default setting.

#### Command Mode

Interface-Ethernet Configuration

Interface-Management Configuration

#### Command Syntax

```
monitor link-flap [LF_PROFILES]
```

```
no monitor link-flap
```

```
default monitor link-flap
```

#### Parameters

- **LF\_PROFILES** Name of link-flap profiles assigned to interface. Parameter may contain zero, one, or multiple link-flap profile names:
  - *<no parameter>* Link flap criteria determined by default-profile set.
  - *profiles profile\_name* Name of single link-flap profile.
  - *profiles profile\_name\_1 profile\_name\_2 ... profile\_name\_N* List of link-flap profile names.

#### Examples

- This command applies the LF03 and LF04 link flap profiles to *Ethernet interface 33*.

```
switch(config)#interface ethernet 33
switch(config-if-Et33)#monitor link-flap profiles LF03 LF04
switch(config-if-Et33)#show active
interface Ethernet33
    monitor link-flap profiles LF04 LF03
switch(config-if-Et33)#
```

- This command disables link-flap monitoring on *Ethernet interface 34*.

```
switch(config)#interface ethernet 34
switch(config-if-Et34)#no monitor link-flap
switch(config-if-Et34)#show active
interface Ethernet34
    no monitor link-flap
switch(config-if-Et34)#
```

---

### 10.4.6.21 monitor server-failure link

The **monitor server-failure link** command enables Rapid Automated Indication of Link-Loss (RAIL) on the configuration mode interface. RAIL must be properly configured globally or this command has no effect on switch operation.

When an interface monitored by RAIL goes down, the switch performs these steps for servers that the switch accesses from the interface:

1. IP addresses of the servers are removed from ARP cache.
2. A dynamic MAC entry is added to the MAC address table for each server. The port for each entry is listed as CPU.

The **no monitor server-failure link** and **default monitor server-failure link** commands disable RAIL on the configuration mode interface by deleting the corresponding **monitor server-failure link** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
monitor server-failure link
no monitor server-failure link
default monitor server-failure link
```

#### Related Commands

[monitor server-failure](#) places the switch in server-failure configuration mode for configuring RAIL.

#### Example

These commands enable RAIL on port channel interface 100.

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#monitor server-failure link
switch(config-if-Po100)#show active
interface Port-Channel100
    monitor server-failure link
switch(config-if-Po100)#
```

### 10.4.6.22 monitor server-failure

The **monitor server-failure** command places the switch in server-failure configuration mode. Rapid Automated Indication of Link-Loss (RAIL) settings are configured in server-failure configuration mode. RAIL is disabled by default and is enabled by the **no shutdown** command in server-failure configuration mode.

The **no monitor server-failure** and **default monitor server-failure** commands disable RAIL and restore all settings to their default state by removing all server-failure configuration mode statements from **running-config**.

Server-failure configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting server-failure configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor server-failure
no monitor server-failure
default monitor server-failure
```

#### Commands Available in server-failure Configuration Mode

- [network \(server-failure configuration mode\)](#)
- [proxy \(server-failure configuration mode\)](#)
- [shutdown \(server-failure configuration mode\)](#)

#### Examples

- These commands place the switch in server-failure configuration mode and enables RAIL.

```
switch(config)#monitor server-failure
switch(config-server-failure)#show active
switch(config-server-failure)#no shutdown
switch(config-server-failure)#show active
monitor server-failure
  no shutdown
switch(config-server-failure)#
```

- This command deletes all server-failure configuration mode commands from **running-config**.

```
switch(config)#no monitor server-failure
switch(config)#
```

### 10.4.6.23 monitor session destination cpu

The `monitor session destination cpu` command configures the CPU as the destination port of a specified port mirroring session. The `monitor session source` command configures the source port of the mirroring session. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from one direction.

The CPU can only be configured as a destination for a mirroring session, not as a source. However, the CPU can serve as the destination for multiple mirroring sessions. Traffic mirrored to the CPU can be viewed using `tcpdump`.

The `no monitor session destination cpu` and `default monitor session destination cpu` commands remove the mirror session destination assignment by deleting the corresponding `monitor session destination cpu` command from *running-config*. The `no monitor session` command removes the entire mirror session.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor session session_name destination cpu
no monitor session session_name destination cpu
default monitor session session_name destination cpu
```

#### Parameters

*session\_name* Label assigned to port mirroring session.

#### Guidelines

To view the traffic mirrored to the CPU from a source port, use `tcpdump` from the Bash shell, with the source interface as an argument. This causes `tcpdump` to capture packets from the kernel interface of the source port.

#### Examples

- These commands configure *Ethernet interface 35* as the source and the CPU as the destination port for the *redirect\_1* mirroring session, then display the mirror interface.

```
switch(config)#monitor session redirect_1 destination cpu
switch(config)#monitor session redirect_1 source ethernet 35
switch(config)#show monitor session

Session redirect_1
-----
Source Ports:

  Both:          Et35

Destination Ports:

  Cpu :  active (mirror0)

switch(config)#
```

- This command uses `tcpdump` to view the traffic mirrored by the *redirect\_1* mirroring session. The CPU mirror interface specified in the previous output must be used in the `tcpdump` expression (in this case, `mirror0`).

```
switch#bash tcpdump -i mirror0
tcpdump: WARNING: mirror0: no IPv4 address assigned
```

```
tcpdump: verbose output suppressed, use -v or -vv for full protocol
decode
listening on mirror0, link-type EN10MB (Ethernet), capture size 65535
bytes

```

#### 10.4.6.24 monitor session destination

The **monitor session destination** command configures an interface as the destination port of a specified port mirroring session. The destination is usually an Ethernet interface, but other options are available on certain platforms (see **Guidelines**). The **monitor session source** command configures the source port of the mirroring session.

An interface cannot be used in more than one mirror session and cannot be simultaneously used as both source and destination. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic only from one direction.

**Note:** On platforms which support the use of port channels as mirror destinations, a port channel *must not* be used as a mirror destination if it is a member of an MLAG.

The **no monitor session destination** and **default monitor session destination** commands remove the mirroring session destination assignment by deleting the corresponding **monitor session destination** command from *running-config*. The **no monitor session** removes the entire mirroring session.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor session session_name destination{cpu | ethernet e_range | port-channel p_range | tunnel mode}
```

```
no monitor session session_name destination
```

```
default monitor session session_name destination
```

#### Parameters

- *session\_name* label assigned to the port mirroring session.
- **cpu** configures a CPU as the destination interface.
- **ethernet *e\_range*** configures Ethernet interfaces specified by *e\_range* as the destination interface. The ethernet interface value ranges from 1 to 50.
- **port-channel *p\_range*** configures port channel interfaces specified by *p\_range* as the destination interface. The port-channel value ranges from 1 to 2000.
- **tunnel mode** configures a tunnel as the destination interface. Option includes:
  - **gre** configures GRE-tunnel as the destination interface.

#### Guidelines

The tunnel mode is supported on DCS-7280SE, DCS-7500E, DCS-7050/7050X, DCS-7250X, and DCS-7300X devices only.

Port mirroring capacity varies by platforms. The session destination capacity of switches on each platform is listed below:

- **Arad Platform:** Ethernet interfaces (one)
- **FM6000 Platform:** Ethernet interfaces (any count), Port channel interfaces (any count), CPU
- **Petra Platform:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways)
- **Trident Platform:** Ethernet interfaces (one)
- **Trident II Platform:** Ethernet interfaces (one)

When there are multiple transmit (Tx) sources in a monitor session, mirrored frames use Tx properties of the lowest numbered Tx mirror source configured. Packets are modified based on properties.

#### Example

Allowed VLANs on the ethernet8 source interface are 10, 20 and 30. Allowed VLANs on ethernet9 source interface are 30, 40, and 50. The frames going out of ethernet9 tagged with 10, 20, and 30

appears at the mirrored destination as tagged frames. The tagged frames with 40 or 50 on ethernet9 appears at the mirrored destination as untagged frames. Since ethernet8 is the lowest numbered source interface, all Tx frames on ethernet8 are tagged in the mirrored destination.

### Examples

- This command configures *Ethernet interface 8* as the destination port for the *redirect\_1* mirroring session.

```
switch(config)#monitor session redirect_1 destination ethernet 2
switch(config)#show monitor session

Session redirect_1
-----
Source Ports:

Destination Ports:

    Et2 : active

switch(config)#
```

- This command configures a GRE tunnel with source and destination addresses as *1.1.1.1* and *2.2.2.2* respectively as the destination interface for the *redirect\_2* mirroring.

```
switch(config)#monitor session redirect_2 destination tunnel mode gre source
1.1.1.1 destination 2.2.2.2
switch(config)#show monitor session

Session redirect_2
-----
Source Ports:

Destination Ports:

      status      source      dest TTL DSCP proto      VRF fwd-drop
Grel : active    1.1.1.1    2.2.2.2 128    0 0x88be default    no

switch(config)#
```

---

### 10.4.6.25 monitor session destination

The **monitor session destination** command configures an interface as the destination port of a specified port mirroring session. The destination is usually an Ethernet interface, but other options are available on certain platforms (see **Guidelines**). The **monitor session source** command configures the source port of the mirroring session.

An interface cannot be used in more than one mirror session and cannot be simultaneously used as both source and destination. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic only from one direction.

**Note:** On platforms which support the use of port channels as mirror destinations, a port channel *must not* be used as a mirror destination if it is a member of an MLAG.

The **no monitor session destination** and **default monitor session destination** commands remove the mirroring session destination assignment by deleting the corresponding **monitor session destination** command from *running-config*. The **no monitor session** removes the entire mirroring session.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor session session_name destination{cpu | ethernet e_range | port-channel p_range | tunnel mode}
```

```
no monitor session session_name destination
```

```
default monitor session session_name destination
```

#### Parameters

- *session\_name* label assigned to the port mirroring session.
- **cpu** configures a CPU as the destination interface.
- **ethernet *e\_range*** configures Ethernet interfaces specified by *e\_range* as the destination interface. The ethernet interface value ranges from 1 to 50.
- **port-channel *p\_range*** configures port channel interfaces specified by *p\_range* as the destination interface. The port-channel value ranges from 1 to 2000.
- **tunnel mode** configures a tunnel as the destination interface. Option includes:
  - **gre** configures GRE-tunnel as the destination interface.

#### Guidelines

The tunnel mode is supported on DCS-7280SE, DCS-7500E, DCS-7050/7050X, DCS-7250X, and DCS-7300X devices only.

Port mirroring capacity varies by platforms. The session destination capacity of switches on each platform is listed below:

- **Arad Platform:** Ethernet interfaces (one)
- **FM6000 Platform:** Ethernet interfaces (any count), Port channel interfaces (any count), CPU
- **Petra Platform:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways)
- **Trident Platform:** Ethernet interfaces (one)
- **Trident II Platform:** Ethernet interfaces (one)

When there are multiple transmit (Tx) sources in a monitor session, mirrored frames use Tx properties of the lowest numbered Tx mirror source configured. Packets are modified based on properties.

#### Example

Allowed VLANs on the ethernet8 source interface are 10, 20 and 30. Allowed VLANs on ethernet9 source interface are 30, 40, and 50. The frames going out of ethernet9 tagged with 10, 20, and 30

appears at the mirrored destination as tagged frames. The tagged frames with 40 or 50 on ethernet9 appears at the mirrored destination as untagged frames. Since ethernet8 is the lowest numbered source interface, all Tx frames on ethernet8 are tagged in the mirrored destination.

### Examples

- This command configures *Ethernet interface 8* as the destination port for the *redirect\_1* mirroring session.

```
switch(config)#monitor session redirect_1 destination ethernet 2
switch(config)#show monitor session

Session redirect_1
-----
Source Ports:

Destination Ports:

    Et2 :  active

switch(config)#
```

- This command configures a GRE tunnel with source and destination addresses as *1.1.1.1* and *2.2.2.2* respectively as the destination interface for the *redirect\_2* mirroring.

```
switch(config)#monitor session redirect_2 destination tunnel mode gre source
1.1.1.1 destination 2.2.2.2
switch(config)#show monitor session

Session redirect_2
-----
Source Ports:

Destination Ports:

    status  source  dest  TTL  DSCP  proto  VRF  fwd-drop
Gre1 :  active  1.1.1.1  2.2.2.2  128  0     0x88be  default no

switch(config)#
```

### 10.4.6.26 monitor session forwarding-drop

The **monitor session forwarding-drop** command configures a forwarding-drop session for mirroring ingress packets that are dropped during ASIC forwarding.

The **no monitor session forwarding-drop** and **default monitor session forwarding-drop** commands delete the current forwarding-drop configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor session session_name forwarding-drop destination tunnel mode
no monitor session session_name forwarding-drop destination tunnel mode
default monitor session session_name forwarding-drop destination tunnel mode
```

#### Parameters

- **destination** specifies to mirror packets at destination
- **tunnel mode** specifies to mirror packets that pass through a tunnel. Options include:
  - **gre** configures GRE-tunnel as the destination interface.

#### Related Commands

- [monitor session destination](#)
- [monitor session destination cpu](#)
- [show monitor session](#)

#### Guidelines

The forwarding-drop configuration is supported on DCS-7050/7050X, DCS-7250X, and 7300X devices only.

#### Example

This command configures a forwarding-drop session to *1.1.1.1* as the destination.

```
switch(config)#monitor session 1 forwarding-drop destination tunnel mode
gre source 1.1.1.1 destination
2.2.2.2
switch(config)#show monitor session

Session 1
-----

Programmed in HW: No

Source Ports:

Destination Ports:

      status  source  dest      TTL  DSCP  proto  VRF
fwd-drop
  Gre1 : active  1.1.1.1  2.2.2.2  128   0    0x88be default
yes

switch(config)#
```

### 10.4.6.27 monitor session ip access-group

The **monitor session ip access-group** command configures an ACL to filter the traffic being mirrored to the destination port. ACLs applied to a source port affect the RX side of the interface, and do not impact the TX side of the interface. TX mirrored packets cannot be filtered, and will continue to be sent to the mirror destination.

The **no monitor session ip access-group** and **default monitor session ip access-group** commands remove the filter from the specified mirror session by deleting the corresponding **monitor session ip access-group** command from *running-config*. The **no monitor session** command removes the entire mirror session.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor session session_name ip access-group acl_name
no monitor session session_name ip access-group
default monitor session session_name ip access-group
```

#### Parameters

- *session\_name* Label assigned to port mirroring session.
- *acl\_name* The ACL to be applied to filter traffic for the specified session.

#### Examples

- These commands create an ACL and apply it to filter the traffic mirrored to the destination port by session "redirect\_1."

```
switch(config)#ip access-list allow-host
switch(config-acl-allow-host)#10 permit ip host 192.168.11.24 host
10.0.215.23
switch(config-acl-allow-host)#20 deny ip any any
switch(config-acl-allow-host)#exit
switch(config)#
switch(config)#monitor session redirect_1 ip access-group allow-host
switch(config)#
```

- Use the **show monitor session** command to verify the configuration.

```
switch#show monitor session
Session redirect_1
-----
Source Ports:
Both:          Et35(Acl:allow-host)
Destination Ports:
Cpu : active (mirror0)
ip access-group: allow-host
switch#
```

### 10.4.6.28 monitor session source ip access-group

The **monitor session source ip access-group** command configures an ACL to filter the traffic being mirrored from a specific source port. This enables the ability to filter traffic using a different ACL on each source port and have the combined matched traffic sent to the destination port.

The **no monitor session source ip access-group** and **default monitor session source ip access-group** commands remove the filter from the specified mirror session by deleting the corresponding **monitor session source ip access-group** command from **running-config**. The **no monitor session** command removes the entire mirror session.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor session s_name source INT_NAME [DIRECT] ip access-group acl_name
```

```
no monitor session s_name source INT_NAME [DIRECT] ip access-group acl_name
```

```
default monitor session s_name source INT_NAME [DIRECT] ip access-group acl_name
```

#### Parameters

- *s\_name* Label assigned to port mirroring session.
- INT\_NAME Source interface for the mirroring session.
  - ethernet *e\_range* Ethernet interfaces specified by *e\_range*.
  - port-channel *p\_range* Port channel interfaces specified by *p\_range*.
- DIRECT transmission direction of traffic to be mirrored. Options include:
  - *<no parameter>* mirrors received traffic only.
  - rx mirrors received traffic only.
- *acl\_name* The ACL to be applied to filter traffic for the specified session.

#### Example

These commands create ACLs and apply them to filter the traffic mirrored from two source ports by session "redir\_1."

```
switch(config)#ip access-list allow-host-x
switch(config-acl-allow-host-x)#10 permit ip host 192.168.11.24 host
10.0.215.23
switch(config-acl-allow-host-x)#20 deny ip any any
switch(config-acl-allow-host-x)#exit
switch(config)#ip access-list allow-host-y
switch(config-acl-allow-host-y)#10 permit ip host 172.16.233.80 host
10.0.215.23
switch(config-acl-allow-host-y)#20 deny ip any any
switch(config-acl-allow-host-y)#exit
switch(config)#monitor session redir_1 source ethernet 5,9 rx
switch(config)#monitor session redir_1 source ethernet 5 ip access-group
allow-host-x
switch(config)#monitor session redir_1 source ethernet 9 ip access-group
allow-host-y
switch(config)#
```

### 10.4.6.29 monitor session source

The `monitor session source` command configures the source port of a specified port mirroring session. The `monitor session destination` or `monitor session destination cpu` command configures the destination port of the mirroring session.

An interface cannot be used in more than one mirror session and cannot be simultaneously a source and a destination. An interface which is part of a port channel cannot be used as a source, but a port channel which is a member of an MLAG can be used. By default, mirror sessions duplicate ingress and egress traffic but are configurable to mirror traffic from only one direction.

The `no monitor session source` and `default monitor session source` commands remove the mirroring session source assignment by deleting the corresponding `monitor session source` command from *running-config*. The `no monitor session` removes entire the mirroring session.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor session session_name source INT_NAME DIRECTION
no monitor session session_name source INT_NAME DIRECTION
default monitor session session_name source INT_NAME DIRECTION
```

#### Parameters

- *session\_name* Label assigned to port mirroring session.
- INT\_NAME Source interface for the mirroring session.
  - ethernet *e\_range* Ethernet interfaces specified by *e\_range*.
  - port-channel *p\_range* Port channel interfaces specified by *p\_range*.
- DIRECTION transmission direction of traffic to be mirrored.
  - *<no parameter>* mirrors transmitted and received traffic.
  - both mirrors transmitted and received traffic.
  - rx mirrors received traffic only.
  - tx mirrors transmitted traffic only.

#### Guidelines

On DCS-7050, DCS-7050X, DCS-7250X, and DCS-7300X series, due to limitations of the switch ASIC, all frames mirrored on egress are prefixed with an 802.1Q VLAN tag, even when the egress port is configured as an access port. If the capture device is unable to process VLAN tags in a desirable manner mirroring should be configured exclusively for ingress traffic by specifying **rx**.

#### Restrictions

Port mirroring capacity varies by platform. Session source capacity for each platform is listed below:

- **FM6000 Platform:** Ethernet interfaces (any number), port channel interfaces (any number)
- **Arad Platform:** Ethernet interfaces (any number), port channel interfaces (any number).
- **Petra Platform:** Ethernet interfaces (eight for Rx or Tx sessions; four for both ways)
- **Trident Platform:** Ethernet interfaces (any number), port channel interfaces (any number)
- **Trident II Platform:** Ethernet interfaces (any number), port channel interfaces (any number)

The number of interfaces that can be effectively mirrored is restricted by the destination port speed.

#### Example

---

This command configures Ethernet interface 7 as the source port for *redirect\_1* mirroring session.

```
switch(config)#monitor session redirect_1 source ethernet 7  
switch(config)#
```

### 10.4.6.30 monitor session truncate

The **monitor session truncate** command configures a port mirroring session to truncate mirrored packets, retaining only the first 160 bytes. Packet truncation can be used to prevent oversubscription of the session's destination port.

Packet truncation applies to the mirroring session as a whole, and cannot be applied to individual source ports.

The **no monitor session truncate** and **default monitor session truncate** commands restores mirroring of full packets by deleting the corresponding **monitor session truncate** command from *running-config*. The **no monitor session** removes the entire mirroring session.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor session session_name truncate
no monitor session session_name truncate
default monitor session session_name truncate
```

#### Parameters

*session\_name* Label assigned to port mirroring session.

#### Example

This command configures mirroring session *redirect\_1* to truncate mirrored packets.

```
switch(config)#monitor session redirect_1 truncate
switch(config)#
```

---

### 10.4.6.31 mtu

The **mtu** command configures the IPv4 and IPv6 Maximum Transmission Unit (MTU) size for the configuration mode interface. The switch fragments IP packets that are larger than the MTU value for the outbound interface. An interface's MTU value is displayed with the [show interfaces](#) command.

MTU is independently configurable on all routable interfaces. The switch supports MTU sizes ranging from 68 to 9214 bytes. The default MTU size is 1500 bytes.

The **no mtu** and **default mtu** commands restore the interface's MTU to the default value by removing the corresponding mtu command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
mtu bytes
```

```
no mtu
```

```
default mtu
```

#### Parameters

*bytes* MTU size (bytes). Values range from 68 to 9214.

#### Example

This command sets the MTU size of 1492 bytes on *VLAN interface 20*.

```
switch(config)#interface vlan 20  
switch(config-if-Vl20)#mtu 1492  
switch(config-if-Vl20)#
```

### 10.4.6.32 network (server-failure configuration mode)

The **network** command specifies the IPv4 network space that Rapid Automated Indication of Link-Loss (RAIL) monitors for failed links to connected servers. RAIL reduces the wait time for applications on directly connected servers that are blocked due to a failed link. **Running-config** supports simultaneous network command, allowing RAIL to monitor multiple disjoint network spaces.

When a server on the specified network is blocked because of a failed Ethernet or port channel link, the switch becomes a proxy for the unavailable server and responds with **TCP RST** or **ICMP Unreachable** segments to devices sending packets to the unavailable server.

The **no network** and **default network** commands terminate the RAIL monitoring of the specified IPv4 address space by deleting the corresponding **network** command from **running-config**.

#### Command Mode

Server-failure Configuration

#### Command Syntax

```
network netv4_address
```

```
no network netv4_address
```

```
default network netv4_address
```

#### Parameters

- *netv4\_addr* IPv4 subnet address to be monitored (CIDR or address-mask notation).

#### Related Command

[monitor server-failure](#) places the switch in server-failure configuration mode.

#### Example

This command specifies two IPv4 network spaces that RAIL monitors for server failures.

```
switch(config)#monitor server
switch(config-server-failure)#network 10.1.1.0/24
switch(config-server-failure)#network 10.2.1.96/28
switch(config-server-failure)#show active
monitor server-failure
  network 10.2.1.96/28
  network 10.1.1.0/24
switch(config-server-failure)#
```

---

### 10.4.6.33 no monitor session

The **no monitor session** and default monitor session commands remove the specified monitor session from the switch by deleting all corresponding monitor commands from **running-config**. Commands that remove or alter individual commands within a session configuration are described in the [monitor session destination](#) and [monitor session source](#) commands.

#### Command Mode

Global Configuration

#### Command Syntax

```
no monitor session session_name
```

```
default monitor session session_name
```

#### Parameters

*session\_name* Label assigned to port mirroring session.

#### Example

This command displays the configuration of the *redirect\_1* mirroring session, deletes the session, then confirms that the session was removed.

```
switch(config)#show monitor session redirect_1

Session redirect_1
-----

Source Ports

  Both:          Et7

Destination Port: Et8
switch(config)#no monitor session redirect_1
switch(config)#show monitor session redirect_1
Session not created

switch(config)#
```

### 10.4.6.34 platform sand monitor serdes error log

The `platform sand monitor serdes error log` command is used for enabling the serdes error log for fabric link monitoring.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform sand monitor serdes error log
```

#### Example

This command enables the serdes error log for fabric link monitoring.

```
switch(config)#platform sand monitor serdes error log  
switch(config)#
```

---

### 10.4.6.35 platform sand monitor serdes error threshold

The **platform sand monitor serdes error threshold** command is used for generating a fabric link monitoring serdes error threshold.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform sand monitor serdes error threshold
```

#### Example

This command monitors serdes error thresholds over the specified number of received cells, resulting in the isolation of a fabric link between 200 and 30,000 received cells.

```
switch(config)#platform sand monitor serdes error threshold 200 30000  
switch(config)#
```

### 10.4.6.36 platform sand monitor serdes poll period

The `platform sand monitor serdes poll period` command is used to enable the serdes poll period.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform sand monitor serdes poll period
```

#### Example

This command changes the serdes polling period for fabric link monitoring to 6 seconds.

```
switch(config)#platform sand monitor serdes poll period 6  
switch(config)#
```

---

### 10.4.6.37 platform sand monitor serdes poll threshold isolation

The `platform sand monitor serdes poll threshold isolation` command is used to set and enables fabric link monitoring for serdes poll threshold isolation.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform sand monitor serdes poll threshold isolation
```

#### Example

This command changes the number of consecutive polls in which the threshold needs to be detected to isolate a link. In this case the number is 5 consecutive polls.

```
switch(config)#platform sand monitor serdes poll threshold isolation 5  
switch(config)#
```

### 10.4.6.38 platform sand monitor serdes poll threshold recovery

The **platform sand monitor serdes poll threshold recovery** command is used to set and enable fabric link monitoring for serdes poll threshold recovery.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform sand monitor serdes poll threshold recovery
```

#### Example

This command changes the number of consecutive serdes polls used for threshold recovery to 6 seconds.

```
switch(config)#platform sand monitor serdes poll threshold recovery 6  
switch(config)#
```

### 10.4.6.39 profile max-flaps (Link Flap Configuration)

The **profile max-flaps** command creates a link flap profile that, when assigned to an Ethernet interface, specifies the conditions that result in an error-disable action. Link flap profile parameters include:

- **flaps** Threshold number of interface state changes.
- **period** Interval when link flaps accumulate to trigger an error condition.
- **violations** Number of link flap errors (threshold exceeded over specified period).
- **intervals** Quantity of periods.

By default, violations and intervals are each set to one, resulting in a profile that triggers a link-flap error when the specified frequency is exceeded once. By configuring violations and intervals, link-flap errors are defined when the frequency is exceeded multiple times over a specified set of intervals.

**Default** is a reserved profile name that modifies the [errdisable flap-setting cause link-flap](#) statement in *running-config*. When configuring the **default** profile, violations and intervals are disregarded.

The **no profile max-flaps** command removes the specified profile by deleting the corresponding **profile max-flaps** command from *running-config*. The **no profile max-flaps default** command restores default [errdisable flap-setting cause link-flap](#) values by removing that command from *running-config*.

#### Command Mode

Link-flap Configuration

#### Command Syntax

```
profile PROFILE_NAME max-flaps flap_max time period [EXTENTIONS]
no profile LF_PROFILE
```

#### Parameters

- **PROFILE\_NAME** Name of link flap profile. Options include:
  - **default** command modifies default values ([errdisable flap-setting cause link-flap](#)).
  - **profile\_name** command modifies specified link-flap profile.
- **flap\_max** Threshold number of interface state changes. Value ranges from 1 to 100.
- **period** Interval when flaps accumulate toward threshold (seconds). Value ranges from 1 to 1800.
- **EXTENSIONS** Configures multi-flap triggers. Options include:
  - **<no parameter>** Sets errors and episodes to default values (one).
  - **violations errors intervals episodes** Link flap errors (*errors*) and number of periods (*episodes*).

*Errors* range is 1 to 1000. Default value is one.

*Episodes* range is 1 to 1000. Default value is one.

#### Related Command

[monitor link-flap policy](#) places the switch in link-flap configuration mode.

#### Example

These commands create two link flap profiles with various trigger settings.

```
switch(config)#monitor link-flap policy
switch(config-link-flap)#profile LF01 max-flaps 15 time 60
switch(config-link-flap)#profile LF02 max-flaps 10 time 30 violations 5
intervals
10
switch(config-link-flap)#show active
monitor link-flap policy
  profile LF01 max-flaps 15 time 60 violations 1 intervals 1
```

```
profile LF02 max-flaps 10 time 30 violations 5 intervals 10
switch(config-link-flap)#
```

#### 10.4.6.40 proxy (server-failure configuration mode)

The **proxy** command enables the Rapid Automated Indication of Link-Loss (RAIL) proxy setting and specifies the interval that RAIL responds to messages sent to servers on failed links, starting from when the switch detects the failed link. The RAIL state machine is in the proxying state during the timeout interval this command specifies. When RAIL proxy is not enabled, the switch maintains a list of unavailable servers without responding to messages sent to the servers. The switch can enter RAIL proxy state only when this command is enabled.

The RAIL proxy setting is **disabled** by default. When RAIL proxy is enabled, the default period is three minutes.

The **no proxy** and **default proxy** commands return the RAIL proxy setting to disabled by removing the proxy statement from *running-config*.

The **no proxy lifetime** and **default proxy lifetime** command sets the proxy time setting to its default value of three minutes if the RAIL proxy setting is **enabled**. These commands have no effect if the RAIL proxy setting is **disabled**.

##### Command Mode

Server-failure Configuration

##### Command Syntax

```
proxy [lifetime time_span]
```

```
no proxy [lifetime]
```

```
default proxy [lifetime]
```

##### Parameters

*timespan* proxy timeout period (minutes). Value ranges from 1 to 10080. Default value is 3.

##### Related Command

[monitor server-failure](#) places the switch in server-failure configuration mode.

##### Examples

- These commands enable the RAIL proxy and sets the proxy timeout period of 10 minutes.

```
switch(config)#monitor server
switch(config-server-failure)#proxy lifetime 10
switch(config-server-failure)#show active
monitor server-failure
    proxy lifetime 10
switch(config-server-failure)#
```

- This command sets the proxy timeout period to its default value of 3 minutes.

```
switch(config-server-failure)#no proxy lifetime
switch(config-server-failure)#show active
monitor server-failure
    proxy
switch(config-server-failure)#
```

- This command disables the RAIL proxy.

```
switch(config-server-failure)#no proxy
switch(config-server-failure)#show active
monitor server-failure
switch(config-server-failure)#
```

#### 10.4.6.41 show bridge mac-address-table aging timeout

The **show bridge mac-address-table aging timeout** command displays the aging time for MAC address table dynamic entries. Aging time defines the period an entry is in the table, as measured from the most recent reception of a frame on the entry's VLAN from the specified MAC address. The switch removes entries that exceed the aging time.

Aging time ranges from 10 seconds to 1,000,000 seconds with a default of 300 seconds (five minutes).

##### Command Mode

EXEC

##### Command Syntax

```
show bridge mac-address-table aging timeout
```

##### Example

This command shows the MAC address table aging time.

```
switch>show bridge mac-address-table aging timeout  
Global Aging Time: 120  
switch>
```

---

#### 10.4.6.42 show fabric monitoring health

The `platform sand monitor health` command is used to display the fabric monitoring connected state status with isolated links.

##### Command Mode

Global Configuration

##### Command Syntax

```
platform sand monitor health
```

##### Example

This command displays the connected state status with isolated links.

```
switch(config)#show platform sand health
Fabric serdes isolated by fabric monitoring: (36 total)

Arad5/0 serdes [0-1, 10-19, 2, 20-29, 3, 30-35, 4-9]

Top fabric serdes list by number of times isolated by monitoring:
Arad5/0 serdes 0: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 1: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 10: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 11: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 12: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 13: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 14: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 15: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 16: 1 (last occurred: 0:01:04 ago)
Arad5/0 serdes 17: 1 (last occurred: 0:01:04 ago)

switch(config)#
```

### 10.4.6.43 show interfaces description

The **show interfaces description** command displays the status and description text of the specified interfaces. The **description** command configures an interface's description parameter.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INT_NAME] description
```

#### Parameters

- INT\_NAME Interface type and labels. Options include:
  - *<no parameter>* all interfaces.
  - ethernet *e\_range* Ethernet interface range specified by *e\_range*.
  - loopback *l\_range* Loopback interface specified by *l\_range*.
  - management *m\_range* Management interface range specified by *m\_range*.
  - port-channel *p\_range* Port-Channel Interface range specified by *p\_range*.
  - vlan *v\_range* VLAN interface range specified by *vx\_range*.
  - vxlan *vx\_range* VXLAN interface range specified by *vx\_range*.

Range formats include number, number range, or comma-delimited list of numbers and ranges.

#### Example

This command displays description text and status of *ethernet interfaces 1-10*.

```
switch>show interfaces ethernet 1-10 description
Interface          Status      Protocol  Description
Et1                 up          up        ctar_01
Et2                 up          up        ctar_02
Et3                 up          up        ctar_03
Et4                 up          up        fobd_01
Et5                 up          up        fobd_02
Et6                 up          up        yzrq_01
Et7                 up          up        yzrq_02
Et8                 down        down      yzrq_03
Et9                 up          up        yzrq_04
Et10                up          up        yzrq_05
switch>
```

#### 10.4.6.44 show interfaces

The **show interfaces** command displays operational status and configuration information of specified interfaces. The output includes speed, duplex, flow control information and basic interface statistics.

The input and output bit rates, as displayed, do not include framing bits that are part of the Ethernet standard, the inter-frame gap and preamble that total 20 bytes per packet. The percentage number includes those framing bits to provide a better link utilization estimate.

