### 11.3.4.12 show interfaces switchport vlan mapping

The **show interfaces switchport vlan mapping** command displays mapping information of the configured VLANs in an interface mode.

#### Command Mode

EXEC

#### Command Syntax

**show interfaces switchport vlan mapping**

#### Examples

- This command displays mapping information of the configured VLAN IDs.

```
switch#show interfaces switchport vlan mapping
-----
Ethernet3

```

| Original Vlan | New Vlan | Status | Direction<br>Configured | Direction<br>Active |
|---------------|----------|--------|-------------------------|---------------------|
| 10            | 100      | Active | In/Out                  | In/Out              |
| 11            | 200      | Active | In                      | In                  |
| 300           | 12       | Active | Out                     | Out                 |

- This command displays dual tag mapping information of the configured VLAN IDs.

```
switch(config)#show interfaces switchport vlan mapping
-----
Ethernet3/1
Direction
Outer Tag      Direction
                Inner Tag      VLAN ID      Status      Configured  Active Dot1  qTunnel
-----
1000           100           200          active      In/Out      In/Out      -
1001           101           201          active      In           In           -
1002           102           202          active      Out          Out          -
```

- This command displays dual tag mapping information of the configured VLAN IDs.

```
switch(config)#show interfaces switchport vlan mapping
-----
Ethernet1/1

```

| Outer Tag | Inner Tag | VLAN ID | Status | Direction<br>Configured | Direction<br>Active |
|-----------|-----------|---------|--------|-------------------------|---------------------|
| 70        | -         | 300     | Active | In/Out                  | In/Out              |
| 10        | 50        | 100     | Active | In/Out                  | In/Out              |
| 20        | 60        | 100     | Active | In                      | In                  |
| 30        | 40        | 200     | Active | Out                     | Out                 |

### 11.3.4.13 show interfaces switchport

The **show interfaces switchport** command displays the switching configuration and operational status of the specified ports.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] switchport
```

#### Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - *<no parameter>* Display the switching status for all interfaces.
  - *ethernet e\_range* Ethernet interface range specified by *e\_range*.
  - *loopback l\_range* Loopback interface specified by *l\_range*.
  - *management m\_range* Management interface range specified by *m\_range*.
  - *port-channel p\_range* Port-Channel Interface range specified by *p\_range*.
  - *vlan v\_range* VLAN interface range specified by *v\_range*.

Valid *e\_range*, *l\_range*, *m\_range*, *p\_range*, and *v\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

#### Example

- This command displays the switching status for all interfaces.

```
switch(config)#show interface switchport
Default switchport mode: access

Name: Et5/1
Switchport: Enabled
Administrative Mode: static access
Operational Mode: static access
MAC Address Learning: enabled
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Static Trunk Groups:
Dynamic Trunk Groups:

Name: Et5/2
Switchport: Enabled
Administrative Mode: static access
Operational Mode: static access
MAC Address Learning: enabled
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Static Trunk Groups:
Dynamic Trunk Groups:

[...]

switch(config)#
```

- This command displays the switching status of port channel interfaces 21 and 22.

```
switch>show interface port-channel 21-22 switchport
```

```
Name: Po21
Switchport: Enabled
Administrative Mode: tunnel
Operational Mode: tunnel
Access Mode VLAN: 1 (inactive)
Trunking Native Mode VLAN: 100 (VLAN0100)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Trunk Groups: foo

Name: Po22
Switchport: Enabled
Administrative Mode: tunnel
Operational Mode: tunnel
Access Mode VLAN: 1 (inactive)
Trunking Native Mode VLAN: 1 (inactive)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Trunk Groups:

switch>
```

- This command displays the configured status of VLAN scaling for the Ethernet interface 2/1 port.

```
switch#show interface Ethernet 2/1 switchport
Name: Ethernet 2/1
Switchport: Enabled
Administrative Mode: trunk
Operational Mode: trunk
MAC Address Learning: enabled
Dot1q ethertype/TPID: 0x8100 (active)
Dot1q VLAN Tag: Allowed
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: ALL
Static Trunk Groups:
Dynamic Trunk Groups:
Source interface filtering: enabled
VLAN forwarding mode: allConfiguredVlans

switch>
```

---

### 11.3.4.14 show interfaces trunk

The **show interfaces trunk** command displays configuration and status information for interfaces configured in switchport trunk mode.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] trunk
```

#### Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - *<no parameter>* Display information for all interfaces.
  - *ethernet e\_range* Ethernet interface range specified by *e\_range*.
  - *management m\_range* Management interface range specified by *m\_range*.
  - *port-channel p\_range* Port-Channel Interface range specified by *p\_range*.

Valid *e\_range*, *m\_range*, and *p\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

#### Example

This command displays the trunk status for all interfaces configured in switchport trunk mode.

```
switch>show interfaces trunk
Port          Mode          Status          Native vlan
Po1           trunk         trunking        1
Po2           trunk         trunking        1

Port          Vlans allowed
Po1           1-15
Po2           16-30

Port          Vlans allowed and active in management domain
Po1           1-10
Po2           21-30

Port          Vlans in spanning tree forwarding state
Po1           1-10
Po2           21-30

switch>
```

### 11.3.4.15 show interfaces vlans

The **show interfaces vlans** command displays a table that lists the VLANs that are carried by the specified interfaces. Interfaces that do not carry VLANs are not listed in the table. The table lists the untagged (native or access) and tagged VLANs for each interface.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INT_NAME] vlans
```

#### Parameters

- INT\_NAME Interface type and number. Values include
  - ethernet *e\_num* Ethernet interface specified by *e\_num*.
  - management *m\_num* Management interface specified by *m\_num*.
  - port-channel *p\_num* Port-Channel Interface specified by *p\_num*.

#### Example

This command displays the VLANs carried by all L2 ports.

```
switch>show interfaces vlans
Port      Untagged Tagged
Et9       3910     -
Et11      3912     -
Et16      500      -
Et17      3908     -
Et18      3908     -
Po1       1        101-102,500,721,3000,
Po2       101      -
Po4       3902     -
Po5       3903     -
Po6       3992     -
Po7       661      -
Po8       3911     -
```

### 11.3.4.16 show pvlan mapping interfaces

The **show pvlan mapping interfaces** command displays information about the private VLAN mapping interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show pvlan mapping interfaces
```

#### Example

- This command displays information about the private VLAN mapping interfaces.

```
switch(config)#int vlan 50
switch(config-if-Vl50)#pvlan mapping 70
switch(config-if-Vl50)#show pvlan mapping interfaces
Interface      Secondary Vlans
-----
Vlan50         70
```

---

### 11.3.4.17 show vlan brief count

The `show vlan brief count` command displays the number of VLANs that are configured on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show vlan brief count
```

#### Example

This command displays the number of VLANs on the switch.

```
switch>show vlan brief count  
Number of existing VLANs           : 18  
  
switch>
```

### 11.3.4.18 show vlan dynamic

The **show vlan dynamic** command displays the source and quantity of dynamic VLANs on the switch. Dynamic VLANs support VM Tracer monitoring sessions.

#### Command Mode

EXEC

#### Command Syntax

```
show vlan dynamic
```

#### Example

This command displays the source and quantity of dynamic VLANs on the switch.

```
switch>show vlan dynamic
Dynamic VLAN source      VLANS
vmtracer-poc             88
switch>
```

---

### 11.3.4.19 show vlan internal allocation policy

The **show vlan internal allocation policy** command displays the method the switch uses to allocate VLANs to routed ports. The [vlan internal order](#) command configures the allocation method.

The allocation method consists of two configurable components:

- range: the list of VLANs that are allocated to routed ports.
- direction: the direction by which VLANs are allocated (ascending or descending).

#### Command Mode

EXEC

#### Command Syntax

```
show vlan internal allocation policy
```

#### Example

This command displays the internal allocation policy.

```
switch>show vlan internal allocation policy  
Internal VLAN Allocation Policy: ascending  
Internal VLAN Allocation Range: 1006-4094  
switch>
```

### 11.3.4.20 show vlan internal usage

The **show vlan internal usage** command shows the VLANs that are allocated as internal VLANs for routed ports.

A routed port is an Ethernet or port channel interface that is configured as a layer 3 interface. Routed ports do not bridge frames and are not members of any VLANs. Routed ports can have IP addresses assigned to them and packets are routed directly to and from the port.

When an interface is configured as a routed port, the switch allocates an SVI with a previously unused VLAN ID. The switch prohibits the configuration of VLANs with numbers corresponding to internal VLAN interfaces allocated to a routed port. VLAN interfaces corresponding to SVIs allocated to a routed port cannot be configured by VLAN interface configuration mode commands.

#### Command Mode

EXEC

#### Command Syntax

```
show vlan internal usage
```

#### Example

This command displays the VLANs that are allocated to routed ports.

```
switch>show vlan internal usage  
1006 Ethernet3  
1007 Ethernet4  
switch>
```

---

### 11.3.4.21 show vlan trunk group

The **show vlan trunk group** command displays the trunk group membership of the specified VLANs.

#### Command Mode

EXEC

#### Command Syntax

```
show vlan [VLAN_LIST] trunk group
```

#### Parameters

- VLAN\_LIST VLAN list. Options include:
  - *<no parameter>* all VLANs.
  - *v\_range* VLANs specified by *v\_range*.
  - *id v\_range* VLANs specified by *v\_range*.
  - *name v\_name* VLANs specified by the VLAN name *v\_name*.

#### Display Values

- VLAN VLAN ID.
- Trunk Groups Trunk groups associated with the listed VLANs.

#### Example

This command displays the trunk group membership of all configured VLANs.

```
switch>show vlan trunk group
VLAN      Trunk Groups
-----
5
10        first_group
12
40        second_group
100       third_group
101       middle_group
102
200

switch>
```

### 11.3.4.22 show vlan

The **show vlan** command displays the VLAN ID, name, status, and member ports of all configured VLANs. The command only displays active ports by default; by specifying **configured-ports**, the command displays all ports that are members of a configured VLAN regardless of their activity status, including Ethernet ports that are members of a port channel.

#### Command Mode

EXEC

#### Command Syntax

```
show vlan [VLAN_LIST][PORT_ACTIVITY]
```

#### Parameters

- **VLAN\_LIST** List of VLANs displayed by command. Options include:
  - *<no parameter>* all VLANs.
  - *v\_range* VLANs specified by *v\_range*.
  - *id v\_range* VLANs specified by *v\_range*.
  - *name v\_name* VLANs specified by the VLAN name *v\_name*.

*v\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

- **PORT\_ACTIVITY** Ports listed in table. Options include:
  - *<no parameter>* table displays only active ports (same as **active-configuration** option).
  - **active-configuration** table displays only active ports.
  - **configured-ports** table displays all configured ports.

#### Display Values

- **VLAN** The VLAN ID.
- **Name** The name of the VLAN.
- **Status** The status of the VLAN.
- **Ports** The ports that are members of the VLAN.

#### Examples

- This command displays status and ports of VLANs 1-1000.

```
switch> show vlan 1-1000
VLAN  Name                               Status  Ports
-----
 1     default                               active  Po1
184    fet.arka                               active  Cpu, Po1, Po2
262    mgq.net                                active  PPo2, Po1
512    sant.test                              active  Cpu, Et16, Po1
821    ipv6.net                               active  Cpu, Po1, Po7

switch>
```

- This command displays the list of all the member interfaces under each SVI.

```
switch# show vlan
VLAN  Name                               Status  Ports
-----
-----
 1     default                               active
2148   VLAN2148                              active  Cpu, Et1, Et26
2700   VLAN2700                              active  Cpu, Et18
```

---

### 11.3.4.23 state

The **state** command configures the VLAN transmission state of the configuration mode VLAN.

- **Active state:** Ports forward VLAN traffic.
- **Suspend state:** Ports block VLAN traffic.

The default transmission status is active.

The **no state** command restores the default VLAN transmission state to the configuration mode VLAN by removing the corresponding **state** command from **running-config**.

#### Command Mode

VLAN Configuration

#### Command Syntax

```
state OPERATION_STATE
```

```
no state
```

```
default state
```

#### Parameters

- OPERATION\_STATE VLAN transmission state. Options include:
  - active VLAN traffic is forwarded
  - suspend LAN traffic is blocked.

#### Example

These commands suspend VLAN traffic on VLANs 100-102.