##### Command Mode

EXEC

##### Command Syntax

```
show interfaces [INT_NAME]
```

##### Parameters

- INT\_NAME Interface type and numbers. Options include:
  - *<no parameter>* all interfaces.
  - ethernet *e\_range* Ethernet interface range specified by *e\_range*.
  - loopback *l\_range* Loopback interface specified by *l\_range*.
  - management *m\_range* Management interface range specified by *m\_range*.
  - port-channel *p\_range* Port-Channel Interface range specified by *p\_range*.
  - vlan *v\_range* VLAN interface range specified by *v\_range*.
  - vxlan *vx\_range* VXLAN interface range specified by *vx\_range*.

Valid range formats include number, number range, or comma-delimited list of numbers and ranges.

##### Example

This command display configuration and status information for Ethernet interface 1 and 2.

```
switch>show interfaces ethernet 1-2
Ethernet1 is up, line protocol is up (connected)
Hardware is Ethernet, address is 001c.2481.7647 (bia 001c.2481.7647)
Description: mkt.1
MTU 9212 bytes, BW 10000000 Kbit
Full-duplex, 10Gb/s, auto negotiation: off
Last clearing of "show interface" counters never
5 seconds input rate 33.5 Mbps (0.3% with framing), 846 packets/sec
5 seconds output rate 180 kbps (0.0% with framing), 55 packets/sec
 76437268 packets input, 94280286608 bytes
  Received 2208 broadcasts, 73358 multicast
  0 runts, 0 giants
  0 input errors, 0 CRC, 0 alignment, 0 symbol
  0 PAUSE input
6184281 packets output, 4071319140 bytes
  Sent 2209 broadcasts, 345754 multicast
  0 output errors, 0 collisions
  0 late collision, 0 deferred
  0 PAUSE output
Ethernet2 is up, line protocol is up (connected)
Hardware is Ethernet, address is 001c.2481.7648 (bia 001c.2481.7648)
Description: mkt.2
MTU 9212 bytes, BW 10000000 Kbit
Full-duplex, 10Gb/s, auto negotiation: off
Last clearing of "show interface" counters never
5 seconds input rate 711 kbps (0.0% with framing), 271 packets/sec
5 seconds output rate 239 kbps (0.0% with framing), 65 packets/sec
 73746370 packets input, 78455101010 bytes
```

```
Received 11 broadcasts, 83914 multicast
0 runts, 0 giants
0 input errors, 0 CRC, 0 alignment, 0 symbol
0 PAUSE input
5687714 packets output, 4325064454 bytes
Sent 15 broadcasts, 107279 multicast
0 output errors, 0 collisions
0 late collision, 0 deferred
0 PAUSE output
switch>
```

---

#### 10.4.6.45 show link tracking group

The **show link tracking group** command displays information about a specified link-state group or about all groups.

##### Command Mode

EXEC

##### Command Syntax

```
show link tracking group [DATA_LEVEL][GROUPS]
```

##### Parameters

- **DATA\_LEVEL** device for which the command provides data. Options include:
  - *<no parameter>* information about all groups in group list.
  - **detail** detailed information about all groups in group list.
- **GROUPS**
  - *<no parameter>* all link-state groups.
  - *group\_name* link-state group name.

##### Example

This command displays all the link-state group information.

```
switch#show link tracking group detail
Link State Group: 1 Status: up
Upstream Interfaces : Vlan100
Downstream Interfaces : Vlan200
Number of times disabled : 2
Last disabled 0:10:29 ago

Link State Group: group3 Status: down
Upstream Interfaces : Ethernet24
Downstream Interfaces : Ethernet8
Number of times disabled : 2
Last disabled 0:30:35 ago

Link State Group: 2 Status: up
Upstream Interfaces : Ethernet2 Ethernet5
Downstream Interfaces : Ethernet12
Number of times disabled : 0
Last disabled never
switch#
```

#### 10.4.6.46 show mac address-table count

The **show mac-address-table count** command displays the number of entries in the MAC address table for the specified VLAN or for all VLANs.

##### Command Mode

EXEC

##### Command Syntax

```
show mac address-table count [VLANS]
```

##### Parameters

- **VLANS** The VLANs for which the command displays the entry count.
  - *<no parameter>* all configured VLANs.
  - *vlan v\_num* VLAN interface specified by *v\_num*.

##### Example

This command displays the number of entries on *VLAN 39*.

```
switch>show mac address-table count vlan 39

Mac Entries for Vlan 39:
-----
Dynamic Address Count      : 1
Unicast Static Address Count : 1
Multicast Static Address Count : 0
Total Mac Addresses       : 2

switch>
```

---

#### 10.4.6.47 show mac address-table mlag-peer

The `show mac-address-table mlag-peer` command displays the specified MAC address table entries learned from the MLAG peer switch.

##### Command Mode

EXEC

##### Command Syntax

```
show mac address-table mlag-peer [ENTRY_TYPE][MAC_ADDR][INTF_1 ... INTF_N][VLANS]
```

##### Parameters

- **ENTRY\_TYPE** command filters display by entry type. Entry types include mlag-peer, dynamic, static, unicast, multicast entries, and configured.
  - *<no parameter>* all MLAG peer entries.
  - `configured` static entries on MLAG peer; includes unconfigured VLAN entries.
  - `dynamic` entries learned on MLAG peer.
  - `static` MLAG entries entered by CLI commands and include a configured VLAN.
  - `unicast` MLAG entries with unicast MAC address.
- **MAC\_ADDR** command uses MAC address to filter displayed entries.
  - *<no parameter>* all MAC addresses table entries.
  - `address mac_address` displays entries with specified address (dotted hex notation – H.H.H).
- **INTF\_X** command filters display by port list. When parameter lists multiple interfaces, command displays all entries containing at least one listed interface.
  - *<no parameter>* all Ethernet and port channel interfaces.
  - `ethernet e_range` Ethernet interfaces specified by *e\_range*.
  - `port-channel p_range` Port channel interfaces specified by *p\_range*.
- **VLANS** command filters display by VLAN.
  - *<no parameter>* all VLANs.
  - `vlan v_num` VLANs specified by *v\_num*.

##### Related Commands

- [show mac address-table](#)
- [show mac address-table multicast](#)

#### 10.4.6.48 show mac address-table multicast brief

The `show mac-address-table` command displays a summary of multicast MAC address table entries.

##### Command Mode

EXEC

##### Command Syntax

```
show mac address-table multicast [VLAN] brief
```

##### Parameters

- `VLAN` command filters display by VLAN.
  - `<no parameter>` all VLANs.
  - `vlan v_num` VLANs specified by `v_num`.

##### Related Command

[show mac address-table multicast](#).

---

#### 10.4.6.49 show mac address-table multicast

The `show mac-address-table` command displays the specified multicast MAC address table entries.

##### Command Mode

EXEC

##### Command Syntax

```
show mac address-table multicast [MAC_ADDR][INTF][VLANS]
```

##### Parameters

- `MAC_ADDR` command uses MAC address to filter displayed entries.
  - `<no parameter>` all MAC addresses table entries.
  - `address mac_address` displays entries with specified address (dotted hex notation – H.H.H).
- `INTF` command filters display by port list. When parameter lists multiple interfaces, command displays all entries containing at least one listed interface.
  - `<no parameter>` all Ethernet and port channel interfaces.
  - `ethernet e_range` Ethernet interfaces specified by `e_range`.
  - `port-channel p_range` Port channel interfaces specified by `p_range`.
- `VLANS` command filters display by VLAN.
  - `<no parameter>` all VLANs.
  - `vlan v_num` VLANs specified by `v_num`.

##### Related Commands

- [show mac address-table](#)
- [show mac address-table multicast brief](#)

### 10.4.6.50 show mac address-table

The `show mac address-table` command displays the specified MAC address table entries.

#### Command Mode

EXEC

#### Command Syntax

```
show mac address-table [ENTRY_TYPE][MAC_ADDR][INTF_1 ... INTF_N][VLANS]
```

#### Parameters

- **ENTRY\_TYPE** command filters display by entry type. Entry types include mlag-peer, dynamic, static, unicast, multicast entries, and configured.
  - `<no parameter>` all table entries.
  - `configured` static entries; includes unconfigured VLAN entries.
  - `dynamic` entries learned by the switch.
  - `static` entries entered by CLI commands and include a configured VLAN.
  - `unicast` entries with unicast MAC address.
- **MAC\_ADDR** command uses MAC address to filter displayed entries.
  - `<no parameter>` all MAC addresses table entries.
  - `address mac_address` displays entries with specified address (dotted hex notation – H.H.H).
- **INTF\_X** command filters display by port list. When parameter lists multiple interfaces, command displays all entries containing at least one listed interface.
  - `<no parameter>` all Ethernet and port channel interfaces.
  - `ethernet e_range` Ethernet interfaces specified by `e_range`.
  - `port-channel p_range` Port channel interfaces specified by `p_range`.
- **VLANS** command filters display by VLAN.
  - `<no parameter>` all VLANs.
  - `vlan v_num` VLANs specified by `v_num`.

#### Related Commands

- [show mac address-table mlag-peer](#)
- [show mac address-table multicast](#)

#### Examples

- This command displays the MAC address table.

```
switch>show mac address-table

### 10.4.6.51 show monitor server-failure history

The **show monitor server-failure history** command displays the time of all link failures detected by Rapid Automated Indication of Link-Loss (RAIL) and includes the interface name for each failure.

The history is cleared by removing RAIL from the switch (**no monitor server-failure**).

#### Command Mode

EXEC

#### Command Syntax

```
show monitor server-failure history
```

#### Related Command

[clear server-failure servers inactive](#)

#### Example

This command displays the Fast Server Failure link failure history from the time RAIL is instantiated on the switch.

```
switch>show monitor server-failure history
Total server failures: 4

Server IP      Server MAC      Interface      Last Failed
-----
10.1.67.92    01:22:ab:cd:ee:ff  Ethernet17    2013-02-02 11:26:22

switch>
```

### 10.4.6.52 show monitor server-failure servers

The **show monitor server-failure servers** command displays status and configuration information about each server that RAIL is monitoring. The display format depends on the parameter specified by the command:

- **single IP address:** command displays information about the server at the specified address, including IP address, MAC address, RAIL state, the time of most recent entry of all RAIL states, and the number of failed, proxied, and inactive state entries.
- **no parameter, key specifying a server list:** command displays a table. Each row corresponds to a monitored server. Information that the command displays includes IP address, MAC address, RAIL state, the time of most recent link failure.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor server-failure servers [SERVER_LIST]
```

#### Parameters

- **SERVER\_LIST** Servers for which command displays information. Valid options include:
  - *<no parameter>* all servers in up, down, and proxying states.
  - *ipv4\_addr* individual server; command displays detailed information.
  - *all* all servers on monitored networks.
  - *inactive* all servers in inactive state.
  - *proxying* all servers in proxying state.

#### Examples

- This command displays RAIL information for the server at IP address *10.11.11.7*.

```
switch>show monitor server-failure servers 10.11.11.7
Server information:
Server Ip Address      : 10.11.11.7
MAC Address           : ad:3e:5f:dd:64:cf
Current state         : down
Interface             : Ethernet23
Last Discovered       : 2013-01-06 06:47:39
Last Failed           : 2013-02-10 00:07:56
Last Proxied          : 2013-02-10 00:08:33
Last Inactive         : 2013-02-09 23:52:21
Number of times failed : 3
Number of times proxied : 1
Number of times inactive : 18

switch>
```

- This command displays RAIL data for all servers in monitored networks that are in inactive state.

```
switch>show monitor server-failure servers inactive
Inactive servers: 1

Server IP      Server MAC          Interface      State      Last Failed
-----
10.1.67.92    01:22:ab:cd:ee:ff    Ethernet17    inactive   7 days, 12:48:06
ago

switch>
```

- This command displays RAIL information for all servers in monitored networks that are in up, down, and proxying states.

```
switch>show monitor server-failure servers
Active servers: 4

Server IP      Server MAC          Interface          State          Last
Failed
-----
44.11.11.7    ad:3e:5f:dd:64:cf  Ethernet23        down
0:03:21 ago
10.1.1.1      01:22:df:42:78:cd  Port-Channel6     up
4:35:08 ago
10.1.8.13     01:33:df:ee:39:91  Port-Channel5     proxying
0:07:38 ago
132.23.23.1   00:11:aa:bb:32:ad  Ethernet1         up              never

switch>
```

- This command displays RAIL information for all servers on configured interfaces.

```
switch>show monitor server-failure servers all
Total servers monitored: 5

Server IP      Server MAC          Interface          State Last Failed
-----
10.1.67.92     01:22:ab:cd:ee:ff  Ethernet17        inactive 7 days,
12:47:48 ago

132.23.23.1    00:11:aa:bb:32:ad  Ethernet1         up       never

switch>
```

---

### 10.4.6.53 show monitor server-failure

The **show monitor server-failure** command displays Rapid Automated Indication of Link-Loss (RAIL) configuration settings and the number of servers on each monitored network.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor server-failure
```

#### Example

This command displays RAIL configuration status and lists the number of servers that are on each monitored network.

```
switch>show monitor server-failure
Server-failure monitor is enabled
Proxy service: disabled
Networks being monitored: 3
  10.2.1.96/28      : 0 servers
  10.1.1.0/24      : 0 servers
  10.3.0.0/16      : 3 servers
switch>
```

#### 10.4.6.54 show monitor session

The **show monitor session** command displays the configuration of the specified port mirroring session. The command displays the configuration of all mirroring sessions on the switch when the session name parameter is omitted.

##### Command Mode

EXEC

##### Command Syntax

```
show monitor session SESSION_NAME
```

##### Parameters

- **SESSION\_NAME** Port mirroring session identifier. Options include:
  - *<no parameter>* displays configuration for all sessions.
  - *label* command displays configuration of the specified session.

##### Example

This command displays the mirroring configuration of the specified monitor session.

```
switch>show monitor session redirect_1

Session redirect_1
-----

Source Ports

  Both:          Et7

Destination Port: Et8
switch(config)>
```

---

### 10.4.6.55 show platform trident mirroring

The **show platform trident mirroring** command displays current parameters of all configured mirroring sessions in Trident series platforms.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show platform trident mirroring [detail | session]
```

#### Parameters

- **detail** displays the detailed information of all configured mirroring sessions.
- **session *session\_name*** displays the information of specified mirroring session.

#### Guidelines

This command is supported on DCS-7050/7050X, DCS-7250X, and DCS-7300X devices only.

#### Examples

- This command displays the detailed information of all configured mirroring sessions.

```
switch(config)#show platform trident mirroring detail

Session : 123
=====

srcIntf(rx): Ethernet12/3
Hw Mirror Id: 0x1

                Et12/3(tx)      Et15/1

switch(config)#
```

### 10.4.6.56 show port-channel load-balance

The **show port-channel load-balance** command displays the traffic distribution between the member ports of the specified port channels. The command displays distribution for unicast, multicast, and broadcast streams.

- The distribution values displayed are based on the total interface counters which start from zero at boot time or when the counters are cleared. For more current traffic distribution values, clear the interface counters of the member interfaces using the [clear counters](#) command.

#### Command Mode

EXEC

#### Command Syntax

```
show port-channel load-balance [MEMBERS]
```

#### Parameters

- MEMBERS List of port channels for which information is displayed. Options include:
  - *<no parameter>* All configured port channels.
  - *c\_range* Ports in specified channel list (number, number range, or list of numbers and ranges).

#### Example

This command displays traffic distribution for all configured port channels.

```
switch>show port-channel load-balance
ChanId Port      Rx-Ucst Tx-Ucst Rx-Mcst Tx-Mcst Rx-Bcst Tx-Bcst
-----
 8      Et10      100.00% 100.00% 100.00% 100.00%  0.00%  100.00%
-----

switch>
```

### 10.4.6.57 show port-security interface

The **show port-security interface** command displays the switchport port-security status of all specified interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show port-security interface [INT_NAME]
```

#### Parameters

- INT\_NAME Interface type and numbers. Options include:
  - *<no parameter>* Display information for all interfaces.
  - *ethernet e\_range* Ethernet interface range specified by *e\_range*.
  - *loopback l\_range* Loopback interface specified by *l\_range*.
  - *management m\_range* Management interface range specified by *m\_range*.
  - *port-channel p\_range* Port-Channel Interface range specified by *p\_range*.
  - *vlan v\_range* VLAN interface range specified by *v\_range*.
  - *vxlan vx\_range* VXLAN interface range specified by *vx\_range*.

Valid *range* formats include number, number range, or comma-delimited list of numbers and ranges.

#### Example

This command display port-security configuration and status for the specified interfaces.

```
switch>show port-security interface ethernet 7-8
Interface                : Ethernet7
Port Security            : Enabled
Port Status              : Secure-down
Violation Mode           : Shutdown
Maximum MAC Addresses    : 5
Aging Time               : 5 mins
Aging Type               : Inactivity
SecureStatic Address Aging : Disabled
Total MAC Addresses      : 3
Configured MAC Addresses : 3
Learn/Move/Age Events    : 5
Last Source Address:Vlan : 164f.29ae.4e14:10
Last Address Change Time : 0:39:47 ago
Security Violation Count : 0

Interface                : Ethernet8
Port Security            : Disabled
Port Status              : Secure-down
Violation Mode           : Shutdown
Maximum MAC Addresses    : 1
Aging Time               : 5 mins
Aging Type               : Inactivity
SecureStatic Address Aging : Disabled
switch>
```

---

### 10.4.6.58 show port-security mac-address

The **show port-security mac-address** command display static unicast MAC addresses assigned to interfaces where switchport port security is enabled.

#### Command Mode

EXEC

#### Command Syntax

```
show port-security mac-address
```

#### Example

This command displays MAC addresses assigned to port-security protected interfaces.

```
switch>show port-security mac-address
Secure Mac Address Table
-----
Vlan    Mac Address          Type                Ports    Remaining Age
-----  -
10      164f.29ae.4e14      SecureConfigured    Et7      N/A
10      164f.29ae.4f11      SecureConfigured    Et7      N/A
10      164f.320a.3a11      SecureConfigured    Et7      N/A
-----
Total Mac Addresses for this criterion: 3
switch>
```

### 10.4.6.59 show port-security

The **show port-security** command displays a summary of MAC address port security configuration and status on each interface where switchport port security is enabled.

#### Command Mode

EXEC

#### Command Syntax

```
show port-security
```

#### Display Values

Each column corresponds to one physical interface. The table displays interfaces with port security enabled.

- **Secure Port:** Interface with switchport port-security enabled.
- **MaxSecureAddr:** Maximum quantity of MAC addresses that the specified port can process.
- **CurrentAddr:** Static MAC addresses assigned to the interface.
- **SecurityViolation:** Number of frames with unsecured addresses received by port.
- **Security Action:** Action triggered by a security violation.

#### Example

This command displays switchport port security configuration and status data.

```
switch>show port-security
Secure Port      MaxSecureAddr  CurrentAddr    SecurityViolation  Security Action
              (Count)          (Count)          (Count)
-----
      Et7                5                3                0                Shutdown
      Et10               1                0                0                Shutdown
-----
Total Addresses in System: 3
switch>
```

---

### 10.4.6.60 show storm-control

The **show storm-control** command displays the storm-control level and interface inbound packet capacity for the specified interface.

The configured value ([storm-control](#)) differs from the programmed threshold in that the hardware accounts for Interframe Gaps (IFG) based on the minimum packet size. This command displays the broadcast or multicast rate after this adjustment.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show storm-control [INT_NAME]
```

#### Parameters

- *<no parameter>* Command returns data for all interfaces configured for storm control.
- INT\_NAME interface type and port range. Settings include:
  - ethernet *e\_range* Ethernet interfaces that *e\_range* denotes.
  - port-channel *p\_range* Port channel interfaces that *p\_range* denotes.

When storm control commands exist for a port-channel and an Ethernet port that is a member of the port channel, the command for the port-channel takes precedence.

Valid *range* formats include number, number range, or comma-delimited list of numbers and ranges.

#### Example

This command displays the storm control configuration for Ethernet ports 2 through 4.

```
switch#show storm-control
Port          Type      Level Rate (Mbps)  Status      Drops Reason
Et10/2        all       75      7500        active      0
Et10/3        multicast 55      5500        active      0
Et10/4        broadcast 50      5000        active      0
switch#
```

#### 10.4.6.61 show switch forwarding-mode

The **show switch forwarding-mode** command displays the switch's current and available forwarding plane hardware modes.

##### Command Mode

EXEC

##### Command Syntax

```
show switch forwarding-mode
```

##### Related Command

[switch forwarding-mode](#) configures the switch's forwarding mode setting.

##### Example

This command changes the switch's forward mode to store-and-forward, then displays the forwarding mode.

```
switch(config)#switch forwarding-mode store-and-forward
switch(config)#show switch forwarding-mode
Current switching mode:    store and forward
Available switching modes: cut through, store and forward
```

---

### 10.4.6.62 show track

The **show track** command displays information about tracked objects configured on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show track [OBJECT][INFO_LEVEL]
```

#### Parameters

- **OBJECT** tracked object for which information is displayed. Options include:
  - *<no parameter>* displays information for all tracked objects configured on the switch.
  - *object\_name* displays information for the specified object.
- **INFO\_LEVEL** amount of information that is displayed. Options include:
  - *<no parameter>* displays complete information including object status, number of status changes, time since last change, and client process tracking the object (if any).
  - *brief* displays brief list of all tracked objects and their current status.

#### Examples

- This command displays all information for tracked object ETH8.

```
switch#show track ETH8
Tracked object ETH8 is up
  Interface Ethernet8 line-protocol
    4 change, last change time was 0:36:12 ago
  Tracked by:
    Ethernet5/1 vrrp instance 50
switch#
```

- This command displays summary information for all tracked objects.

```
switch#show track brief
Tracked object ETH2 is up
Tracked object ETH4 is down
Tracked object ETH6 is up
Tracked object ETH8 is up
switch#
```

### 10.4.6.63 shutdown (server-failure configuration mode)

The **shutdown** command disables Rapid Automated Indication of Link-Loss (RAIL). By default, RAIL is disabled.

After entering server-failure configuration mode, a **no shutdown** command is required to enable RAIL.

The **no shutdown** command enables RAIL on the switch. The **shutdown** and **default shutdown** commands disable RAIL by removing the shutdown command from *running-config*.

#### Command Mode

Server-failure Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

#### Examples

- This command enables RAIL on the switch.

```
switch(config)#monitor server
switch(config-server-failure)#no shutdown
switch(config-server-failure)#show active
monitor server-failure
    no shutdown
switch(config-server-failure)#
```

- This command disables RAIL on the switch.

```
switch(config-server-failure)#shutdown
switch(config-server-failure)#show active
monitor server-failure
switch(config-server-failure)#
```

---

#### 10.4.6.64 storm-control

The **storm-control** command configures and enables storm control on the configuration mode physical interface. The command provides three mode options:

- **storm-control all** unicast, multicast, and broadcast inbound packet control.
- **storm-control broadcast** broadcast inbound packet control.
- **storm-control multicast** multicast inbound packet control.

An interface configuration can contain three storm-control statements, one with each mode setting. The **storm-control all** threshold overrides broadcast and multicast thresholds.

The threshold is a percentage of the available port bandwidth and is configurable on each interface for each transmission mode.

The **no storm-control** and **default storm-control** commands remove the corresponding **storm-control** statement from *running-config*, disabling storm control for the specified transmission type on the configuration mode interface.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

##### Command Syntax

```
storm-control MODE level threshold
```

```
no storm-control MODE
```

```
default storm-control MODE
```

##### Parameters

- **MODE** packet transmission type. Options include:
  - all
  - broadcast
  - multicast
- **threshold** Inbound packet level that triggers storm control, as a percentage of port capacity. Value ranges from 0.01 to 100. Storm control is suppressed by a level of 100.

The configured value differs from the programmed threshold in that the hardware accounts for Interframe Gaps (IFG) based on the minimum packet size. The [show storm-control](#) command displays the broadcast or multicast rate after this adjustment.

##### Restrictions

The **storm-control all** option is not available on Arad platform switches.

##### Example

These commands enable multicast and broadcast storm control on Ethernet port 20 and sets thresholds of 65% (multicast) and 50% (broadcast). During each one second interval, the interface drops inbound multicast traffic and broadcast traffic in excess of the specified thresholds.

```
switch(config)#interface ethernet 20
switch(config-if-Et20)#storm-control multicast level 65
switch(config-if-Et20)#storm-control broadcast level 50
switch(config-if-Et20)#show active
interface Ethernet20
    storm-control broadcast level 50
    storm-control multicast level 65
switch(config-if-Et20)#
```

### 10.4.6.65 switch forwarding-mode

The **switch forwarding-mode** command specifies the mode of the switch's forwarding plane hardware. The default forwarding mode is **cut through**.

The **no switch forwarding-mode** and **default switch forwarding-mode** commands restore the default forwarding mode by removing the **switch forwarding-mode** command from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
switch forwarding-mode MODE_SETTING
```

```
no switch forwarding-mode
```

```
default switch forwarding-mode
```

#### Parameters

- **MODE\_SETTING** Specifies the switch's forwarding plane hardware mode. Options include:
  - **cut-through** the switch begins forwarding frames before their reception is complete.
  - **store-and-forward** the switch accumulates entire packets before forwarding them.

#### Guidelines

The forwarding plane mode is **store-and-forward** on Petra and Arad platform switches.

#### Related Command

[show switch forwarding-mode](#) displays the current forwarding mode.

#### Example

This command changes the forwarding mode to **store-and-forward**.

```
switch(config)#switch forwarding-mode store-and-forward
switch(config)#
```

---

#### 10.4.6.66 **switchport default mode access**

The **switchport default mode access** command places the configuration mode interface in **switched port default access** (Layer 3) mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments.

##### **Command Mode**

Global Configuration

##### **Command Syntax**

```
switchport default mode access
```

##### **Related Command**

[switchport default mode routed](#) puts a switch with all ports in routed port mode.

##### **Example**

This command puts a switch with all ports in access port mode.

```
switch(config)#switchport default mode access
```

### 10.4.6.67 `switchport default mode routed`

The `switchport default mode routed` command places the configuration mode interface in ***switched port default routed*** (Layer 3) mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments.

By default, on a switch with default startup config or no config, all ports come up in access mode. By adding the CLI command `switchport default mode routed` to kickstart config, all ports will come up in routed mode after boot up. On boot up, Zero Touch Provisioning (ZTP) is enabled by default if the startup config (/mnt/flash/startupconfig) is deleted. ZTP can be disabled by setting `DISABLE=True` in ZTP config (/mnt/flash/zerotouchconfig). Kickstart config (/mnt/flash/kickstart-config) is used when startup config is missing and ZTP is disabled.

#### Command Mode

Global Configuration

#### Command Syntax

```
switchport default mode routed
```

#### Related Command

[switchport default mode access](#) puts a switch with all ports in access port mode.

#### Example

This command puts a switch with all ports in routed port mode.

```
switch(config)#switchport default mode routed
```

---

### 10.4.6.68 switchport mac address learning

The **switchport mac address learning** command enables MAC address learning for the configuration mode interface. MAC address learning is enabled by default on all Ethernet and port channel interfaces.

The switch maintains a MAC address table for switching frames between VLAN ports. When the switch receives a frame, it associates the MAC address of the transmitting interface with the recipient VLAN and port. When MAC address learning is enabled for the recipient port, the entry is added to the MAC address table. When MAC address learning is not enabled, the entry is not added to the table.

The **no switchport mac address learning** command disables MAC address learning for the configuration mode interface. The **switchport mac address learning** and **default switchport mac address learning** commands enable MAC address learning for the configuration mode interface by deleting the corresponding **no switchport mac address learning** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
switchport mac address learning
no switchport mac address learning
default switchport mac address learning
```

#### Example

These commands disables MAC address learning for Ethernet interface 8, then displays the active configuration for the interface.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#no switchport mac address learning
switch(config-if-Et8)#show active
interface Ethernet8
  no switchport mac address learning
switch(config-if-Et8)#
```

### 10.4.6.69 `switchport port-security mac-address maximum`

The `switchport port-security mac-address maximum` command specifies the maximum MAC address limit for the configuration mode interface when configured as a secure port. When port security is enabled, the port accepts traffic and adds source addresses to the MAC table until the maximum is reached. Once the maximum is reached, if any traffic arrives from a source not already in the MAC table for the secure port, the port becomes errdisabled. The `switchport port-security` command configures an interface as a secure port.

The `no switchport port-security mac-address maximum` and `default switchport port-security mac-address maximum` commands restore the maximum MAC address limit of one on the configuration mode interface by removing the corresponding `switchport port-security mac-address maximum` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
switchport port-security mac-address maximum max_addr
```

```
no switchport port-security mac-address maximum
```

```
default switchport port-security mac-address maximum
```

#### Parameters

*max\_addr* maximum number of MAC addresses. Value ranges from 1 to 1000. Default value is 1.

#### Example

These commands configure a maximum of five incoming addresses for secure port channel interface 14.

```
switch(config)#interface port-channel 14  
switch(config-if-Po14)#switchport port-security mac-address maximum 5  
switch(config-if-Po14)#
```

---

#### 10.4.6.70 switchport port-security violation

The **switchport port-security violation** command configures port security in protect mode (with the option of enabling logging) or the shutdown mode.

The **no switchport port-security** and **no switchport port-security violation protect log** commands disable port security protect mode and port security protect mode logging on the configuration mode interface.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

##### Command Syntax

```
switchport port-security violation {protect [log] | shutdown}
no switchport port-security violation protect log
default switchport port-security violation protect log
```

##### Parameters

- **protect** configures the port security in the protect mode.
- **shutdown** configures the port security in the shutdown mode.
- **log** *the log of new addresses seen after limit is reached in the protect mode.*

##### Guidelines

When port security is enabled, the port accepts traffic and adds source addresses to the MAC table until the maximum is reached. The **switchport port-security** command configures an interface as a secure port.

In the protect mode, the ACLs are dynamically created to block incoming MAC addresses when the configured maximum MAC value is reached.

In the shutdown mode, once the maximum is reached, if any traffic arrives from a source not already in the MAC table for the secure port, the port is set to be errdisabled.

##### Examples

- These commands configure port security violation protect mode for secure port channel interface 14.

```
switch(config)#interface port-channel 14
switch(config-if-Po14)#switchport port-security violation protect
switch(config-if-Po14)#
```

- These commands configure port security violation protect logging mode for secure port channel interface 14.

```
switch(config)#interface port-channel 14
switch(config-if-Po14)#switchport port-security violation protect log
switch(config-if-Po14)#
```

- These commands configure port security violation shutdown mode for secure port channel interface 15.

```
switch(config)#interface port-channel 15
switch(config-if-Po15)#switchport port-security violation shutdown
switch(config-if-Po15)#
```

### 10.4.6.71 switchport port-security

The **switchport port-security** command enables MAC address port security on the configuration mode interface. Ports with port security enabled restrict traffic to a limited number of hosts, as determined by their MAC addresses. The [switchport port-security mac-address maximum](#) command specifies the maximum number of MAC addresses. The [switchport port-security violation](#) command enables port security in protect mode.

The **no switchport port-security** and **default switchport port-security** commands disable port security on the configuration mode interface by removing the corresponding **switchport port-security** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
switchport port-security
```

```
no switchport port-security
```

```
default switchport port-security
```

#### Example

These commands enable port security on *ethernet interface 7*.

```
switch(config)#interface ethernet 7  
switch(config-if-Et7)#switchport port-security  
switch(config-if-Et7)#
```

---

### 10.4.6.72 switchport

The **switchport** command places the configuration mode interface in **switched port** (Layer 2) mode. Switched ports are configurable as members of one or more VLANs through other switchport commands. Switched ports ignore all IP level configuration commands, including IP address assignments.

The **no switchport** command places the configuration mode interface in **routed port** (Layer 3) mode. Routed ports are not members of any VLANs and do not switch or bridge packets. All IP level configuration commands, including IP address assignments, apply directly to the routed port interface.

By default, Ethernet and Port Channel interfaces are in switched port mode. The **default switchport** command also places the configuration mode interface in switched port mode by removing the corresponding **no switchport** command from **running-config**.

These commands only toggle the interface between switched and routed modes. They have no effect on other configuration states.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
switchport
```

```
no switchport
```

```
default switchport
```

#### Guidelines

When an interface is configured as a routed port, the switch transparently allocates an internal VLAN whose only member is the routed interface. Internal VLANs are created in the range from 1006 to 4094. VLANs that are allocated internally for a routed interface cannot be directly created or configured. The **vlan internal order** command specifies the method that VLANs are allocated.

All IP-level configuration commands, except **autostate** and **ip virtual-router**, can be used to configure a routed interface. Any IP-level configuration changes made to a routed interface are maintained when the interface is toggled to switched port mode.

A LAG that is created with the **channel-group** command inherits the mode of the member port. A LAG created from a routed port becomes a routed LAG. IP-level configuration statements are not propagated to the LAG from its component members.

#### Examples

- These commands put Ethernet interface 5 in routed port mode.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no switchport
switch(config-if-Et5)#
```

- These commands returns Ethernet interface 5 to switched port mode.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport
switch(config-if-Et5)#
```

### 10.4.6.73 system control-plane

The **system control-plane** command places the switch in control-plane configuration mode. Control-plane mode is used for assigning an ACL (access control list) to the control plane.

Control-plane configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. Exiting control-plane configuration mode does not affect the configuration.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
system control-plane
```

#### Command Available in control-plane Configuration Mode

[ip access-group \(Control Plane mode\)](#)

#### Examples

- This command places the switch in control plane mode.

```
switch(config) #system control-plane  
switch(config-system-cp)
```

- This command assigns the *control-plane-2* ACL to the control plane.

```
switch(config-system-cp) #ip access-group control-plane-2  
switch(config-system-cp)
```

- This command exits control plane mode.

```
switch(config-system-cp) #exit  
switch(config)
```

---

#### 10.4.6.74 track

The **track** command creates an object whose state changes to provide information to a client process. The client process must be separately configured for object tracking to have an effect on the switch.