```
switch(config)#vlan 100-102
switch(config-vlan-100-102)#state suspend
switch(config-vlan-100-102)#
```

### 11.3.4.24 switchport access vlan

The **switchport access vlan** command specifies the access VLAN of the configuration mode interface. Ethernet or port channel interfaces that are in access mode are members of only the access VLAN. Untagged frames that the interface receives are associated with the access VLAN. Frames tagged with the access VLAN are also associated with the access VLAN. The interface drops all other tagged frames that it receives. By default, VLAN 1 is the access VLAN of all Ethernet and port channel interfaces.

An interface's access mode is effective only when the interface is in access mode or dot1q-tunnel mode, as specified by the switchport mode command. Interfaces in dot1q-tunnel mode handle inbound traffic as untagged traffic and associate all traffic with the access VLAN. Interfaces configured to switchport trunk mode maintain and ignore existing switchport access commands.

The **no switchport access vlan** and **default switchport access vlan** commands restore VLAN 1 as the access VLAN of the configuration mode interface by removing the corresponding **switchport access vlan** statement from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

#### Command Syntax

```
switchport access vlan v_num
no switchport access vlan
default switchport access vlan
```

#### Parameters

- *v\_num* number of access VLAN. Value ranges from 1 to 4094. Default is 1.

#### Example

These commands assign VLAN 100 as the access VLAN to Ethernet interface 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport access vlan 100
switch(config-if-Et5)#
```

---

### 11.3.4.25 switchport dot1q ethertype

The **switchport dot1q ethertype** command configures the tag protocol identifier (TPID, also known as a dot1q ethertype), of the configuration mode interface. By default, all switch ports use the standard TPID of 0x8100.

The **no switchport dot1q ethertype** and **default switchport dot1q ethertype** commands restore the TPID to 0x8100 by removing the corresponding **switchport dot1q ethertype** statement from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
switchport dot1q ethertype ethertype
```

```
no switchport dot1q ethertype
```

```
default switchport dot1q ethertype
```

#### Parameters

- *ethertype* ethertype number (TPID). Value ranges from 0x600 (1536) through 0xFFFF (65535), and can be entered in decimal or hexadecimal notation. Value is stored and displayed in hexadecimal form; the default value is 0x8100.

#### Example

These commands configure 0x9100 as the TPID of *Ethernet interface 5*.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport dot1q ethertype 0x9100
switch(config-if-Et5)#
```

### 11.3.4.26 switchport mode

The **switchport mode** command specifies the switching mode of the configuration mode interface. The switch supports five switching modes: access, trunk, dot1q-tunnel, tap, and tool.

- **Access switching mode:** The interface is a member of one VLAN, called the access VLAN, as specified by the **switchport access vlan** command. Tagged frames received on the interface are dropped unless they are tagged with the access VLAN. Frames transmitted from the interface are always untagged.
- **Trunk switching mode:** The interface may be a member of multiple VLANs, as configured by the **switchport trunk allowed vlan** command. Untagged traffic is associated with the interface's native VLAN, as configured with the **switchport trunk native vlan** command.
- **Dot1q-tunnel switching mode:** The interface treats all inbound packets as untagged traffic and handles them as traffic of its access VLAN, as specified by the **switchport access vlan** command.
- **Tap mode:** The interface operates as a tap port. Tap ports receive traffic for replication on one or more tool ports. The interface may be a member of multiple VLANs, as configured by the **switchport tap allowed vlan** command. Untagged traffic is associated with the interface's native VLAN, as configured with the **switchport tap native vlan** command.

Tap ports are in STP forwarding state and prohibit egress traffic. MAC learning, control plane interaction and traps for inbound traffic are disabled.

- **Tool mode:** The interface operates as a tool port. Tool ports replicate traffic received by tap ports. The interface may be a member of multiple VLANs, as configured by the **switchport tool allowed vlan** command. MAC learning, control plane interaction and traps for inbound traffic are disabled.

Tool ports are in STP forwarding state and prohibit ingress traffic that uses port settings.

The status of switchport configured ports depends on the switch's tap aggregation mode (which can be viewed by using the **mode (tap-agg configuration mode)** command):

- tap aggregation mode enabled: tap and tool ports are errdisabled. Switching ports are errdisabled.
- tap aggregation mode disabled: tap and tool ports are errdisabled. Switching ports are enabled.

The **no switchport mode** and **default switchport mode** commands return the configuration mode interface to its default setting as an access port by deleting the corresponding **switchport mode** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

#### Command Syntax

```
switchport mode MODE_TYPE
```

```
no switchport mode
```

```
default switchport mode
```

#### Parameters

- **MODE\_TYPE** switching mode of the configuration mode interfaces. Options include:
  - access access switching mode.
  - dot1q-tunnel dot1q-tunnel switching mode.
  - tap tap switching mode.
  - tool tool switching mode.
  - trunk trunk switching mode.

#### Restrictions

---

Dot1q-tunnel switching mode is not available on Petra platform switches.

Tap aggregation (tap and tool modes) is available on FM6000 and Arad platform switches.

**Example**

These commands configure Ethernet 4 interface as a trunk port.

```
switch(config) #interface ethernet 4  
switch(config-if-Et4) #switchport mode trunk  
switch(config-if-Et4) #
```

### 11.3.4.27 switchport trunk allowed vlan

The **switchport trunk allowed vlan** command creates or modifies the list of VLANs for which the configuration mode interface, in trunk mode, handles tagged traffic. By default, interfaces handle tagged traffic for all VLANs. Command settings persist in **running-config** without taking effect when the switch is in tap aggregation mode or the interface is not in trunk mode.

The **no switchport trunk allowed vlan** and **default switchport trunk allowed vlan** commands restore the trunk mode default allowed VLAN setting of **all** by removing the corresponding **switchport trunk allowed vlan** statement from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

#### Command Syntax

```
switchport trunk allowed vlan EDIT_ACTION
```

```
no switchport trunk allowed vlan
```

```
default switchport trunk allowed vlan
```

#### Parameters

- **EDIT\_ACTION** modifications to the VLAN list.
  - *v\_range* Creates VLAN list from *v\_range*.
  - *add v\_range* Adds specified VLANs to current list.
  - *all* VLAN list contains all VLANs.
  - *except v\_range* VLAN list contains all VLANs except those specified.
  - *none* VLAN list is empty (no VLANs).
  - *remove v\_range* Removes specified VLANs from current list.

Valid *v\_range* formats include number, range, or comma-delimited list of numbers and ranges.

#### Example

These commands create the trunk mode allowed VLAN list of 6-10 for Ethernet interface 14, then verifies the VLAN list.

```
switch(config)#interface ethernet 14
switch(config-if-Et14)#switchport trunk allowed vlan 6-10
switch(config-if-Et14)#show interfaces ethernet 14 switchport
Name: Et14
Switchport: Enabled
Administrative Mode: trunk
Operational Mode: trunk
Access Mode VLAN: 1 (inactive)
Trunking Native Mode VLAN: 1 (inactive)
Administrative Native VLAN tagging: disabled
Trunking VLANs Enabled: 6-10
Trunk Groups:

switch(config-if-Et14)#
```

---

### 11.3.4.28 switchport trunk group

The **switchport trunk group** command assigns the configuration mode interface to the specified trunk group. Trunk group ports handle traffic of the VLANs assigned to the group.

The **no switchport trunk group** and **default switchport trunk group** commands remove the configuration mode interface from the specified trunk group by deleting the corresponding statement from running-config. If the command does not specify a trunk group, the interface is removed from all trunk groups to which it is assigned.

**Note:** On platforms which support the use of port channels as mirror destinations, a port channel which is being used as a mirror destination *must not* be assigned to an MLAG.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

#### Command Syntax

```
switchport trunk group [group_name]
```

```
no switchport trunk group [group_name]
```

```
default switchport trunk group [group_name]
```

#### Parameters

- *group\_name* trunk group name.

#### Example

These commands assign port channel 4 to trunk group *fe-1*.

```
switch(config)#interface port-channel 4  
switch(config-if-Po4)#switchport trunk group fe-1  
switch(config-if-Po4)#
```

### 11.3.4.29 switchport trunk native vlan

The **switchport trunk native vlan** command specifies the trunk mode native VLAN for the configuration mode interface. Interfaces in trunk mode associate untagged frames with the native VLAN. Trunk mode interfaces can also be configured to drop untagged frames. The default native VLAN for all interfaces is VLAN 1.

The **no switchport trunk native vlan** and **default switchport trunk native vlan** commands restore VLAN 1 as the trunk mode native VLAN to the configuration mode interface by removing the corresponding **switchport trunk native vlan** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

#### Command Syntax

```
switchport trunk native vlan VLAN_ID
```

```
no switchport trunk native vlan
```

```
default switchport trunk native vlan
```

#### Parameters

- VLAN\_ID the ID of the native VLAN. Options include
  - *v\_num* VLAN number. Value ranges from 1 to 4094
  - tag interface drops all untagged frames.

#### Example

These commands configure *VLAN 100* as the native VLAN for *port channel 21*.

```
switch(config)#interface port-channel 21  
switch(config-if-Po21)#switchport trunk native vlan 100  
switch(config-if-Po21)#
```

---

### 11.3.4.30 switchport vlan forwarding

The **switchport vlan forwarding** command forwards packets between the ports belonging to VLAN in the interface configuration mode. The scaling configuration is applicable on a per-port basis. In the 7160 platform, the hardware uses a Port-VLAN table for storing the configuration on a per port/VLAN combination and supports a maximum of 128 ports.

**Note:** The configuration is applicable to trunk ports only.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
switchport vlan forwarding accept | all
```

#### Parameters

- **accept** accepts packets for VLAN
- **all** all VLANs

#### Example

This command forwards and accepts all the packets of VLAN of ethernet interface 2.

```
switch(config) #interface ethernet 2  
switch(config-if-Et2) #switchport vlan forwarding accept all  
switch(config-if-Et2) #
```

### 11.3.4.31 switchport vlan mapping

The **switchport vlan mapping** command allows you to map an arbitrary incoming VLAN tag to a particular bridging VLAN on the switch. The mapping is applied on a trunk port and multiple mappings can exist under each trunk port.

The **no switchport vlan mapping** and **default switchport vlan mapping** commands remove VLAN mapping by removing the corresponding **switchport vlan mapping** command from the *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

#### Command Syntax

```
switchport vlan mapping [in | out] incoming_vlanid destination_vlanid
```

```
no switchport vlan mapping [in | out] incoming_vlanid destination_vlanid
```

```
default switchport vlan mapping [in | out] incoming_vlanid destination_vlanid
```

#### Parameters

- **in** maps the specified VLAN ID for received traffic only.
- **out** maps the specified VLAN ID for transmitted traffic only.
- *incoming\_vlanid* specifies the VLAN ID to be mapped. Value ranges from 1 to 4094.
- *destination\_vlanid* specifies the destination VLAN ID. Value ranges from 1 to 4094.

#### Examples

- These commands map ingress packets of VLAN tag 11 with VLAN 200 on an *Ethernet interface 3*.

```
switch(config)#interface Ethernet 3
switch(config-if-Et3)#switchport mode trunk
switch(config-if-Et3)#switchport vlan mapping in 11 200
```

- These commands map egress packets of VLAN 300 with VLAN tag 12 on an *Ethernet interface 5*.

```
switch(config)#interface Ethernet 5
switch(config-if-Et5)#switchport mode trunk
switch(config-if-Et5)#switchport vlan mapping out 300 12
```

- These commands map inner and outer VLAN IDs on an *Ethernet interface 1*.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#switchport vlan mapping 10 inner 50 100
switch(config-if-Et1)#switchport vlan mapping in 20 inner 60 100
switch(config-if-Et1)#switchport vlan mapping out 200 30 inner 40
switch(config-if-Et1)#switchport vlan mapping 70 300
```

---

### 11.3.4.32 switchport vlan translation

The **switchport vlan translation** command allows you to map packets from one VLAN to another using VLAN translation. This is carried out on packets having a dot1q header (tagged frames) only. The translation rewrites the VLAN ID (VID) field in dot1q headers on packets passing through a switched port without changing any other fields.

By default, the translation is bidirectional. The packets ingressing an interface through VLAN A are internally mapped to VLAN B; VLAN B packets egressing the same interface are mapped to VLAN A.

To use VLAN translation on a switched port, the port must be configured as a trunk port using the [switchport mode](#) command.

VLAN translation on routed ports is accomplished through the [encapsulation dot1q vlan](#) command.

The **no switchport vlan translation** and **default switchport vlan translation** commands remove VLAN mapping by removing the switchport vlan translation command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

#### Command Syntax

```
switchport vlan translation [DIRECTION] incoming_vlanid new_vlanid
```

```
no switchport vlan translation incoming_vlanid new_vlanid
```

```
no switchport vlan translation DIRECTION incoming_vlanid
```

```
default switchport vlan translation incoming_vlanid new_vlanid
```

```
default switchport vlan translation DIRECTION incoming_vlanid
```

#### Parameters

- **DIRECTION** direction of traffic to be translated.
  - *<no parameter>* translates the specified VLAN IDs for transmitted and received traffic.
  - **in** translates the specified VLAN IDs for received traffic only.
  - **out** translates the specified VLAN IDs for transmitted traffic only.
- **incoming\_vlanid** Enter the VLAN ID to be translated. Value ranges from 1 to 4094.
- **new\_vlanid** The new VLAN ID or bridging VLAN ID that will be used internally. Value ranges from 1 to 4094.

#### Example

- These commands translate only incoming packets, changing the VLAN ID to 2008 in the dot1q header of packets ingressing on *VLAN 201*.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport vlan translation in 201 2008
switch(config-if-Et5)#
```

- These commands translate multiple VLAN mappings on an *Ethernet interface 5*.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#switchport vlan translation 50 60
switch(config-if-Et5)#switchport vlan translation 61 71
switch(config-if-Et5)#switchport vlan translation 62 72
switch(config-if-Et5)#
```

### 11.3.4.33 trunk group

The **trunk group** command assigns the configuration mode VLAN to a specified trunk group.

A trunk group is the set of physical interfaces that comprise the trunk and the collection of VLANs whose traffic is carried on the trunk. The traffic of a VLAN that belongs to one or more trunk groups is carried only on ports that are members of trunk groups to which the VLAN belongs. Switchport commands specify the physical interfaces that carry trunk group traffic.

The **no trunk group** and **default trunk group** commands remove the configuration mode VLAN from the specified trunk group by removing the corresponding **trunk group** statement from **running-config**. If a trunk group is not specified, the commands remove the configuration mode VLAN from all trunk groups.

#### Command Mode

VLAN Configuration

#### Command Syntax

```
trunk group [name]
no trunk group [name]
default trunk group [name]
```

#### Parameters

- *name* a name representing the trunk group.

#### Example

These commands assigns VLAN 49 to the trunk group *mlagpeer*:

```
switch(config)#vlan 49
switch(config-vlan-49)#trunk group mlagpeer
switch(config-vlan-49)#
```

## 11.4 DCBX and Flow Control

This section describes Data Center Bridging Capability Exchange (DCBX) configuration tasks. Topics in this section include:

- [Introduction](#)
- [Overview](#)
- [DCBX Configuration and Verification](#)
- [Configuring Priority-Flow-Control \(PFC\)](#)
- [Configuring PFC Watchdog](#)
- [DCBX and Flow Control Commands](#)

### 11.4.1 Introduction

EOS implements Link Layer Discovery Protocol (LLDP) and the Data Center Bridging Capability Exchange (DCBX) protocol to help automate the configuration of Data Center Bridging (DCB) parameters, including the Priority-Based Flow Control (PFC) standard, which allows an end-to-end flow-control feature.

This feature enables a switch to recognize when it is connected to an iSCSI device and automatically configure the switch link parameters (such as priority flow control) to provide optimal support for that device. DCBX can be used to prioritize the handling of iSCSI traffic to help ensure that packets are not dropped or delayed. DCBX is off by default.

---

## 11.4.2 Overview

### 11.4.2.1 Data Center Bridging Capability Exchange (DCBX)

DCBX works with LLDP to allow switches to exchange information about their data center bridging (DCB) capabilities and configuration and automatically negotiate common Priority-Based Flow Control (PFC) parameters.

Data is exchanged in type-length-value (TLV) format. For DCBX to function on an interface LLDP must be enabled on that interface as well.

### 11.4.2.2 Priority-Based Flow Control (PFC)

PFC uses a new control packet defined in IEEE 802.1Qbb and is not compatible with 802.3x flow control (FC). An interface that is configured for PFC will be disabled for FC. When PFC is disabled on an interface, the FC configuration for the interface becomes active. Any FC frames received on a PFC configured interface are ignored.

Each priority is configured as either drop or no-drop. If a priority that is designated as no-drop is congested, the priority is paused. Drop priorities do not participate in pause.

When PFC is disabled, the interface defaults to the IEEE 802.3x flow control setting for the interface. PFC is disabled by default.

### 11.4.2.3 PFC Watchdog

The PFC watchdog identifies the egress queues that are unable to transmit packets for a long time due to receiving continuous PFC pause frames. On identifying such stuck tx-queue PFC watchdog error-disables the respective port with a error-disable reason of stuck-queue. When there is an error reported on a port the traffic is re-routed through a different port to the destination.

The PFC watchdog supports the following PFC watchdog configurations:

- PFC watchdog forced recovery of queues
- PFC watchdog polling interval configuration
- PFC Watchdog non-disruptive priorities configuration
- Displaying stuck queue and recovery counters

## 11.4.3 DCBX Configuration and Verification

### 11.4.3.1 Set the Priority Rank to the Traffic Class

The `dcbx application priority` command assigns a priority rank to the specified traffic class in the application priority table. This table is transmitted on each DCBX-enabled interface.

#### Examples

- These commands tell the DCBX peer that iSCSI frames (TCP ports 860 and 3260) should be assigned the given priority of 5.

```
switch(config)#dcbx application tcp-sctp 860 priority 5
switch(config)#dcbx application tcp-sctp 3260 priority 5
```

- These commands specify a different priority for the two iSCSI traffic ports.

```
switch(config)# dcbx application tcp-sctp 860 priority 3
switch(config)# dcbx application tcp-sctp 3260 priority 4
```

- This command is equivalent to the `dcbx application tcp-sctp` command. The DCBX peer that iSCSI frames are assigned are the given the priority 5.

```
switch(config)#dcbx application iscsi priority 5
switch(config)#
```

- These commands prevent the peers from sending anything about the iSCSI frames.

```
switch(config)#no dcbx application tcp-sctp 860 priority 5
switch(config)#no dcbx application tcp-sctp 3260 priority 5
```

### 11.4.3.2 Configuring CEE DCBX Priority Group

The `priority-flow-control priority` command configures the enhanced transmission selection (ETS) to the specified QoS group, and sets the traffic class priority and the bandwidth percentage for the packets in the traffic class.

#### Examples

- This command configures the ETS to the QoS group map and assigns the CoS map value as 7 and sets traffic class priority to 5.

```
switch(config)#dcbx ets qos map cos 7 traffic-class 5
```

- This command configures the ETS to the traffic class and sets the traffic class priority as 7 and bandwidth value to 70 percent.

```
switch(config)#dcbx ets traffic-class 7 bandwidth 70
```

### 11.4.3.3 DCBX Verification

To display the DCBX status and the interfaces on which DCBX is enabled, use the `show dcbx` command.

#### Examples

- This command displays the DCBX status for Ethernet 50.

```
switch#show dcbx Ethernet 50
Ethernet50:
  IEEE DCBX is enabled and active
  Last LLDPDU received on Thu Feb 14 12:06:01 2013
  No priority flow control configuration TLV received
  No application priority configuration TLV received
switch#
```

## 11.4.4 Configuring Priority-Flow-Control (PFC)

### 11.4.4.1 Enable Priority-Flow-Control (PFC)

The `priority-flow-control` command enables Priority-Flow-Control (PFC) on an individual port.

#### Example

The `priority-flow-control` command in DCBX mode enables PFC on an interface.

```
switch(config)#interface ethernet 2
```

```
switch(config-if-Et2) #priority-flow-control on
```

#### 11.4.4.2 Set the Priority Flow Control Priority

The `priority-flow-control priority` command in DCBX mode creates a priority group that pauses priority. Each priority is configured as either drop or no-drop. If a priority that is designated as no-drop is congested, the priority is paused. Drop priorities do not participate in pause.

##### Examples

- The `priority-flow-control priority` command in DCBX mode creates a priority group that pauses priority 5 on Ethernet 2.

```
switch(config)#interface ethernet 2  
switch(config-if-Et2) #priority-flow-control on  
switch(config-if-Et2) # priority-flow-control priority 5 no-drop
```

- To enable lossy behavior, use the drop option of the `priority-flow-control priority` command.

```
switch(config)#interface ethernet 2  
switch(config-if-Et2) #priority-flow-control on  
switch(config-if-Et2) #priority-flow-control priority 5 drop
```

#### 11.4.4.3 Disable Priority-Flow-Control (PFC)

To disable priority flow control (PFC) on the configuration mode interface and restore the default packet drop setting on the interface, use the `priority-flow-control priority` command.

##### Example

To disable PFC, use the `no priority-flow-control` command.

```
switch (config)#interface ethernet 2  
switch(config-if-Et2) #no priority-flow-control
```

#### 11.4.5 Configuring PFC Watchdog

##### 11.4.5.1 Enabling PFC Watchdog

The `priority-flow-control pause watchdog default timeout` command starts monitoring all the egress queues which have guaranteed bandwidth enabled and for the priorities on which PFC is enabled.

- 📌 **Note:** To enable PFC watchdog, user is required to configure guaranteed bandwidth on the tx-queue to be monitored. Also, PFC must be enabled on the port for the traffic flowing into the queue that is being monitored.

##### Example

These commands enable the PFC watchdog monitoring on tx-queue 3 of Ethernet 1/1, and configures a PFC congestion timeout of 10 seconds which will error-disable the port if the queue is stuck.

```
switch# config  
switch(config)# interface Ethernet1/1  
switch(config-if-Et1/1) # priority-flow-control on  
switch(config-if-Et1/1) # priority-flow-control priority 3 no-drop
```

```
switch(config-if-Et1/1)# tx-queue 3
switch(config-if-Et1/1-txq-3)# bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)# exit
switch(config-if-Et1/1)# exit
switch(config)# priority-flow-control pause watchdog default timeout 10
```

#### 11.4.5.2 Enabling PFC Watchdog Queue Recovery

The **priority-flow-control pause watchdog default recovery-time forced** command recovers a stuck queue after the PFC storm ceases. PFC watchdog supports the following two recovery methods.

- Auto Recovery – recover queue(s) after the PFC storm ceases.
- Forced Recovery – recover queue(s) after a fixed duration, irrespective of PFC storm being received.

 **Note:** The default recovery mode is “auto”.

#### Example

This command recovers a stuck queue after a fixed duration of 10 seconds.

```
switch(config)# priority-flow-control pause watchdog default recovery-time 10 forced
```

#### 11.4.5.3 Configuring PFC Watchdog Polling Interval

The **priority-flow-control pause watchdog default polling-interval** command configures the frequency at which queues should be checked for stuck or recovery detection. By default, polling interval is calculated internally or it considers the value configured through CLI.

 **Note:** Configuring a very low polling interval may increase load on the CPU.

#### Example

This command configures a polling interval of 10 seconds on the switch.

```
switch(config)# priority-flow-control pause watchdog default polling-interval 10
```

#### 11.4.5.4 Displaying Stuck Queue and Recovery Counters

The **show priority-flow-control counters watchdog** command displays the value of number of times a queue is identified as stuck and recovered. These counters are maintained only for those queues that have PFC watchdog functionality enabled. These counters are cleared when either PFC or PFC watchdog configuration is disabled. Alternatively, **show interfaces priority-flow-control counters watchdog** command can be used to display the counters.