The **no track** and **default track** commands remove the specified tracked object by removing the corresponding **track** command from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

```
track object_name interface INTERFACE_NAME PROPERTY
```

```
no track object_name
```

```
default track object_name
```

##### Parameters

- *object\_name* User-created name for the tracked object.
- INTERFACE\_NAME Interface associated with the tracked object. Options include:
  - ethernet *e\_num* Ethernet interface specified by *e\_num*.
  - loopback *l\_num* Loopback interface specified by *l\_num*.
  - management *m\_num* Management interface specified by *m\_num*.
  - port-channel *p\_num* Port-channel interface specified by *p\_num*.
  - vlan *v\_num* VLAN interface specified by *v\_num*.
  - vxlan *vx\_num* VXLAN interface specified by *vx\_num*.
- PROPERTY Tracked property. Options include:
  - line-protocol Object changes when the state of the associated interface changes.

##### Example

This command creates a tracked object which tracks the state of the line protocol on *Ethernet interface 8*.

```
switch(config)#track ETH8 interface ethernet 8 line-protocol
switch(config)#
```

### 10.4.6.75 track

The **track** command creates an object whose state changes to provide information to a client process. The client process must be separately configured for object tracking to have an effect on the switch.

The **no track** and **default track** commands remove the specified tracked object by removing the corresponding **track** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
track object_name interface INTERFACE_NAME PROPERTY
```

```
no track object_name
```

```
default track object_name
```

#### Parameters

- *object\_name* User-created name for the tracked object.
- INTERFACE\_NAME Interface associated with the tracked object. Options include:
  - ethernet *e\_num* Ethernet interface specified by *e\_num*.
  - loopback *l\_num* Loopback interface specified by *l\_num*.
  - management *m\_num* Management interface specified by *m\_num*.
  - port-channel *p\_num* Port-channel interface specified by *p\_num*.
  - vlan *v\_num* VLAN interface specified by *v\_num*.
  - vxlan *vx\_num* VXLAN interface specified by *vx\_num*.
- PROPERTY Tracked property. Options include:
  - line-protocol Object changes when the state of the associated interface changes.

#### Example

This command creates a tracked object which tracks the state of the line protocol on *Ethernet interface 8*.

```
switch(config)#track ETH8 interface ethernet 8 line-protocol
switch(config)#
```

---

### 10.4.6.76 traffic-loopback

The **traffic-loopback** command verifies the functionality of interfaces and link partners.

The **traffic-loopback source network device phy** command configures the loopback device and implements loopback in physical layer for the traffic sent from a peer host. This command loops back the data packets that are sent from the link partner towards the link partner again, as a part of link partner troubleshooting.

The **traffic-loopback source system device** command configures the loopback device for the traffic sent from a local host. This command loops back the packets that are sent from the system, back to the same system.

The **no traffic-loopback** command deletes the loopback configuration from MAC and physical layers.

#### Command Mode

Interface Configuration

#### Command Syntax

```
traffic-loopback source network device phy
traffic-loopback source system device{mac | phy}
no traffic-loopback
```

#### Parameters

- **mac** implements loopback in the MAC layer
- **phy** implements loopback in the physical layer

#### Guidelines

This command is not supported on the Jericho platform.

#### Examples

- The **traffic-loopback source network device phy** command configures the loopback device and implements loopback in the physical layer for the traffic sent from a peer host.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#traffic-loopback source network device phy
switch(config-if-Et1)#show active
interface Ethernet1
    traffic-loopback source network device phy
switch(config-if-Et1)#
```

- The **traffic-loopback source system device mac** command configures the loopback device and implements loopback in the MAC layer for the traffic sent from a local host.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#show active
interface Ethernet1
switch(config-if-Et1)#traffic-loopback source system device mac
switch(config-if-Et1)#show active
interface Ethernet1
    traffic-loopback source system device mac
switch(config-if-Et1)#
```

- The **traffic-loopback source system device phy** command configures the loopback device and implements loopback in the physical layer for the traffic sent from a local host.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#show active
```

```
interface Ethernet1
  traffic-loopback source system device mac
switch(config-if-Et1)#traffic-loopback source system device phy
switch(config-if-Et1)#show act
interface Ethernet1
  traffic-loopback source system device phy
```

- The **no traffic-loopback** command deletes the loopback configuration from MAC and physical layers.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#show active
interface Ethernet1
  traffic-loopback source network device phy
switch(config-if-Et1)#no traffic-loopback
switch(config-if-Et1)#show active
interface Ethernet1
switch(config-if-Et1)#
```

## Layer 2 Configuration

---

This chapter contains the following sections:

- [Spanning Tree Protocol](#)
- [Link Layer Discovery Protocol](#)
- [VLANs](#)
- [DCBX and Flow Control](#)

### 11.1 Spanning Tree Protocol

Spanning Tree Protocols prevent bridging loops in Layer 2 Ethernet networks. Arista switches support Rapid Spanning Tree, Multiple Spanning Tree, and Rapid-Per VLAN Spanning Tree protocols.

These sections describe the Arista Spanning Tree Protocol implementation.

- [Introduction to Spanning Tree Protocols](#)
- [Spanning Tree Overview](#)
- [Configuring a Spanning Tree](#)
- [STP Commands](#)

#### 11.1.1 Introduction to Spanning Tree Protocols

Arista Switches support the leading spanning tree protocols: RSTP, MST and Rapid-PVST. This variety of options simplifies integration into existing networks without compromising network reliability, scalability or performance.

#### 11.1.2 Spanning Tree Overview

An Ethernet network functions properly when only one active path exists between any two stations. A spanning tree is a loop-free subset of a network topology. STP is a L2 network protocol that ensures a loop-free topology for any bridged Ethernet LAN. STP allows a network to include spare links as automatic backup paths that are available when an active link fails without creating loops or requiring manual intervention. The original STP is standardized as IEEE 802.1D.

Several variations to the original STP improve performance and add capacity. Arista switches support these STP versions:

- Rapid Spanning Tree (RSTP)
- Multiple Spanning Tree (MSTP)
- Rapid Per-VLAN Spanning Tree (Rapid-PVST)

The Overview contains the following sections:

- [Spanning Tree Protocol Versions](#)
- [Structure of a Spanning Tree Instance](#)
- [BPDUs](#)

---

### 11.1.2.1 Spanning Tree Protocol Versions

STP versions supported by Arista switches address two limitations of the original Spanning Tree protocol that was standardized as IEEE 802.1D:

- Slow convergence to the new spanning tree topology after a network change
- The entire network is covered by one spanning tree instance.

The following sections describe the supported STP versions, compatibility issues in networks containing switches running different STP versions, and supported alternatives to spanning tree.

#### 11.1.2.1.1 Rapid Spanning Tree Protocol (RSTP)

RSTP is specified in 802.1w and supersedes STP. RSTP provides rapid convergence after network topology changes. Similar to STP, RSTP provides a single instance of spanning tree for the entire network. Standard 802.1D-2004 incorporates RSTP and obsoletes STP.

The RSTP instance is the base unit of MST and Rapid-PVST spanning trees.

#### 11.1.2.1.2 Rapid Per-VLAN Spanning Tree Protocol (Rapid-PVST)

Rapid Per-VLAN Spanning Tree (PVST) extends the original STP to support a spanning tree instance on each VLAN in the network. The maximum number of PVST instances that can be created on a switch depends on the hardware platform. In most of the cases, it is 510. PVST can load balance layer-2 traffic without creating a loop because it handles each VLAN as a separate network. However, PVST does not address slow network convergence after a network topology change.

Arista switches support Rapid-PVST, which is a variation of PVST based on RSTP instances. Rapid-PVST provides rapid connectivity recovery after the failure of a bridge, port, or LAN. Rapid-PVST can be enabled or disabled on individual VLANs.

#### 11.1.2.1.3 Multiple Spanning Tree Protocol (MSTP)

MST extends rapid spanning tree protocol (RSTP) to support multiple spanning tree instances on a network, but is still compatible with RSTP. By default, Arista switches use MSTP.

MST supports multiple spanning tree instances, similar to Rapid PVST. However, MST associates an instance with multiple VLANs. This architecture supports load balancing by providing numerous forwarding paths to data traffic. Network fault tolerance is improved because failures in one instance do not affect other instances.

##### **MST Regions**

An *MST region* is a group of connected switches with identical MST configuration. Each region can support a maximum of 65 spanning-tree instances. MST regions are identified by a version number, name, and VLAN-to-instance map. You must configure identical parameters on all switches in the regions. Only MST region members participate with the MST instances defined in the region. A VLAN can be simultaneously assigned to only one spanning-tree instance. MST does not specify the maximum number of regions that a network can contain.

##### **MST Instances**

Each MST instance is identified by an instance number that ranges from 0 to 4094 and is associated with a set of VLANs. An MST region contains two types of spanning tree instances: an Internal Spanning Tree Instance (IST) and Multiple Spanning Tree Instances (MSTI).

- IST is the default spanning tree instance in MST regions; and is always zero. It gives a root switch to the region that contains all VLANs configured across all switches in the region but not assigned to a MST instance.

- *Multiple Spanning Tree instances* (MSTIs) consist of VLANs that are assigned through MST configuration statements. VLANs assigned to an MSTI are removed from the IST instance. VLANs in an MSTI operate as a part of a single Spanning Tree topology. Because each VLAN can belong to only one instance, MST instances (and the IST) are topologically independent.

### MSTP-Rapid PVST+ interoperation

MSTP-Rapid PVST+ interoperation allows protocol-level interaction between MSTP and Rapid PVST+ by consuming and transmitting PVST BPDUs through MSTP at the border ports. While transmitting from Rapid PVST+ to MSTP or vice-versa, you can deploy MSTP in certain regions and Rapid PVST+ in other regions based on their merits or other factors. MSTP-Rapid PVST+ interoperation allows MSTP to work with any Rapid PVST+ implementation.

MSTP inter-operation can be viewed as bi-directional BPDUs conversion occurring at MSTP PVST+ border ports as following:

- The outgoing Common Internal Spanning Tree (CIST) BPDUs are projected as Rapid PVST+ BPDUs across various VLANs.
- Incoming PVST+ topology BPDUs are mapped to corresponding MSTI based on incoming VLAN.

The following restrictions are enforced based on port role. These are relevant only for border ports with roles designated or root (for CIST) that can potentially forward.

- Case (A): If the MSTP-Rapid PVST+ border port role is designated for CIST, it should not receive any superior PVST BPDUs (with respect to CIST). Root of all VLANs in the PVST region should be towards the MSTP region.
- Case (B): If the MSTP-Rapid PVST+ border port role is root for CIST, it should not receive any inferior Rapid PVST+ BPDUs (with respect to CIST). Root of all VLANs in the Rapid PVST+ region should be within the PVST+ region.

**Note:** If the restrictions are violated, the port enters blocking state. The BPDUs translation occurs only on MSTP-Rapid PVST+ border ports with the forwarding state for CIST.

It is desirable to configure multiple MSTP-Rapid PVST+ border ports conforming to Case(A) for a specified Rapid PVST+ region as it allows VLAN load balancing across the ports. This can be achieved by adjusting the per-VLAN port cost towards the Rapid PVST+ region such that the per-VLAN root port is evenly distributed across the border ports.

#### 11.1.2.1.4 Version Interoperability

A network can contain switches running different spanning tree versions. The common spanning tree (CST) is a single forwarding path the switch calculates for STP, RSTP, MSTP, and Rapid-PVST topologies in networks containing multiple spanning tree variations.

In multi-instance topologies, the following instances correspond to the CST:

- **Rapid-PVST:** VLAN 1
- **MST:** IST (instance 0)

RSTP and MSTP are compatible with other spanning tree versions:

- An RSTP bridge sends 802.1D (original STP) BPDUs on ports connected to an STP bridge.
- RSTP bridges operating in 802.1D mode remain in 802.1D mode even after all STP bridges are removed from their links.
- An MST bridge detects a port is at a region boundary when it receives an STP BPDUs or an MST BPDUs from a different region.
- MST ports assume they are boundary ports when the bridges to which they connect join the same region.

The `clear spanning-tree detected-protocols` command forces MST ports to renegotiate with their neighbors.

---

### 11.1.2.1.5 Switchport Interface Pairs

Switchport interface pairs associate two interfaces in a primary-backup configuration. When the primary interface is functioning, the backup interface remains dormant in standby mode. When the primary interface stops functioning, the backup interface handles the traffic.

An alternative implementation balances traffic between the primary and backup interfaces. If either interface shuts down, the other handles traffic addressed to the pair.

The following guidelines apply to switchport interface pairs.

- Ethernet and Port Channels can be primary interfaces.
- Ethernet, Port Channel, Management, Loopback, and VLAN interfaces can be backup interfaces.
- The primary and backup interfaces can be different interface types.
- Interface pairs should be similarly configured to ensure consistent behavior.
- An interface can be associated with a maximum of one backup interface.
- An interface can back up a maximum of one interface.
- Any Ethernet interface configured in an interface pair cannot be a port channel member.
- STP is disabled on ports configured as primary or backup interfaces.
- Static MAC addresses should be configured after primary-backup pairs are established.

### 11.1.2.2 Structure of a Spanning Tree Instance

A layer 2 network consists of bridges and network segments. A loop exists when multiple active paths connect two components. Spanning tree protocols allow only one active path between any two network components. Loops are removed by blocking selected ports that connect bridges to network segments.

Ports are assigned cost values that reflect their transmission speed and any other criteria selected by the administrator. Ports with faster transmission speeds and other desirable characteristics are assigned lower costs. High cost ports are blocked in deference to lower cost ports.

A network topology defines multiple possible spanning trees. Network bridges collectively compute and implement one spanning tree to maintain connectivity between all network components while blocking ports that could result in loops. Administrators improve network performance by adjusting parameter settings to select the most efficient spanning tree.

Spanning tree bridges continuously transmit topology information to notify all other bridges on the network when topology changes are required, such as when a link fails. Bridge Protocol Data Units (BPDUs) are STP information packets that bridges exchange.

The following sections describe spanning tree configuration parameters.

#### 11.1.2.2.1 Root and Designated Bridges

The **root bridge** is the center of the STP topology. A spanning tree instance has one root bridge. Spanning tree bases path calculations on each network components distance from the root bridge.

All other network bridges calculate paths to the root bridge when selecting spanning tree links. STP calculates the distance to the root bridge to build a loop-free topology that features the shortest distance between devices among all possible paths.

Each switch is assigned a unique bridge ID number for each instance. All network switches collectively elect the root bridge by comparing bridge IDs. The root bridge is the switch with the lowest bridge ID.

The bridge ID contains the following eight bytes, in order of decreasing significance:

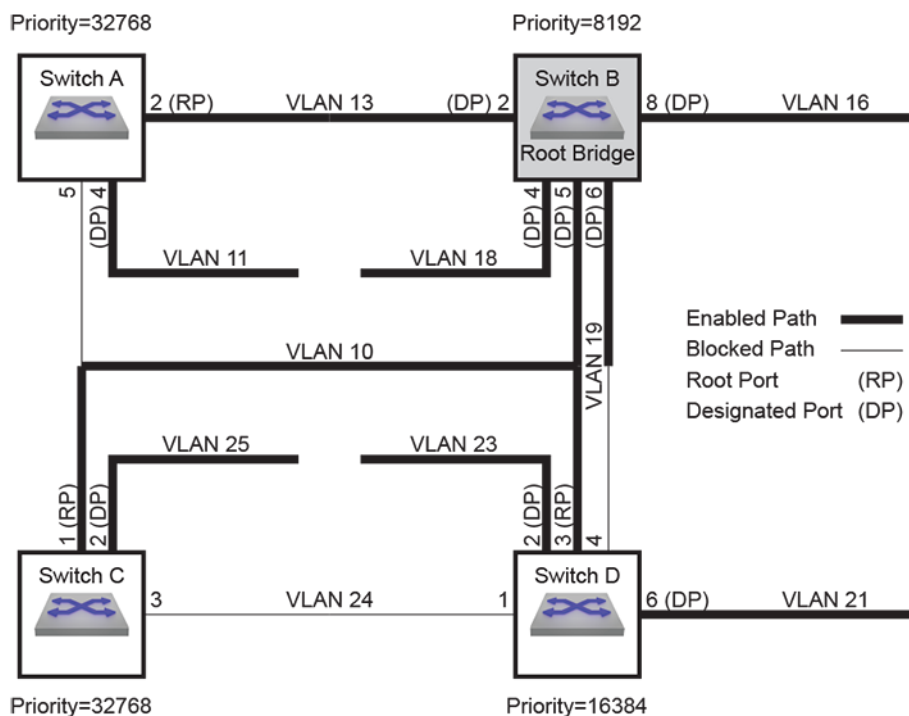

- Port priority (four bits)
- Instance number (12 bits): VLAN number (Rapid-PVST); instance number (MST); 0 (RST)
- MAC address of switch (six bytes)

A **designated bridge** is defined for each network segment as the switch that provides the segments shortest path to the root bridge. A designated bridge is selected for each segment after a root bridge is selected; a switch can be a designated bridge for multiple segments.

The following network calculations in [Spanning Tree Network Example](#) assume that each path has the same cost:

- Switch B is the root bridge its bridge ID is lowest because it has the smallest port priority.
- Switch A is the designated bridge for VLAN 11.
- Switch B is the designated bridge for VLAN 10, VLAN 13, VLAN 16, VLAN 18, VLAN 19.
- Switch C is the designated bridge for VLAN 25.
- Switch D is the designated bridge for VLAN 21, VLAN 23.

**Figure 13: Spanning Tree Network Example**

#### 11.1.2.2.2 Port Roles

Messages from connected devices to the root bridge traverse a least-cost path, which has the smallest cost among all possible paths to the root bridge. The cost of a path is the sum of the costs of all path segments, as defined through port cost settings.

Active ports in a least cost-path fulfill one of two possible roles: root port and designated port. STP blocks all other network ports. STP also defines alternate and backup ports to handle traffic when an active port is inaccessible.

- Root Port (RP) accesses the bridge's least-cost path to the root bridge. Each bridge selects its root port after calculating the cost of each possible path to the root bridge.

The following ports in [Spanning Tree Network Example](#) are root ports:

- **Switch A:** port 2
- **Switch C:** port 1
- **Switch D:** port 3
- Designated port (DP) accesses a network segment's designated bridge. Each segment defines one DP. Switches can provide DPs for multiple segments. All ports on the root bridge are DPs.

---

The following ports in [Spanning Tree Network Example](#) are designated ports:

- **Switch A:** port 4 (VLAN 11)
- **Switch B:** port 2 (VLAN 13), port 4 (VLAN 18), port 5 (VLAN 10), port 6 (VLAN 19), port 8 (VLAN 16)
- **Switch C:** port 2 (VLAN 25)
- **Switch D:** port 2 (VLAN 23), port 6 (VLAN 21)
- Alternate ports provide backup paths from their bridges to the root bridge. An alternate port is blocked until a network change transforms it into a root port.
- Backup ports provide alternative paths from VLANs to their designated bridges. A backup port is blocked until a network change transforms it into a designated port.

#### 11.1.2.2.3 Port Activity States

A port's activity state defines its current STP activity level. STP monitors BPDUs for network changes that require an activity state transition.

STP defines three port activity states:

- **Forwarding:** The port receives and sends data. Root ports and designated ports are either in, or transitioning to, this state.
- **Discarding:** The port does not receive or send data. Blocked ports receive BPDU packets. All ports except RPs and DPs are blocked, including alternate and backup ports.
- **Learning:** The transitional post-discarding state where the port prepares to forward frames by adding source addresses from inbound data packets to the switching database.

#### 11.1.2.2.4 Port Types

Port type is a configurable parameter that reflects the type of network segment that is connected to the port. Proper port type configuration results in rapid convergence after network topology changes. RSTP port types include normal, network, and edge ports. Normal is the default port type.

- **Normal** ports have an unspecified topology.
- **Network** ports connect only to switches or bridges.

RSTP immediately transitions network ports to the discarding state.

- **Edge** ports connect directly to end stations.

Edge ports transition directly to forwarding state because they do not create loops. An edge port becomes a normal port when it receives a BPDU.

#### 11.1.2.2.5 Link Types

Link type is a configurable parameter that determines candidates for RSTP fast state transition.

- the default link type for full-duplex ports is point-to-point.
- the default link type for half-duplex ports is shared.

Fast state transitions are allowed on point-to-point links that connect bridges. Fast state transitions are not allowed on shared ports regardless of the duplex setting.

#### 11.1.2.3 BPDUs

Spanning tree rules specify a root bridge, select designated bridges, and assign roles to ports. STP rule implementation requires that network topology information is available to each switch.

Switches exchange topology information through bridge protocol data units (BPDUs). Information provided by BPDU packets include bridge IDs and root path costs.

### 11.1.2.3.1 BPDU Types

STP defines three BPDU types:

- Configuration BPDU (CBPDU), used for computing the spanning tree.
- Topology Change Notification (TCN) BPDU, announces network topology changes.
- Topology Change Notification Acknowledgment (TCA), acknowledges topology changes.

Bridges enter the following addresses in outbound BPDU frames:

- source address: outbound port's MAC address.
- destination address: STP multicast address 01:80:C2:00:00:00.

Bridges regularly exchange BPDUs to track network changes that trigger STP recomputations and port activity state transitions. The *hello timer* specifies the period between consecutive BPDU messages; the default is two seconds.

### 11.1.2.3.2 Bridge Timers

Bridge timers specify parameter values that the switch includes in BPDU packets that it sends as a root bridge. Bridge timers include:

- **hello-time**: transmission interval between consecutive BPDU packets.
- **forward-time**: the period that ports remain in learning state.
- **max-age**: the period that BPDU data remains valid after it is received.
- **max-hop**: the number of bridges in an MST region that a BPDU can traverse before it is discarded.

The switch recomputes the spanning tree topology if it does not receive another BPDU before the max-age timer expires. When edge ports and point-to-point links are properly configured, RSTP network convergence does not require forward-delay and max-age timers.

### 11.1.2.3.3 MSTP BPDUs

MSTP BPDUs are targeted at a single instance and provide STP information for the entire region. MSTP encodes a standard BPDU for the IST, then adds region information and MST instance messages for all configured instances, where each message conveys spanning tree data for an instance. Frames assigned to VLANs operate in the instance to which the VLAN is assigned. Bridges enter an MD5 digest of the VLAN-to-instance map table in BPDUs to avoid including the entire table in each BPDU. Recipients use this digest and other administratively configured values to identify bridges in the same MST region.

MSTP BPDUs are compatible with RSTP. RSTP bridges view an MST region as a single-hop RSTP bridge regardless of the number of bridges inside the region because:

- RSTP bridges interpret MSTP BPDUs as RSTP BPDUs.
- RSTP bridges increment the message age timer only once while data flows through an MST region; MSTP measures time to live with a **remaining hops** variable, instead of the **message age timer**.

Ports at the edge of an MST region connecting to a bridge (RSTP or STP) or to an endpoint are *boundary ports*.

## 11.1.3 Configuring a Spanning Tree

These sections describe the following configuration processes:

- [Version Configuration and Instance Creation](#)
- [Spanning Tree Instance Configuration](#)
- [Port Roles and Rapid Convergence](#)
- [Configuring BPDU Transmissions](#)

---

### 11.1.3.1 Version Configuration and Instance Creation

The switch supports three STP versions and switchport backup interface pairs. Disabling spanning tree is also supported but not recommended.

The `spanning-tree mode` global configuration command specifies the spanning tree version the switch runs. This section describes command options that enable and configure STP versions.

#### 11.1.3.1.1 Multiple Spanning Tree (MST)

Multiple Spanning Tree is enabled by the `spanning-tree mode` command with the `mstp` option. MSTP is the default STP version.

##### Example

This command enables Multiple Spanning Tree.

```
switch(config)#spanning-tree mode mstp
switch(config)#
```

#### Configuring MST Regions

All switches in an MST region must have the same name, revision, and VLAN-to-instance map. MST configuration mode commands sets the region parameters. MST configuration mode is a group-change mode where changes are saved by exiting the mode.

##### Example

The `spanning-tree mst configuration` command places the switch in MST configuration mode.

```
switch(config)#spanning-tree mst configuration
switch(config-mst)#
```

The `instance` command assigns VLANs to MST instances. The `name (mst-configuration mode)` and `revision (mst-configuration mode)` commands configure the MST region name and revision.

##### Examples

- These commands assign VLANs 4-7 and 9 to instance 8 and remove VLAN 6 from instance 10.

```
switch(config-mst)#instance 8 vlans 4-7,9
switch(config-mst)#no instance 10 vlans 6
switch(config-mst)#
```

- These commands assign the `name` (`corporate_1`) and `revision` (`3`) to the switch.

```
switch(config-mst)#name corporate_1
switch(config-mst)#revision 3
switch(config-mst)#
```

The `exit (mst-configuration mode)` command transitions the switch out of MST configuration mode and saves all pending changes. The `abort (mst-configuration mode)` command exits MST configuration mode without saving the pending changes.

##### Example

This command exits MST configuration mode and saves all pending changes.

```
switch(config-mst)#exit
switch(config)#
```

## Configuring MST Instances

These STP commands provide an optional MST instance parameter. These commands apply to instance 0 when the optional parameter is not included.

- `spanning-tree priority`
- `spanning-tree root`
- `spanning-tree port-priority`

### Examples

- This command configures priority for MST instance 4.

```
switch(config)#spanning-tree mst 4 priority 4096
switch(config)#
```

- Each of these commands configure priority for MST instance 0.

```
switch(config)#spanning-tree mst 0 priority 4096
```

or

```
switch(config)#spanning-tree priority 4096
```

### 11.1.3.1.2 Rapid Spanning Tree (RST)

Rapid spanning tree is enabled through the `spanning-tree mode rstp` command with the `rstp` option.

#### Example

- This command enables Rapid Spanning Tree.

```
switch(config)#spanning-tree mode rstp
switch(config)#
```

These STP commands, when they do not include an optional MST or VLAN parameter, apply to RSTP. Commands that configure MSTP instance 0 also apply to the RSTP instance.

- `spanning-tree priority`
- `spanning-tree root`
- `spanning-tree port-priority`

### Examples

- These commands apply to the RST instance.

```
switch(config)#spanning-tree priority 4096
```

and

```
switch(config)#spanning-tree mst 0 priority 4096
```

- These commands do not apply to the RST instance.

```
switch(config)#spanning-tree mst 4 priority 4096
```

and

```
switch(config)#spanning-tree vlan-id 3 priority 4096
```

**Show** commands (such as `show spanning-tree`) displays the RSTP instance as MST0 (MST instance 0).

### Example

- This command, while the switch is in RST mode, displays RST instance information.

```
switch(config)#show spanning-tree
MST0
Spanning tree enabled protocol rstp<---RSTP mode indicator
Root ID      Priority    32768
Address      001c.730c.1867
This bridge is the root

Bridge ID    Priority    32768 (priority 32768 sys-id-ext 0)
Address      001c.730c.1867
Hello Time   2.000 sec  Max Age 20 sec  Forward Delay 15
sec

Interface      Role        State        Cost        Prio.Nbr Type
-----
Et51            designated forwarding 2000        128.51  P2p

switch(config)#
```

#### 11.1.3.1.3 Rapid Per-VLAN Spanning Tree (Rapid-PVST)

Rapid-PVST mode is enabled by the `spanning-tree mode` command with the `rapid-pvst` option.

### Example

- This command enables Rapid Per-VLAN Spanning Tree.

```
switch(config)#spanning-tree mode rapid-pvst
switch(config)#
```

These commands provide an optional VLAN parameter for configuring Rapid-PVST instances.

- `spanning-tree priority`
- `spanning-tree root`
- `spanning-tree port-priority`
- `spanning-tree mst pvst border`

### Examples

- This command configures bridge priority for VLAN 4.

```
switch(config)#spanning-tree vlan-id 4 priority 4096
switch(config)#
```

- This command enables MSTP PVST+ border ports. The command is effective only if spanning-tree mode is MSTP.

```
switch(config)#spanning-tree mst pvst border
```

#### 11.1.3.1.4 Switchport Backup Mode

Switchport backup interface pairs are enabled through the `spanning-tree mode` command with the `backup` option. Enabling switchport backup disables all spanning-tree modes. For loop avoidance under switchport backup mode, use the [Loop Protection](#) feature.

## Example

This command enables switchport backup.

```
switch(config) #spanning-tree mode backup
switch(config) #
```

The `switchport backup-link` command establishes an interface pair between the command mode interface (primary) and the interface specified by the command (backup).

## Example

These commands establish Ethernet interface 7 as the backup port for Ethernet interface 1.

```
switch(config) #interface ethernet 1
switch(config-if-Et1) #switchport backup-link ethernet 7
switch(config-if-Et1) #
```

The preferred option of the `switchport backup-link` command establishes a peer relationship between the primary and backup interfaces and specifies VLAN traffic that the backup interface normally carries. If either interface goes down, the other interface carries traffic normally handled by both interfaces.

## Examples

These steps perform the following:

- configures Ethernet interface 1 as a trunk port that handles VLANs 4 through 9 traffic.
- configures Ethernet interface 2 as the backup interface.
- assigns Ethernet 2 as the preferred interface for VLANs 7 through 9.

1. Enter configuration mode for the primary interface.

```
switch(config) #interface ethernet 1
```

2. Configure the primary interface as a trunk port that services VLANs 4-9

```
switch(config-if-Et1) #switchport mode trunk
switch(config-if-Et1) #switchport trunk allowed vlan 4-9
```

3. Configure the backup interface and specify the VLANs that it normally services.

```
switch(config-if-Et1) #switchport backup-link Ethernet 2 prefer vlan 7-9
switch(config-if-Et1) #
```

### 11.1.3.1.5 Loop Protection

Loop protection is a loop detection and prevention method which is independent of STP and is not disabled when the switch is in switchport backup mode. When loop protection is active on an interface, that interface periodically sends out loop-detection frames; if one is received that originated on the switch, the receiving port is errdisabled until a timeout period has passed or it is manually reset.

Loop protection is configured and enabled per VLAN, but individual ports in a VLAN can be configured to disable loop protection.

**Note:** Loop protection cannot be enabled on an MLAG peer link.

This feature is disabled by default. To enable it, use the `monitor loop-protection` command to enter loop-protection configuration mode, then use the `no shutdown (Loop-protection)` command to enable the feature. To enable loop protection on a VLAN, use the `protect vlan` command. To exclude a port from loop protection, use the `no loop-protection` command.

---

The feature is configured with the following additional commands:

- `transmit-interval`
- `disabled-time`
- `rate-limit`

### Examples

- This command enters loop protection configuration mode.

```
switch(config)#monitor loop-protection
switch(config-monitor-loop-protect)#
```

- These commands enable loop protection on VLANs 1025-2000.

```
switch(config)#monitor loop-protection
switch(config-monitor-loop-protect)#no shutdown
switch(config-monitor-loop-protect)#protect vlan 1025-2000
switch(config-monitor-loop-protect)#
```

- These commands exclude Ethernet interface 38 from loop protection.

```
switch(config)#interface ethernet 38
switch(config-if-Et38)#no loop-protection
switch(config-if-Et38)#
```

- These commands configure loop protection with a transmission interval of 10 seconds, a disabled time of two days, and a maximum rate of 500 loop detection frames per second.

```
switch(config-monitor-loop-protect)#transmit-interval 10
switch(config-monitor-loop-protect)#disabled-time 172800
switch(config-monitor-loop-protect)#rate-limit 500
switch(config-monitor-loop-protect)#
```

#### 11.1.3.1.6 Disabling Spanning Tree

Spanning tree is disabled by the `spanning-tree mode none` command with the `none` option. The switch does not generate STP packets. Switchport interfaces forward packets when connected to other ports. The switch forwards inbound STP packets as multicast data packets on the VLAN where they are received.

#### Example

This command disables all STP functions.

```
switch(config)#spanning-tree mode none
switch(config)#
```

#### 11.1.3.2 Spanning Tree Instance Configuration

A network performs these steps to set up an STP instance:

1. The bridge with the lowest ID is elected root bridge.
2. Root ports (RP) are selected on all other bridges.
3. Designated bridges are selected for each network segment.
4. Designated ports (DP) are selected on each designated bridge.
5. Networks begin forwarding data through RPs and DPs. All other ports are blocked.

### 11.1.3.2.1 Root Bridge Parameters

STPs use bridge IDs for electing the root bridge. Switches denote a bridge ID for each configured Spanning Tree instance. The bridge ID composition is

- Priority (four bits)  
Priority is expressed as a multiple of 4096 because it is stored as the four most significant bits of a two-byte number.
- Protocol Dependent (twelve bits)
  - Rapid-PVST: VLAN number
  - MST: Instance number
  - RST: 0
- MAC address of switch (six bytes)

#### Example

- The switch defines bridge IDs for three MST instances:
  - MST 0: 32768 (Priority (32768)+Instance number(0)) and 001c.7301.23de (MAC address)
  - MST101: 32869 (Priority (32768)+Instance number(101)) and 001c.7301.23de (MAC address)
  - MST102: 32870 (Priority (32768)+Instance number(102)) and 001c.7301.23de (MAC address)

This command displays a table of root bridge information.