#### Example

- This command displays the value of number of times the queue was stuck and recovered for all the interfaces.

```
switch#show priority-flow-control counters watchdog
Port          TxQ    Total times    Total times
             -----  stuck         recovered
-----
```

|       |     |    |    |
|-------|-----|----|----|
| Et1/1 | UC2 | 2  | 2  |
| Et1/1 | UC3 | 3  | 3  |
| Et2/1 | UC2 | 12 | 12 |
| Et2/1 | UC3 | 31 | 30 |

- This command displays the value of number of times the queue was stuck and recovered for a specific interface. In this case it is Et1/1.

```
switch#show priority-flow-control interfaces Ethernet 1/1 counters
watchdog
Port          TxQ      Total times      Total times
-----      ----      -stuck           -recovered
Et1/1         UC2          2                2
Et1/1         UC3          3                3
```

#### 11.4.5.5 PFC Watchdog Non-disruptive Priorities

The PFC Watchdog acts to drop the traffic entering or leaving the port at the stuck PFC priority. Later when the queue recovers, this action is reversed. While applying these actions, some traffic (for all priorities) is dropped on that port. In such case, the priority-flow-control pause watchdog hardware non-disruptive priority command can be used to avoid the traffic drop on ports at stuck queues.

This traffic drop can be avoided by configuring specific PFC priorities as non-disruptive. When queues corresponding to these priorities are stuck/recovered, the traffic for other priorities are not impacted.

#### Example

- This command configures the specific PFC priorities as non-disruptive, and the priority is set to 3.

```
switch(config)#priority-flow-control pause watchdog hardware non-
disruptive priority 3
```

- This command configures all the ports, having a subset of non-disruptive priorities as a part of their no-drop priorities, start in non-disruptive mode.

```
switch(config)#priority-flow-control pause watchdog hardware port non-
disruptive-only
```

#### 11.4.5.6 Displaying PFC Watchdog Information

The `show priority-flow-control` command displays the PFC watchdog status information. Note, if the PFC watchdog default timeout value is non-zero then PFC watchdog is active on the switch.

#### Example

This command displays the PFC watchdog default timeout value, in this show example the timeout value is 3.0 which means the PFC watchdog is active.

```
switch# show priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog default timeout is 3.0

Port    Enabled Priorities Active Note
Et1/1   Yes      34      Yes   DCBX disabled
Et1/2   Yes      34      Yes   DCBX disabled
Et1/3   Yes      34      Yes   DCBX disabled
Et1/4   Yes      34      Yes   DCBX disabled
```

The **show interface status errdisabled** command displays the port which is error-disabled due to stuck-queue condition.

### Example

This command displays the interface Ethernet Eth1/1 status as errdisabled and the reason.

```
switch# show interface Eth1/1 status errdisabled
```

| Port   | Name | Status      | Reason      |
|--------|------|-------------|-------------|
| Eth1/1 |      | errdisabled | stuck-queue |

The show priority-flow-control status command displays the current PFC watchdog details.

### Example

This command displays the PFC watchdog configuration details at global and interface level.

```
switch #show priority-flow-control status
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog timeout is 1.0 second(s)
The PFC watchdog recovery-time is 2.0 second(s) (auto)
The PFC watchdog polling-interval is 0.1 second(s)
The PFC watchdog non-disruptive priorities are 3 4
The PFC watchdog port non-disruptive-only is False

E: PFC Enabled, D: PFC Disabled, A: PFC Active, W: PFC Watchdog Enabled
Port      Status  Priorities Note
Et1/1     E A W   1      7   DCBX disabled
Et1/2     E A -                   DCBX disabled
Et1/3     D - -
Et1/4     D - -
Et2/1     D - -
..
..
```

---

## 11.4.6 DCBX and Flow Control Commands

### Configuration Commands

- `dcbx application priority`
- `dcbx ets`
- `dcbx mode`
- `no priority-flow-control`
- `platform fm6000 pfc-wm`
- `priority-flow-control`
- `priority-flow-control pause watchdog action`
- `priority-flow-control pause watchdog default`
- `priority-flow-control pause watchdog hardware`
- `priority-flow-control priority`

### Show Commands

- `show dcbx`
- `show dcbx application-priority-configuration`
- `show dcbx priority-flow-control-configuration`
- `show dcbx status`
- `show interfaces priority-flow-control`
- `show platform fm6000 pfc-wm`
- `show priority-flow-control`

### 11.4.6.1 dcbx application priority

The **dcbx application priority** command assigns a priority rank to the specified traffic class in the application priority table. This table is transmitted on each DCBX-enabled interface.

The **no dcbx application priority** and **default dcbx application priority** commands remove the specified DCBX traffic class  $i_{c}$  priority assignment by deleting the corresponding **dcbx application priority** command from **running-config**. When the command does not specify a traffic class, all DCBX traffic class priority assignments are removed.

#### Command Mode

Global Configuration

#### Command Syntax

```
dcbx application [APPLICATION_TYPE priority] rank
no dcbx application [APPLICATION_TYPE priority]
default dcbx application [APPLICATION_TYPE priority]
```

#### Parameters

- APPLICATION\_TYPE traffic class receiving the priority assignment. Options include:
  - ether *ethertype\_number* Ethernet traffic. *ethertype\_number* varies from 1536 to 65535.
  - iscsi iSCSI traffic. Maps to TCP/SCTP ports 860 and 3260.
  - tcp-sctp *port\_number* TCP/SCTP traffic. Port number varies from 1 to 65535.
  - tcp-sctp-udp *port\_number* TCP/SCTP/UDP traffic. Port number varies from 1 to 65535.
  - udp *port\_number* UDP traffic. Port number varies from 1 to 65535.
- *rank* priority assigned to traffic class. Values range from 0 to 7.

#### Examples

- These commands tell the DCBX peer that iSCSI frames (TCP ports 860 and 3260) should be assigned the given priority of 5.

```
switch(config)#dcbx application tcp-sctp 860 priority 5
switch(config)#dcbx application tcp-sctp 3260 priority 5
```

- These commands specify a different priority for the two iSCSI traffic ports.

```
switch(config)#dcbx application tcp-sctp 860 priority 3
switch(config)# dcbx application tcp-sctp 3260 priority 4
```

- This command is equivalent to the **dcbx application tcp-sctp** command. The DCBX peer that iSCSI frames are assigned to is given priority 5.

```
switch(config)#dcbx application iscsi priority 5
switch(config)#
```

- These commands prevent the peers from sending anything about the iSCSI frames.

```
switch(config)#no dcbx application tcp-sctp 860 priority
switch(config)#no dcbx application tcp-sctp 3260 priority
```

---

### 11.4.6.2 dcbx ets

The **dcbx ets** command configures the enhanced transmission selection (ETS) to the specified QoS group, and sets the traffic class priority and the bandwidth percentage for the packets in the traffic class.

The **no dcbx ets** and **default dcbx ets** commands remove the specified DCBX traffic class priority assignment by deleting the corresponding **dcbx ets** command from the **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
dcbx ets [qos map cos <value> traffic-class <value> | traffic-class <value> bandwidth <value>]
```

```
no dcbx ets [qos map cos <value> traffic-class <value> | traffic-class <value> bandwidth <value>]
```

```
default dcbx ets [qos map cos <value> traffic-class <value> | traffic-class <value> bandwidth <value>]
```

#### Parameters

- qos QoS to configure.(The sub options include)
  - map QoS map to configure.
  - cos CoS value assigned to port. Value ranges from 0 to 7. Default value is 0.
  - traffic-class Assigns the traffic-class priority to the QoS map. The value ranges from 0 to 7.
- traffic-class Assigns the traffic class priority. The value ranges from 0 to 7. (The sub options include)
  - bandwidth The percentage of bandwidth assigned to the packets received from traffic class. The value ranges from 0 to 100 in percentage. The default value is 0.

#### Examples

- This command configures the ETS to the QoS group map and assigns the CoS map value as 7 and sets the traffic class priority to 5.

```
switch(config)#dcbx ets qos map cos 7 traffic-class 5
```

- This command configures the ETS to the traffic class and sets the traffic class priority value to 7 and sets the bandwidth value to 70 percent.

```
switch(config)#dcbx ets traffic-class 7 bandwidth 70
```

### 11.4.6.3 dcbx mode

The **dcbx mode** command enables DCBX mode on the configuration mode interface. The switch supports IEEE P802.1Qaz. When DCBX is enabled, two TLVs are added to outgoing LLDPDUs, which instruct the peer on the interface to configure PFC (priority flow control) and the application priority table in the same way as the switch.

The **no dcbx mode**, **default dcbx mode**, and **dcbx mode none** commands disable DCBX on the configuration mode interface by removing the corresponding **dcbx mode** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
dcbx mode MODE_NAME
```

```
no dcbx mode
```

```
default dcbx mode
```

#### Parameters

- **MODE\_NAME** Specifies the DCBX version. Options include:
  - **ieee** IEEE version.
  - **cee** Converged Enhanced Ethernet version.
  - **none** DCBX is disabled.

#### Examples

- These commands enable *interface Ethernet 2* to use IEEE DCBX.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#dcbx mode ieee
switch(config-if-Et2)#
```

- These commands disable DCBX on *interface Ethernet 5*.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#dcbx mode none
switch(config-if-Et2)
```

---

#### 11.4.6.4 no priority-flow-control

The **no priority-flow-control** and **default priority-flow-control** commands disable the priority flow control (PFC) on the configuration mode interface and restore the default packet drop setting on the interface, which takes effect when PFC is re-enabled. The commands delete all corresponding [priority-flow-control](#) commands from *running-config*.

##### Command Mode

Interface-Ethernet Configuration

##### Command Syntax

```
no priority-flow-control
default priority-flow-control
```

##### Example

These commands disable priority flow control (PFC) on *Ethernet interface 3*.

```
switch(config)#interface Ethernet 3
switch(config-if-Et3)#no priority-flow-control
switch(config-if-Et3)#
```

### 11.4.6.5 platform fm6000 pfc-wm

The `platform fm6000 pfc-wm` command configures the hardware buffer space allocated to the PFC (Priority Flow Control) RX-Private buffer. The command provides options to configure the buffer size and specify when PFC frames are sent to request that a neighbor stop sending traffic. The default values are as follows:

- **RX-Private:** 18400 bytes
- **on (watermark):** 9280 bytes
- **off (watermark):** 1600 bytes

Values that are entered in the command are rounded up to the closest multiple of 160. The **RX-Private** value must be greater than the **off** value, which must be larger than the **on** value.

The `no platform fm6000 pfc-wm` and `default platform fm6000 pfc-wm` commands restore the default settings by removing the `platform fm6000 pfc-wm` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform fm6000 pfc-wm [RX-PRIVATE_SIZE][PFC-ON_WM][PFC-OFF_WM]
no platform fm6000 pfc-wm
default platform fm6000 pfc-wm
```

The `platform fm6000 pfc-wm` command must explicitly configure at least one parameter.

#### Parameters

- **RX-PRIVATE\_SIZE** Specifies size of rx-private buffer. Options include:
  - *<no parameter>* rx-private buffer retains previously configured size.
  - rx-private **< 18268 to 102400 >** Size of rx-private buffer (bytes).
- **PFC-ON\_WM** Buffer capacity that triggers the switch to send PFC frames. Options include:
  - *<no parameter>* Parameter retains previously configured value.
  - on **< 9134 to 102400 >** Buffer capacity that triggers PFC frames (bytes).
- **PFC-OFF\_WM** Buffer capacity that triggers the switch to stop PFC frame transmissions. Options include:
  - *<no parameter>* Parameter retains previously configured value.
  - off **< 1536 to 102400 >** Buffer capacity that turns off PFC frames.

#### Related Command

[show platform fm6000 pfc-wm](#) displays the PFC RX-Private buffer memory allocations.

#### Example

This command configures the rx-private hardware buffer.

```
switch(config) #platform fm6000 pfc-wm rx-private 24800 on 16000 off 3200
switch(config) #
```

---

### 11.4.6.6 priority-flow-control pause watchdog action

The **priority-flow-control pause watchdog** action command either drops the traffic on a stuck queue, or error disables the port which has a stuck queue, or notifies if there is no action on the stuck queue. The following actions are performed based on the queue status.

The **no priority-flow-control pause watchdog** action command removes the specified **priority-flow-control pause watchdog action configuration** by deleting the corresponding **priority-flow-control pause watchdog action** command from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
priority-flow-control pause watchdog action
no priority-flow-control pause watchdog action
```

#### Parameters

- action PFC watchdog action for stuck transmit queues. Options include.
  - drop Drop traffic on the stuck queue.
  - errdisable Error disable port which has the stuck transmit queue.
  - notify-only No action on the stuck queue.

#### Guidelines

Before enabling the PFC watchdog configuration, configure the guaranteed bandwidth on the tx-queue to be monitored. Also, enable the PFC on the port for the PFC priorities for the traffic flowing into the queue that is being monitored.

#### Example

These commands enables the pfc-watchdog monitoring on *tx-queue 3* of *Ethernet 1/1*, and configures a PFC watchdog action drop and drops the traffic if the queue is a stuck queue.

```
switch#config
switch(config)#interface Ethernet1/1
switch(config-if-Et1/1)#priority-flow-control on
switch(config-if-Et1/1)#priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)#tx-queue 3
switch(config-if-Et1/1-txq-3)#bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)#exit
switch(config-if-Et1/1)#exit
switch(config)#priority-flow-control pause watchdog action drop
```

### 11.4.6.7 priority-flow-control pause watchdog default

The **priority-flow-control pause watchdog** default command monitors all the egress queues which have guaranteed bandwidth enabled and for the priorities on which PFC is enabled. Guaranteed bandwidth is needed to ensure starvation due to higher priority traffic is not wrongly flagged as a stuck-queue due to congestion. The stuck duration after which the port needs to be error disabled is also configurable.

The **no priority-flow-control pause watchdog default** command removes the specified **priority-flow-control pause watchdog configuration** by deleting the corresponding **priority-flow-control pause watchdog** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
priority-flow-control pause watchdog default
no priority-flow-control pause watchdog default
```

#### Parameters

- **default** Specifies the default value. Options include.
  - *polling-interval* Configures the interval at which the watchdog should poll the queues. The polling interval value ranges from 0.005 to 30 seconds.
  - *recovery-time* Configures recovery-time after which stuck queue should recover and start forwarding. The recovery-time value ranges from 0.01 to 60 seconds.
    - **forced** Force recover any stuck queue(s) after the recovery-time interval, irrespective of whether PFC frames are being received or not.
  - *timeout* Configures timeout after which port should be errdisabled or should start dropping on congested priorities. The timeout value ranges from 0.01 to 60 seconds.

#### Guidelines

Before enabling the PFC watchdog configuration, configure the guaranteed bandwidth on the tx-queue to be monitored. Also, enable the PFC on the port for the PFC priorities for the traffic flowing into the queue that is being monitored.

- **Polling Interval Discrepancy**

For user configured polling-interval to be valid, it must satisfy the following conditions

When the recovery-mode is auto and timeout, recovery-time, and polling-interval are non-default,  $\text{polling-interval} \leq \min(\text{timeout}, \text{recovery-time}) / 2$ ,

When recovery-mode is forced or recovery-time is not configured,  $\text{polling-interval} \leq (\text{timeout} / 2)$

For better functioning of PFC Watchdog, when user configured polling interval is too large compared to either timeout or recovery time values, Watchdog will use auto calculated value instead of user configured value until the discrepancy is resolved. Also, CLI warning and syslog messages are generated to inform user of the discrepancy.

- **CLI Warnings**

When there is discrepancy between timeout and polling-interval, the format of the message is as shown below

```
! User configured polling interval <user-cfgd polling-interval>
second(s) is
greater than half of timeout <user-cfgd timeout> second(s). Setting
polling-interval to <to-be-used polling-interval> second(s)
```

---

When there is discrepancy between recovery-time and polling-interval, the format of the message is as shown below

```
! User configured polling interval <user-cfgd polling-interval>
second(s) is
greater than half of recovery-time <user-cfgd recovery-time> second(s).
Setting
polling-interval to <to-be-used polling-interval> second(s)
```

### Examples

- These commands enable the pfc-watchdog monitoring on tx-queue 3 of Ethernet 1/1, and configures a PFC congestion timeout of 10 seconds which will error-disable the port if the queue is stuck.

```
switch#config
switch(config)#interface Ethernet1/1
switch(config-if-Et1/1)#priority-flow-control on
switch(config-if-Et1/1)#priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)#tx-queue 3
switch(config-if-Et1/1-txq-3)#bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)#exit
switch(config-if-Et1/1)#exit
switch(config)#priority-flow-control pause watchdog default timeout 10
```

- These commands enable the pfc-watchdog monitoring on tx-queue 3 of Ethernet 1/1, and configures a PFC forced recovery-time interval of 30 seconds after which the stuck queue(s) are recovered, irrespective of whether PFC frames are being received or not.

```
switch#config
switch(config)#interface Ethernet1/1
switch(config-if-Et1/1)#priority-flow-control on
switch(config-if-Et1/1)#priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)#tx-queue 3
switch(config-if-Et1/1-txq-3)#bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)#exit
switch(config-if-Et1/1)#exit
switch(config)#priority-flow-control pause watchdog default recovery-
time 30 forced
```

- These commands enable the pfc-watchdog monitoring on tx-queue 3 of Ethernet 1/1, and configures a PFC polling-interval of 20 seconds after which queue is polled.

```
switch#config
switch(config)#interface Ethernet1/1
switch(config-if-Et1/1)#priority-flow-control on
switch(config-if-Et1/1)#priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)#tx-queue 3
switch(config-if-Et1/1-txq-3)#bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)#exit
switch(config-if-Et1/1)#exit
switch(config)#priority-flow-control pause watchdog default polling-
interval 20
```

### 11.4.6.8 priority-flow-control pause watchdog hardware

The **priority-flow-control pause watchdog** hardware command configures specific PFC priorities as non-disruptive. This will avoid traffic drop on queues corresponding to these priorities are stuck/recovered, the traffic for other priorities are not impacted.

The **no priority-flow-control pause watchdog hardware** command removes the specified **priority-flow-control pause watchdog non-disruptive configuration** by deleting the corresponding **priority-flow-control pause watchdog hardware** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
priority-flow-control pause watchdog hardware
no priority-flow-control pause watchdog hardware
```

#### Parameters

- **hardware** Configure PFC priority through hardware. Options include.
  - *non-disruptive* PFC watchdog non-disruptive configuration. The priority value ranges from 0 to 7.

#### Guidelines

Before enabling the PFC watchdog configuration, configure the guaranteed bandwidth on the tx-queue to be monitored. Also, enable the PFC on the port for the PFC priorities for the traffic flowing into the queue that is being monitored.

#### Example

These commands enable the pfc-watchdog monitoring on tx-queue 3 of Ethernet 1/1, and configures PFC priorities as non-disruptive on PFC priorities 3 and 4.

```
switch#config
switch(config)#interface Ethernet1/1
switch(config-if-Et1/1)#priority-flow-control on
switch(config-if-Et1/1)#priority-flow-control priority 3 no-drop
switch(config-if-Et1/1)#tx-queue 3
switch(config-if-Et1/1-txq-3)#bandwidth guaranteed 100
switch(config-if-Et1/1-txq-3)#exit
switch(config-if-Et1/1)#exit
switch(config)#priority-flow-control pause watchdog hardware non-
disruptive priority 3 4
```

---

### 11.4.6.9 priority-flow-control priority

The **priority-flow-control priority** command configures the packet resolution setting on the configuration mode interface. This setting determines if packets are dropped when priority flow control (PFC) is enabled on the interface. Packets are dropped by default.

The **no priority-flow-control priority** and **default priority-flow-control priority** commands restore the default packet drop setting on the configuration mode interface by deleting the corresponding **priority-flow-control priority** command from **running-config**. The **priority-flow-control priority** command also restores the default setting on the configuration mode interface.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
priority-flow-control priority pack-drop
no priority-flow-control priority
default priority-flow-control priority
```

#### Parameters

- pack-drop denotes the interfaces. Options include:
  - drop Packets are dropped. Default setting.
  - no drop Packets are not dropped.

#### Examples

- These commands in DCBX mode create a priority group that pauses dot1p priority 5 on Ethernet 2.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#priority-flow-control on
switch(config-if-Et2)#priority-flow-control priority 5 no-drop
```

- These commands enable lossy behavior.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#priority-flow-control on
switch(config-if-Et2)#priority-flow-control priority 5 drop
```

- These commands remove the priority group that pauses dot1p priority 5 on Ethernet 2.

```
switch(config)#interface ethernet 2
switch(config-if-Et2)#priority-flow-control on
switch(config-if-Et2)#no priority-flow-control priority
```

### 11.4.6.10 priority-flow-control

The **priority-flow-control** command enables priority flow control (PFC) on the configuration mode interface to pause selected traffic classes.

The **no priority-flow-control** and **default priority-flow-control** commands disable PFC on the configuration mode interface by deleting the corresponding **priority-flow-control** command from **running-config**. The **priority-flow-control priority** command also disables PFC on the configuration mode interface.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
priority-flow-control on
no priority-flow-control [on]
default priority-flow-control [on]
```

#### Example

- These commands enable PFC on *Ethernet interface 3*.

```
switch(config)# interface Ethernet 3
switch(config-if-Et3)#priority-flow-control on
switch(config-if-Et3)#
```

- These commands disable PFC on *Ethernet interface 3*.

```
switch(config)# interface Ethernet 3
switch(config-if-Et3)# no priority-flow-control
switch(config-if-Et3)#
```

---

### 11.4.6.11 show dcbx application-priority-configuration

The **show dcbx application-priority-configuration** command displays the DCBX peer application priority configuration.

#### Command Mode

EXEC

#### Command Syntax

```
show dcbx [INTERFACE] application-priority-configuration
```

#### Parameters

- INTERFACE Interface type and number. Options include:
  - *<no parameter>* All configured DCBX interfaces.
  - ethernet *e-num* Ethernet interface specified by *e-num*.

#### Guidelines

This command and the [show priority-flow-control](#) command function identically.

#### Example

This command displays the DCBX peer application priority configuration for all DCBX-enabled interfaces.

```
switch#show dcbx application-priority-configuration
Ethernet1:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
  No application priority configuration TLV received
Ethernet2:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
  No application priority configuration TLV received
...
Ethernet50:
  Last LLDPDU received on Thu Feb 14 12:08:29 2013
  - Application priority configuration:
    2 application priorities configured:
      tcp-sctp 860 priority 5
      tcp-sctp 3260 priority 5
switch#
```

### 11.4.6.12 show dcbx priority-flow-control-configuration

The **show dcbx priority-flow-control-configuration** command displays the IEEE DCBX peer priority flow control configurations.

#### Command Mode

EXEC

#### Command Syntax

```
show dcbx [INTERFACE] priority-flow-control-configuration
```

#### Parameters

- INTERFACE Interface type and number. Options include:
  - *<no parameter>* all configured DCBX interfaces.
  - ethernet *e-num* Ethernet interface specified by *e-num*.

#### Example

This command displays the DCBX peer priority flow control configuration for the DCBX-enabled interfaces on the device.

```
switch#show dcbx priority-flow-control-configuration
Ethernet1:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
  No priority flow control configuration TLV received
Ethernet2:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
  No priority flow control configuration TLV received
...
Ethernet50:
  Last LLDPDU received on Thu Feb 14 12:11:29 2013
  - PFC configuration: willing
    not capable of bypassing MACsec
    supports PFC on up to 4 traffic classes
    PFC enabled on priorities: 5 7
  WARNING: peer PFC configuration does not match the local PFC
  configuration
switch#
```

---

### 11.4.6.13 show dcbx status

The **show dcbx status** command displays the DCBX status on the interfaces on which DCBX is enabled.