```
switch>show spanning-tree root
```

| Instance | Root ID  |                | Root Cost | Hello Time | Max Age | Fwd Dly | Root Port |
|----------|----------|----------------|-----------|------------|---------|---------|-----------|
|          | Priority | MAC addr       |           |            |         |         |           |
| MST0     | 32768    | 001c.7301.23de | 0         | 2          | 20      | 15      | Po937     |
| MST101   | 32869    | 001c.7301.23de | 3998      | 0          | 0       | 0       | Po909     |
| MST102   | 32870    | 001c.7301.23de | 3998      | 0          | 0       | 0       | Po911     |

The switch provides two commands that configure the switch priority: `spanning-tree priority` and `spanning-tree root`. The commands differ in the available parameter options:

- `spanning-tree priority` options are integer multiples of 4096 between 0 and 61440.
- `spanning-tree root` options are primary and secondary.
- `primary` assigns a priority of 8192.
- `secondary` assigns a priority of 16384.

The default priority value is 32768.

The following examples configure bridge IDs with both commands.

#### Examples

- These commands configure MST instance bridge priorities with the `root` command:

```
switch(config)#spanning-tree mst 0 root primary
switch(config)#spanning-tree mst 1 root secondary
switch>show spanning-tree root
```

| Instance | Root ID  |                | Root Cost | Hello Time | Max Age | Fwd Dly | Root Port |
|----------|----------|----------------|-----------|------------|---------|---------|-----------|
|          | Priority | MAC addr       |           |            |         |         |           |
| MST0     | 8192     | 001c.7301.6017 | 0         | 2          | 20      | 15      | None      |
| MST1     | 16385    | 001c.7301.6017 | 0         | 0          | 0       | 0       | None      |
| MST2     | 32770    | 001c.7301.6017 | 0         | 0          | 0       | 0       | None      |

- Instance 0 root priority is 8192: primary priority plus the instance number of 0.
- Instance 1 root priority is 16385: secondary priority plus the instance number of 1.

- Instance 2 root priority is 32770: default priority plus the instance number of 2.

These priority settings normally program the switch to be the primary root bridge for instance 0, the secondary root bridge for instance 1, and a normal bridge for instance 2. Primary and secondary root bridge elections also depend on the configuration of other network bridges.

- These priority commands configure Rapid-PVST VLAN bridge priorities:

```
switch(config)#spanning-tree vlan-id 1 priority 8192
switch(config)#spanning-tree vlan-id 2 priority 16384
switch(config)#spanning-tree vlan-id 3 priority 8192
switch(config)#no spanning-tree vlan-id 4 priority
switch(config)#show spanning-tree root
```

| Instance | Priority       | Root ID<br>MAC addr | Root<br>Cost | Hello<br>Time | Max<br>Age | Fwd<br>Dly | Root Port |
|----------|----------------|---------------------|--------------|---------------|------------|------------|-----------|
| VL18193  | 001c.7301.6017 | 0                   | 2            | 20            | 15         | None       |           |
| VL216386 | 001c.7301.6017 | 0                   | 2            | 20            | 15         | None       |           |
| VL38195  | 001c.7301.6017 | 0                   | 2            | 20            | 15         | None       |           |
| VL432788 | 001c.7301.6017 | 0                   | 2            | 20            | 15         | None       |           |

- VLAN 1 root priority is 8193: configured priority plus the VLAN number of 1.
- VLAN 2 root priority is 16386: configured priority plus the VLAN number of 2.
- VLAN 3 root priority is 8195: configured priority plus the VLAN number of 3.
- These priority settings normally program the switch to be the primary root bridge for VLANs 1 and 3, the secondary root bridge for VLAN2, and a normal bridge for VLAN 4. Primary and secondary root bridge elections also depend on the configuration of other network bridges.VLAN 4 root priority is 32788: default priority plus the VLAN number of 4.

### 11.1.3.2.2 Path Cost

Spanning tree calculates the costs of all possible paths from each component to the root bridge. The path cost is equal to the sum of the cost assigned to each port in the path. Ports are assigned a cost by default or through CLI commands. Cost values range from 1 to 200000000 (200 million).

The default cost is a function of the interface speed:

- 1 gigabit interfaces have a default cost of 20000.
- 10 gigabit interfaces have a default cost of 2000.

The `spanning-tree cost` command configures the path cost of the configuration mode interface. Costs can be specified for Ethernet and port channel interfaces. The command provides a mode parameter for assigning multiple costs to a port for MST instances or Rapid-PVST VLANs.

#### Examples

- These commands configure a port cost of 25000 to Ethernet interface 5. This cost is valid for RSTP or MSTP instance 0.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree cost 25000
switch(config-if-Et5)#
```

- This command configures a path cost of 300000 to Ethernet interface 5 in MST instance 200.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree mst 200 cost 300000
switch(config-if-Et5)#
```

- This command configures a path cost of 10000 to Ethernet interface 5 in Rapid-PVST VLAN 200-220.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree vlan-id 200-220 cost 10000
switch(config-if-Et5)#
```

### 11.1.3.2.3 Port Priority

STP uses the port priority interface parameter to select ports when resolving loops. The port with the lower port priority numerical value is placed in forwarding mode. When multiple ports are assigned equal port priority numbers, the port with the lower interface number is placed in forwarding mode. Valid port-priority numbers are multiples of 16 between 0 and 240; the default is 128.

The **spanning-tree port-priority** command configures the port-priority number for the configuration mode interface. The command provides a mode option for assigning different priority numbers to a port for multiple MST instances or Rapid-PVST VLANs. Port-priority can be specified for Ethernet and port channel interfaces.

#### Examples

- This command sets the access port priority of 144 for Ethernet 5 interface.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree port-priority 144
switch(config-if-Et5)#
```

- This command sets the access port priority of 144 for Ethernet 5 interface in MST instance 10.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree mst 10 port-priority 144
switch(config-if-Et5)#
```

### 11.1.3.3 Port Roles and Rapid Convergence

Spanning Tree provides the following options for controlling port configuration and operation:

- **PortFast**: Allows ports to skip learning state before entering the forwarding state.
- **Port type** and **link type**: Designates ports for rapid transitions to the forwarding state.
- **Root guard**: Ensures that a port will not become the root port.
- **Loop guard**: Prevents loops resulting from unidirectional failure of links.
- **Bridge assurance**: Prevents loops caused by unidirectional links or a malfunctioning switch.

#### 11.1.3.3.1 PortFast

PortFast allows devices to gain immediate network access before convergence of the spanning tree. Enabling PortFast on ports connected to another switch can create loops.

A portfast port that receives a BPDU sets its operating state to non-portfast while remaining in portfast configured state. In this state, the port is subject to topology changes and can enter the discarding state.

The **spanning-tree portfast** command programs access ports to immediately enter the forwarding state. PortFast connects devices attached to an access port, such as a single workstation, to the network immediately without waiting for STP convergence. PortFast can also be enabled on trunk ports.

#### Example

---

This command unconditionally enables portfast on Ethernet 5 interface.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast
switch(config-if-Et5)#
```

### 11.1.3.3.2 Port Type and Link Type Configuration

RSTP only achieves rapid transition to forwarding state on edge ports and point-to-point links.

#### Port Type

Edge ports are directly connected to end stations. Because edge ports do not create loops, they transition directly to forwarding state when a link is established.

The `spanning-tree portfast <port type>` command sets the configuration mode interfaces port type. Spanning tree ports can be configured as edge ports, network ports, or normal ports. The default port type is normal.

- **Edge ports** connect to a host (end station). Configuring a port that connects to a bridge as an edge port may create a loop. Edge ports that receive a BPDU become a normal spanning tree port.
- **Network ports** connect only to a Layer 2 switch or bridge. Configuring a port connected to a host as a network port transitions the port to the discarding state.
- **Normal ports** have an unspecified topology.

#### Example

- This command configures Ethernet 5 interface as a network port.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast network
switch(config-if-Et5)#
```

- Auto-edge detection converts ports into edge ports when they do not receive a new BPDU before the current BPDU expires, as measured by the max-age timer. The `spanning-tree portfast auto` command enables auto-edge detection on the configuration mode interface, superseding the `spanning-tree portfast` command. Auto-edge detection is enabled by default.

#### Example

This command enables auto-edge detection on Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast auto
switch(config-if-Et5)#
```

#### Link Type

The switch derives a ports default link type from its duplex mode:

- full-duplex ports are point-to-point.
- half-duplex ports are shared.

The `spanning-tree link-type` command specifies the configuration mode interfaces link-type. RSTP fast transition is not allowed on shared link ports, regardless of their duplex setting. Because the ports are full-duplex by default, the default link-type setting is point-to-point.

#### Example

This command configures Ethernet 5 interface as a shared port.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree link-type shared
switch(config-if-Et5)#
```

### 11.1.3.3.3 Root Guard and Loop Guard

**Root guard** stops a port from becoming a root port, which stops connected switches from becoming root bridges. When a switch detects a new root bridge, its root-guard-enabled ports enter blocked (root-inconsistent) state. When the switch no longer detects a new root, these ports enter learning state.

Root guard is enabled on a per-port basis. The setting applies to all STP instances. Disabling root guard places the port in learning state.

The `spanning-tree guard` command, with the `root` option, enables root guard on the configuration mode interface.

#### Example

This command enables root guard on Ethernet 5 interface.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree guard root
switch(config-if-Et5)#
```

**Loop guard** prevents loops resulting from unidirectional failure of point-to-point links by verifying that non-designated ports (root, blocked, and alternate) are receiving BPDUs from their designated ports. A loop-guard-enabled root or blocked port that stops receiving BPDUs transitions to the discarding (loop-inconsistent) state. The port recovers from this state when it receives a BPDU.

Loop guard, when enabled globally, applies to all point-to-point ports. Loop guard is configurable on individual ports and applies to all STP instances of an enabled port. Loop-inconsistent ports transition to learning state when loop guard is disabled.

If loop guard is enabled on a root switch, it takes effect only if the switch becomes a nonroot switch.

When using loop guard:

- Do not enable loop guard on portfast-enabled ports.
- Loop guard is not functional on ports not connected to point-to-point links.
- Loop guard has no effect on disabled spanning tree instances.

Loop guard aspects on port channels include:

- BPDUs are sent over the channels first operational port. Loop guard blocks the channel if that link becomes unidirectional even when other channel links function properly.
- Creating a new channel destroys state information for its component ports; new channels with loop-guard-enabled ports can enter forwarding state as a DP.
- Disassembling a channel destroys its state information; component ports from a blocked channel can enter the forwarding state as DPs, even if the channel contained unidirectional links.
- If a link on any port of the channel becomes unidirectional, the channel is blocked. Transmission resumes if the port is removed from the channel or the bidirectional communication is restored.

Loop guard configuration commands include:

- `spanning-tree guard loop default` command enables loop guard as a default on all switch ports.
- `spanning-tree guard` control the loop guard setting on the configuration mode interface. This command overrides the default command for the specified interface.

#### Examples

- This command enables loop guard as the default on all switch ports.

```
switch(config)#spanning-tree guard loop default
switch(config)#
```

- This command enables loop guard on Ethernet 6 interface.

```
switch(config)#interface ethernet 6
switch(config-if-Et6)#spanning-tree guard loop
switch(config-if-Et6)#
```

#### 11.1.3.3.4 Bridge Assurance

Bridge assurance protects against unidirectional link failures, other software failures, and devices that continue forwarding data traffic after they quit running spanning tree.

Bridge assurance programs the switch to send BPDUs at each hello time period through all bridge assurance-enabled ports (i.e., network ports). Bridge assurance operates only on network ports with point-to-point links, ideally with bridge assurance enabled on each side of the link. Bridge assurance-enabled ports will not necessarily be blocked when they link to a port where bridge assurance is not enabled.

Ports not receiving a BPDU packet within a hello time period enter inconsistent (blocking) state. In this case, the `show spanning-tree transmit active` command will show a bridge assurance status of inconsistent for the port. If the other side of the link has bridge assurance enabled, or if the other switch is the root bridge, it will send periodic BPDUs, preventing an inconsistent blocking state.

Bridge assurance is globally enabled by default, but must also be enabled on a per-port basis by designating the port as a network port with the `spanning-tree portfast <port type>` command. The `no spanning-tree transmit active` command disables bridge assurance globally.

##### Example

These commands enable bridge assurance on the switch, then enable bridge assurance on Ethernet port 5 by designating it a network port.

```
switch(config)#spanning-tree transmit active
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast network
switch(config-if-Et5)#
```

#### 11.1.3.4 Configuring BPDU Transmissions

The following sections describe instructions that configure BPDU packet contents and transmissions.

##### 11.1.3.4.1 Configuring Bridge Timers

Bridge timers specify parameter values that the switch includes in BPDU packets that it sends as a root bridge. Bridge timers include:

- **hello-time:** transmission interval between consecutive BPDU packets.
- **forward-time:** the period that ports remain in learning state.
- **max-age:** the period that BPDU data remains valid after it is received.
- **max-hop:** the number of bridges in an MST region that a BPDU can traverse before it is discarded.

In standard STP, ports passively wait for **forward\_delay** and **max\_age** periods before entering the forwarding state. RSTP achieves faster convergence by relying on edge port and link type definitions to

start forwarding traffic. When edge ports and link types are properly configured, bridge timers are used in RSTP as backup or when interacting with networks running standard STP.

The `spanning-tree hello-time` command configures the hello time.

#### Example

This command configures a hello-time of 1 second (1000 ms).

```
switch(config) #spanning-tree hello-time 1000
switch(config) #
```

The `spanning-tree max-hops` command specifies the max hop setting that the switch inserts into BPDUs that it sends out as the root bridge.

#### Example

This command sets the max hop value to 40.

```
switch(config) #spanning-tree max-hops 40
switch(config) #
```

The `spanning-tree forward-time` command configures the forward delay setting that the switch inserts into BPDUs that it sends out as the root bridge.

#### Example

This command sets the forward delay timer value to 25 seconds.

```
switch(config) #spanning-tree forward-time 25
switch(config) #
```

The `spanning-tree max-age` command configures the max age setting that the switch inserts into BPDUs that it sends out as the root bridge.

#### Example

This command sets the max age timer value to 25 seconds.

```
switch(config) #spanning-tree max-age 25
switch(config) #
```

### 11.1.3.4.2 BPDU Transmit Hold-Count

The `spanning-tree bpdu tx hold-count` command specifies the maximum number of BPDUs per second that the switch can send from an interface. Valid settings range from 1 to 10 BPDUs with a default of 6 BPDUs.

Higher hold-count settings can significantly impact CPU utilization, especially in Rapid-PVST mode. Smaller values can slow convergence in some configurations.

#### Example

This command configures a transmit hold-count of 8 BPDUs.

```
switch(config) #spanning-tree bpdu tx hold-count 8
switch(config) #
```

---

#### 11.1.3.4.3 BPDU Guard

PortFast interfaces do not receive BPDUs in a valid configuration. BPDU Guard provides a secure response to invalid configurations by disabling ports when they receive a BPDU. Disabled ports differ from blocked ports in that they are re-enabled only through manual intervention.

- When configured globally, BPDU Guard is enabled on ports in the operational portfast state.
- When configured on an individual interface, BPDU Guard disables the port when it receives a BPDU, regardless of the ports portfast state.

The `spanning-tree edge-port bpduguard default` global configuration command enables BPDU guard by default on all portfast ports. BPDU guard is disabled on all ports by default.

The `spanning-tree bpduguard` interface configuration command controls BPDU guard on the configuration mode interface. This command takes precedence over the default setting configured by `spanning-tree edge-port bpduguard default`.

- `spanning-tree bpduguard` enables BPDU guard on the configuration mode interface.
- `spanning-tree bpduguard disable` disables BPDU guard on the configuration mode interface.
- `no spanning-tree bpduguard` reverts the configuration mode interface to the default BPDU guard setting.

#### Example

These commands enable BPDU guard by default on all portfast ports, then disable BPDU guard on Ethernet 5.

```
switch(config)#spanning-tree edge-port bpduguard default
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree bpduguard disable
switch(config-if-Et5)
```

#### 11.1.3.4.4 BPDU Filter

BPDU filtering prevents the switch from sending or receiving BPDUs on specified ports. BPDU filtering is configurable on Ethernet and port channel interfaces.

Ports with BPDU filtering enabled do not send BPDUs and drops inbound BPDUs. Enabling BPDU filtering on a port not connected to a host can result in loops as the port continues forwarding data while ignoring inbound BPDU packets.

The `spanning-tree bpdufilter` command controls BPDU filtering on the configuration mode interface. BPDU filtering is disabled by default.

#### Example

- These commands enable BPDU filtering on Ethernet 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree bpdufilter enable
switch(config-if-Et5)#
```

#### 11.1.3.4.5 BPDU Rate Limit

BPDU input rate limiting restricts the number of BPDUs that a port with BPDU guard and BPDU filter disabled, can process during a specified interval. The port discards all BPDUs that it receives in excess of the specified limit. Configuring the rate limiter requires two steps:

- Establishing the rate limit threshold
- Enabling rate limiting

## Establishing the Rate Limit Threshold

The `spanning-tree bpduguard rate-limit count (interface)` command specifies the BPDU reception rate (quantity per interval) that triggers the discarding of BPDUs. The command is available in global and interface configuration modes.

- The `spanning-tree bpduguard rate-limit count` global command specifies the maximum reception rate for ports that are not covered by interface rate limit count commands. The global command specifies the default limit.

### Note:

Arista Networks recommends to retain the default values of rate limit. In the PVST mode, when the VLAN membership of a port is changed by a significant margin, it is advisable to disable interface BPDU rate limit on both ends of a port. For example, if three VLANs are present on a port initially, the operator must first add 300 more VLANs on one side of the port and then add the same 300 VLANs on the other side of the port. In this case, if the VLANs are increased towards the root bridge first, then the other side can cross the rate-limit threshold.

- The `spanning-tree bpduguard rate-limit count` interface command defines the maximum BPDU reception rate for ports in the configuration mode interface.

### Examples

- This command configures the global limit of 5000 BPDUs over a four second interval.

```
switch(config)#spanning-tree bpduguard rate-limit count 5000 interval 4
switch(config)#
```

- These commands configure a limit of 7500 BPDUs over an 8 second interval on the Ethernet interface 2.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#spanning-tree bpduguard rate-limit count 7500
interval 8
switch(config-if-Et2)#
```

## Enabling Rate Limiting

BPDU rate limiting is enabled globally or on individual ports:

- `spanning-tree bpduguard rate-limit default` enables ratelimiting on all ports that are not covered by the interface rate limiting command. The default setting is enabled.
- `spanning-tree bpduguard rate-limit enable / disable` interface command enables or disables BPDU rate limiting on the configuration mode interface. This command has precedence over the global command.

### Example

- This command enables rate limiting on ports that are not covered by interface rate limit commands.

```
switch(config)#spanning-tree bpduguard rate-limit default
switch(config)#
```

- These commands enable rate limiting on the Ethernet interface 15.

```
switch(config)#interface ethernet 15
switch(config-if-Et15)#spanning-tree bpduguard rate-limit enable
switch(config-if-Et15)#
```

---

## 11.1.4 STP Commands

### Spanning Tree Commands: Global Configuration

- spanning-tree bpdu tx hold-count
- spanning-tree bpduguard rate-limit default
- spanning-tree bpduguard rate-limit count (global)
- spanning-tree edge-port bpdufilter default
- spanning-tree edge-port bpduguard default
- spanning-tree forward-time
- spanning-tree guard loop default
- spanning-tree hello-time
- spanning-tree max-age
- spanning-tree max-hops
- spanning-tree mode
- spanning-tree mst configuration
- spanning-tree mst pvst border
- spanning-tree portchannel guard misconfig
- spanning-tree priority
- spanning-tree root
- spanning-tree transmit active
- spanning-tree vlan-id

### Loop Protection Commands

- disabled-time
- loop-protection
- monitor loop-protection
- protect vlan
- rate-limit
- shutdown (Loop-protection)
- transmit-interval

### Spanning Tree Commands: Interface Configuration Mode

- spanning-tree bpdufilter
- spanning-tree bpduguard
- spanning-tree bpduguard rate-limit count (interface)
- spanning-tree bpduguard rate-limit enable / disable
- spanning-tree cost
- spanning-tree guard
- spanning-tree link-type
- spanning-tree port-priority
- spanning-tree portfast
- spanning-tree portfast auto
- spanning-tree portfast <port type>
- switchport backup-link

### MST Configuration Commands

- abort (mst-configuration mode)

- exit (mst-configuration mode)
- instance
- name (mst-configuration mode)
- revision (mst-configuration mode)
- show (mst-configuration mode)

**Display Commands**

- show spanning-tree
- show spanning-tree bridge detail
- show spanning-tree blockedports
- show spanning-tree counters
- show spanning-tree instance
- show spanning-tree interface
- show spanning-tree mst
- show spanning-tree mst configuration
- show spanning-tree mst interface
- show spanning-tree mst test information
- show spanning-tree root
- show spanning-tree topology status
- show spanning-tree transmit active

**Clear Commands**

- clear spanning-tree counters
- clear spanning-tree counters session
- clear spanning-tree detected-protocols

---

#### 11.1.4.1 abort (mst-configuration mode)

The **abort** command, in MST-configuration mode, discards pending changes to the MST region configuration, then returns the switch to global configuration mode.

The `exit (mst-configuration mode)` command saves MST region changes to **running-config** before returning the switch to global configuration mode.

##### Command Mode

MST-configuration

##### Command Syntax

```
abort
```

##### Example

This command discards changes to the MST region, then returns the switch to global configuration mode.

```
switch(config-mst)#abort
switch(config)#
```

### 11.1.4.2 clear spanning-tree counters session

The **clear spanning-tree counter session** command resets the BPDU counters to zero on all interfaces in the current CLI session. Counters in other CLI sessions are not affected.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear spanning-tree counters session
```

#### Example

This command resets the BPDU counters in the current CLI session.

```
switch#show spanning-tree counters
      Port      Sent      Received      Tagged Error      Other
-----
0      Ethernet15      32721      0      0
0      Port-Channel10      8487      0      0

switch#clear spanning-tree counters session
switch#show spanning-tree counters
      Port      Sent      Received      Tagged Error      Other
-----
0      Ethernet15      11      0      0
0      Port-Channel10      7      2      6

switch#
```

### 11.1.4.3 clear spanning-tree counters

The **clear spanning-tree counters** command resets the BPDU counters for the specified interfaces to zero in all CLI sessions.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear spanning-tree counters [INT_NAME]
```

#### Parameters

- INT\_NAME Interface type and number. Options include:
  - <no parameter> resets counters for all interfaces.
  - **interface ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **interface loopback** *l\_num* Loopback interface specified by *l\_num*.
  - **interface management** *m\_num* Management interface specified by *m\_num*.
  - **interface port-channel** *p\_num* Port-Channel Interface specified by *p\_num*.
  - **interface vlan** *v\_num* VLAN interface specified by *v\_num*.

#### Example

This command resets the BPDU counters on Ethernet 15 interface.

```
switch#show spanning-tree counters
      Port      Sent      Received      Tagged Error      Other
-----
0      Ethernet15      32721      0      0
0      Port-Channel10      8487      0      0

switch#clear spanning-tree counters interface ethernet 15<---Clear
command
switch#show spanning-tree counters
      Port      Sent      Received      Tagged Error      Other
-----
0      Ethernet15      11      0      0
0      Port-Channel10      84942      6      0

switch#
```

#### 11.1.4.4 clear spanning-tree detected-protocols

The **clear spanning-tree detected-protocols** command restarts the spanning tree protocol (STP) migration state machine on the specified interfaces. The switch is reset to running rapid spanning tree protocol on an interface where it previously detected a bridge running an old version of the protocol.

##### Command Mode

Privileged EXEC

##### Command Syntax

```
clear spanning-tree detected-protocols [INT_NAME]
```

##### Parameters

- INT\_NAME Interface type and number. Values include:
  - <no parameter> all interfaces.
  - **ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **loopback** *l\_num* Loopback interface specified by *l\_num*.
  - **management** *m\_num* Management interface specified by *m\_num*.
  - **port-channel** *p\_num* Port-Channel Interface specified by *p\_num*.
  - **vlan** *v\_num* VLAN interface specified by *v\_num*.

##### Example

This command restarts the STP migration machine on all switch interfaces.

```
switch#clear spanning-tree detected-protocols  
switch#
```

---

#### 11.1.4.5 disabled-time

The **disabled-time** command sets the time for which the port remains disabled after a loop is detected by loop protection. The **no disabled-time** and **default disabled-time** commands reset the disabled time to the default of 604800 seconds (seven days).

**Note:** If this value is changed, interfaces that are already disabled by loop protection will remain disabled for the previously configured period.

##### Command Mode

Loop-protection Configuration

##### Command Syntax

```
disabled-time [period]
```

```
no disabled-time [period]
```

```
default disabled-time [period]
```

##### Parameters

***period*** Time in seconds for which the port remains disabled. Values range from 0 to 604800 (seven days). Default is 604800. A value of 0 disables the interface until it is manually reset, even if the disabled time is later set to a non-zero value. To restore the port manually, shut it down and then re-enable it.

##### Example

This command configures loop protection to disable a port on which a loop is detected for a period of two days (172800 seconds).

```
switch(config-monitor-loop-protect) #disabled-time 172800  
switch(config-monitor-loop-protect) #
```

#### 11.1.4.6 exit (mst-configuration mode)

The **exit** command, in MST-configuration mode, saves changes to the MST region configuration, then returns the switch to global configuration mode. MST region configuration changes are also saved by entering a different configuration mode.

##### Command Mode

MST-configuration

##### Command Syntax

```
exit
```

##### Examples

- This command saves changes to the MST region, then returns the switch to global configuration mode.

```
switch(config-mst) #exit  
switch(config) #
```

- This command saves changes to the MST region, then places the switch in Interface-Ethernet mode.

```
switch(config-mst) #interface ethernet 3  
switch(config-if-Et3) #
```

---

### 11.1.4.7 instance

The **instance** command inserts an entry into the VLAN-to-instance map that associates a set of VLANs to an MST instance. In addition to defining the MST topology, the VLAN-to-instance map is one of three parameters, along with the MST name and revision number, that identifies the switch's MST region.

The **no instance** command removes specified entries from the VLAN-to-instance map. If the command does not provide a VLAN list, all entries are removed for the specified instance. The **no instance** and **default instance** commands function identically.

#### Command Mode

MST-Configuration

#### Command Syntax

```
instance mst_inst vlans v_range
no instance mst_inst [vlans v_range]
no default instance mst_inst [vlans v_range]
```

#### Parameters

- *mst\_inst* MST instance number. Value of *mst\_inst* ranges from 0 to 4094.
- *v\_range* VLAN list. Formats include a number, number range, or comma-delimited list of numbers and ranges.

#### Examples

- This command maps VLANs 20-39 to MST instance 2

```
switch(config)#spanning-tree mst configuration
switch(config-mst)#instance 2 vlans 20-39
switch(config-mst)#
```

- This command removes all VLAN mappings to MST instance 10.

```
switch(config-mst)#no instance 10
switch(config-mst)#
```

### 11.1.4.8 loop-protection

The **loop-protection** command enables loop protection on the configuration mode interface. All interfaces in a VLAN under loop protection have loop protection enabled by default. The **no loop-protection** and **default loop-protection** commands disable loop protection on the interface.

When loop protection is disabled (at the VLAN or interface level), the computed state of the interface is forgotten and packets queued to be sent are dropped. If an interface is err-disabled by loop protection, disabling loop protection removes the err-disable.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
loop-protection
```

```
no loop-protection
```

```
default loop-protection
```

#### Example

These commands disable loop protection on Ethernet interface 2/4. If the interface is currently err-disabled by loop protection, the err-disable will be removed.

```
switch(config)#interface ethernet 2/4  
switch(config-if-Et2/4)#no loop-protection  
switch(config-if-Et2/4)#
```

---

#### 11.1.4.9 monitor loop-protection

The `monitor loop-protection` command places the switch in loop-protection configuration mode.

##### Command Mode

Global Configuration

##### Command Syntax

```
monitor loop-protection
```

##### Commands available in loop-protection configuration mode:

- [shutdown \(Loop-protection\)](#)
- [protect vlan](#)
- [transmit-interval](#)
- [disabled-time](#)
- [rate-limit](#)

##### Example

This command places the switch in loop-protection configuration mode.

```
switch(config) #monitor loop-protection  
switch(config-monitor-loop-protect) #
```

### 11.1.4.10 name (mst-configuration mode)

The **name** command configures the MST region name. The name is one of three parameters, along with the MST revision number and VLAN-to-instance map, that identifies the switch's MST region.

The name has up to 32 characters. The default name is an empty string. The name string accepts all characters except the space.

The **no name** and **default name** commands restore the default name by removing the **name** command from *running-config*.

#### Command Mode

MST-Configuration

#### Command Syntax

name *label\_text*

no name

default name

#### Parameters

*label\_text* character string assigned to name attribute. Maximum 32 characters. The space character is not permitted in the name string.

#### Example

This command assigns corporate\_100 as the MST region name.

```
switch(config)#spanning-tree mst configuration
switch(config-mst)#name corporate_100
switch(config-mst)#show pending
Active MST configuration
Name      [corporate_100]
Revision  0      Instances configured 1

Instance  Vlans mapped
-----
0         1-4094
-----
```

---

#### 11.1.4.11 protect vlan

The **protect vlan** command specifies which VLANs will participate in loop protection. The **no protect vlan** and **default protect vlan** commands remove loop protection from the specified VLANs.

##### Command Mode

Loop-protection Configuration

##### Command Syntax

```
protect vlan vlan-range
```

##### Parameters

*vlan-range* List of VLANs (number, range, comma-delimited list of numbers and ranges). Numbers range from 1 to 4094.

##### Example

This command enables loop protection on VLANs 1025-2000.

```
switch(config-monitor-loop-protect) #protect vlan 1025-2000  
switch(config-monitor-loop-protect) #
```

### 11.1.4.12 rate-limit

The **rate-limit** command sets the maximum number of loop detection frames which can be sent by the switch per second. The **no rate-limit** and **default rate-limit** commands return the rate limit to the default value of 1000.

#### Command Mode

Loop-protection Configuration

#### Command Syntax

```
rate-limit [frames]
```

```
no rate-limit [frames]
```

```
default rate-limit [frames]
```

#### Parameters

*frames* Maximum number of frames sent per second. Values range from 0-1000, default is 1000. A value of zero disables throttling.

#### Example

This command sets the maximum number of loop detection frames to 500 per second.

```
switch(config-monitor-loop-protect) #rate-limit 500  
switch(config-monitor-loop-protect) #
```

---

### 11.1.4.13 revision (mst-configuration mode)

The **revision** command configures the MST revision number. The revision number is one of three parameters, along with the MST name and VLAN-to-instance map, that identifies the switch's MST region. Revision numbers range from 0 to 65535. The default revision number is 0.

The **no revision** and **default revision** commands restore the revision number to its default value by removing the revision command from *running-config*.

#### Command Mode

MST-Configuration

#### Command Syntax

```
revision rev_number
```

```
no revision
```

```
default revision
```

#### Parameters

*rev\_number* revision number. Possible ranges from 0 to 65535 with a default of 0.

#### Example

This command sets the revision number to 15.

```
switch(config)#spanning-tree mst configuration
switch(config-mst)#revision 15
switch(config-mst)#show pending
Active MST configuration
Name      []
Revision 15Instances configured 1

Instance  Vlans mapped
-----  -
0         1-4094
-----
```

### 11.1.4.14 show (mst-configuration mode)

The **show** command displays the current and pending MST configuration:

Exiting MST configuration mode stores all pending configuration changes to *running-config*.

#### Command Mode

MST-Configuration

#### Command Syntax

**show** [EDIT\_VERSION]

#### Parameters

- EDIT\_VERSION specifies configuration version that the command displays. Options include:
  - <no parameter> command displays pending MST configuration.
  - **active** command displays MST configuration stored in *running-config*.
  - **current** command displays MST configuration stored in *running-config*.
  - **pending** command displays pending MST configuration.

#### Example

These commands contrast the difference between the active and pending configuration by adding MST configuration commands, then showing the configurations.

```
switch(config-mst)#show pending
Active MST configuration
Name      []
Revision  0      Instances configured 1

Instance  Vlans mapped
-----
0          1-4094
-----

switch(config-mst)#instance 2 vlan 20-29,102
switch(config-mst)#revision 2
switch(config-mst)#name baseline
switch(config-mst)#show pending
Pending MST configuration
Name      [baseline]
Revision  2      Instances configured 2

Instance  Vlans mapped
-----
0          1-19,30-101,103-4094
2          20-29,102
-----

switch(config-mst)#show active
Active MST configuration
Name      []
Revision  0      Instances configured 1

Instance  Vlans mapped
-----
0          1-4094
-----
```

### 11.1.4.15 show loop-protection

The **show loop-protection** command displays loop protection status.