#### Command Mode

EXEC

#### Command Syntax

```
show dcbx [INTERFACE] status
```

#### Parameters

- INTERFACE Interface type and number. Options include:
  - *<no parameter>* all configured DCBX interfaces.
  - ethernet *e-num* Ethernet interface specified by *e-num*.

#### Example

This command displays the DCBX status for the DCBX-enabled interfaces.

```
switch#show dcbx status
Ethernet1:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
Ethernet2:
  Last LLDPDU received on Thu Feb 14 10:52:20 2013
Ethernet50:
  IEEE DCBX is enabled and active
  Last LLDPDU received on Thu Feb 14 12:11:54 2013
switch#
```

### 11.4.6.14 show dcbx

The **show dcbx** command list DCBX status and the interfaces on which DCBX is enabled.

#### Command Mode

EXEC

#### Command Syntax

```
show dcbx [INTERFACE]
```

#### Parameters

- INTERFACE Interface type and number. Options include:
  - *<no parameter>* all configured DCBX interfaces.
  - ethernet *e-num* Ethernet interface specified by *e-num*.

#### Examples

- This command displays the DCBX status for Ethernet 50.

```
switch#show dcbx Ethernet 50
Ethernet50:
  IEEE DCBX is enabled and active
  Last LLDPDU received on Thu Feb 14 12:06:01 2013
  No priority flow control configuration TLV received
  No application priority configuration TLV received
switch#
```

- This command displays the DCBX status for Ethernet 50 when Priority Flow Control (PFC) is not enabled.

```
switch#show dcbx Ethernet 50
Ethernet50:
  IEEE DCBX is enabled and active
  Last LLDPDU received on Thu Feb 14 12:08:29 2013
  - PFC configuration: willing
    not capable of bypassing MACsec
    supports PFC on up to 4 traffic classes
    PFC enabled on priorities: 5 7
    WARNING: peer PFC configuration does not match the local PFC
    configuration
  - Application priority configuration:
    2 application priorities configured:
      tcp-sctp 860 priority 5
      tcp-sctp 3260 priority 5
switch#
```

### 11.4.6.15 show interfaces priority-flow-control

The **show interfaces priority-flow-control** command displays the status of PFC on all interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] priority-flow-control [INFO_LEVEL]
```

#### Parameters

- **INTERFACE** Interface type and numbers. Options include:
  - *<no parameter>* Display information for all interfaces.
  - *ethernet e\_range* Ethernet interface range specified by *e\_range*.
  - *loopback l\_range* Loopback interface specified by *l\_range*.
  - *management m\_range* Management interface range specified by *m\_range*.
  - *port-channel p\_range* Port-Channel Interface range specified by *p\_range*.
  - *vlan v\_range* VLAN interface range specified by *v\_range*.
  - *vxlan vx\_range* VXLAN interface range specified by *vx\_range*.

Valid range formats include number, number range, or comma-delimited list of numbers and ranges.
- **INFO\_LEVEL** specifies the type of information displayed. Options include:
  - *<no parameter>* Displays information about all DCBX neighbor interfaces.
  - *status* Displays the DCBX status.
  - *counters* Displays the DCBX counters.

#### Guidelines

This command and the **show priority-flow-control** command function identically.

#### Example

This command displays the PFC for all interfaces.

```
switch#show interfaces priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7

Port      Enabled Priorities Active Note
Et1       No
Et2       No
...
Et50      Yes          5      Yes
...
Port      RxFfc      TxPfc
Et1       0          0
Et2       0          0
...
Et50      0          0
...
switch#
```

#### 11.4.6.16 show platform fm6000 pfc-wm

The `show platform fm6000 pfc-wm` command displays the buffer space allocated to the RX-Private buffer and buffer levels that trigger PFC frame transmission activities.

##### Command Mode

Privileged EXEC

##### Command Syntax

```
show platform fm6000 pfc-wm
```

##### Related Command

[priority-flow-control priority](#) specifies the PFC RX-Private buffer memory allocation.

##### Example

This command displays the rx-private hardware buffer memory allocation.

```
switch#show platform fm6000 pfc-wm
Pfc_Rx_Private_WM: 24800 Bytes
Pfc_On_WM: 16000 Bytes
Pfc_Off_WM: 3200 Bytes
switch#
```

### 11.4.6.17 show priority-flow-control

The **show priority-flow-control** command displays the status and other PFC and PFC watchdog information on all interfaces if no specific interface is specified.

#### Command Mode

EXEC

#### Command Syntax

```
show priority-flow-control [status | counters | interfaces]
```

#### Parameters

- *interfaces* specifies the interface for which the information is displayed. Options include.
  - Ethernet Hardware Ethernet interface
  - Loopback Loopback interface
  - Management Management interface
  - Port-Channel Lag interface
  - Recirc-Channel Recirculation interface
  - Tunnel Tunnel interface
  - Vlan VLAN interface
  - Vxlan Vxlan Tunnel Interface
- *status* displays the interface PFC status.
- *counters* displays the interface PFC counters. Options include.
  - *detail* displays the DCBX counters for each priority class. This option is available only on Trident switches.
  - *watchdog* displays the PFC watchdog counters.

#### Examples

- This command displays the PFC status on all interfaces.

```
switch#show priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
Port      Enabled Priorities Active Note

Et1       No                               No

Et2       No                               No

...
Et50     Yes                5                Yes

...
Port      RxPfc      TxPfc
Et1       0          0
Et2       0          0
...
Et50     0          0
...
```

- This command displays the PFC watchdog status. If PFC watchdog default timeout is non-zero (in this case it is 3.0) then PFC watchdog is actively running on the switch.

```
switch# show priority-flow-control
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog default timeout is 3.0

Port      Enabled Priorities Active Note
```

```
Et1/1  Yes    34    Yes    DCBX disabled
Et1/2  Yes    34    Yes    DCBX disabled
Et1/3  Yes    34    Yes    DCBX disabled
Et1/4  Yes    34    Yes    DCBX disabled
...
```

- This command displays the current value of these counters for all the interfaces being monitored by PFC watchdog. Alternatively, show interfaces priority-flow-control counters watchdog command can be used for the same.

```
switch #show priority-flow-control counters watchdog
Port      TxQ      Total times      Total times
          stuck      recovered
-----
Et1/1     UC2           2                2
Et1/1     UC3           3                3
Et2/1     UC2          12               12
Et2/1     UC3          31               30
```

- This command displays the current value of these counters for a specific subset of interfaces. Alternatively, show interfaces <name> priority-flow-control counters watchdog command can be used for the same.

```
switch #show priority-flow-control interfaces Ethernet 1/1 counters
watchdog
Port      TxQ      Total times      Total times
          stuck      recovered
-----
Et1/1     UC2           2                2
Et1/1     UC3           3                3
```

- This command displays the configuration details of PFC watchdog at global and interface level.

```
switch #show priority-flow-control status
The hardware supports PFC on priorities 0 1 2 3 4 5 6 7
The PFC watchdog timeout is 1.0 second(s)
The PFC watchdog recovery-time is 2.0 second(s) (auto)
The PFC watchdog polling-interval is 0.1 second(s)
The PFC watchdog non-disruptive priorities are 3 4
The PFC watchdog port non-disruptive-only is False

E: PFC Enabled, D: PFC Disabled, A: PFC Active, W: PFC Watchdog Enabled
Port      Status  Priorities Note
Et1/1     E A W   1      7    DCBX disabled
Et1/2     E A -   -      -    DCBX disabled
Et1/3     D - -   -      -
Et1/4     D - -   -      -
Et2/1     D - -   -      -
..
```

## Layer 3 Configuration

---

This chapter covers the following Layer 3 sections:

- [IPv4](#)
- [IPv6](#)
- [ACLs and Route Maps](#)
- [VRRP and VARP](#)
- [OpenFlow](#)
- [DirectFlow](#)
- [Decap Groups](#)
- [Nexthop Groups](#)
- [Global Knob to Set MTU for all Layer 3 Interfaces](#)

### 12.1 IPv4

Arista switches support Internet Protocol version 4 (IPv4) and Internet Protocol version 6 (IPv6) for routing packets across network boundaries. This section describes Arista's implementation of IPv4 and includes these topics:

- [IPv4 Addressing](#)
- [IPv4 Routing](#)
- [IPv4 Multicast Counters](#)
- [Route Management](#)
- [IPv4 Route Scale](#)
- [IP Source Guard](#)
- [DHCP Relay Across VRF](#)
- [TCP MSS Clamping](#)
- [IPv4 GRE Tunneling](#)
- [IPv4 Commands](#)

#### 12.1.1 IPv4 Addressing

Each IPv4 network device is assigned a 32-bit IP address that identifies its network location. These sections describe IPv4 address formats, data structures, configuration tasks, and display options:

- [IPv4 Address Formats](#)
- [IPv4 Address Configuration](#)
- [Address Resolution Protocol \(ARP\)](#)
- [Displaying ARP Entries](#)

##### 12.1.1.1 IPv4 Address Formats

IPv4 addresses are composed of 32 bits, expressed in dotted decimal notation by four decimal numbers, each ranging from 0 to 255. A subnet is identified by an IP address and an address space defined by a routing prefix. The switch supports the following subnet formats:

- **IP address and subnet mask:** The subnet mask is a 32-bit number (dotted decimal notation) that specifies the subnet address space. The subnet address space is calculated by performing an AND operation between the IP address and subnet mask.
- **IP address and wildcard mask:** The wildcard mask is a 32-bit number (dotted decimal notation) that specifies the subnet address space. Wildcard masks differ from subnet masks in that the bits are inverted. Some commands use wildcard masks instead of subnet masks.
- **CIDR notation:** CIDR notation specifies the scope of the subnet space by using a decimal number to identify the number of leading ones in the routing prefix. When referring to wildcard notation, CIDR notation specifies the number of leading zeros in the routing prefix.

**Examples:**

- These subnets (subnet mask and CIDR notation) are calculated identically:

```
10.24.154.13 255.255.255.0
10.24.154.13/24
```

The defined space includes all addresses between *10.24.154.0* and *10.24.154.255*.

- These subnets (wildcard mask and CIDR notation) are calculated identically:

```
124.17.3.142 0.0.0.15
124.17.3.142/28
```

The defined space includes all addresses between *124.17.3.128* and *124.17.3.143*.

### 12.1.1.2 IPv4 Address Configuration

#### Assigning an IPv4 Address to an Interface

The `ip address` command specifies the IPv4 address of an interface and the mask for the subnet to which the interface is connected.

**Example:**

These commands configure an IPv4 address with subnet mask for *VLAN 200*:

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip address 10.0.0.1/24
switch(config-if-Vl200)#
```

### 12.1.1.3 Address Resolution Protocol (ARP)

Address Resolution Protocol (ARP) is a protocol that maps IP addresses to MAC addresses that local network devices recognize. The ARP cache is a table that stores the correlated addresses of the devices for which the router facilitates data transmissions.

After receiving a packet, routers use ARP to find the MAC address of the device assigned to the packet's destination IP address. If the ARP cache contains both addresses, the router sends the packet to the specified port. If the ARP cache does not contain the addresses, ARP broadcasts a request packet to all devices in the subnet. The device at the requested IP address responds and provides its MAC address. ARP updates the ARP cache with a dynamic entry and forwards the packet to the responding device. Static ARP entries can also be added to the cache through the CLI.

Proxy ARP is an ARP variant. A network device (proxy) responds to ARP requests for network addresses on a different network with its MAC address. Traffic to the destination is directed to the proxy device which then routes the traffic toward the ultimate destination.

### Configuring ARP

The switch uses ARP cache entries to correlate 32-bit IP addresses to 48-bit hardware addresses. The `arp aging timeout` command specifies the duration of dynamic address entries in the Address Resolution Protocol (ARP) cache for addresses learned through the Layer 3 interface. The default duration is *14400* seconds (four hours).

Entries are refreshed and expired at a random time that is in the range of 80%-100% of the cache expiry time. The refresh is tried 3 times at an interval of 2% of the configured timeout.

Static ARP entries never time out and must be removed from the table manually.