#### Command Syntax

**show loop-protection [detail]**

#### Examples

- This command displays basic loop protection information.

```
switch#show loop-protection
Loop protection is enabled
Transmit interval: 5
Disable Time: 604800(or Permanent)
Packets Transmitted rate: 12/second(or Unthrottled)
Total: 3 Vlans enabled.
switch>
```

- This command displays detailed information about loop protection.

```
switch#show loop-protection detail
Loop protection is enabled

Transmit interval: 5
Disable Time: 604800
Packets Transmitted rate: 12/second
Total: 3 Vlans enabled.
Destination address: ffff.ffff.ffff
Ethernet type: 0x88b7
Receive action: Interface Disable

Vlan      Loop      Disabled Intfs  Total Latest
Detected  -----  Intfs Disabled Time  -----
-----
1          Yes      Et1-2          20    18:01
2          No       -              20    -
3          No       -              20    -
switch#
```

- This command displays loop protection information for the interfaces in VLANS 3-4.

```
switch#show loop-protection vlan 3-4
Vlan Intf LP Enabled State      LP      Disabled Bring
-----  -----  -----  -----  -----  -----
3      Et1  Yes  shutdown Yes      17:21  18:21
3      Et2  Yes  shutdown No       -      -
3      Et3  Yes  enabled  No       -      -
3      Et4  No   -        -       -      -
4      -    No   -        -       -      -
switch#
```

- This command displays the number of loop detection packets sent and received.

```
switch#show loop-protection counters
VLAN Tx      Rx      Rx-Other
-----
2          200    0      100

-----
```

```
Et1      200    0    100
Et2      200    1     0
switch#
```

---

#### 11.1.4.16 show spanning-tree blockedports

The **show spanning-tree blockedports** command displays the list of blocked (discarding) ports.

##### Command Mode

EXEC

##### Command Syntax

```
show spanning-tree blockedports
```

##### Example

This command shows the ports that are in discarding state.

```
switch#show spanning-tree blockedports
Name    Blocked Interfaces List
-----
MST0    Po903, Po905, Po907, Po909, Po911, Po913, Po915, Po917, Po919, Po921, Po923
        Po925, Po927, Po929, Po931, Po933, Po935, Po939, Po941, Po943, Po945, Po947

Number of blocked ports (segments) in the system : 22
switch#
```

### 11.1.4.17 show spanning-tree bridge detail

The **show spanning-tree bridge detail** command displays detailed MST information including MSTP-Rapid PVST+ interoperation status.

#### Command Mode

EXEC

#### Command Syntax

```
show spanning-tree bridge detail
```

#### Example

This command displays detailed MST information.

```
switch#show spanning-tree bridge detail
Stp Detailed Status:
  Stp agent restartable : True
  MST-PVST interoperation : Enabled
  Stp heartbeat timeout : 2.0
  Last local heartbeat timeout : 36 days, 19:10:46 ago
  Local heartbeat timeout since reboot : 1
MST0
  Bridge ID Priority 32768 (priority 32768 sys-id-ext 0)
  Address 001c.7374.8572
  Hello Time 2.000 sec Max Age 20 sec Forward Delay 15 sec
```

### 11.1.4.18 show spanning-tree counters

The **show spanning-tree counters** command displays the number of BPDU transactions on each interface running spanning tree.

#### Command Mode

EXEC

#### Command Syntax

```
show spanning-tree counters
```

#### Example

This command displays the BPDU counter status on each interface running spanning tree.

```
switch#show spanning-tree counters
      Port      Sent   Received   Tagged Error   Other Error
sinceTimer
-----
0   Ethernet2   1008399      0           0             0
0   Ethernet3   1008554      0           0             0

### 11.1.4.19 show spanning-tree instance

The **show spanning-tree instance** command displays spanning tree protocol bridge configuration settings for each instance on the switch. The display includes Bridge ID, Hello Time, Max Age, and Forward Delay times.

The command also displays the restartability of the STP agent when the **detail** option is selected. A switch can continue support of MLAG operation when its peer is offline and the STP agent is unavailable.

#### Command Mode

EXEC

#### Command Syntax

```
show spanning-tree instance [INFO_LEVEL]
```

#### Parameters

- **INFO\_LEVEL** specifies level of information detail provided by the command.
  - **<no parameter>** command displays information in a data table.
  - **detail** command displays bridge information in data blocks for each instance.

#### Examples

- This command displays a bridge data table.

```
switch#show spanning-tree instance
          Bridge ID              Hello  Max
          Fwd                    Time   Age
Instance Priority          MAC addr  Time   Age
Dly
-----
---
MST0     32768(32768, sys-id 0  ) 001c.7302.2f98  2000  20
  15

### 11.1.4.20 show spanning-tree interface

The **show spanning-tree interface** command displays spanning tree protocol information for the specified interface.

#### Command Mode

EXEC

#### Command Syntax

```
show spanning-tree interface INT_NAME [INFO_LEVEL]
```

#### Parameters

- INT\_NAME Interface type and number. Values include:
  - **ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **peer ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **port-channel** *p\_num* Port-Channel Interface specified by *p\_num*.
  - **peerport-channel** *p\_num* Port-Channel Interface specified by *p\_num*.
- INFO\_LEVEL specifies level of detail provided by the output. Options include:
  - <no parameter> command displays a table of STP data for the specified interface.
  - **detail** command displays a data block for the specified interface.

#### Examples

- This command displays an STP table for Ethernet interface 5.

```
switch#show spanning-tree interface ethernet 5
Instance           Role           State           Cost           Prio.Nbr  Type
-----
MST0                designated forwarding 20000         128.5         P2p
switch#
```

- This command displays a data block for Ethernet interface 5.

```
switch#show spanning-tree interface ethernet 5 detail
Port 5 (Ethernet5) of MST0 is designated forwarding
Port path cost 20000, Port priority 128, Port Identifier 128.5.
Designated root has priority 32768, address 001c.7301.07b9
Designated bridge has priority 32768, address 001c.7304.195b
Designated port id is 128.5, designated path cost 1999 (Ext) 0 (Int)
Timers: message age 1, forward delay 15, hold 20
Number of transitions to forwarding state: 1
Link type is point-to-point by default, Internal
BPDU: sent 1008766, received 0, taggedErr 0, otherErr 0,
rateLimiterCount 0
Rate-Limiter: enabled, Window: 10 sec, Max-BPDU: 400

switch#
```

### 11.1.4.21 show spanning-tree mst configuration

The **show spanning-tree mst configuration** command displays information about the MST regions VLAN-to-instance mapping. The command provides two display options:

- **default** displays a table that lists the instance to VLAN map.
- **digest** displays the configuration digest.

The configuration digest is a 16-byte hex string calculated from the md5 encoding of the VLAN-to-instance mapping table. Switches with identical mappings have identical digests.

#### Command Mode

EXEC

#### Command Syntax

```
show spanning-tree mst configuration [INFO_LEVEL]
```

#### Parameters

- INFO\_LEVEL specifies data provided by the output. Options include:
  - <no parameter> command displays VLAN-to-instance map.
  - **digest** command displays the MST configuration digest.

#### Examples

- This command displays the MST regions VLAN-to-instance map.

```
switch#show spanning-tree mst configuration
Name      []
Revision  0      Instances configured 3

Instance  Vlans mapped
-----
01,4-4094
22
33
-----
switch#
```

- This command displays the MST regions configuration digest.

```
switch#show spanning-tree mst configuration digest
Name      []
Revision  0      Instances configured 1
Digest    0xAC36177F50283CD4B83821D8AB26DE62
switch#
```

#### 11.1.4.22 show spanning-tree mst interface

The **show spanning-tree mst interface** command displays Multiple Spanning Tree Protocol (MSTP) information for a specified interface on the specified MST instances.

##### Command Mode

EXEC

##### Command Syntax

```
show spanning-tree mst [INSTANCE] interface INT_NAME [INFO_LEVEL]
```

##### Parameters

- **INSTANCE** MST instance for which the command displays information. Options include:
  - <no parameter> all MST instances.
  - **mst\_inst** denotes a single MST instance. Value of *mst\_inst* ranges from 0 to 4094.
- **INT\_NAME** Interface type and number. Values include:
  - **ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **peerethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **port-channel** *p\_num* Port-channel interface specified by *p\_num*.
  - **peerport-channel** *p\_num* Port-channel interface specified by *p\_num*.
- **INFO\_LEVEL** specifies level of detail provided by the output. Options include:
  - <no parameter> command displays a table of STP instance data for the specified interface
  - **detail** command displays a data block for all specified instance-interface combinations.

##### Examples

- This command displays a table of STP instance data for Ethernet 1 interface:

```
switch#show spanning-tree mst interface ethernet 1
Ethernet1 of MST0 is root forwarding
Edge port: nobpdu guard: disabled
Link type: point-to-point
Boundary : Internal
Bpdus sent 2120, received 2164, taggedErr 0, otherErr 0

Instance Role Sts CostPrio.Nbr Vlans mapped
-----
0RootFWD2000128.11,4-4094
2DesgFWD2000128.12
3RootFWD2000128.13
```

- This command displays blocks of STP instance information for Ethernet 1 interface.

```
switch#show spanning-tree mst 3 interface ethernet 1 detail
Edge port: nobpdu guard: disabled
Link type: point-to-point
Boundary : Internal
Bpdus sent 2321, received 2365, taggedErr 0, otherErr 0

Designated bridgeaddress 0011.2233.4401priority32768 port id128.1
```

### 11.1.4.23 show spanning-tree mst test information

The **show spanning-tree mst test information** displays diagnostic spanning tree protocol information.

#### Command Mode

EXEC

#### Command Syntax

```
show spanning-tree mst test information
```

#### Example

This command displays diagnostic STP information.

```
switch#show spanning-tree mst test information
bi = MstInfo.BridgeInfo( "dut" )
bi.stpVersion = "rstp"
bi.mstpRegionId = ""
bi.bridgeAddr = "00:1c:73:01:60:17"
si = MstInfo.BridgeStpiInfo( "Mst" )
bi.stpiInfoIs( "Mst", si )
si.cistRoot = Tac.Value( "Stp::BridgeId", priority=32768, systemId=0,
address='00:1c:73:01:60:17' )
si.cistPathCost = 0
bmi = MstInfo.BridgeMstiInfo( "Mst0" )
bmi.bridgeId = Tac.Value( "Stp::BridgeId", priority=32768, systemId=0,
address='00:1c:73:01:60:17' )
bmi.designatedRoot = Tac.Value( "Stp::BridgeId", priority=32768,
systemId=0,
address='00:1c:73:01:60:17' )
si.mstiInfoIs( "Mst0", bmi )
bmii = MstInfo.BridgeMstiIntfInfo( "Mst0", "Ethernet15" )
bmii.portId = Tac.Value( "Stp::PortId",
portPriority=128, portNumber=15 )
bmii.role = "designated"
bmii.operIntPathCost = 2000
bmii.fdbFlush = 1
bmi.mstiIntfInfoIs( "Ethernet15", bmii )
bii = MstInfo.BridgeIntfInfo( "Ethernet15" )
bii.operExtPathCost = 2000
si.intfInfoIs( "Ethernet15", bii )
bmii = MstInfo.BridgeMstiIntfInfo( "Mst0", "Port-Channel10" )
bmii.portId = Tac.Value( "Stp::PortId",
portPriority=128, portNumber=101 )
bmii.role = "designated"
bmii.operIntPathCost = 1999
bmii.fdbFlush = 1
bmi.mstiIntfInfoIs( "Port-Channel10", bmii )
bii = MstInfo.BridgeIntfInfo( "Port-Channel10" )
bii.operExtPathCost = 1999
si.intfInfoIs( "Port-Channel10", bii )
switch>
```

#### 11.1.4.24 show spanning-tree mst

The **show spanning-tree mst** command displays configuration and state information for Multiple Spanning Tree Protocol (MST) instances.

##### Command Mode

EXEC

##### Command Syntax

```
show spanning-tree mst [INSTANCE] [INFO_LEVEL]
```

##### Parameters

- **INSTANCE** MST instance for which the command displays information. Options include:
  - <no parameter> all MST instances.
  - **mst\_inst** MST instance number. Value of *mst\_inst* ranges from 0 to 4094.
- **INFO\_LEVEL** type and amount of information in the output. Options include:
  - <no parameter> output is interface data in tabular format.
  - **detail** output is a data block for each interface.

##### Examples

- This command displays interface data blocks for MST instance 3.

```
switch#show spanning-tree mst 3 detail
##### MST3vlans mapped:3

### 11.1.4.25 show spanning-tree root

The **show spanning-tree root** command displays the Bridge-ID, cost to the root bridge, root port, and the root bridge timer settings for all instances.

#### Command Mode

EXEC

#### Command Syntax

```
show spanning-tree root [INFO_LEVEL]
```

#### Parameters

- **INFO\_LEVEL** specifies output format. Options include:
  - **<no parameter>** output displays data in tabular format.
  - **detail** output displays a data block for each instance.

#### Examples

- This command displays a table of root bridge information.

```
switch#show spanning-tree root
      Root ID
Instance  Priority  MAC addr  Cost  Hello Time  Max Age  Fwd Dly  Root Port
-----
MST0     32768  001c.7301.23de  0     2     20     15     Po937
MST101   32869  001c.7301.23de  3998  0     0     0     Po909
MST102   32870  001c.7301.23de  3998  0     0     0     Po911
switch>
```

- This command displays root bridge data blocks for each MSTP instance.

```
switch#show spanning-tree root detail
MST0

switch>
```

### 11.1.4.26 show spanning-tree topology status

The **show spanning-tree topology status** command displays the forwarding state of ports on the specified VLANs.

#### Command Mode

EXEC

#### Command Syntax

```
show spanning-tree topology [VLAN_NAME] status [INFO_LEVEL]
```

#### Parameters

- VLAN\_NAME specifies the VLANs that the output displays. Options include:
  - <no parameter> output includes all VLANs.
  - **vlan** output includes all VLANs.
  - **vlan v\_num** command includes specified VLAN; *v\_num* ranges from 1 to 4094.
- INFO\_LEVEL specifies information provided by output. Options include:
  - <no parameter> output lists forwarding state of interfaces.
  - **detail** output lists forwarding state and change history of interfaces.

#### Examples

- This command displays forwarding state for ports mapped to all VLANs.

```
switch#show spanning-tree topology status
Topology: Cist
Mapped Vlans: 1-4,666,1000-1001,1004-1005
Cpu:          forwarding
Ethernet2:    forwarding
Ethernet3:    forwarding
Ethernet4:    forwarding
Ethernet5:    forwarding
Ethernet6:    forwarding
Ethernet8:    forwarding
Ethernet10:   forwarding
Port-Channel1: forwarding
Port-Channel2: forwarding
Port-Channel3: forwarding

switch>
```

- This command displays forwarding state and history for ports mapped to VLAN 1000.

```
switch#show spanning-tree topology vlan 1000 status detail
Topology: Cist
Mapped Vlans: 1000
Cpu:          forwarding (1 changes, last 23 days, 22:54:43 ago)
Ethernet2:    forwarding (3 changes, last 23 days, 22:48:59 ago)
Ethernet4:    forwarding (3 changes, last 10 days, 19:54:17 ago)
Ethernet5:    forwarding (3 changes, last 23 days, 22:54:38 ago)
Ethernet6:    forwarding (3 changes, last 19 days, 15:49:10 ago)
Ethernet10:   forwarding (3 changes, last 9 days, 7:37:05 ago)
Port-Channel1: forwarding (3 changes, last 23 days, 22:54:34 ago)
Port-Channel3: forwarding (5 changes, last 21 days, 4:56:41 ago)

switch>
```

---

#### 11.1.4.27 show spanning-tree transmit active

The **show spanning-tree transmit active** command displays spanning tree protocol bridge assurance information for network ports or for all ports. Bridge assurance-enabled ports will not necessarily be blocked when they link to a port where bridge assurance is not enabled, but if they do not receive periodic BPDUs from the other side of the link the **show spanning-tree transmit active** command will show a bridge assurance status of inconsistent (blocking) for that port.

##### Command Mode

EXEC

##### Command Syntax

```
show spanning-tree transmit active INFO_LEVEL
```

##### Parameters

- INFO\_LEVEL specifies level of information detail provided by the command.
  - <no parameter> command displays bridge assurance information for network ports.
  - **detail** command displays bridge assurance information for all ports.

##### Example

This command displays the bridge assurance status of network ports.

```
switch#show spanning-tree transmit active
Name                               Bridge Assurance Status
-----
VL1          Et5/1          consistent

Number of bridge assurance inconsistent ports in the system : 0
switch>
```

### 11.1.4.28 show spanning-tree

The `show spanning-tree command` displays spanning tree protocol (STP) data, organized by instance.

#### Command Mode

EXEC

#### Command Syntax

```
show spanning-tree [VLAN_ID] [INFO_LEVEL]
```

#### Parameters

- **VLAN\_ID** specifies the VLANs for which the command displays information. Formats include:
  - `<no parameter>` displays information for all VLANs.
  - **vlan** displays data for instances containing the first VLAN listed in running-config.
  - **vlan v\_range** displays data for instances containing a VLAN in the specified range.
- **INFO\_LEVEL** specifies level of information detail provided by the command.
  - `<no parameter>` displays table for each instance listing status, configuration, and history.
  - **detail** displays data blocks for each instance and all ports on each instance.

#### Display Values

- **Root ID** Displays information on the ROOT ID (elected spanning tree root bridge ID):
  - **Priority** Priority of the bridge. Default value is 32768.
  - **Address** MAC address of the bridge.
- **Bridge ID** bridge status and configuration information for the locally configured bridge:
  - **Priority** Priority of the bridge. The default priority is 32768.
  - **Address** MAC address of the bridge.
  - **Hello Time** Interval (seconds) between bridge protocol data units (BPDUs) transmissions.
  - **Max Age** Maximum time that a BPDU is saved.
  - **Forward Delay** Time (in seconds) that is spent in the learning state.
- **Interface** STP configuration participants. Link-down interfaces are not shown.
- **Role** Role of the port as one of the following:
  - **Root** The best port for a bridge to a root bridge used for forwarding.
  - **Designated** A forwarding port for a LAN segment.
  - **Alternate** A port acting as an alternate path to the root bridge.
  - **Backup** A port acting as a redundant path to another bridge port.
- **State** Displays the interface STP state as one of the following:
  - **Learning**
  - **Discarding**
  - **Forwarding**
- **Cost** STP port path cost value.
- **Prio. Nbr.** STP port priority. Values range from 0 to 240. Default is 128.
- **Type** The link type of the interface (automatically derived from the duplex mode of an interface):
  - **P2p Peer (STP)** Point to point full duplex port running standard STP.
  - **shr Peer (STP)** Shared half duplex port running standard STP.

#### Examples

- This command displays STP data, including a table of port parameters.

```
switch#show spanning-tree vlan 1000
```

```

MST0
  Spanning tree enabled protocol rstp
  Root ID      Priority    32768
              Address     001c.7301.07b9
              Cost        1999 (Ext) 0 (Int)
              Port        101 (Port-Channel2)

switch#
```

---

#### 11.1.4.29 shutdown (Loop-protection)

The **shutdown (Loop-protection)** command disables loop protection globally. The feature is disabled by default, and is enabled by using the **no shutdown (Loop-protection)** command.

**Note:** To function, loop protection must also be enabled on a per-VLAN basis using the **protect vlan** command.

##### Command Mode

Loop-protection Configuration

##### Command Syntax

```
shutdown
```

```
no shutdown
```

##### Example

This command enables loop protection globally on the switch.

```
switch(config-monitor-loop-protect) #no shutdown  
switch(config-monitor-loop-protect) #
```

### 11.1.4.30 spanning-tree bpdu tx hold-count

The **spanning-tree bpdu tx hold-count** command specifies the maximum number of BPDUs per second that the switch can send from an interface. Valid settings range from 1 to 10 BPDUs with a default of 6 BPDUs.

The **no spanning-tree bpdu tx hold-count** and **default spanning-tree bpdu tx hold-count** commands restore the transmit hold count default of 6 BPDUs by removing the **spanning-tree bpdu tx hold-count** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
spanning-tree bpdu tx hold-count max_bpdu
```

```
no spanning-tree bpdu tx hold-count
```

```
default spanning-tree bpdu tx hold-count
```

#### Parameters

*max\_bpdu* BPDU packets. Value ranges from 1 to 10. Default is 6.

#### Example

This command configures a transmit hold-count of 8 BPDUs.

```
switch(config)#spanning-tree bpdu tx hold-count 8  
switch(config)#
```

---

### 11.1.4.31 spanning-tree bpdudfilter

The **spanning-tree bpdudfilter** command controls bridge protocol data unit (BPDU) filtering on the configuration mode interface. BPDU filtering is disabled by default.

- **spanning-tree bpdudfilter enabled** enables BPDU filtering.
- **spanning-tree bpdudfilter disabled** disables BPDU filtering by removing the **spanning-tree bpdudfilter** command from *running-config*.

The BPDU filter default setting for portfast ports is configured by the **spanning-tree edge-port bpdudfilter default** command; BPDU filter is disabled by default on all non-portfast ports.

The **no spanning-tree bpdudfilter** and **default spanning-tree bpdudfilter** commands restore the global BPDU filter setting on the configuration mode interface by removing the corresponding **spanning-tree bpdudfilter** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
spanning-tree bpdudfilter FILTER_STATUS
```

```
no spanning-tree bpdudfilter
```

```
default spanning-tree bpdudfilter
```

#### Parameters

- **FILTER\_STATUS** BPDU filtering status. Options include:
  - **enabled** BPDU filter is enabled on the interface.
  - **disabled** BPDU filter is disabled on the interface.

#### Example

This command enables BPDU filtering on Ethernet 5 interface.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#spanning-tree bpdudfilter enabled  
switch(config-if-Et5)#
```

### 11.1.4.32 spanning-tree bpduguard rate-limit count (global)

The `spanning-tree bpduguard rate-limit count` command sets the maximum BPDU reception rate (quantity per interval) for ports that are not covered by a `spanning-tree bpduguard rate-limit count (interface)` command.

BPDU rate limiting restricts the number of BPDUs that ports with BPDU guard or BPDU filter disabled can process during a specified interval. Ports discard BPDUs they receive in excess of the specified limit. BPDU rate limiting is enabled or disabled by `spanning-tree bpduguard rate-limit enable / disable` commands.

The `no spanning-tree bpduguard rate-limit count` and `default spanning-tree bpduguard rate-limit count` commands restore the global setting to its default value by removing the `spanning-tree bpduguard rate-limit count` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
spanning-tree bpduguard rate-limit count max_bpdu [interval period]
```

```
no spanning-tree bpduguard rate-limit count
```

```
default spanning-tree bpduguard rate-limit count
```

#### Parameters

- *max\_bpdu* configures the maximum number of BPDUs per timer interval. The value of *BPDU quantity* ranges from 1 to 20000.
- *interval period* configures the timer interval in seconds. The value of *period* ranges from 1 to 15.

#### Guidelines

Arista Networks recommends to retain the default values of rate limit.

In the PVST mode, when the VLAN membership of a port is changed by a significant margin, it is advisable to disable interface BPDU rate limit on both ends of a port. For example, if three VLANs are present on a port initially, the operator must first add 300 more VLANs on one side of the port and then add the same 300 VLANs on the other side of the port. In this case, if the VLANs are increased towards the root bridge first, then the other side can cross the rate-limit threshold.

#### Example

This command configures the global rate limit as 5000 BPDUs per four second period.

```
switch(config)#spanning-tree bpduguard rate-limit count 5000 interval 4  
switch(config)#
```

---

### 11.1.4.33 spanning-tree bpduguard rate-limit count (interface)

The **spanning-tree bpduguard rate-limit count** command configures the maximum BPDU reception rate for the configuration mode interface. The default rate limit is specified by the [spanning-tree bpduguard rate-limit count \(global\)](#) command.

BPDU rate limiting restricts the number of BPDUs that ports with BPDU guard or BPDU filter disabled can process during a specified interval. Ports discard BPDUs it receives in excess of the specified limit. BPDU rate limiting is enabled or disabled by [spanning-tree bpduguard rate-limit enable / disable](#) commands.

The **no spanning-tree bpduguard rate-limit count** and **default spanning-tree bpduguard rate-limit count** commands restore the interface value to the global setting by removing the corresponding **spanning-tree bpduguard rate-limit count** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
spanning-tree bpduguard rate-limit count max_bpdu [TIMER]
no spanning-tree bpduguard rate-limit count
default spanning-tree bpduguard rate-limit count
```

#### Parameters

- *max\_bpdu* BPDU quantity. Value ranges from 1 to 20,000.
- TIMER BPDU reception interval (seconds). Options include:
  - <no parameter> reception interval defaults to hello-time.
  - **interval** *period* Value of *period* ranges from 1 to 15.

#### Example

These commands configure rate limit as 7500 BPDUs per 8 second period on Ethernet 2.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#spanning-tree bpduguard rate-limit count 7500
interval 8
switch(config-if-Et2)#
```

#### 11.1.4.34 spanning-tree bpduguard rate-limit default

The **spanning-tree bpduguard rate-limit default** command configures the global BPDU rate limit setting. The global BPDU rate limit setting provides the default for individual ports whose configuration does not include a [spanning-tree bpduguard rate-limit enable / disable](#) command. The default global setting is enabled.

BPDU rate limiting restricts the number of BPDUs that ports with BPDU guard or BPDU filter disabled can process during a specified interval. Ports discard BPDUs it receives in excess of the specified limit. BPDU rate limits are established by [spanning-tree bpduguard rate-limit count \(global\)](#) commands.

The **no spanning-tree bpduguard rate-limit default** sets the global BPDU rate limit setting to disabled. The **spanning-tree bpduguard rate-limit default** and **default spanning-tree bpduguard rate-limit default** commands restore the default global rate limit setting to enabled by removing the **nospawning-tree bpduguard rate-limit default** command from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

```
spanning-tree bpduguard rate-limit default
no spanning-tree bpduguard rate-limit default
default spanning-tree bpduguard rate-limit default
```

##### Example

This command enables rate limiting on all ports not covered by an interface rate limit command.

```
switch(config) #spanning-tree bpduguard rate-limit default
switch(config) #
```

---

### 11.1.4.35 spanning-tree bpduguard rate-limit enable / disable

These commands enable and disable BPDU rate limiting on the configuration mode interface:

- `spanning-tree bpduguard rate-limit enable` enables BPDU rate limiting.
- `spanning-tree bpduguard rate-limit disable` disables BPDU rate limiting.

The `spanning-tree bpduguard rate-limit default` command enables BPDU rate limiting on all ports not configured with a `spanning-tree bpduguard rate-limit` command.

BPDU rate limiting restricts the number of BPDUs that ports with BPDU guard or BPDU filter disabled can process during a specified interval. Ports discard BPDUs it receives in excess of the specified limit. BPDU rate limits are established by `spanning-tree bpduguard rate-limit count (interface)` commands.

The `no spanning-tree bpduguard rate-limit` and `default spanning-tree bpduguard rate-limit` commands restore the global rate limit setting on the configuration mode interface by removing the corresponding `spanning-tree bpduguard rate-limit` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
spanning-tree bpduguard rate-limit enable
spanning-tree bpduguard rate-limit disable
no spanning-tree bpduguard rate-limit
default spanning-tree bpduguard rate-limit
```

#### Example

These commands enable rate limiting on Ethernet 15.

```
switch(config)#interface ethernet 15
switch(config-if-Et15)#spanning-tree bpduguard rate-limit enable
switch(config-if-Et15)#
```

### 11.1.4.36 spanning-tree bpduguard

The **spanning-tree bpduguard** command controls BPDU guard on the configuration mode interface. A BPDU guard-enabled port is disabled when it receives a BPDU packet.

The BPDU guard default setting for portfast ports is configured by the [spanning-tree edge-port bpduguard default](#) command; BPDU guard is disabled by default on all non-portfast ports.

The **no spanning-tree bpduguard** and **default spanning-tree bpduguard** commands restore the global BPDU guard setting on the configuration mode interface by removing the corresponding **spanning-tree bpduguard** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
spanning-tree bpduguard GUARD_ACTION
```

```
no spanning-tree bpduguard
```

```
default spanning-tree bpduguard
```

#### Parameters

- **GUARD\_ACTION** BPDU guard setting. Options include:
  - **disable** Disable bpduguard
  - **enable** Enable bpduguard
  - **rate-limit** BPDU Input Rate Limiter options

#### Example

These commands enable BPDU guard on Ethernet interface 5.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#spanning-tree bpduguard enabled  
switch(config-if-Et5)
```

### 11.1.4.37 spanning-tree cost

The **spanning-tree cost** command configures the path cost of the configuration mode interface. Cost values range from 1 to 200000000 (200 million). The default cost depends on the interface speed:

- 1 gigabit interface: cost = 20000
- 10 gigabit interface: cost = 2000

The **spanning-tree cost** command provides a mode option:

- RST instance cost is configured by not including a mode.
- MST instance 0 cost is configured by not including a mode or with the **mst** mode option.
- MST instance cost is configured with the **mst** mode option.
- Rapid-PVST VLAN cost is configured with the **vlan** mode option.

The **no spanning-tree cost** and **default spanning-tree cost** commands restore the default cost on the configuration mode interface by removing the corresponding **spanning-tree cost** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
spanning-tree MODE cost value
```

```
no spanning-tree MODE cost
```

```
default spanning-tree MODE cost
```

#### Parameters

- **MODE** specifies the spanning tree instances for which the cost is configured. Values include:
  - <no parameter> RST instance, MST instance 0, or all Rapid-PVST instances permitted on the interface.
  - **mst m\_range** specified MST instances. **m\_range** formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from 0 to 4094.
  - **vlan v\_range** specified Rapid-PVST instances. **v\_range** formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from 1 to 4094.
- **value** path cost assigned to interface. Values range from 1 to 200000000 (200 million). Default values are 20000 (1 G interfaces) or 2000 (10 G interfaces).

#### Examples

- These commands configure a port cost of 25000 for Ethernet interface 5 when configured as an RST port, as a port in MST instance 0, or all unconfigured Rapid-PVST instances that are not explicitly configured.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#spanning tree cost 25000
```

- This command configures a port cost of 30000 for Ethernet interface 5 when configured as a port in MST instance 200.

```
switch(config-if-Et5)#spanning tree mst 200 cost 30000
```

- This command configures a port cost of 100000 for Ethernet interface 5 when configured as a port in VLANs 200-220.

```
switch(config-if-Et5)#spanning tree vlan 200-220 cost 100000
```

```
switch(config-if-Et5) #
```

---

#### 11.1.4.38 spanning-tree edge-port bpdufilter default

The **spanning-tree edge-port bpdufilter default** command configures the global BPDU filter setting as enabled. Ports not covered by a [spanning-tree bpdufilter](#) command use the global BPDU filter setting.

##### Command Mode

Global Configuration

##### Command Syntax

```
spanning-tree edge-port bpdufilter default
no spanning-tree edge-port bpdufilter default
default spanning-tree edge-port bpdufilter default
```

##### Example

This command configures the BPDU filter global setting to **enabled**.

```
switch(config)#spanning-tree edge-port bpdufilter default
switch(config)#
```

### 11.1.4.39 spanning-tree edge-port bpduguard default

The **spanning-tree edge-port bpduguard default** command sets the global BPDU guard setting as **enabled**. Ports not covered by a [spanning-tree bpduguard](#) command use the global BPDU guard setting.

#### Command Mode

Global Configuration

#### Command Syntax

```
spanning-tree edge-port bpduguard default
no spanning-tree edge-port bpduguard default
default spanning-tree edge-port bpduguard default
```

#### Example

This command configures the global BPDU guard setting to enabled.

```
switch(config)#spanning-tree edge-port bpduguard default
switch(config)#
```

---

#### 11.1.4.40 spanning-tree forward-time

The **spanning-tree forward-time** command configures the forward delay timer. Forward delay is the time that a port is in learning state before it begins forwarding data packets.

The switch inserts the forward delay timer value in BPDU packets it sends as the root bridge. The forward delay value ranges from 4 to 30 seconds with a default of 15 seconds.

The **no spanning-tree forward-time** and **default spanning-tree forward-time** commands restore the forward delay timer default of 15 seconds by removing the **spanning-tree forward-time** command from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

**spanning-tree forward-time *period***

no spanning-tree forward-time

default spanning-tree forward-time

##### Parameters

*period* forward delay timer (seconds). Value ranges from 4 to 30. Default is 15.

##### Example

This command sets the forward delay timer value to 25 seconds.

```
switch(config)#spanning-tree forward-time 25
switch(config)#
```

#### 11.1.4.41 spanning-tree guard loop default

The **spanning-tree guard loop default** command configures the global loop guard setting as enabled. Ports not covered by a **spanning-tree guard** command use the global loop guard setting. Loop guard prevents blocked or root ports from becoming a designated port due to failures resulting in a unidirectional link. The **spanning-tree guard** interface configuration statement overrides the global setting for a specified interface. The default global loop guard setting is disabled.

The **no spanning-tree guard loop default** and **default spanning-tree guard loop default** commands restore the global loop guard setting of disabled by removing the **spanning-tree guard loop default** command from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

```
spanning-tree guard loop default
no spanning-tree guard loop default
default spanning-tree guard loop default
```

##### Example

This command enables loop guard as the default on all switch ports.

```
switch(config)#spanning-tree guard loop default
switch(config)#
```

---

#### 11.1.4.42 spanning-tree guard

The **spanning-tree guard** command enables root guard or loop guard on the configuration mode interface. The **spanning-tree guard loop default** command configures the global loop guard setting.