#### Example:

This command specifies an ARP cache duration of *7200* seconds (two hours) for dynamic addresses added to the ARP cache that were learned through *VLAN 200*.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#arp aging timeout 7200
switch(config-if-Vl200)#show active
interface Vlan200
    arp timeout 7200
switch(config-if-Vl200)#
```

The `arp` command adds a static entry to an Address Resolution Protocol (ARP) cache.

#### Example:

This command adds a static entry to the ARP cache in the default VRF.

```
switch(config)#arp 172.22.30.52 0025.900e.c63c arpa
switch(config)#
```

### 12.1.1.3.1 Gratuitous ARP

Gratuitous ARP packets are broadcast by a device in response to an internal change rather than as a response to an ARP request. The gratuitous ARP packet is a request packet (no reply expected) that supplies an unrequested update of ARP information. In a gratuitous ARP packet, both the source and destination IP addresses are the IP of the sender, and the destination MAC address is the broadcast address (*ff:ff:ff:ff:ff:ff*).

Gratuitous ARP packets are generated to update ARP tables after an IPv4 address or a MAC address change occurs.

### Configuring Gratuitous ARP

By default, Arista switch interfaces reject gratuitous ARP request packets. The `arp gratuitous accept` command configures an L3 interface to accept the gratuitous ARP request packets sent from a different device in the network and add their mappings to the ARP table. Gratuitous ARP can be configured on Ethernet interfaces, VLANs/SVI, or L3 port channels, but has no effect on L2 interfaces.

**Example:**

These commands enable gratuitous ARP packet acceptance on *Ethernet interface 2/1*.

```
switch (config)#interface ethernet 2/1
switch (config-if-Et2/1)#arp gratuitous accept
```

### 12.1.1.4 Displaying ARP Entries

The `show ip arp` command displays ARP cache entries that map an IP address to a corresponding MAC address. The table displays addresses by their host names when the command includes the `resolve` argument.

**Examples:**

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses.

```
switch>show ip arp
Address           Age (min)  Hardware Addr  Interface
172.25.0.2        0          004c.6211.021e  Vlan101, Port-
Channel2
172.22.0.1        0          004c.6214.3699  Vlan1000, Port-
Channel1
172.22.0.2        0          004c.6219.a0f3  Vlan1000, Port-
Channel1
172.22.0.3        0          0045.4942.a32c  Vlan1000,
Ethernet33
172.22.0.5        0          f012.3118.c09d  Vlan1000, Port-
Channel1
172.22.0.6        0          00e1.d11a.a1eb  Vlan1000, Ethernet5
172.22.0.7        0          004f.e320.cd23  Vlan1000, Ethernet6
172.22.0.8        0          0032.48da.f9d9  Vlan1000,
Ethernet37
172.22.0.9        0          0018.910a.1fc5  Vlan1000,
Ethernet29
172.22.0.11       0          0056.cbe9.8510  Vlan1000,
Ethernet26

switch>
```

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses. Host names assigned to IP addresses are displayed in place of the address.

```
switch>show ip arp resolve
Address           Age (min)  Hardware Addr  Interface
green-vl101.new   0          004c.6211.021e  Vlan101, Port-
Channel2
172.22.0.1        0          004c.6214.3699  Vlan1000, Port-
Channel1
orange-vl1000.n   0          004c.6219.a0f3  Vlan1000, Port-
Channel1

172.22.0.11         0 0056.cbe9.8510 Vlan1000,
Ethernet26

switch>

```

### 12.1.1.4.1 ARP Inspection

Address Resolution Protocol (ARP) inspection command `ip arp inspection vlan` activates a security feature that protects the network from ARP spoofing. ARP requests and responses on untrusted interfaces are intercepted on specified VLANs, and intercepted packets are verified to have valid IP-MAC address bindings. All invalid ARP packets are dropped. On trusted interfaces, all incoming ARP packets are processed and forwarded without verification.

#### Enabling and Disabling ARP Inspection

By default, ARP inspection is disabled on all VLANs.

#### Examples:

- This command enables ARP inspection on VLANs 1 through 150.

```

switch(config)#ip arp inspection vlan 1 - 150
switch(config)#

```

- This command disables ARP inspection on VLANs 1 through 150.

```

switch(config)#no ip arp inspection vlan 1 - 150
switch(config)#

```

- This command sets the ARP inspection default to VLANs 1 through 150.

```

switch(config)#default ip arp inspection vlan 1 - 150
switch(config)#

```

- These commands enable ARP inspection on multiple VLANs 1 through 150 and 200 through 250.

```

switch(config)#ip arp inspection vlan 1-150,200-250
switch(config)#

```

#### Syslog for Invalid ARP Packets Dropped

When an invalid ARP packet is dropped, the following syslog message appears. The log severity level can be set higher if required.

```

%SECURITY-4-ARP_PACKET_DROPPED: Dropped ARP packet on interface
Ethernet28/1 Vlan
2121 because invalid mac and ip binding. Received: 00:0a:00:bc:0
0:de/1.1.1.1.

```

---

## Displaying ARP Inspection States

The command `show ip arp inspection vlan` displays the configuration and operation state of ARP inspection. For a VLAN range specified by `show ip arp inspection vlan` only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed. The operation state turns to **Active** when hardware is ready to trap ARP packets for inspection.

### Example:

This command displays the configuration and operation state of ARP inspection for VLANs 1 through 150.

```
switch(config)#show ip arp inspection vlan 1 - 150

VLAN 1
-----
Configuration
: Enabled
Operation State : Active
VLAN 2
-----
Configuration
: Enabled
Operation State : Active
{...}
VLAN 150
-----
Configuration
: Enabled
Operation State : Active

switch(config)#
```

## Displaying ARP Inspection Statistics

The command `show ip arp inspection statistics` displays the statistics of inspected ARP packets. For a VLAN specified by `show ip arp inspection statistics` only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed.

The command `clear arp inspection statistics` clears ARP inspection.

### Examples:

- This command displays ARP inspection statistics for *VLAN 1*.

```
switch(config)#show ip arp inspection statistics vlan 2

Vlan : 2
-----
ARP Req Forwarded = 20
ARP Res Forwarded = 20
ARP Req Dropped = 1
ARP Res Dropped = 1

Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: Ethernet 3/1
```

```
Packet:
Source MAC: 00:01:00:01:00:01
Dest MAC: 00:02:00:02:00:02
ARP Type: Request
ARP Sender MAC: 00:01:00:01:00:01
ARP Sender IP: 1.1.1
```

```
switch(config)#
```

- This command displays ARP inspection statistics for *Ethernet interface 3/1*.

```
switch(config)#show ip arp inspection statistics ethernet
interface 3/1
```

```
Interface : 3/1
```

```
-----
ARP Req Forwarded = 10
ARP Res Forwarded = 10
ARP Req Dropped = 1
ARP Res Dropped = 1
```

```
Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: VLAN 10
Packet:
Source MAC: 00:01:00:01:00:01
Dest MAC: 00:02:00:02:00:02
ARP Type: Request
ARP Sender MAC: 00:01:00:01:00:01
ARP Sender IP: 1.1.1
```

```
switch(config)#
```

- This command clears ARP inspection statistics.

```
switch(config)#clear arp inspection statistics
switch(config)#
```

### Configure Trust Interface

By default, all interfaces are untrusted. The command `ip arp inspection trust` configures the trust state of an interface.

#### Examples:

- This command configures the trust state of an interface.

```
switch(config)#ip arp inspection trust
switch(config)#
```

- This command configures the trust state of an interface to untrusted.

```
switch(config)#no ip arp inspection trust
switch(config)#
```

- This command configures the trust state of an interface to its default (untrusted).

```
switch(config)#default ip arp inspection trust
```

```
switch(config)#
```

## Configure Rate Limit

When ARP inspection is enabled, ARP packets are trapped to the CPU. Two actions can be taken when the incoming ARP rate exceeds expectation. For notification purpose, the command `ip arp inspection logging` will enable logging of the incoming ARP packets. To prevent a denial-of-service attack, the command `ip arp inspection limit` will error-disable interfaces.

### Examples:

- This command enables logging of incoming ARP packets when its rate exceeds the configured value, and sets the rate to 2048 (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to 15 seconds.

```
switch(config)#ip arp inspection logging rate 2048 burst
interval 15
switch(config)#
```

- This command configures the rate limit of incoming ARP packets to errdisable the interface when the incoming ARP rate exceeds the configured value, sets the rate to 512 (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to 11 seconds.

```
switch(config)#ip arp inspection limit rate 512 burst interval
11
switch(config)#
```

- This command displays verification of the interface specific configuration.

```
switch(config)#interface Ethernet 3 / 1
switch(config)#ip arp inspection limit rate 20 burst interval
5
switch(config)#interface Ethernet 3 / 3
switch(config)#ip arp inspection trust
switch(config)#show ip arp inspection interfaces
```

| Interface | Trust State | Rate (pps) | Burst Interval |
|-----------|-------------|------------|----------------|
| Et3/1     | Untrusted   | 20         | 5              |
| Et3/3     | Trusted     | None       | N/A            |

```
switch(config)#
```

## Configure Errdisable Caused by ARP Inspection

If the incoming ARP packet rate on an interface exceeds the configured rate limit in burst interval, the interface will be errdisabled (by default). If errdisabled, the interface will stay in this state until you intervene with the command `errdisable detect cause arp-inspection` (e.g., after you perform a `shutdown` or `no shutdown` of the interface) or it automatically recovers after a certain time period. The command `errdisable recovery cause arp-inspection` will enable auto recovery. The command `errdisable recovery interval` will enable sharing the auto recovery interval among all errdisable interfaces. (See the chapter “Data Transfer” for information on all `errdisable` commands.)

**Examples:**

- This command enables errdisable caused by an ARP inspection violation.

```
switch(config)#errdisable detect cause arp-inspection
switch(config)#
```

- This command disables errdisable caused by an ARP inspection violation.

```
switch(config)#no errdisable detect cause arp-inspection
switch(config)#
```

- This command enables auto recovery.

```
switch(config)#errdisable recovery cause arp-inspection
switch(config)#
```

- This command disables auto recovery.

```
switch(config)#no errdisable recovery cause arp-inspection
switch(config)#
```

- This command enables sharing the auto recovery interval of 10 seconds among all errdisable interfaces.

```
switch(config)#errdisable recovery interval 10
switch(config)#
```

- This command disables sharing the auto recovery interval of 10 seconds among all errdisable interfaces.

```
switch(config)#no errdisable recovery interval 10
switch(config)#
```

- This command displays the reason for a port entering the errdisable state.

```
switch(config)#show interfaces status errdisabled

Port          Name          Status          Reason
-----
Et3/2                errdisabled    arp-inspection

switch(config)#
```

**Configure Static IP MAC Binding**

The ARP inspection command [ip source binding](#) allows users to add static IP-MAC binding. If enabled, ARP inspection verifies incoming ARP packets based on the configured IP-MAC bindings. The static IP-MAC binding entry can only be configured on Layer 2 ports. By default, there is no binding entry on the system.

**Examples:**

- This command configures static IP-MAC binding for IP address *127.0.0.1*, MAC address *0001.0001.0001*, VLAN 1, and Ethernet interface *slot 4 and port 1*.

```
switch(config)#ip source binding 127.0.0.1 0001.0001.0001 vlan
1 interface
ethernet 4/1
```

```
switch(config)#
```

- This command configures static IP-MAC binding for IP address *127.0.0.1*, MAC address *0001.0001.0001*, VLAN *1*, and *port-channel interface 20*.

```
switch(config)#ip source binding 127.0.0.1 0001.0001.0001 vlan
1 interface
port-channel 20
switch(config)#
```

- This command displays the configured IP-MAC binding entries. Note that the Lease column is mainly used for displaying dynamic DHCP snooping binding entries. For static binding entries, lease time is shown as infinite.