- Root guard prevents a port from becoming a root or blocked port. A root guard port that receives a superior BPDU transitions to the root-inconsistent (blocked) state.
- Loop guard protects against loops resulting from unidirectional link failures on point-to-point links by preventing non-designated ports from becoming designated ports. When loop guard is enabled, a root or blocked port transitions to loop-inconsistent (blocked) state if it stops receiving BPDUs from its designated port. The port returns to its prior state when it receives a BPDU.

The **no spanning-tree guard** and **default spanning-tree guard** commands sets the configuration mode interface to the global loop guard mode by removing the **spanning-tree guard** statement from **running-config**. The **spanning-tree guard none** command disables loop guard and root guard on the interface, overriding the global setting.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

##### Command Syntax

**spanning-tree guard**PORT\_MODE

no spanning-tree guard

default spanning-tree guard

##### Parameters

- PORT\_MODE the port mode. Options include:
  - **loop** enables loop guard on the interface.
  - **root** enables root guard on the interface.
  - **none** disables root guard and loop guard.

##### Example

This command enables root guard on Ethernet 5 interface.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree guard root
switch(config-if-Et5)#
```

#### 11.1.4.43 spanning-tree hello-time

The **spanning-tree hello-time** command configures the hello time, which specifies the transmission interval between consecutive bridge protocol data units (BPDU) that the switch sends as a root bridge. The hello time is also inserted in outbound BPDUs.

This hello time ranges from 0.2 seconds to 10 seconds with a default of 2 seconds.

The **no spanning-tree hello-time** and **default spanning-tree hello-time** commands restore the hello time default of 2 seconds by removing the **spanning-tree hello-time** command from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

**spanning-tree hello-time *period***

no spanning-tree hello-time

default spanning-tree hello-time

##### Parameters

*period* hello-time (milliseconds). Value ranges from 200 to 10000. Default is 2000.

##### Example

This command configures a hello-time of one second.

```
switch(config)#spanning-tree hello-time 1000
switch(config)#
```

---

#### 11.1.4.44 spanning-tree link-type

The **spanning-tree link-type** command specifies the configuration mode interfaces link type, which is normally derived from the ports duplex setting. The default setting depends on a ports duplex mode:

- full-duplex ports are point-to-point.
- half-duplex ports are shared.

The **no spanning-tree link-type** and **default spanning-tree link-type** commands restore the default link type on the configuration mode interface by removing the corresponding **spanning-tree link-type** command from *running-config*.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

##### Command Syntax

**spanning-tree link-type TYPE**

**no spanning-tree link-type**

**default spanning-tree link-type**

##### Parameters

- TYPE link type of the configuration mode interface. Options include:
  - **point-to-point**
  - **shared**

##### Example

This command configures Ethernet 5 interface as a shared port.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree link-type shared
switch(config-if-Et5)#
```

#### 11.1.4.45 spanning-tree max-age

The **spanning-tree max-age** command configures the switch's max age timer, which specifies the max age value that the switch inserts in outbound BPDU packets it sends as a root bridge. The max-age time value ranges from 6 to 40 seconds with a default of 20 seconds.

Max age is the interval, specified in the BPDU, that BPDU data remains valid after its reception. The bridge recomputes the spanning tree topology if it does not receive a new BPDU before max age expiry.

The **no spanning-tree max-age** and **default spanning-tree max-age** commands restore the max-age default of 20 seconds by removing the **spanning-tree max-age** command from **running-config**.

##### Command Mode

Global Configuration

##### Command Syntax

**spanning-tree max-age *period***

no spanning-tree max-age

default spanning-tree max-age

##### Parameters

*period* max age period (seconds). Value ranges from 6 to 40. Default is 20.

##### Example

This command sets the max age timer value to 25 seconds.

```
switch(config)#spanning-tree max-age 25
switch(config)#
```

---

#### 11.1.4.46 spanning-tree max-hops

The **spanning-tree max-hops** command specifies the max hop setting that the switch inserts into BPDUs that it sends out as the root bridge. The max hop setting determines the number of bridges in an MST region that a BPDU can traverse before it is discarded. The max-hop value ranges from 1 to 40 with a default of 20.

The **no spanning-tree max-hops** and **default spanning-tree max-hops** commands restore the max-hops setting to its default value of 20 by removing the **spanning-tree max-hops** command from **running-config**.

##### Command Mode

Global Configuration

##### Command Syntax

```
spanning-tree max-hops ports
```

```
no spanning-tree max-hops
```

```
default spanning-tree max-hops
```

##### Parameters

*ports* max hops (bridges). Value ranges from 1 to 40. Default is 20.

##### Example

This command sets the max hop value to 40.

```
switch(config)#spanning-tree max-hop 40  
switch(config)#
```

### 11.1.4.47 spanning-tree mode

The **spanning-tree mode** command specifies the spanning tree protocol version that the switch runs. The default mode is Multiple Spanning Tree (mstp).

The **no spanning-tree mode** and **default spanning-tree mode** commands restore the default spanning tree protocol version.

**Note:** The **spanning-tree mode** command may disrupt user traffic. When the switch starts a different STP version, all spanning-tree instances are stopped, then restarted in the new mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
spanning-tree mode VERSION
```

```
no spanning-tree mode
```

```
default spanning-tree mode
```

#### Parameters

- **VERSION** spanning tree version that the switch runs. Options include:
  - **mstp** multiple spanning tree protocol described in the IEEE 802.1Q-2005 specification and originally specified in the IEEE 802.1s specification.
  - **rstp** rapid spanning tree protocol described in the IEEE 802.1D-2004 specification and originally specified in the IEEE 802.1w specification.
  - **rapid-pvst** rapid per-VLAN spanning tree protocol described in the IEEE 802.1D-2004 specification and originally specified in the IEEE 802.1w specification.
  - **backup** disables STP and enables switchport interface pairs configured with the [switchport backup-link](#) command.
  - **none** disables STP. The switch does not generate STP packets. Each switchport interface forwards data packets to all connected ports and forwards STP packets as multicast data packets on the VLAN where they are received.

#### Guidelines

Backup mode is not available on Trident platform switches.

#### Example

This command configures the switch to run multiple spanning tree protocol.

```
switch(config)#spanning-tree mode mstp  
switch(config)#
```

---

#### 11.1.4.48 spanning-tree mst configuration

The **spanning-tree mst configuration** command places the switch in MST-configuration mode, which is the group change mode where MST region parameters are configured.

Changes made in a group change mode are saved by leaving the mode through the **exit** command or by entering another configuration mode. To discard changes from the current edit session, leave the mode with the **abort** command.

These commands are available in MST-configuration mode:

- `abort (mst-configuration mode)`
- `exit (mst-configuration mode)`
- `instance`
- `name (mst-configuration mode)`
- `revision (mst-configuration mode)`
- `show (mst-configuration mode)`

The **no spanning-tree mst configuration** and **default spanning-tree mst configuration** commands restore the MST default configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
spanning-tree mst configuration
```

```
no spanning-tree mst configuration
```

```
default spanning-tree mst configuration
```

#### Examples

- This command enters MST configuration mode.

```
switch(config)#spanning-tree mst configuration
switch(config-mst)#
```

- This command exits MST configuration mode, saving MST region configuration changes to **running-config**.

```
switch(config-mst)#exit
switch(config)#
```

- This command exits MST configuration mode without saving MST region configuration changes to **running-config**.

```
switch(config-mst)#abort
switch(config)#
```

#### 11.1.4.49 spanning-tree mst pvst border

The **spanning-tree mst pvst border** command configures MSTP PVST border feature to automatically detect border ports facing PVST+ regions. By default, spanning-tree mst pvst border is disabled.

The **no spanning-tree mst pvst border** and **default spanning-tree mst pvst border** commands restore the default MST configuration.

##### Command Mode

MST Configuration

##### Command Syntax

```
spanning-tree mst pvst border
no spanning-tree mst pvst border
default spanning-tree mst pvst border
```

##### Example

This command enters the MST configuration mode.

```
switch(config)#spanning-tree mst configuration
switch(config-mst)#spanning-tree mst pvst border
```

---

#### 11.1.4.50 spanning-tree portchannel guard misconfig

The **spanning-tree portchannel guard misconfig** command enables the switch to detect misconfigured port channels that may cause network loops by monitoring inbound BPDUs. When a port channel receives 75 inconsistent BPDUs within 30 seconds, the switch error disables the port. When a port channel receives 5 BPDUs with the same source BPDU during the 30 second measurement interval, the error counter is reset and the port continues normal port channel operation. Misconfigured port channel detection is disabled by default.

The **no spanning-tree portchannel guard misconfig** and **default spanning-tree portchannel guard misconfig** commands disables the detection of misconfigured port channels by removing the **spanning-tree portchannel guard misconfig** statement from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
spanning-tree portchannel guard misconfig
no spanning-tree portchannel guard misconfig
default spanning-tree portchannel guard misconfig
spanning-tree etherchannel guard misconfig
no spanning-tree etherchannel guard misconfig
default spanning-tree etherchannel guard misconfig
```

#### Guidelines

The **spanning-tree portchannel guard misconfig** and **spanning-tree etherchannel guard misconfig** commands are equivalent.

#### Examples

- This command enables port channel misconfiguration detection on the switch.

```
switch(config)#spanning-tree portchannel guard misconfig
switch(config)#show running-config

!
spanning-tree mode mstp
spanning-tree portchannel guard misconfig
!

!
end
switch(config)#
```

- This command disables port channel misconfiguration detection on the switch.

```
switch(config)#no spanning-tree portchannel guard misconfig
switch(config)#show running-config

!
spanning-tree mode mstp
!

!
end
switch(config)#
```

### 11.1.4.51 spanning-tree portfast auto

The **spanning-tree portfast auto** command enables auto-edge detection on the configuration mode interface. When auto-edge detection is enabled, the port is configured as an edge port if it does not receive a new BPDU before the current BPDU expires. Auto-edge detection is enabled by default. The **spanning-tree portfast** command, when configured, has priority over this command.

The **no spanning-tree portfast auto** command disables auto-edge port detection. This command is removed from *running-config* with the **spanning-tree portfast auto** and **default spanning-tree portfast auto** commands.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
spanning-tree portfast auto
no spanning-tree portfast auto
default spanning-tree portfast auto
```

#### Example

This command enables auto-edge detection on Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast auto
switch(config-if-Et5)#
```

---

#### 11.1.4.52 spanning-tree portfast <port type>

The `spanning-tree portfast <port-type>` command specifies the STP port mode for the configuration mode interface. Default port mode is normal.

Port modes include:

- **Edge:** Edge ports connect to hosts and transition to the forwarding state when the link is established. An edge port that receives a BPDU becomes a normal port.
- **Network:** Network ports connect only to switches or bridges and support bridge assurance. Network ports that connect to hosts or other edge devices transition to the discarding state.
- **Normal:** Normal ports function as normal STP ports and can connect to any type of device.

The `no spanning-tree portfast <port-type>` and `default spanning-tree portfast <port-type>` commands restore the default port mode of normal by removing the corresponding `spanning-tree portfast <port-type>` command from *running-config*.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

##### Command Syntax

```
spanning-tree portfast PORT_MODE
no spanning-tree portfast PORT_MODE
default spanning-tree portfast PORT_MODE
```

##### Parameters

- PORT\_MODE STP port mode. Options include:
  - **edge**
  - **network**
  - **normal**

The **normal** option is not available for the **no** and **default** commands.

##### Related Commands

The `spanning-tree portfast <port-type>` command also affects the `spanning-tree portfast auto` and `spanning-tree portfast` configuration for the configuration mode interface:

- **spanning-tree portfast normal:** `spanning-tree portfast auto` is enabled.
- **spanning-tree portfast edge:** `spanning-tree portfast` is enabled.
- **spanning-tree portfast network:** `spanning-tree portfast auto` is disabled.

##### Example

This command configures Ethernet 5 interface as a network port.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree portfast network
switch(config-if-Et5)#
```

### 11.1.4.53 spanning-tree portfast

The **spanning-tree portfast** command programs configuration mode ports to immediately enter forwarding state when they establish a link. PortFast ports are included in spanning tree topology calculations and can enter discarding state. This command overrides the **spanning-tree portfast auto** command.

The **no spanning-tree portfast** and **default spanning-tree portfast** commands remove the corresponding **spanning-tree portfast** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
spanning-tree portfast
```

```
no spanning-tree portfast
```

```
default spanning-tree portfast
```

#### Example

This command unconditionally enables portfast on Ethernet 5.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#spanning-tree portfast  
switch(config-if-Et5)#
```

---

#### 11.1.4.54 spanning-tree port-priority

The **spanning-tree port-priority** command specifies the configuration mode interfaces port-priority number. The switch uses this number to determine which interface it places into forwarding mode when resolving a loop. Valid settings are all multiples of 16 between 0 and 240. Default value is 128. Ports with lower numerical priority values are selected over other ports.

The **no spanning-tree port-priority** and default spanning-tree port-priority commands restore the default of 128 for the configuration mode interface by removing the **spanning-tree port-priority** command from **running-config**.

The **spanning-tree port-priority** command provides a mode option:

- RST instance port-priority is configured by not including a mode.
- MST instance 0 port-priority is configured by not including a mode or with the **mst** mode option.
- MST instance port-priority is configured with the **mst** mode option.
- Rapid-PVST VLAN port-priority is configured with the **vlan** mode option.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
spanning-tree [MODE] port-priority value
no spanning-tree [MODE] port-priority
default spanning-tree [MODE] port-priority
```

#### Parameters

- **MODE** specifies the spanning tree instances for which the cost is configured. Values include:
  - <no parameter> RST instance or MST instance 0.
  - **mst** *m\_range* specified MST instances. *m\_range* formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from 0 to 4094.
  - **vlan** *v\_range* specified Rapid-PVST instances. *v\_range* formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from 1 to 4094.
- *value* bridge priority number. Values range from 0 to 240 and must be a multiple of 16.

#### Example

This command sets the port priority of Ethernet 5 interface to 144.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#spanning-tree port-priority 144
switch(config-if-Et5)#
```

### 11.1.4.55 spanning-tree priority

The **spanning-tree priority** command configures the bridge priority number. The bridge priority is the four most significant digits of the bridge ID, which is used by spanning tree algorithms to select the root bridge and choose among redundant links. Bridge ID numbers range from 0 to 65535 (16 bits); bridges with smaller bridge IDs are elected over other bridges.

Because bridge priority sets the four most significant bits of the bridge ID, valid settings include all multiples of 4096 between 0 and 61440. Default value is 32768.

The **spanning-tree priority** command provides a mode option:

- RST instance priority is configured by not including a mode.
- MST instance 0 priority is configured by not including a mode or with the **mst** mode option.
- MST instance priority is configured with the **mst** mode option.
- Rapid-PVST VLAN priority is configured with the **vlan** mode option.

The **no spanning-tree priority** and **default spanning-tree priority** commands restore the bridge priority default of 32768 for the specified mode by removing the corresponding **spanning-tree priority** command from *running-config*.

Another method of adding **spanning-tree priority** commands to the configuration is through the **spanning-tree root** command. Similarly, the **no spanning-tree root** command removes the corresponding **spanning-tree priority** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
spanning-tree [MODE] priority level
no spanning-tree [MODE] priority
default spanning-tree [MODE] priority
```

#### Parameters

- MODE spanning tree instances for which the command configures priority. Options include:
  - <no parameter> RST instance or MST instance 0.
  - **mst** *m\_range* specified MST instances. *m\_range* formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from 0 to 4094.
  - **vlan** *v\_range* specified Rapid-PVST instances. *v\_range* formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from 1 to 4094.
- *level* priority number. Values include multiples of 4096 between 0 and 61440. Default is 32768.

#### Examples

- This command configures a bridge priority value of 20480 for Rapid-PVST VLANs 20, 24, 28, and 32.

```
switch(config)#spanning-tree vlan-id 20,24,28,32 priority 20480
switch(config)#
```

- This command configures a bridge priority value of 36864 for the RST instance. When MST is enabled, this command configures a priority of 36864 for MST instance 0.

```
switch(config)#spanning-tree priority 36864
switch(config)#
```

---

#### 11.1.4.56 spanning-tree root

The **spanning-tree root** command configures the bridge priority number by adding a **spanning-tree priority** command to the configuration. Parameter settings set the following priority values:

- **primary** sets the bridge priority to 8192.
- **secondary** sets the bridge priority to 16384.

The bridge priority is the four most significant digits of the bridge ID, which is used by spanning tree algorithms to select the root bridge and choose among redundant links. Bridge ID numbers range from 0 to 65535 (16 bits); bridges with smaller bridge IDs are elected over other bridges.

When no other switch in the network is similarly configured, assigning the primary value to the switch facilitates its selection as the root switch. Assigning the secondary value to the switch facilitates its selection as the backup root in a network that contains one switch with a smaller priority number.

The **spanning-tree root** command provides a mode option:

- RST instance priority is configured by not including a mode.
- MST instance 0 priority is configured by not including a mode or with the **mst** mode option.
- MST instance priority is configured with the **mst** mode option.
- Rapid-PVST VLAN priority is configured with the **vlan** mode option.

The **no spanning-tree root** and **default spanning-tree root** commands restore the bridge priority default of 32768 by removing the corresponding **spanning-tree priority** command from **running-config**. The **no spanning-tree root**, **no spanning-tree priority**, **default spanning-tree root** and **default spanning-tree priority** commands perform the same function.

#### Command Mode

Global Configuration

#### Command Syntax

```
spanning-tree [MODE] root TYPE
```

```
no spanning-tree [MODE] root
```

```
default spanning-tree [MODE] root
```

#### Parameters

- **MODE** specifies the spanning tree instances for which priority is configured. Values include:
  - **<no parameter>** RST instance or MST instance 0.
  - **mst *m\_range*** specified MST instances. *m\_range* formats include a number, number range, or comma-delimited list of numbers and ranges. Instance numbers range from 0 to 4094.
  - **vlan *v\_range*** specified Rapid-PVST instances. *v\_range* formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from 1 to 4094.
- **TYPE** sets the bridge priority number. Values include:
  - **primary** sets the bridge priority to 8192.
  - **secondary** sets the bridge priority to 16384.

#### Examples

- This command configures a bridge priority value of 8192 for Rapid-PVST VLANs 20-36.

```
switch(config) #spanning-tree vlan-id 20-36 root primary
```

- This command configures a bridge priority value of 16384 for the RSTP instance and MST instance 0.

```
switch(config)#spanning-tree root secondary
```

---

#### 11.1.4.57 spanning-tree transmit active

The **spanning-tree transmit active** command enables bridge assurance globally, which enables bridge assurance on all ports with a port type of network. Bridge assurance protects against unidirectional link failure, other software failure, and devices that quit running a spanning tree algorithm.

Bridge assurance is available only on point-to-point links on spanning tree network ports. Both ends of the link should ideally have bridge assurance enabled. Bridge assurance-enabled ports will not necessarily be blocked when they link to a port where bridge assurance is not enabled, but if they do not receive periodic BPDUs from the other side of the link the **show spanning-tree transmit active** command will show a bridge assurance status of inconsistent (blocking) for that port.

The **no spanning-tree transmit active** command disables bridge assurance.

The **spanning-tree transmit active** and **default spanning-tree transmit active** commands restore the default behavior by removing the **no spanning-tree transmit active** command from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

```
spanning-tree transmit active
no spanning-tree transmit active
default spanning-tree transmit active
```

##### Example

This command enables bridge assurance on the switch.

```
switch(config)#spanning-tree transmit active
switch(config)#
```

### 11.1.4.58 spanning-tree vlan-id

The **spanning-tree vlan-id** command enables Spanning Tree Protocol (STP) on specified VLANs by removing any corresponding **no spanning-tree vlan-id** statements from **running-config**. Spanning-tree is enabled on all VLANs by default.

The **no spanning-tree vlan-id** command disables STP on the specified interfaces. The **default spanning-tree vlan-id** enables STP on the specified interfaces.

**Note:** Disabling STP is not recommended, even in topologies free of physical loops; STP guards against configuration mistakes and cabling errors. When disabling STP, ensure that there are no physical loops in the VLAN.

When disabling STP on a VLAN, ensure that all switches and bridges in the network disable STP for the same VLAN. Disabling STP on a subset of switches and bridges in a VLAN may have unexpected results because switches and bridges running STP will have incomplete information regarding the network's physical topology.

The following STP global configuration commands provide a **vlan** option for configuring Rapid-PVST VLAN instances:

- [spanning-tree priority](#)
- [spanning-tree root](#)

#### Command Mode

Global Configuration

#### Command Syntax

```
spanning-tree vlan-id v_range
```

```
no spanning-tree vlan-id v_range
```

```
default spanning-tree vlan-id v_range
```

#### Parameters

*v\_range* VLAN list. Formats include a number, number range, or comma-delimited list of numbers and ranges. VLAN numbers range from 1 to 4094.

#### Examples

- This command disables STP on VLANs 200-205

```
switch(config)#no spanning-tree vlan-id 200-205
switch(config)#
```

- This command enables STP on VLAN 203

```
switch(config)#spanning-tree vlan-id 203
switch(config)#
```

---

### 11.1.4.59 switchport backup-link

The **switchport backup-link** command establishes a primary-backup configuration for forwarding VLAN traffic between the command mode interface and a specified interface. The **show interfaces switchport backup-link** command displays the state of backup interface pairs on the switch:

- the primary interface is the command mode interface.
- the backup interface is the interface specified in the command.

The following guidelines apply to primary and backup interfaces.

- Ethernet and Port Channels can be primary interfaces.
- Ethernet, Port Channel, Management, Loopback, and VLANs can be backup interfaces.
- The primary and backup interfaces can be different interface types.
- Interface pairs should be similarly configured to ensure consistent behavior.
- An interface can be associated with a maximum of one backup interface.
- An interface can back up a maximum of one interface.
- Any Ethernet interface configured in an interface pair cannot be a port channel member.
- The STP mode is backup.
- Static MAC addresses should be configured after primary-backup pairs are established.

When load balancing is not enabled, the primary and backup interfaces cannot simultaneously forward VLAN traffic. When the primary interface is forwarding VLAN traffic, the backup interface drops all traffic. If the primary interface fails, the backup interface forwards VLAN traffic until the primary interface is functional.

The **prefer vlan** option balances the load across the primary and backup interfaces. When the command includes the **prefer vlan** option, each interface is the primary for a subset of the vlans carried by the pair. When both interfaces are up, **prefer** option vlans are forwarded on the backup interface and all other configured vlans are carried by the primary interface.

The **no switchport backup-link** and **default switchport backup-link** commands remove the primary-backup configuration for the configuration mode interface.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
switchport backup-link INT_NAME [BALANCE]
no switchport backup-link
default switchport backup-link
```

#### Parameters

- INT\_NAME the backup interface. Options include:
  - **ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **loopback** *l\_num* Loopback interface specified by *l\_num*.
  - **management** *m\_num* Management interface specified by *m\_num*.
  - **port-channel** *p\_num* Channel group interface specified by *p\_num*.
  - **vlan** *v\_num* VLAN interface specified by *v\_num*.
  - **vxlan** *vx\_num* VXLAN interface specified by *vx\_num*.
- BALANCE VLANs whose traffic is normally handled on the backup interfaces. Values include:
  - <no parameter> backup interface handles no traffic if the primary interface is operating.
  - **prefer vlan** *v\_range* list of VLANs whose traffic is handled by backup interface.

## Examples

- These commands establish Ethernet interface 7 as the backup port for Ethernet interface 1.

```
switch(config)#interface ethernet 1  
switch(config-if-Et1)#switchport backup-link ethernet 7  
switch(config-if-Et1)#
```

- These commands configure the following:
  - Ethernet interface 1 as a trunk port that handles VLAN 4 through 9 traffic.
  - Ethernet interface 2 as its backup interface.
  - Ethernet 2 as the preferred interface for VLANs 7 through 9.

```
switch(config-if-Et1)#switchport mode trunk  
switch(config-if-Et1)#switchport trunk allowed vlan 4-9  
switch(config-if-Et1)#switchport backup-link Ethernet 2 prefer vlan  
7-9  
switch(config-if-Et1)#
```

---

#### 11.1.4.60 transmit-interval

The `transmit-interval` command sets the interval at which loop detection packets are transmitted. The `no transmit-interval` and `default transmit-interval` commands restore the transmission interval to the default of 5 seconds.

##### Command Mode

Loop-protection Configuration

##### Command Syntax

```
transmit-interval interval
```

##### Parameters

*interval* Interval in seconds at which loop-detection packets are transmitted. Values range from 1 to 10; default is 5.

##### Example

This command sets the loop detection packet transmission interval to 10 seconds.

```
switch(config-monitor-loop-protect) #transmit-interval 10  
switch(config-monitor-loop-protect) #
```

## 11.2 Link Layer Discovery Protocol

This section describes Link Layer Discovery Protocol (LLDP) configuration tasks. Refer to the command descriptions for information about commands used in this chapter.

Topics in this section include:

- [LLDP Introduction](#)
- [LLDP Overview](#)
- [LLDP Configuration Procedures](#)
- [LLDP Configuration Commands](#)

### 11.2.1 LLDP Introduction

Link Layer Discovery Protocol (LLDP) lets Ethernet network devices to advertise details about themselves, such as capabilities, identification, and device configurations to directly connected devices on the network that are also using LLDP.

### 11.2.2 LLDP Overview

LLDP is a discovery protocol that allows devices to advertise information about themselves to peer devices that are on the same physical LAN and store information about the network. LLDP allows a device to learn higher layer management reachability and connection endpoint information from adjacent devices.

Each switch with an active LLDP agent sends and receives messages on all physical interfaces enabled for LLDP transmission. These messages are sent periodically and are typically configured for short time intervals to ensure that accurate information is always available. These messages are then stored for a configurable period of time, and contained within the received packet. The message information expires and is discarded when the configured value is met. The only other time an advertisement is sent is when a relevant change takes place in the switch. If information changes for any reason, the LLDP agent is notified and will send out and update the new values.

### 11.2.2.1 LLDP Data Units

A single LLDP Data Unit (LLDPDU) is transmitted in a single 802.3 Ethernet frame. The basic LLDPDU includes a header and a series of type-length-value elements (TLVs). Each TLV advertises different types of information, such as its device ID, type, or management addresses.

LLDP advertises the following TLVs by default:

- port-description
- system-capabilities
- system-description
- system-name
- management-address
- port-vlan

### 11.2.2.2 Transmission and Reception

Every device that uses LLDP has its own LLDP agent. The LLDP agent is responsible for the reception, transmission, and management of LLDP. When LLDP is enabled on a port, transmission and reception of LLDPDUs are both enabled by default, but the agent can be configured to only transmit or only receive.

#### Transmission

When LLDP transmission is enabled, the LLDP agent advertises information about the switch to neighbors at regular intervals. Each transmitted LLDPDU contains the mandatory TLVs, and any enabled optional TLVs.

#### Reception

When LLDP reception is enabled, the LLDP agent receives and stores advertised information from neighboring devices.

### 11.2.2.3 Storing LLDP Information

Whenever the switch receives a valid and current LLDP advertisement from a neighbor, it stores the information in a Simple Network Management Protocol (SNMP) management information base (MIB).

### 11.2.2.4 Guidelines and Limitations

LLDP has the following configuration limitations:

- LLDP must be enabled globally before it can be enabled on an interface.
- LLDP is not supported on virtual interfaces.
- LLDP can discover only one device per port.

## 11.2.3 LLDP Configuration Procedures

These sections describe the following configuration processes:

- [Enabling LLDP Globally](#)
- [Enabling LLDP on an Interface](#)
- [Optional LLDP Parameters](#)
- [Clearing LLDP Statistics](#)
- [Displaying LLDP Information](#)

---

### 11.2.3.1 Enabling LLDP Globally

The `lldp run` command globally enables LLDP on the Arista switch. Once LLDP is enabled, the switch will transmit advertisements from the ports that are configured to send TLVs. The neighbor information table is populated as advertisements from the neighbors arrive on the ports.

#### Example

This command enables LLDP globally on the Arista switch.

```
switch(config)#lldp run
switch(config)#
```

### 11.2.3.2 Enabling LLDP on an Interface

When enabling LLDP, it is enabled on all interfaces by default. By using the `lldp transmit` and `lldp receive` commands, LLDP can be enabled or disabled on individual interfaces or configured to only send or only receive LLDP packets.

#### Examples

- These commands enable Ethernet port 3/1 to transmit LLDP packets.

```
switch(config)#interface ethernet 3/1
switch(config-if-Et3/1)#lldp transmit
switch(config-if-Et3/1)#
```

- These commands enable Ethernet port 3/1 to receive LLDP packets.

```
switch(config)#interface ethernet 3/1
switch(config-if-Et3/1)#lldp receive
switch(config-if-Et3/1)#
```

### 11.2.3.3 Optional LLDP Parameters

The following sections describe these tasks:

- [Setting the LLDP Timer](#)
- [Setting the LLDP Hold Time](#)
- [Setting the LLDP Re-initialization Timer](#)
- [Setting the IP Management Address to be used in the TLV](#)
- [Selecting the LLDP TLVs](#)
- [Configuring LLDP for Power over Ethernet](#)

#### 11.2.3.3.1 Setting the LLDP Timer

The `lldp timer` command specifies the time in seconds between LLDP updates sent by the switch.

#### Examples

- This command specifies that the LLDP updates should be sent every 120 seconds.

```
switch(config)#lldp timer 120
switch(config)#
```

- This command reverts the LLDP timer to its default value of 30 seconds.

```
switch(config)#no lldp timer 120
```

```
switch(config)#
```

### 11.2.3.3.2 Setting the LLDP Hold Time

The `lldp hold-time` command sets the amount of time a receiving device should retain the information sent by the device.

#### Examples

- This command specifies that the receiving device should retain the information for 180 seconds before discarding it.

```
switch(config)#lldp hold-time 180
switch(config)#
```

- This command reverts the LLDP hold time and to the default value of 120 seconds.

```
switch(config)#no lldp hold-time 180
switch(config)#
```

### 11.2.3.3.3 Setting the LLDP Re-initialization Timer

The `lldp run` command specifies the amount in time in seconds to delay the re-initialization attempt by the switch.

#### Example

This command specifies that the switch waits 10 seconds before attempting to re-initialize.

```
switch(config)#lldp timer reinitialization 10
switch(config)#
```

### 11.2.3.3.4 Setting the IP Management Address to be used in the TLV

The `lldp management-address` command specifies the IP management address or the IP address of the VRF interface in LLDP type-length-value (TLV) triplets.

#### Example

- This command specifies the IP management address to be used in the TLV.

```
switch(config)# lldp management-address ethernet 3/1
switch(config)#
```

### 11.2.3.3.5 Selecting the LLDP TLVs

The `lldp tlv transmit` command specifies which type, length, and value elements (TLVs) are to be included in LLDP packets. The `no lldp tlv transmit` command removes the TLV configuration.

#### Example

This command enables the system descriptions to be included in the TLVs.

```
switch(config)#lldp tlv transmit system-description
switch(config)#
```

---

### 11.2.3.3.6 Configuring LLDP for Power over Ethernet

Initial power over Ethernet (PoE) power-level negotiation with a powered device (PD) takes place in hardware (see [Configuring Power over Ethernet \(PoE\)](#)). Once hardware negotiation has taken place, IEEE 802.3at Power Via MDI type-length-value elements (TLVs) are included by default in LLDP packets sent to connected PDs to allow LLDP to further negotiate power needs. LLDP allows the switch to deal with more granular power requests from PDs, and also allows dynamic power-level setting. TLVs received from connected power-sourcing equipment (PSE) are ignored.

**Note:** Power Via MDI TLVs are not sent (even when enabled) under the following circumstances: 1) there is a user-configured power limit on the port, or 2) hardware negotiation sets the power to higher than class 4 because IEEE 802.3bt, which increases the maximum power output for PoE, is not yet supported by LLDP.

To disable Power Via MDI TLVs globally, use the `no lldp tlv transmit` command and specify the Power Via MDI TLV. Hardware negotiation and manual power limits will remain in effect.

#### Example

This command disables the sending of Power Via MDI TLVs globally.

```
switch(config) #no lldp tlv transmit power-via-mdi
switch(config) #
```

To disable Power Via MDI TLVs on an individual interface, use the `po negotiation lldp disabled` command. Hardware negotiation and manual power limits will remain in effect.

#### Example

These commands disable the sending of Power Via MDI TLVs on *Ethernet interface 5*.

```
switch(config) #interface ethernet 5
switch(config-if-Et5) #po negotiation lldp disabled
switch(config-if-Et5) #
```

### New LLDP Fields Defined by IEEE 802.3at-2009

Arista switches *do not* support the following new LLDP/SNMP fields defined in IEEE standard 802.3at-2009:

- **Power type** a LldpXdot3RemPowerType
- **Power source** a LldpXdot3RemPowerSource
- **Power priority** a LldpXdot3RemPowerPriority
- **PD requested power value** a LldpXdot3RemPDRequestedPowerValue
- **PSE allocated power value** a LldpXdot3RemPSEAllocatedPowerValue

### 11.2.3.4 Clearing LLDP Statistics

- [clear lldp counters](#)
- [clear lldp table](#)

### 11.2.3.5 Displaying LLDP Information

- [Viewing LLDP Global Information](#)
- [Viewing LLDP Local Information](#)
- [Viewing LLDP Neighbors](#)
- [Viewing LLDP Traffic](#)

### 11.2.3.5.1 Viewing LLDP Global Information

The `show lldp` command displays LLDP information.

#### Examples

- This command displays global information about LLDP.

```
switch#show lldp
LLDP transmit interval      : 60 seconds
LLDP transmit holdtime     : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : default
Enabled optional TLVs:
  Port Description
  System Name
  System Description
  System Capabilities
  Management Address (Management0)
  IEEE802.1 Port VLAN ID
  IEEE802.3 Link Aggregation
  IEEE802.3 Maximum Frame Size
Port      Tx Enabled  Rx Enabled
Et3/1    Yes         Yes

switch#
```

- This command displays LLDP information.

```
switch#show lldp ethernet interface 3/1
LLDP transmit interval      : 30 seconds
LLDP transmit holdtime     : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : default
Enabled optional TLVs:
  Port Description
  System Name
  System Description
  System Capabilities

switch#
```

### 11.2.3.5.2 Viewing LLDP Local Information

The `show lldp local-info` command displays the information contained in the LLDP TLVs to be sent about the local system.

#### Example

This command displays information contained in the TLVS about the local systems.

```
switch#show lldp local-info management 1
Local System:
- Chassis ID type: MAC address (4)
  Chassis ID      : 001c.730f.11a8
- System Name: "switch.aristanetworks.com"
- System Description: "Arista Networks EOS version 4.13.2F running on
an Arista
Networks DCS-7150S-64-CL"
- System Capabilities : Bridge, Router
  Enabled Capabilities: Bridge
```

```

Interface Management1:
- Port ID type: Interface name (5)
  Port ID      : "Management1"
- Port Description: ""
- Management Address Subtype: IPv4 (1)
  Management Address      : 172.22.30.154
  Interface Number Subtype : ifIndex (2)
  Interface Number       : 999001
  OID String              :
- IEEE802.1 Port VLAN ID: 0
- IEEE802.1/IEEE802.3 Link Aggregation
  Link Aggregation Status: Not Capable (0x00)
  Port ID                  : 0
- IEEE802.3 Maximum Frame Size: 1518 bytes
switch(config)#

```

### 11.2.3.5.3 Viewing LLDP Neighbors

The `show lldp neighbors` command displays information about LLDP neighbors.

#### Examples

- This command shows information about LLDP neighbors.

```

switch#show lldp neighbor
Last table change time   : 0:12:33 ago
Number of table inserts  : 33
Number of table deletes  : 0
Number of table drops    : 0
Number of table age-outs : 0

Port      Neighbor Device ID      Neighbor Port ID      TTL
Et3/1     tg104.sjc.aristanetworks.com Ethernet3/2           120
Ma1/1     dc1-rack11-tor1.sjc     1/1                   120
switch#

```

- This command displays detailed information about the neighbor Ethernet 3/1.

```

switch# show lldp neighbor ethernet 3/1
Last table change time   : 0:16:24 ago
Number of table inserts  : 33
Number of table deletes  : 0
Number of table drops    : 0
Number of table age-outs : 0

Port      Neighbor Device ID      Neighbor Port ID      TTL
Et3/1     tg104.sjc.aristanetworks.com Ethernet3/2           120
switch#

```

### 11.2.3.5.4 Viewing LLDP Traffic

The `show lldp counters` command displays the LLDP traffic information for the switch.

#### Example

This command displays the LLDP counters on the switch.

```

switch#show lldp counters
Port      Tx Frames Tx Length Exceeded

```

```
Et20          69485          0
Et21          69394          0
Et22          69203          0
Et23          57546          0
Et24           0          0
Ma1          69665          0
Port      Rx Frames      Rx Errors      Rx Discard      TLVs Discard      TLVs Unknown
Et20          69470           0           0           0           0
Et21          69383           0           0           0           0
Et22          69143           0           0           0           0
Et23          55370           0           0           0           0
Et24           0           0           0           0           0
Ma1          69078          69078           0          69078           0
switch#
```

---

## 11.2.4 LLDP Configuration Commands

### Global Configuration Commands

- `lldp hold-time`
- `lldp management-address`
- `lldp management-address vrf`
- `lldp run`
- `lldp timer`
- `lldp timer reinitialization`
- `lldp tlv transmit`

### Interface Configuration Commands – Ethernet Interface

- `lldp receive`
- `lldp transmit`
- `poe negotiation lldp disabled`

### Privileged EXEC Commands

- `clear lldp counters`
- `clear lldp table`

### EXEC Commands

- `show lldp`
- `show lldp counters`
- `show lldp local-info`
- `show lldp neighbors`

### 11.2.4.1 clear lldp counters

The `clear lldp counters` command resets the LLDP counters to zero.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear lldp counters [SCOPE]
```

#### Parameters

- SCOPE Session affected by command. Options include:
  - *<no parameter>* command affects counters on all CLI sessions.
  - session clears LLDP counters for the current CLI session only.

#### Examples

- This command resets all the LLDP counters to zero.

```
switch(config)#clear lldp counters
switch(config)#
```

- This command resets only the LLDP counters for the current CLI session.

```
switch(config)#clear lldp counters session
switch(config)#
```

---

#### 11.2.4.2 clear lldp table

The `clear lldp table` command clears neighbor information from the LLDP table.

##### Command Mode

Privileged EXEC

##### Command Syntax

```
clear lldp table
```

##### Example

This command clears neighbor information from the LLDP table.

```
switch(config)#clear lldp table  
switch(config)#
```

### 11.2.4.3 lldp hold-time

The `lldp hold-time` command specifies the amount of time a receiving device should maintain the information sent by the device before discarding it.

#### Command Mode

Global Configuration

#### Command Syntax

```
lldp hold-time period
no lldp hold-time
default lldp hold-time
```

#### Parameters

*period* The amount of time a receiving device should hold LLDPDU information before discarding it. Value ranges from 10 to 65535 second; default value is 120 seconds.

#### Examples

- This command sets the amount of time before the receiving device discards LLDPDU information to 180 seconds.

```
switch(config)#lldp hold-time 180
switch(config)#
```

- This command restores the hold-time to its default value of 120 seconds.

```
switch(config)#no lldp hold-time 180
switch(config)#
```

---

#### 11.2.4.4 lldp management-address vrf

The `lldp management-address vrf` command enables the user to add the IP address of the VRF interface used in LLDP type-length-value (TLV).

##### Command Mode

Global Configuration

##### Command Syntax

```
lldp management-address vrf VRF_INSTANCE  
no lldp management-address vrf VRF_INSTANCE  
default lldp management-address vrf VRF_INSTANCE
```

##### Parameters

VRF\_INSTANCE specifies the VRF instance.

##### Examples

- This command specifies the management address VRF to be used in the TLV.

```
switch(config)#lldp management-address vrf test 1  
switch(config)#
```

- This command removes the management VRF used in the TLV.

```
switch(config)#no lldp management-address vrf test 1  
switch(config)#
```

### 11.2.4.5 lldp management-address

The `lldp management-address` command enables the user to add the IP management address used for LLDP type-length-value (TLV).

#### Command Mode

Global Configuration

#### Command Syntax

```
lldp management-address [INTERFACE]
no lldp management-address [INTERFACE]
default lldp management-address [INTERFACE]
```

#### Parameters

- INTERFACE Interface type and number. Options include:
  - all all interfaces.
  - ethernet *e\_num* Ethernet interface specified by *e\_num*.
  - loopback *l\_num* Loopback interface specified by *l\_num*.
  - management *m\_num* Management interface specified by *m\_num*.
  - port-channel *p\_num* Port-Channel Interface specified by *p\_num*.
  - vlan *v\_num* VLAN interface specified by *v\_num*.

#### Examples

- This command specifies the IP management address to be used in the TLV.

```
switch(config)#lldp management-address ethernet 3/1
switch(config)#
```

- This command removes the IP management address used in the TLV.

```
switch(config)#no lldp management-address ethernet 3/1
switch(config)#
```

- This command specifies that VLAN 200 is used in the TLV.

```
switch(config)#lldp management-address vlan 200
switch(config)#
```

- This command removes the VLAN ID used in the TLV.

```
switch(config)#no lldp management-address vlan 200
switch(config)#
```

---

### 11.2.4.6 lldp receive

The **lldp receive** command enables LLDP packets on an interface. The **no lldp receive** command disables the acceptance of LLDP packets.

#### Command Mode

Interface-Ethernet configuration

Interface-Management configuration

#### Command Syntax

```
lldp receive
```

```
no lldp receive
```

```
default lldp receive
```

#### Examples

- These commands enable the reception of LLDP packets on Ethernet interface 4/1.

```
switch(config)#interface ethernet 4/1  
switch(config-if-Et4/1)#lldp receive  
switch(config-if-Et4/1)#
```

- These commands disable LLDP the reception of LLDP packets on Ethernet interface 4/1.

```
switch(config)#interface ethernet 4/1  
switch(config-if-Et4/1)#no lldp receive  
switch(config-if-Et4/1)#
```

### 11.2.4.7 lldp run

The `lldp run` command enables LLDP on the Arista switch.

#### Command Mode

Global Configuration

#### Command Syntax

```
lldp run
no lldp run
default lldp run
```

#### Examples

- This command enables LLDP globally on the Arista switch.

```
switch(config)#lldp run
switch(config)#
```

- This command disables LLDP globally on the Arista switch.

```
switch(config)#no lldp run
switch(config)#
```

---

### 11.2.4.8 lldp timer reinitialization

The `lldp timer reinitialization` command sets the time delay in seconds for LLDP to initialize.

#### Command Mode

Global Configuration

#### Command Syntax

```
lldp timer reinitialization delay
no lldp timer reinitialization
default lldp timer reinitialization
```

#### Parameters

*delay* the amount of time the device should wait before re-initialization is attempted. Value ranges from 1 to 20 seconds; default value is 2 seconds.

#### Examples

- This command specifies that the switch should wait 10 seconds before attempting to re-initialize.

```
switch(config)#lldp timer reinitialization 10
switch(config)#
```

- This command restores the default initialization delay of 2 seconds.

```
switch(config)#no lldp timer reinitialization 10
switch(config)#
```

### 11.2.4.9 lldp timer

The **lldp timer** command specifies the amount of time a receiving device should maintain the information sent by the device before discarding it. The **no lldp timer** command removes the configured LLDP timer.

#### Command Mode

Global Configuration

#### Command Syntax

```
lldp timer transmission_time
```

```
no lldp timer
```

```
default lldp timer
```

#### Parameters

*transmission\_time* the period of time at which LLDPDUs are transmitted. Values range from 5 to 32768 seconds; the default is 30 seconds.

#### Examples

- This command configures a period of 80 seconds at which the LLDPDUs are transmitted.

```
switch(config)#lldp timer 180  
switch(config)#
```

- This command removes the configured period of time at which the LLDPDUs are transmitted.

```
switch(config)#no lldp timer 180  
switch(config)#
```

---

### 11.2.4.10 lldp tlv transmit

The `lldp tlv transmit` command allows the user to specify the type-length-values (TLVs) to include in LLDP packets.

#### Command Mode

Global Configuration

#### Command Syntax

```
lldp tlv transmit TLV_NAME
```

```
no lldp tlv transmit TLV_NAME
```

```
default lldp tlv transmit TLV_NAME
```

#### Parameters

- TLV\_NAME Options include:
  - link-aggregation specifies the link aggregation TLV.
  - management-address specifies the management address TLV.
  - max-frame-size specifies the Frame size TLV.
  - port-description specifies the port description TLV.
  - port-vlan specifies the port VLAN ID TLV.
  - power-via-mdi specifies the power over Ethernet TLV.
  - system-capabilities specifies the system capabilities TLV.
  - system-description specifies the system description TLV.
  - system-name specifies the system name TLV.

#### Examples

- This command enables the system description TLV:

```
switch(config)#lldp tlv transmit system-description
switch(config)#
```

- This command disables the system description TLV:

```
switch(config)#no lldp tlv transmit system-description
switch(config)#
```

- This command enables the max-frame-size TLV:

```
switch(config)#lldp tlv transmit max-frame-size
switch(config)#
```

- This command disables the max-frame-size TLV:

```
switch(config)#no lldp tlv transmit max-frame-size
switch(config)#
```

### 11.2.4.11 lldp transmit

The `lldp transmit` command enables the transit of LLDP packets on an interface.

#### Command Mode

Interface-Ethernet configuration

Interface-Management configuration

#### Command Syntax

```
lldp transmit
```

```
no lldp transmit
```

```
default lldp transmit
```

#### Examples

- These commands enable the transmission of LLDP packets

```
switch(config)#interface ethernet 4/1  
switch(config-if-Et4/1)#lldp transmit  
switch(config-if-Et4/1)#
```

- These commands disable the transmission of LLDP packets.

```
switch(config)#interface ethernet 4/1  
switch(config-if-Et4/1)#no lldp transmit  
switch(config-if-Et4/1)#
```

---

### 11.2.4.12 poe negotiation lldp disabled

Power Via MDI TLVs are included by default in LLDP packets sent to power over Ethernet (PoE) powered devices (PDs) to allow dynamic negotiation of power levels. The `poe negotiation lldp disabled` command disables the sending of Power Via MDI TLVs from the configuration-mode interface.

The `no poe negotiation lldp disabled` and `default poe negotiation lldp disabled` commands restore the default behavior (sending Power Via MDI TLVs) by removing the corresponding `poe negotiation lldp disabled` command from *running-config*.

To disable Power Via MDI TLVs globally, use the `no lldp tlv transmit` command and specify the Power Via MDI TLV.

#### Command Mode

Interface-Ethernet configuration

#### Command Syntax

```
poe negotiation lldp disabled
no poe negotiation lldp disabled
default poe negotiation lldp disabled
```

#### Example

These commands disable the sending of Power Via MDI TLVs on *Ethernet interface 5*.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#poe negotiation lldp disabled
switch(config-if-Et5)#
```

### 11.2.4.13 show lldp counters

The `show lldp counters` command displays LLDP traffic information for the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show lldp counters [INTERFACE]
```

#### Parameters

- INTERFACE Interface type and numbers. Options include:
  - `<no parameter>` Display information for all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `management m_range` Management interface range specified by `m_range`.

Valid `e_range` and `m_range` formats include number, number range, or comma-delimited list of numbers and ranges.

#### Example

This command displays the LLDP counters on the switch.

```
switch#show lldp counters
```

| Port | Tx Frames | Tx Length Exceeded |
|------|-----------|--------------------|
| Et20 | 69485     | 0                  |
| Et21 | 69394     | 0                  |
| Et22 | 69203     | 0                  |
| Et23 | 57546     | 0                  |
| Et24 | 0         | 0                  |
| Ma1  | 69665     | 0                  |

| Port | Rx Frames | Rx Errors | Rx Discard | TLVs Discard | TLVs Unknown |
|------|-----------|-----------|------------|--------------|--------------|
| Et20 | 69470     | 0         | 0          | 0            | 0            |
| Et21 | 69383     | 0         | 0          | 0            | 0            |
| Et22 | 69143     | 0         | 0          | 0            | 0            |
| Et23 | 55370     | 0         | 0          | 0            | 0            |
| Et24 | 0         | 0         | 0          | 0            | 0            |
| Ma1  | 69078     | 69078     | 0          | 69078        | 0            |

---

#### 11.2.4.14 show lldp local-info

The `show lldp local-info` command displays LLDP errors and overflows.

##### Command Mode

EXEC

##### Command Syntax

```
show lldp local-info [INTERFACE]
```

##### Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - `<no parameter>` Display information for all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `management m_range` Management interface range specified by `m_range`.

Valid `e_range` and `m_range` formats include number, number range, or comma-delimited list of numbers and ranges.

##### Example

This command displays the specific LLDP errors and overflows on *management interface 1*.

```
switch#show lldp local-info management 1
Local System:
- Chassis ID type: MAC address (4)
  Chassis ID       : 001c.730f.11a8qqq
- System Name: "switch.aristanetworks.com"
- System Description: "Arista Networks EOS version 4.13.2F running on
an Arista
Networks DCS-7150S-64-CL"
- System Capabilities : Bridge, Router
  Enabled Capabilities: Bridge

Interface Management1:
- Port ID type: Interface name (5)
  Port ID       : "Management1"
- Port Description: ""
- Management Address Subtype: IPv4 (1)
  Management Address       : 172.22.30.154
  Interface Number Subtype : ifIndex (2)
  Interface Number        : 999001
  OID String              :
- IEEE802.1 Port VLAN ID: 0
- IEEE802.1/IEEE802.3 Link Aggregation
  Link Aggregation Status: Not Capable (0x00)
  Port ID                 : 0

### 11.2.4.15 show lldp neighbors

The **show lldp neighbors** command displays information about the switch's LLDP neighbors.

#### Command Mode

EXEC

#### Command Syntax

```
show lldp neighbors [INTERFACE][INFO_LEVEL]
```

#### Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - *<no parameter>* displays information for all interfaces.
  - **ethernet e\_range** Ethernet interface range specified by *e\_range*.
  - **management m\_range** Management interface range specified by *m\_range*.

Valid *e\_range* and *m\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

- **INFO\_LEVEL** amount of information that is displayed. Options include:
  - *<no parameter>* Displays information for all interfaces.
  - **detailed** LLDP information for all the adjacent LLDP devices.

#### Examples

- This command displays the neighbor's information about LLDP.

```
switch(config)#show lldp neighbors
Last table change time   : 0:12:33 ago
Number of table inserts  : 33
Number of table deletes  : 0
Number of table drops    : 0
Number of table age-outs : 0

Port      Neighbor Device ID      Neighbor Port ID      TTL
Et3/1     tg104.sjc.aristanetworks.com  Ethernet3/2          120

Ma1/1     dc1-rack11-tor1.sjc      1/1                   120
switch#
```

- This command displays LLDP neighbor information for Ethernet interface 3/1.

```
switch#show lldp neighbors ethernet 3/1
Last table change time   : 0:16:24 ago
Number of table inserts  : 33
Number of table deletes  : 0
Number of table drops    : 0
Number of table age-outs : 0

Port      Neighbor Device ID      Neighbor Port ID      TTL
Et3/1     tg104.sjc.aristanetworks.com  Ethernet3/2          120
switch#
```

- This command displays detailed LLDP neighbor information for Ethernet interface 3/1.

```
switch# show lldp neighbors 3/1 detail

Interface Ethernet 3/1 detected 1 LLDP neighbors:

Neighbor 001c.7300.1506/Ethernet6/25, age 8 seconds
Discovered 5 days, 3:58:58 ago; Last changed 5 days, 3:56:57 ago
```

---

```

### 11.2.4.16 show lldp

The **show lldp** command displays LLDP information.

#### Command Mode

EXEC

#### Command Syntax

```
show lldp [INTERFACE]
```

#### Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - *<no parameter>* Display information for all interfaces.
  - *ethernet e\_range* Ethernet interface range specified by *e\_range*.
  - *management m\_range* Management interface range specified by *m\_range*.

Valid *e\_range* and *m\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

#### Examples

- This command displays all LLDP information.

```
switch#show lldp
LLDP transmit interval      : 60 seconds
LLDP transmit holdtime     : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : test

Enabled optional TLVs:
  Port Description

switch#
```

- This command displays specific information about LLDP for management interface 1/1.

```
switch#show lldp management 1/1
```

```
LLDP transmit interval      : 60 seconds
LLDP transmit holdtime     : 120 seconds
LLDP reinitialization delay : 2 seconds
LLDP Management Address VRF : default
```

```
Enabled optional TLVs:
  Port Description
  System Name
  System Description
  System Capabilities
  Management Address (Management0)
  IEEE802.1 Port VLAN ID
  IEEE802.3 Link Aggregation
  IEEE802.3 Maximum Frame Size
```

```
Port      Tx Enabled  Rx Enabled
Ma1/1     Yes       Yes
switch#
```

## 11.3 Virtual LANs (VLANs)

This chapter describes Arista's Virtual LANs (VLANs) implementation and MAC address tables.

Sections in this chapter include:

- [VLAN Introduction](#)
- [VLAN Conceptual Overview](#)
- [VLAN Configuration Procedures](#)
- [VLAN Configuration Commands](#)

### 11.3.1 VLAN Introduction

Arista switches support industry standard 802.1q VLANs. Arista EOS provides tools to manage and extend VLANs throughout the data center network.

### 11.3.2 VLAN Conceptual Overview

#### 11.3.2.1 VLAN Definition

A virtual local area network (VLAN) allows a group of devices to communicate as if they were in the same network regardless of their physical location. VLANs are layer 2 structures based on the 802.1Q standard.

These parameters are associated with a VLAN:

- VLAN number (1-4094): VLAN numbers uniquely identify the VLAN within a network. VLAN 1 exists by default; all other VLANs only exist after they are configured.
- VLAN name (optional): The VLAN name is a text string that describes the VLAN.
- VLAN state (**active** or **suspended**): The state specifies the VLAN transmission status within the switch. In the **suspended** state, VLAN traffic is blocked on all switch ports. The default state is **active**.

VLANs define layer 2 broadcast domains in a layer 2 network, in which each device can receive broadcast frames sent by any other within the domain. Switches accommodating multiple broadcast domains serve as multi-port bridges where each broadcast domain is a distinct virtual bridge. Traffic does not pass directly between different VLANs within a switch or between two switches.

### 11.3.2.2 VLAN Switching

Ethernet and port channel interfaces are configured as switched ports by default. Switched ports are configurable as members of one or more VLANs. Switched ports ignore all IP-level configuration commands, including IP address assignments.

#### 11.3.2.2.1 VLAN Trunking and Trunk Groups

Trunking extends multiple VLANs beyond the switch through a common interface or port channel.

A trunk group is the set of physical interfaces that comprise the trunk and the collection of VLANs whose traffic is carried on the trunk. The traffic of a VLAN that belongs to one or more trunk groups is carried only on ports that are members of trunk groups to which the VLAN belongs, i.e., VLANs configured in a trunk group are pruned of all ports that are not associated with the trunk group. See the Trunk Ports example section for further details.

**Note:** Be cautious when using allowed VLAN lists or trunk groups to ensure that the VLAN topology is consistent with any Layer-2 control protocol topology, or unpredictable results can occur.

VLAN traffic is carried through Ethernet or LAG ports. A port's switchport mode defines the number of VLANs for which the port can carry traffic.

- Access ports carry traffic for one VLAN – the access VLAN. Access ports associate untagged frames with the access VLAN. Access ports drop tagged frames that are not tagged with the access VLAN.
- Trunk ports carry traffic for multiple VLANs. Tag frames specify the VLAN for which trunk ports process packets.

#### 11.3.2.2.2 Q-in-Q Trunking

A Q-in-Q network is a multi-tier layer 2 VLAN network. A typical Q-in-Q network is composed of a service provider network (tier 1) where each node connects to a customer network (tier 2).

802.1ad is a networking standard that supports Q-in-Q networks by allowing multiple 802.1Q tags in an Ethernet frame.

Each interface in a customer network is assigned to a customer-VLAN (c-VLAN). Packets in c-VLANs contain 802.1q tags that switch traffic within the network. c-VLANs access the service provider VLAN (s-VLAN) through a provider switch. Customer switch ports connect to an s-VLAN through provider switch edge ports, which are configured as dot1q ports and operate as follows:

- Inbound traffic (from customer switches): adds an s-VLAN tag, then forwards packets to the provider network.
- Outbound traffic (to customer switches): removes the s-VLAN tag, then forwards packets to the customer network.

#### 11.3.2.2.3 TPID (Configurable Ethertypes)

By default, VLAN-tagged packets carry a tag protocol identifier (TPID) of 0x8100. On some Arista platforms, however, the TPID of a switchport can be modified in accordance with IEEE 802.1ad to allow for the use of 802.1q TPIDs other than 0x8100. Well known and standard tags include:

- **0x8100** customer VLAN
  - **0x88a8** service VLAN tag used in provider bridging
  - **0x9100** service VLAN tag used in provider bridging (common, but not standardized)

Other non-standard TPID values may also be configured for interoperability with legacy equipment or non-standard systems. Values range from 0x600 (1536) through 0xFFFF (65535).

---

Non-default TPID values are most commonly used for provider bridging on a network-to-network interface.

### 11.3.2.3 VLAN Routing

Each VLAN can be associated with a switch virtual interface (SVI), also called a VLAN interface. The VLAN interface functions in a routed network (Layer 3) with an assigned IP subnet address. Connecting different VLANs requires Layer 3 networking.

#### 11.3.2.3.1 VLAN Interfaces

A switched virtual interface (SVI) connects to the VLAN segment on the switch to provide layer 3 processing for packets from the VLAN. An SVI can be activated only after it is connected to a VLAN. SVIs are typically configured for a VLAN to a default gateway for a subnet to facilitate traffic routing with other subnets.

In a layer 3 network, each VLAN SVI is associated with an IP subnet, with all stations in the subnet members of the VLAN. Traffic between different VLANs is routed when IP routing is enabled.

#### 11.3.2.3.2 Internal VLANs

A routed port is an Ethernet or port channel interface that functions as a layer 3 interface. Routed ports do not bridge frames nor switch VLAN traffic. Routed ports have IP addresses assigned to them and packets are routed directly to and from the port.

The switch allocates an internal VLAN for an interface when it is configured as a routed port. The internal VLAN is assigned a previously unused VLAN ID. The switch prohibits the subsequent configuration of VLANs and VLAN interfaces with IDs corresponding to allocated internal VLANs.

#### 11.3.2.3.3 VLAN Mapping

VLAN mapping allows you to map packets from one VLAN to another. The [switchport vlan mapping](#) command maps an arbitrary incoming VLAN tag to a particular bridging VLAN on the switch. VLAN mapping is configured on packets having a dot1q header (tagged frames) only. The mapping is applied on a trunk port and multiple mappings can exist under each trunk port.

To use VLAN mapping on a switched port, the port must be configured as a trunk port using the [switchport mode](#) command.

##### Platform Compatibility

- DCS-7500E
- DCS-7280E

##### Examples

- These commands map ingress packets on an *Ethernet interface 3*.

```
switch(config)#interface Ethernet 3
switch(config-if-Et3)#switchport vlan mapping in 11 200
```

- These commands map egress packets on an *Ethernet interface 5*.

```
switch(config)#interface Ethernet 5
switch(config-if-Et5)#switchport vlan mapping out 300 12
```

- These commands map multiple packets under a trunk port on an *Ethernet interface 3*.

```
switch(config)#interface Ethernet 3
switch(config-if-Et3)#switchport mode trunk
switch(config-if-Et3)#switchport vlan mapping 10 100
```

```
switch(config-if-Et3)#switchport vlan mapping in 11 200
switch(config-if-Et3)#switchport vlan mapping out 300 12
```

#### 11.3.2.3.4 VLAN Translation

VLAN translation allows you to map packets from one VLAN to another. This can be carried out only on packets having a dot1q header (tagged frames). The translation rewrites the VID field (VLAN ID) in dot1q headers on packets passing through a switched port without changing any other fields.

VLAN translation also supports the ability to translate packets with a dot1q header to the internal VLAN for a routed port. The VLAN in the incoming packets is mapped to the internal VLAN of the routed port and packets egressing the routed port are encapsulated with a dot1q header for the specified VLAN. For egress packets, no priority information is added to the dot1q header and the priority from the incoming encapsulation will be retained.

When configuring the VLAN translation mode, consider the following:

- VLAN translation is only supported for tagged packets.
- BPDUs from STP, LLDP and other protocols are not affected by this mapping.
- VLAN translation is not applicable for access ports.
- Untagged packets entering the switch on the trunk native VLAN are not mapped.
- TPID and VLAN priority does not get re-written during the translation.

### 11.3.3 VLAN Configuration Procedures

These sections describe basic VLAN configuration tasks.

- [Creating and Configuring VLANs](#)
- [Configuring VLAN Switching](#)
- [Creating and Configuring VLAN Interfaces](#)
- [Allocating Internal VLANs](#)
- [VLAN Mapping](#)
- [VLAN Translation](#)

#### 11.3.3.1 Creating and Configuring VLANs

The CLI provides two methods of creating VLANs.

- Explicitly through the `vlan` command.
- Implicitly through the `switchport access vlan` command.

The `switchport access vlan` command generates a warning message when it creates a VLAN.

To create a VLAN, use the `vlan` command in global configuration mode. Valid VLAN numbers range between 1 and 4094. To create multiple VLANs, specify a range of VLAN numbers.

To edit an existing VLAN, enter the `vlan` command with the number of the existing VLAN.

#### Example

This command creates VLAN 45 and enters VLAN configuration mode for the new VLAN.

```
switch(config)#vlan 45
switch(config-vlan-45)#
```

Use the `name (VLAN configuration mode)` command to assign a name to a VLAN.

## Example

These commands assign the name Marketing to VLAN 45.

```
switch(config)#vlan 45
switch(config-vlan-45)#name Marketing
switch(config-vlan-45)#show vlan 45
```

| VLAN | Name      | Status | Ports |
|------|-----------|--------|-------|
| 45   | Marketing | active | Et1   |

```
switch(config-vlan-45)#
```

To change a VLAN's state, use the [state](#) command in VLAN configuration mode.

## Examples

- These commands suspend VLAN 45. VLAN traffic is blocked on all switch ports.

```
switch(config)#vlan 45
switch(config-vlan-45)#state suspend
switch(config-vlan-45)#show vlan 45
```

| VLAN | Name      | Status    | Ports |
|------|-----------|-----------|-------|
| 45   | Marketing | suspended |       |

```
switch(config-vlan-45)#
```

- These commands activate VLAN 45.

```
switch(config)#vlan 45
switch(config-vlan-45)#state active
switch(config-vlan-45)#show vlan 45
```

| VLAN | Name      | Status | Ports |
|------|-----------|--------|-------|
| 45   | Marketing | active | Et1   |

```
switch(config-vlan-45)#
```

### 11.3.3.1.1 VLAN Policy

The VLAN policy configuration command enables a switch to configure a VLAN policy when it receives a packet with unknown destination MAC address on a VLAN. The [mac address forwarding](#) command provides three options to configure a VLAN policy:

- Flood the Layer 2 miss packets on the VLAN
- Drop the Layer 2 miss packets
- Log the Layer 2 miss packets to the CPU (while still flooding them on the VLAN)

The default behavior is to flood the L2 miss packets on all ports of the VLAN.

VLAN policy configuration is supported on the Arista 7010, 7050 (excluding 7050SX3-48YC12, 7050CX3-32S, 7050QX2-32S, 7050SX2-72Q, 7050SX2-128, 7050TX2-128), 7060, 7250, and the 7300 series platforms.

VLAN policy is not supported in the following cases:

- STP, LLDP, and LACP packets
- VLAN policy configurations on VXLAN-enabled VLAN

- On a VLAN if IGMP snooping is configured with Multicast miss action is set to drop, then all multicast packets received on that VLAN are dropped.

### Examples

- These commands create a *VLAN 333* and then set the unicast policy to 'drop' and the multicast policy to 'log' for the specific *VLAN 333*.

```
switch(config)#vlan 333
switch(config-vlan-333)#mac address forwarding unicast miss action drop
switch(config-vlan-333)#
switch(config-vlan-333)#mac address forwarding multicast miss action
log
```

- These commands display the VLAN policy that was defined when *VLAN 333* is created.

```
switch(config)#show vlan 333 mac address forwarding

VLAN   UcMissAction   McMissAction
----   -
333    flood          flood
```

- These commands display the VLAN policy type that was defined when *VLAN 333* is configured with the 'drop' unicast policy and the 'log' multicast policy.

```
switch(config)#show vlan 333 mac address forwarding

VLAN   UcMissAction   McMissAction
----   -
333    drop           log

switch(config)#show vlan mac address forwarding

VLAN   UcMissAction   McMissAction
----   -
1      flood          flood
333    drop           log
```

### 11.3.3.2 Configuring VLAN Switching

The following describe the configuration of VLAN ports.

#### 11.3.3.2.1 Access Ports

Access ports carry traffic for one VLAN, as designated by a [switchport access vlan](#) command. Access ports associate untagged frames with the access VLAN. Tagged frames received by the interface are dropped unless they are tagged with the access VLAN.

To configure an interface group as an access port, use the [switchport mode](#) command.

#### Example

These commands configure *Ethernet interface 1* as an access port.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#switchport mode access
switch(config-if-Et1)#
```

To specify the port's access VLAN, use the [switchport access vlan](#) command.

## Examples

- These commands configure VLAN 15 as the access VLAN for *Ethernet interface 5*.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport access vlan 15
switch(config-if-Et5)#
```

- These commands configure Ethernet interface 1 through 3 as access ports that process untagged frames as *VLAN 5* traffic.

```
switch(config)#interface Ethernet 1-3
switch(config-if-Et1-3)#switchport mode access
switch(config-if-Et1-3)#switchport access vlan 5
switch(config-if-Et1-3)#show interfaces ethernet 1-3 vlans
Port          Untagged Tagged
Et1           None     23,25
Et2           18      -
Et3           None     14
switch(config-if-Et1-3)#
```

### 11.3.3.2.2 Trunk Ports

Trunk ports carry traffic for multiple VLANs. Messages use tagged frames to specify the VLAN for which trunk ports process traffic.

- The **vlan trunk list** specifies the VLANs for which the port handles tagged frames. The port drops any packets tagged for VLANs not in the VLAN list.
- The **native vlan** is the VLAN where the port switches untagged frames.

To configure an interface group as a trunk port, use the **switchport mode** command.

#### Example

These commands configure Ethernet interface 8 as a trunk port.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#switchport mode trunk
switch(config-if-Et8)#
```

By default all VLANs are permitted on a port configured with 'switchport mode trunk'. To limit the port's VLAN trunk list, use the **switchport trunk allowed vlan** command. Only VLANs in the allowed list will be permitted.

#### Examples

- These commands configure VLAN 15, 20, 21, 22, 40, and 75 as the explicitly permitted VLAN trunk list for Ethernet interface 12-16.

```
switch(config)#interface ethernet 12-16
switch(config-if-Et12-16)#switchport trunk allowed vlan 15,20-22,40,75
switch(config-if-Et12-16)#
```

- These commands explicitly permit VLAN 100 through 120 to the VLAN trunk list for *Ethernet interface 14*.

```
switch(config)#interface ethernet 14
switch(config-if-Et14)#switchport trunk allowed vlan add 100-120
switch(config-if-Et14)#
```

To specify the port's native VLAN, use the `switchport trunk native vlan` command.

### Example

These commands configure VLAN 12 as the native VLAN trunk for *Ethernet interface 10*.

```
switch(config)#interface ethernet 10
switch(config-if-Et10)#switchport trunk native vlan 12
switch(config-if-Et10)#
```

By default, ports send native VLAN traffic with untagged frames. The `switchport trunk native vlan` command can also configure the port to send native VLAN traffic with tag frames.

### Examples

- These commands configure *Ethernet interface 10* to send native VLAN traffic as tagged.

```
switch(config)#interface ethernet 10
switch(config-if-Et10)#switchport trunk native vlan tag
switch(config-if-Et10)#
```

- These commands configure *Ethernet interface 12* as a trunk with *VLAN 15* as the native VLAN. The port's trunk list includes all VLANs except 201-300.

```
switch(config)#interface ethernet 12
switch(config-if-Et12)#switchport mode trunk
switch(config-if-Et12)#switchport trunk native vlan 15
switch(config-if-Et12)#switchport trunk allowed vlan except 201-300
switch(config-if-Et12)#
```

### Example

Assume that all ports on the switch are configured with `switchport mode trunk` similar to *ethernet 1* and *2* shown below:

```
!
interface ethernet 1
    switchport mode trunk
!
interface ethernet 2
    switchport mode trunk
!
```

Further assume that *VLAN 30* is not configured as part of a trunk group

```
switch#show vlan
VLAN  Name                               Status  Ports
-----
1      default                                active  Et1, Et2
30     vlan30                                 active  Et1, Et2
```

Now configure *VLAN 30* as part of trunk group 30:

```
switch(config)#vlan 30
switch(config-vlan-30)#trunk group 30
```

This updates the VLAN membership for *VLAN 30*.

```
switch#show vlan
```

| VLAN | Name    | Status | Ports    |
|------|---------|--------|----------|
| 1    | default | active | Et1, Et2 |
| 30   | vlan30  | active |          |

**Note:** *Vlan 30* is no longer on Et1, Et2 i.e. it has been 'pruned' due to the trunk group command in the vlan configuration.

To permit *VLAN 30* on *Et1* you need to associate the interface with the trunk group as follows:

```
switch(config-if-Et1)#switchport trunk group 30
```

Now we see Et1 included in the vlan 30 list

```
switch#show vlan
```

| VLAN | Name    | Status | Ports    |
|------|---------|--------|----------|
| 1    | default | active | Et1, Et2 |
| 30   | vlan30  | active | Et1      |

The trunk group command is not additive to the allowed vlan command

```
interface ethernet 1
    switchport mode trunk
    switchport trunk allowed vlan 10
    switchport trunk group trunk30
```

Vlan 30 will not be permitted on the interface as it is not listed in the allowed vlan list.

### 11.3.3.2.3 Dot1q Tunnel Ports

Dot1q (802.1Q) is a tunneling protocol that encapsulates traffic from multiple customer (c-tag) VLANs in an additional single outer service provider (s-tag) VLAN for transit across a larger network structure that includes traffic from all customers. Tunneling eliminates the service provider requirement that every VLAN be configured from multiple customers, avoiding overlapping address space issues.

Tunneling preserves the inner VLANs through the tunneled network; these inner VLANs are ignored by intermediate devices that make forwarding decisions based only on the outermost VLAN tag (S-Tag)

A dot1q-tunnel port sits at the edge of the tunneled network. Unlike regular access ports, a dot1q-tunnel port does not drop traffic that arrives with 802.1Q tags in place; it ignores existing 802.1Q information and associates arriving traffic (with or without 802.1Q headers) with a new tunnel VLAN ID.

Packets arriving at a tunnel port are encapsulated with an additional 802.1Q tag that can be trunked between multiple devices like any traditional VLAN. When exiting a dot1-tunnel port, the S-Tag is removed to revert the customer traffic to its original tagged or untagged state.

To configure an interface group as a dot1q tunnel port, use the `switchport mode` command.

#### Example

- These commands configure Ethernet interface 12 as a dot1q tunnel port.

```
switch(config)# interface ethernet 12
switch(config-if-Et12)# switchport mode dot1q-tunnel
switch(config-if-Et12)#
```

To specify the dot1q-tunnel port's access VLAN, use the `switchport access vlan` command. The port then handles all inbound traffic as untagged VLAN traffic.

**Example**

- These commands configure VLAN 60 as the access VLAN for Ethernet interface 12.

```
switch(config)#interface ethernet 12
switch(config-if-Et12)#switchport access vlan 60
switch(config-if-Et12)#
```

**11.3.3.2.4 TPID Configuration**

The default tag protocol identifier (TPID, also called dot1q ethertype) on all switch ports is 0x8100. To configure a different TPID on a port, use the [switchport dot1q ethertype](#) command. This feature is available only on 7280E and 7500E platforms.

**Note:** If dot1q tunneling is enabled on the interface, a TPID configured on the interface becomes irrelevant.

**Example**

In this provider bridging example, *Ethernet interface 1* is the user network interface and *Ethernet interface 2* is the network-to-network interface. These commands configure dot1q tunneling on *Ethernet interface 1* and set the TPID of *Ethernet interface 2* to 0x9100.

```
switch(config)#interface ethernet 1
switch(config-if-Et1)#switchport mode dot1q-tunnel
switch(config-if-Et1)#interface ethernet 2
switch(config-if-Et2)#switchport mode trunk
switch(config-if-Et2)#switchport dot1q ethertype 0x9100
switch(config-if-Et2)#
```

In the above configuration, packets from Et1 to Et2 will undergo dot1q-tunneling (stacking of an additional dot1q tag), with an outer TPID of 0x9100 at egress, while packets with outer TPID 0x9100 going from Et2 to Et1 will have the outer tag removed at egress.

**11.3.3.2.5 Layer 2 802.1Q Encapsulation**

Layer 2 traffic encapsulation is enabled on the configuration mode interface for a specified VLAN through [l2-protocol encapsulation dot1q vlan](#).

**Example**

These commands enable traffic encapsulation for VLAN 200 traffic passing through Ethernet interface 5/2.

```
switch(config)#interface ethernet 5/2
switch(config-if-Et5/2)#l2-protocol encapsulation dot1q vlan 200
```

**11.3.3.2.6 Port VLAN Scaling on DCS-7160**

Port VLAN scaling allows the user to configure a subset of ports in the scale mode. The [switchport vlan forwarding](#) command forwards packets between the ports belonging to VLAN in the interface configuration mode. Port-VLAN table is used for storing the configuration on a per port/VLAN combination. The scaling configuration is applicable on a per-port basis and supports a maximum of 128 ports.

**Note:** The configuration is applicable to trunk ports only.

## Example

- This command enables VLAN scaling on a port with an Ethernet interface 2.

```
switch# config terminal
switch(config)# interface Ethernet 2
switch(config-if-Et2)# switchport vlan forwarding accept all
```

- This command disables VLAN scaling on a port.

```
switch# config
switch(config)# interface Ethernet 2
switch(config-if-Et2)# no switchport vlan forwarding accept all
```

### 11.3.3.3 Creating and Configuring VLAN Interfaces

The `interface vlan` command places the switch in VLAN-interface configuration mode for modifying an SVI. An SVI provides a management address point and Layer 3 processing for packets from all VLAN ports.

## Example

This command enters VLAN-interface configuration mode for *VLAN 12*. The command also creates *VLAN 12* interface if it was not previously created.

```
switch#config t
switch(config)#interface vlan 12
switch(config-if-Vl12)#
```

### 11.3.3.4 Allocating Internal VLANs

The `vlan internal order` command specifies the VLANs that the switch allocates as internal VLANs when configuring routed ports and the order of their allocation. By default, the switch allocates VLANs in ascending order. The default allocation range is between VLAN 1006 and VLAN 4094.

The `no switchport` command converts an Ethernet or port channel interface into a routed port, disabling layer 2 switching for the interface.

## Examples

- This command configures the switch to allocate internal VLANs in ascending order starting with 1006.

```
switch(config)#vlan internal order ascending
switch(config)#
```

- This command configures the switch to allocate internal VLANs in descending order starting with 4094.

```
switch(config)#vlan internal order descending
switch(config)#
```

- This command configures the switch to allocate internal VLANs in descending order from 4094 through 4000.

```
switch(config)#vlan internal order descending range 4000 4094
switch(config)#
```

### 11.3.3.5 VLAN Mapping

VLAN mapping allows you to map packets from one VLAN to another. The `switchport vlan mapping` command maps an arbitrary incoming VLAN tag to a particular bridging VLAN on the switch. VLAN mapping is configured on packets having a dot1q header (tagged frames) only. The mapping is applied on a trunk port and multiple mappings can exist under each trunk port.

To use VLAN mapping on a switched port, the port must be configured as a trunk port using the `switchport mode` command.

#### Platform Compatibility

- DCS-7500E
- DCS-7280E

#### Examples

- These commands map ingress packets on an *Ethernet interface 3*.

```
switch(config)#interface Ethernet 3
switch(config-if-Et3)#switchport vlan mapping in 11 200
```

- These commands map egress packets on an *Ethernet interface 5*.

```
switch(config)#interface Ethernet 5
switch(config-if-Et5)#switchport vlan mapping out 300 12
```

- These commands map multiple packets under a trunk port on an *Ethernet interface 3*.

```
switch(config)#interface Ethernet 3
switch(config-if-Et3)#switchport mode trunk
switch(config-if-Et3)#switchport vlan mapping 10 100
switch(config-if-Et3)#switchport vlan mapping in 11 200
switch(config-if-Et3)#switchport vlan mapping out 300 12
```

#### 11.3.3.5.1 Dual Tag VLAN Mapping

Dual tag VLAN mapping allows mapping between outer or inner VID of double tagged packet and a bridging VLAN. At ingress, a pair of VLAN IDs are mapped to a bridging VLAN and at egress, the bridging VLAN is mapped to a pair of VLAN IDs.

#### Examples

- These commands map a pair of VLAN IDs on an Ethernet interface 3/1.

```
switch(config)# interface Ethernet 3/1
switch(config-if-Et3/1)# switchport vlan mapping 1000 inner 100 200
```

### 11.3.3.6 VLAN Translation

VLAN translation allows you to map packets from one VLAN to another. This can be carried out only on packets having a dot1q header (tagged frames). The translation rewrites the VID field (VLAN ID) in dot1q headers on packets passing through a switched port without changing any other fields.

VLAN translation also supports the ability to translate packets with a dot1q header to the internal VLAN for a routed port. The VLAN in the incoming packets is mapped to the internal VLAN of the routed port and packets egressing the routed port are encapsulated with a dot1q header for the specified VLAN. For egress packets, no priority information is added to the dot1q header and the priority from the incoming encapsulation will be retained.

When configuring the VLAN translation mode, consider the following:

- VLAN translation is only supported for tagged packets.
- BPDUs from STP, LLDP and other protocols are not affected by this mapping.
- VLAN translation is not applicable for access ports.
- Untagged packets entering the switch on the trunk native VLAN are not mapped.
- TPID and VLAN priority does not get re-written during the translation.

### 11.3.3.6.1 Per-port VLAN Translation on Switched Ports

The `switchport vlan translation` command allows translation of the VLAN tag of traffic entering or exiting a switched port.

To use VLAN translation on a switched port, the port must be configured as a trunk port using the `switchport mode` command.

#### Example

This command configures *Ethernet interface 5* as a trunk port.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport mode trunk
switch(config-if-Et5)#
```

By default, the translation is bidirectional: packets ingressing an interface through *VLAN A* are internally mapped to *VLAN B*; *VLAN B* packets egressing the same interface are mapped to *VLAN A*.

#### Examples

- These commands map *Ethernet interface 5* traffic with dot1q tag 50 to bridging *VLAN 60*.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport vlan translation 50 60
switch(config-if-Et5)#
```

- These commands provides multiple 1:1 VLAN mappings under an interface.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport vlan translation 50 60
switch(config-if-Et5)#switchport vlan translation 61 71
switch(config-if-Et5)#switchport vlan translation 62 72
switch(config-if-Et5)#
```

- These commands translate only incoming packets.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport vlan translation in 50 60
switch(config-if-Et5)#
```

- These commands translate only egress packets.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport vlan translation out 60 50
switch(config-if-Et5)#
```

### 11.3.3.6.2 Per-port VLAN Translation on Routed Ports

On routed ports, the `encapsulation dot1q vlan` command (permitted only on routed ports) configures the VLAN on the interface to act as the native VLAN. This command will map packets ingressing with the specified VLAN ID to the internal VLAN ID of the routed port. All traffic egressing out of the routed port will be tagged with the VLAN ID specified in the command.

## Examples

These commands translate between *VLAN 50* and the internal VLAN for *Ethernet interface 5* (a routed port).

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no switchport
switch(config-if-Et5)#encapsulation dot1q vlan 50
switch(config-if-Et5)#
```

### 11.3.3.6.3 Double VLAN Translation

VLAN translation allows you to map packets from one VLAN to another. The translation rewrites the VLAN ID (VID) field in dot1q headers on packets passing through a switched port without changing any other fields. By default, the translation is bidirectional.

The command allows translation of the VLAN traffic entering or exiting a switched port.

The command allows translation between outer or inner VLAN ID of double tagged packet and a bridging VLAN. At the ingress, a pair of VLAN IDs are mapped to a bridging VLAN while at the egress, the bridging VLAN is mapped to a pair of VLAN IDs.

#### Platform Compatibility

- DCS-7500E
- DCS-7280E

#### Examples

- These commands map inner and outer VLAN IDs on an *Ethernet interface 1*.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#switchport vlan mapping 10 inner 50 100
switch(config-if-Et1)#switchport vlan mapping in 20 inner 60 100
switch(config-if-Et1)#switchport vlan mapping out 200 30 inner 40
switch(config-if-Et1)#switchport vlan mapping 70 300
```

- These commands map *Ethernet interface 5* traffic with dot1q tag 50 to bridging *VLAN 60*.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport vlan translation 50 60
switch(config-if-Et5)#
```

---

## 11.3.4 VLAN Configuration Commands

### Global VLAN Configuration Commands

- [interface vlan](#)
- [vlan](#)
- [vlan internal order](#)

### VLAN Configuration Mode Commands

- [mac address forwarding](#)
- [name \(VLAN configuration mode\)](#)
- [state](#)
- [trunk group](#)

### Layer 2 Interface (Ethernet and Port Channel) Configuration Commands

- [switchport access vlan](#)
- [switchport mode](#)
- [switchport trunk allowed vlan](#)
- [switchport trunk group](#)
- [switchport trunk native vlan](#)
- [switchport vlan forwarding](#)
- [switchport vlan mapping](#)
- [switchport vlan translation](#)

### VLAN Interface Configuration Mode Commands

- [autostate](#)
- [encapsulation dot1q vlan](#)
- [l2-protocol encapsulation dot1q vlan](#)
- [name \(VLAN configuration mode\)](#)
- [pvlan mapping](#)

### Show Commands

- [show dot1q-tunnel](#)
- [show interfaces switchport](#)
- [show interfaces switchport backup-link](#)
- [show interfaces switchport vlan mapping](#)
- [show interfaces trunk](#)
- [show interfaces vlans](#)
- [show pvlan mapping interfaces](#)
- [show vlan](#)
- [show vlan brief count](#)
- [show vlan dynamic](#)
- [show vlan internal allocation policy](#)
- [show vlan internal usage](#)
- [show vlan trunk group](#)

### 11.3.4.1 vlan internal order

The **vlan internal order** command specifies the range that the switch can allocate as internal VLANs when configuring routed ports and the order of their allocation. By default, the switch allocates VLANs in ascending order from VLAN 1006 to VLAN 4094.

The **no vlan internal order** and **default vlan internal order** commands revert the policy to its default.

#### Command Mode

Global Configuration

#### Command Syntax

```
vlan internal order DIRECTION [RANGE_VLAN]
```

```
no vlan internal order
```

```
default vlan internal order
```

#### Parameters

- **DIRECTION** VLAN allocation number direction. Options include:
  - **ascending** allocates internal VLANs from lower VLAN bound to upper VLAN bound.
  - **descending** allocates internal VLAN from upper VLAN bound to lower VLAN bound.
- **RANGE\_VLAN** allocation range. Options include:
  - *<no parameter>* 1006 (lower bound) to 4094 (upper bound).
  - **range, lower, upper** specifies lower bound (*lower*) and upper bound (*upper*).

#### Examples

- This command configures the switch to allocate internal VLANS from 3000 through 3999.

```
switch(config)#vlan internal order ascending range 3000 3999
switch(config)#
```

- This command configures the switch to allocate internal VLANS from 4094 through 1006.

```
switch(config)#vlan internal order descending
switch(config)#
```

- This command configures the switch to allocate internal VLANS from 4094 down through 4000.

```
switch(config)#vlan internal order descending range 4000 4094
switch(config)#
```

- This command reverts the allocation policy to its default (ascending, between 1006 and 4094).

```
switch(config)#no vlan internal order
switch(config)#
```

---

### 11.3.4.2 vlan

The **vlan** command places the switch in VLAN configuration mode to configure a set of virtual LANs. The command creates the specified VLANs if they do not exist prior to issuing the command. A VLAN that is in use as an internal VLAN may not be created or configured. The switch rejects any **vlan** command that specifies an internal VLAN ID.

The **default vlan** and **no vlan** commands removes the VLAN statements from *running-config* for the specified VLANs.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
vlan vlan_range
```

```
no vlan vlan_range
```

```
default vlan vlan_range
```

#### Parameters

- *vlan\_range* VLAN list.

Formats include a name, number, number range, or comma-delimited list of numbers and ranges.

#### Commands Available in VLAN configuration mode

- [name \(VLAN configuration mode\)](#)
- [state](#)
- [trunk group](#)

#### Guidelines

In MLAG configurations, VLANs operate as follows:

- The VLAN must be configured identically on both MLAG peer switches.
- The port-specific bridging configuration originates on the switch where the port is physically located. This configuration includes the switchport access VLAN, switchport mode (trunk or access), trunk-allowed VLANs, the trunk native VLAN, and the switchport trunk groups.

#### Example

This command creates *VLAN 49* and enters VLAN configuration mode for the new VLAN:

```
switch(config) #vlan 49
switch(config-vlan-49) #
```

### 11.3.4.3 autostate

When **autostate** is **enabled**, the VLAN interface will be up when:

- the corresponding VLAN exists and is in the active state.
- one or more layer 2 ports in the VLAN are up and in spanning-tree forwarding state.
- the VLAN interface exists and is not in a shutdown state.

Autostate is **enabled** by default. When autostate is **disabled**, the VLAN interface is forced to be active.

- The **no autostate** command disables autostate on the configuration mode interface. The **no autostate** command is stored to **running-config**.
- The **autostate** command enables the autostate function on the configuration mode VLAN SVI by removing the corresponding **no autostate** statement from **running-config**.
- The **default autostate** command restores the autostate default state of **enabled** by removing the corresponding **no autostate** statement from **running-config**.

#### Command Mode

Interface-VLAN Configuration

#### Command Syntax

```
autostate
```

```
no autostate
```

```
default autostate
```

#### Guidelines

Autostate should be disabled on SVIs configured as an MLAG local interface.

#### Examples

- These commands disable autostate on VLAN 100.

```
switch(config)#interface vlan 100  
switch(config-if-Vl100)#no autostate  
switch(config-if-Vl100)#
```

- These commands enable autostate on VLAN 100.

```
switch(config)#interface vlan 100  
switch(config-if-Vl100)#autostate  
switch(config-if-Vl100)#
```

---

### 11.3.4.4 encapsulation dot1q vlan

#### Routed Port VLAN Translation

In the configuration mode for an Ethernet or port channel interface, the **encapsulation dot1q vlan** translates packets with a dot1q header to the internal VLAN for a routed port. The VLAN in the incoming packets is mapped to the internal VLAN of the routed port, and packets egressing the routed port are encapsulated with a dot1q header for the specified VLAN. For egress packets, no priority information is added to the dot1q header and the priority from the incoming encapsulation will be retained.

#### Subinterface VLAN Assignment

When used in the configuration mode for an Ethernet or port channel subinterface, however, the **encapsulation dot1q vlan** command assigns a dot1q tag to the subinterface. Traffic ingressing on the parent interface with that dot1q tag will then be sent to the configured subinterface. See **Subinterfaces** and **Subinterface Configuration** for details.

The **no encapsulation dot1q vlan** and **default encapsulation dot1q vlan** commands restore the default VLAN to the configuration mode interface by removing the corresponding **encapsulation dot1q vlan** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-port-channel Configuration

Subinterface-Ethernet Configuration

Subinterface-port-channel Configuration

#### Command Syntax

```
encapsulation dot1q vlan vlan_id
no encapsulation dot1q vlan
default encapsulation dot1q vlan
```

#### Parameters

*vlan\_id* For VLAN translation, the ID of the external VLAN to be translated; for subinterface configuration, the VLAN of the subinterface. Values range from 1 to 4094.

#### Examples

- These commands translate between VLAN 50 and the internal VLAN for Ethernet interface 5 (a routed port).

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no switchport
switch(config-if-Et5)#encapsulation dot1q vlan 50
switch(config-if-Et5)#
```

- These commands assign packets ingressing on Ethernet interface 1/1 with VLAN ID 100 to Ethernet subinterface 1/1.1.

```
switch(config)#interface ethernet1/1.1
switch(config-if-Et1/1.1)#no switchport
switch(config-if-Et1/1.1)#encapsulation dot1q vlan 100
switch(config-if-Et1/1.1)#
```

### 11.3.4.5 interface vlan

The **interface vlan** command places the switch in VLAN-interface configuration mode for modifying parameters of the switch virtual interface (SVI). An SVI provides Layer 3 processing for packets from all ports associated with the VLAN. There is no physical interface for the VLAN.

When entering configuration mode to modify existing SVIs, the command can specify multiple interfaces. The command creates an SVI if the specified interface does not exist prior to issuing the command. When creating an SVI, the command can only specify a single interface.

The **no interface vlan** command deletes the specified SVI interfaces from **running-config**. The **default interface vlan** commands remove all configuration statements for the specified SVI interfaces from **running-config** without deleting the interfaces.

#### Command Mode

Global Configuration

#### Command Syntax

```
interface vlan v_range
no interface vlan v_range
default interface vlan v_range
```

#### Parameter

- *v\_range* VLAN interfaces (number, range, or comma-delimited list of numbers and ranges). VLAN number ranges from 1 to 4094.

#### Restrictions

Internal VLANs: A VLAN interface cannot be created or configured for internal VLAN IDs. The switch rejects any **interface vlan** command that specifies an internal VLAN ID.

#### Example

This example creates an SVI for VLAN 12:

```
switch#config
switch(config)#interface vlan 12
switch(config-if-Vl12)#
```

---

### 11.3.4.6 I2-protocol encapsulation dot1q vlan

The `l2-protocol encapsulation dot1q vlan` command enables Layer 2 802.1Q traffic encapsulation on the configuration mode interface for a specified VLAN. The default VLAN for all interfaces is VLAN 1.

The `no l2-protocol encapsulation dot1q vlan` and `default l2-protocol encapsulation dot1q vlan` commands disable the specified encapsulation on the configuration mode interface by removing the corresponding `l2-protocol encapsulation dot1q vlan` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

#### Command Syntax

```
l2-protocol encapsulation dot1q vlan vlan_id  
no l2-protocol encapsulation dot1q vlan  
default l2-protocol encapsulation dot1q vlan
```

#### Parameters

- *vlan\_id* the ID of the native VLAN. Values range from 1 to 4094.

#### Example

These commands enable 802.1Q encapsulation of traffic on VLAN 200.

```
switch(config)#interface ethernet 5/2  
switch(config-if-Et5/2)#l2-protocol encapsulation dot1q vlan 200  
switch(s1)(config-if-Et5/2)#show active  
interface Ethernet5/2  
    l2-protocol encapsulation dot1q vlan 200  
switch(config-if-Et5/2)#
```

### 11.3.4.7 mac address forwarding

The **mac address forwarding** command enables a switch to configure a VLAN policy when it receives a packet with an unknown destination MAC address on a VLAN. The command provides three options to configure a VLAN policy:

- Flood the Layer 2 miss packets on the VLAN
- Drop the Layer 2 miss packets
- Log the Layer 2 miss packets to the CPU (while still flooding them on the VLAN)

The default state is to flood the L2 miss packets on all ports of the VLAN.

The **show vlan** command displays information about the VLAN policy that is being configured.

The **no** form and the default form of the command removes the previously configured VLAN policy on the VLAN.

#### Command Mode

VLAN Configuration

#### Command Syntax

```
mac address forwarding {unicast | multicast} miss action {drop | flood | log}
no mac address forwarding {unicast | multicast} miss action {drop | flood | log}
default mac address forwarding{unicast | multicast} miss action {drop | flood | log}
```

#### Parameters

- **unicast** the unicast type of transmission.
- **multicast** the multicast type of transmission.
- **drop** the selected packets are dropped.
- **flood** the selected packets are flooded in the specific VLAN.
- **log** the selected packets are sent to the CPU for logging purpose.

#### Guidelines

VLAN policy configuration is supported on the Arista 7010, 7050 (excluding 7050SX3-48YC12, 7050CX3-32S, 7050QX2-32S, 7050SX2-72Q, 7050SX2-128, 7050TX2-128), 7060, 7250, and the 7300 series platforms.

VLAN policy is not supported in the following cases:

- STP, LLDP, and LACP packets
- VLAN policy configurations on VXLAN-enabled VLAN
- On a VLAN if IGMP snooping is configured with Multicast miss action is set to drop, then all multicast packets received on that VLAN are dropped.

#### Examples

- These commands create a VLAN 333 and then set the unicast policy to 'drop' and the multicast policy to 'log' for the specific VLAN 333.

```
switch(config)#vlan 333
switch(config-vlan-333)#mac address forwarding unicast miss action drop
switch(config-vlan-333)#
switch(config-vlan-333)#mac address forwarding multicast miss action
log
```

- These commands display the VLAN policy that was defined when VLAN 333 is created.

```
switch(config)#show vlan 333 mac address forwarding
```

| VLAN | UcMissAction | McMissAction |
|------|--------------|--------------|
| 333  | flood        | flood        |

- These commands display the VLAN policy type that was defined when VLAN 333 is configured with the 'drop' unicast policy and the 'log' multicast policy.

```
switch(config)#show vlan 333 mac address forwarding
```

| VLAN | UcMissAction | McMissAction |
|------|--------------|--------------|
| 333  | drop         | log          |

```
switch(config)#show vlan mac address forwarding
```

| VLAN | UcMissAction | McMissAction |
|------|--------------|--------------|
| 1    | flood        | flood        |
| 333  | drop         | log          |

#### 11.3.4.8 name (VLAN configuration mode)

The **name** command configures the VLAN name. The name can have up to 32 characters. The default name for VLAN 1 is **default**. The default name for all other VLANs is VLANxxxx, where xxxx is the VLAN number. The default name for VLAN 55 is VLAN0055. The **show vlan** command displays the VLAN name.

The **name** command accepts all characters except the space.

The **no name** and **default name** commands restore the default name by removing the **name** command from **running-config**.

##### Command Mode

VLAN Configuration

##### Command Syntax

name *label\_text*

no name

default name

##### Parameters

- *label\_text* character string assigned to name attribute. Maximum length is 32 characters. The space character is not permitted in the name string.

##### Example

These commands assign corporate\_100 as the name for VLAN 25, then displays the VLAN name.

```
switch(config)#vlan 25
switch(config-vlan-25)#name corporate_100
switch(config-vlan-25)#show vlan 25
```

| VLAN | Name          | Status | Ports |
|------|---------------|--------|-------|
| 25   | corporate_100 | active |       |

```
switch(config-vlan-25)#
```

### 11.3.4.9 pvlan mapping

The `pvlan mapping` command maps a switch virtual interface (SVI) available in the primary VLAN to the secondary VLAN or VLANs in the VLAN configuration mode. The [show pvlan mapping interfaces](#) command displays the list of mapped VLANs.

The `no pvlan mapping` and `default pvlan mapping` commands restore the default state of the private VLAN mapping.

#### Command Mode

VLAN Configuration

#### Command Syntax

```
pvlan mapping{add | remove | vlan ID}
no pvlan mapping{add | remove | vlan ID}
default pvlan mapping{add | remove | vlan ID}
```

#### Parameters

- `add` adding VLANs to the PVLAN mapping of the current VLAN interface.
- `remove` removing VLANs from the PVLAN mapping of the current VLAN interface.
- `vlan ID` The secondary VLAN IDs of the private VLAN mapping. The IDs range from 1 to 4094.

#### Related Commands

[show pvlan mapping interfaces](#)

#### Example

These commands assign a secondary VLAN ID of 50 to the primary VLAN.

```
switch(config)#vlan 25
switch(config-vlan-25)#pvlan mapping 50
switch(config-vlan-25)#
```

---

### 11.3.4.10 show dot1q-tunnel

The **show dot1q-tunnel** command displays the ports that are configured in dot1q-tunnel switching mode. The **switchport mode** command configures the switching mode for the configuration mode interface.

#### Command Mode

EXEC

#### Command Syntax

```
show dot1q-tunnel [INTERFACE]
```

#### Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - *<no parameter>* Display information for all interfaces.
  - *ethernet e\_range* Ethernet interface range specified by *e\_range*.
  - *loopback l\_range* Loopback interface specified by *l\_range*.
  - *management m\_range* Management interface range specified by *m\_range*.
  - *port-channel p\_range* Port-Channel Interface range specified by *p\_range*.
  - *vlan v\_range* VLAN interface range specified by *v\_range*.
  - *vxlan vx\_range* VXLAN interface range specified by *vx\_range*.

Valid *range* formats include number, number range, or comma-delimited list of numbers and ranges.

#### Example

This command displays the ports that are configured in dot1q-tunnel switching mode.

```
switch>show dot1q-tunnel
dot1q-tunnel mode LAN Port (s)
-----
Po4
Po21
Po22
switch>
```

### 11.3.4.11 show interfaces switchport backup-link

The **show interfaces switchport backup-link** command displays interfaces that are configured as switchport backup pairs and the operational status of each interface. For each pair, the command displays the names, roles, status, and VLAN traffic of each interface.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] switchport backup-link
```

```
show interfaces switchport backup-link [module{Fabric f_num | Linecard lc_num | Supervisor svr_num | Switchcard | <1-2> | <3-6>}]
```

#### Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - *<no parameter>* Display information for all interfaces.
  - *ethernet e\_range* Ethernet interface range specified by *e\_range*.
  - *loopback l\_range* Loopback interface specified by *l\_range*.
  - *management m\_range* Management interface range specified by *m\_range*.
  - *port-channel p\_range* Port-Channel Interface range specified by *p\_range*.
  - *vlan v\_range* VLAN interface range specified by *v\_range*.

Valid *e\_range*, *l\_range*, *m\_range*, *p\_range*, and *v\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

- **module** Displays interfaces of the specified module. Options include:
  - *Fabric f\_num* Displays interfaces of the specified fabric module. Value ranges from 1 to 6.
  - *Linecard lc\_num* Displays interfaces of the specified linecard module. Value ranges from 3 to 6.
  - *Supervisor svr\_num* Displays interfaces of the specified supervisor module. Accepted values are 1 and 2.
  - *Switchcard* Displays interfaces of switchcard modules.
  - *<1-2>* Displays interfaces of the specified supervisor module.
  - *<3-6>* Displays interfaces of the specified linecard module.

#### Display Values

- **State** Operational status of the interface. Values include:
  - **Up** Spanning tree mode is *backup*, interface status is **up**.
  - **Down** Spanning tree mode is **backup**, interface status is **down**.
  - **Inactive Configuration** The spanning tree mode is not **backup**.
- **Forwarding vlans** VLANs forwarded by the interface. Depends on interface operation status and prefer option specified by the **switchport backup** command.

#### Example

- This command displays the configured switchport primary-backup pairs.

```
switch>show interfaces switchport backup-link
Switch backup interface pair: Ethernet3/17, Ethernet3/8
Primary Interface: Ethernet3/17      State: Inactive Configuration
Backup Interface: Ethernet3/8       State: Inactive Configuration
Preemption delay: 0 milliseconds
Mac move burst size: 0
Mac move burst interval: 20 milliseconds
```

---

```
Mac move destination: ff:ff:ff:ff:ff:ff
```

- This command displays interfaces of the module for linecard 4.

```
switch(config)#show int switchport backup-link module Linecard 4
Switch backup interface pair: Ethernet4/19/1, Ethernet4/19/2
Primary Interface: Ethernet4/19/1    State: Inactive Configuration
Backup Interface: Ethernet4/19/2    State: Inactive Configuration
Preemption delay: 0 milliseconds
Mac move burst size: 0
Mac move burst interval: 20 milliseconds
Mac move destination: ff:ff:ff:ff:ff:ff
```