```
switch(config)#show ip source binding 127.0.0.1 0001.0001.0001
static vlan 1
interface port-channel 20
```

| MacAddress     | IpAddress | Lease(sec) | Type   | VLAN | Interface      |
|----------------|-----------|------------|--------|------|----------------|
| 0001.0001.0001 | 127.0.0.1 | infinite   | static | 1    | Port-Channel20 |

```
switch(config)#
```

## 12.1.2 IPv4 Routing

Internet Protocol version 4 (IPv4) is a communications protocol used for relaying network packets across a set of connected networks using the Internet Protocol suite. Routing transmits network layer data packets over connected independent subnets. Each subnet is assigned an IP address range and each device on the subnet is assigned an IP address from that range. The connected subnets have IP address ranges that do not overlap.

A router is a network device that connects multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets' destination address. IPv4 and IPv6 are internet layer protocols that define packet-switched internetworking, including source-to-destination datagram transmission across multiple networks.

These sections describe IPv4 routing and route creation options:

- [Enabling IPv4 Routing](#)
- [Static and Default IPv4 Routes](#)
- [Dynamic IPv4 Routes](#)
- [Viewing IPv4 Routes and Network Components](#)

### 12.1.2.1 Enabling IPv4 Routing

When IPv4 routing is enabled, the switch attempts to deliver inbound packets to destination IPv4 addresses by forwarding them to interfaces or next hop addresses specified by the forwarding table.

The [ip routing](#) command enables IPv4 routing.

#### Example:

This command enables IP routing:

```
switch(config)#ip routing
```

```
switch(config)#
```

### 12.1.2.2 Static and Default IPv4 Routes

Static routes are entered through the CLI and are typically used when dynamic protocols are unable to establish routes to a specified destination prefix. Static routes are also useful when dynamic routing protocols are not available or appropriate. Creating a static route associates a destination IP address with a local interface. The routing table refers to these routes as connected routes that are available for redistribution into routing domains defined by dynamic routing protocols.

The `ip route` command creates a static route. The destination is a network segment; the nexthop is either an IP address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of 200 is overridden by OSPF intra-area routes, which have a default distance of 110.

A route tag is a 32-bit number that is attached to a route. Route maps use tags to filter routes. Static routes have a default tag value of 0.

#### Example:

This command creates a static route:

```
switch(config)#ip route 172.17.252.0/24 vlan 500  
switch(config)#
```

### Creating Default IPv4 Routes

The default route denotes the packet forwarding rule that takes effect when no other route is configured for a specified IPv4 address. All packets with destinations that are not established in the routing table are sent to the destination specified by the default route.

The IPv4 destination prefix is 0.0.0.0/0 and the next-hop is the default gateway.

#### Example:

This command creates a default route and establishes 192.14.0.4 as the default gateway address:

```
switch(config)#ip route 0.0.0.0/0 192.14.0.4  
switch(config)#
```

### 12.1.2.3 Dynamic IPv4 Routes

Dynamic routes are established by dynamic routing protocols. These protocols also maintain the routing table and modify routes to adjust for topology or traffic changes. Routing protocols assist the switch in communicating with other devices to exchange network information, maintaining routing tables, and establishing data paths.

The switch supports these dynamic IPv4 routing protocols:

- [OSPFv2 Introduction](#)

- [Border Gateway Protocol \(BGP\)](#)
- [Routing Information Protocol \(RIP\)](#)
- [IS-IS](#)

#### 12.1.2.4 Viewing IPv4 Routes and Network Components

##### Displaying the FIB and Routing Table

The `show ip route` command displays routing table entries that are in the forwarding information base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal-cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The `show running-config` command displays configured commands not in the FIB. The `show ip route summary` command displays the number of routes, categorized by source, in the routing table.

##### Examples:

- This command displays IP routes learned through BGP.

```
switch>show ip route bgp

Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type
       1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type
       1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, A - Aggregate

B E   170.44.48.0/23 [20/0] via 170.44.254.78
B E   170.44.50.0/23 [20/0] via 170.44.254.78
B E   170.44.52.0/23 [20/0] via 170.44.254.78
B E   170.44.54.0/23 [20/0] via 170.44.254.78
B E   170.44.254.112/30 [20/0] via 170.44.254.78
B E   170.53.0.34/32 [1/0] via 170.44.254.78
B I   170.53.0.35/32 [1/0] via 170.44.254.2
                               via 170.44.254.13
                               via 170.44.254.20
                               via 170.44.254.67
                               via 170.44.254.35
                               via 170.44.254.98

switch>
```

- This command displays a summary of routing table contents.

```
switch>show ip route summary

Route Source          Number Of Routes
-----
connected              15
static                  0
ospf                    74
  Intra-area: 32 Inter-area:33 External-1:0 External-2:9
  NSSA External-1:0 NSSA External-2:0
bgp                      7
  External: 6 Internal: 1
internal                45
attached                18
aggregate               0
```

```
switch>
```

### Displaying the IP Route Age

The [show ip route age](#) command displays the time when the route for the specified network was present in the routing table. It does not account for the changes in parameters like metric, next-hop etc.

#### Example:

This command displays the amount of time since the last update to ip route *172.17.0.0/20*.

```
switch>show ip route 172.17.0.0/20 age

Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I - ISIS, A - Aggregate

B E    172.17.0.0/20 via 172.25.0.1, age 3d01h

switch>
```

### Displaying Gateways

A gateway is a router that provides access to another network. The gateway of last resort, also known as the default route, is the route that a packet uses when the route to its destination address is unknown. The IPv4 default route in is *0.0.0.0/0*.

The [show ip route gateway](#) command displays IP addresses of all gateways (next hops) used by active routes.

#### Example:

This command displays next hops used by active routes.

```
switch>show ip route gateway

The following gateways are in use:
172.25.0.1 Vlan101
172.17.253.2 Vlan2000
172.17.254.2 Vlan2201
172.17.254.11 Vlan2302
172.17.254.13 Vlan2302
172.17.254.17 Vlan2303
172.17.254.20 Vlan2303
172.17.254.66 Vlan2418
172.17.254.67 Vlan2418
172.17.254.68 Vlan2768
172.17.254.29 Vlan3020

switch>
```

## Displaying Host Routes

The `show ip route host` command displays all host routes in the host forwarding table. Host routes are those whose destination prefix is the entire address (mask = 255.255.255.255 or prefix = /32). Each displayed host route is labeled with its purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **B** broadcast address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

### Example:

This command displays all host routes in the host forwarding table.

```
switch#show ip route host

R - receive B - broadcast F - FIB, A - attached

F 127.0.0.1 to cpu
B 172.17.252.0 to cpu
A 172.17.253.2 on Vlan2000
R 172.17.253.3 to cpu

## 12.1.3 IPv4 Multicast Counters

IPv4 multicast counters allow association of IPv4 multicast routes with a packet or byte counter.

This chapter contains the following sections.

- [Multicast Counters Hardware Overview](#)
- [Multicast Counters iBGP and eBGP Configuration](#)
- [Configuring IPv4 Multicast Counters](#)

### 12.1.3.1 Multicast Counters Hardware Overview

This section describes a hardware overview for multicast counters, and contains the following sections.

- [Platform Independent Requirements for Counters](#)
- [Policer Counter Overview](#)

- [BGP Functions Supported for Arista Switches](#)
- [Additional Requirements](#)

#### 12.1.3.1.1 Platform Independent Requirements for Counters

The following platform independent requirements include:

- Enable/Disable counters
- Clear counters
- Show counters
- Configure counter mode for byte (default) or frame mode

#### 12.1.3.1.2 Policer Counter Overview

The switch hardware has two policer banks, each with 4k entries and each entry has one 32 bit entry1, and one 32 bit entry2, which can be used as either packet counter or byte counter.

In the pipeline, each bank can have one policer index coming from upstream blocks, which means different features cannot update multiple policer entries in the same bank simultaneously. Therefore, different features cannot share entries in the same bank.

In switch hardware routing, each FFU/BST entry points to a corresponding RAM. A policer index is saved in the action ram, so when installing a multicast route into hardware, platform code will get a policer index and saved in the action field. If a policer index is unavailable, a counter is not added to the action field.

Switch hardware can have multiple features competing for the policer banks. It is desirable to have a platform command to reserve policer banks dedicated for a certain feature.

The following command reserves one or two policer banks to be used only by the named feature:

```
[no] platform fm6000 [nat | acl | qos | multicast] policer banks <1|2>
```

Available bank(s) are reserved for the feature. Otherwise the command takes effect at the next reboot or FocalPointV2 agent restart. This reservation guarantees the configured number of bank(s) for this feature. However, the feature can still possibly obtain the other policer bank if it needs more, and the other bank is available.

If a feature has a pending reservation request which is not fulfilled because of availability, and some other feature frees a bank, the bank will be allocated to the pending feature.

#### 12.1.3.1.3 BGP Functions Supported for Arista Switches

Arista switches support these BGP functions:

- A single BGP instance
- Simultaneous internal (IBGP) and external (EBGP) peering
- Multiprotocol BGP
- BGP Confederations

#### 12.1.3.1.4 Additional Requirements

On switch hardware, the following additional requirements include:

- Reservation of policer banks
- Notification of policer bank availability when a policer entry is freed by other features

---

### 12.1.3.2 Multicast Counters iBGP and eBGP Configuration

This section describes the commands required to configure an iBGP and an eBGP topology, and contains the following sections.

- [Policer Usage](#)

#### 12.1.3.2.1 Policer Usage

There are two types of counters – those created by wildcard creation and by specific creation. When a specific counter is required and the hardware runs out of policer entries, a wildcard counter is forced to give up its policer entry.

If the user configures a specific counter and the starter group (SG) already has a wildcard-created counter for it, then this counter is upgraded to a specific one, with no change in hardware policer index. If the user configures both a wildcard counter and specific counter for this SG, and subsequently deletes the specific counter, the counter for this SG is downgraded to a wildcard, with no change in hardware policer index. However, if another specific counter is pending for a hardware policer index, then this policer entry will be assigned to that counter due to its higher precedence.

Even if a counter is configured by the user, in order to conserve the use of hardware resources, we should not allocate a policer entry until a real route (G, S) is programmed into the frame filtering and forwarding unit (FFU).

### 12.1.3.3 Configuring IPv4 Multicast Counters

Perform the following CLI steps to configure IPv4 multicast counters on the FM6000 platform:

1. Execute the global configuration command:

- **no | default ip multicast count bytes | packets**

Enables wildcard counters. Also used to change bytes / packets mode. When hardware runs out of resources, specific creation has priority to preempt counters from wildcard creation. The **bytes | packets** optional keyword enables the counter to be in either bytes mode or packets mode. This mode applies to all counters. When the counter mode changes, all counter values will be reset to zero.

- **no | default ip multicast count <G> <S>**

This only takes effect when **ip multicast count** is enabled. Either **<G, S>** or **bytes | packets** optional keyword is used. They can not be used concurrently.

No | default Commands: (default is same as no)

- **no ip multicast count** Deletes all multicast counters, including explicit **<G> <S>** routes
- **no ip multicast count <G> <S>** Removes the config. Does not delete the counter because the wildcard is still active.
  - If no **<G, S>** is specified, all multicast routes will have counters unless the hardware runs out of resources. The creation of counters is referred to as “wildcard creation.”
  - If **<G, S>** is specified, only **<G, S>** will get a counter (and no other route). The creation of counters is referred to as “specific creation.” By default, all mcast routes will have counters allocated. This **<G, S>** configuration is applicable when the hardware runs out of resources. Specific **<G, S>** creation has priority to preempt counters from wildcard creation.

The **byte | frame** optional keyword enables the counter to be in either byte mode or frame mode. This mode applies to all counters. When the counter mode changes, all counter values will be reset to zero.

Either **<G, S>**, or **byte | frame** optional keywords are used but cannot be used together. All counters are **byte | frame**. The **byte | frame** mode is global, and not applicable on a **<G, S>** basis.

2. Execute clear command:

- ```
clear ip multicast count <G> <S>
```

3. Execute show command:

- ```
show multicast fib ipv4 <G> count
```

This command currently exists but does not show anything.

This show command is intended to display the following (example):

```
switch>show multicast fib ipv4 count
Activity poll time: 60 seconds
225.1.1.1 100.0.0.2
Byte: 123
Vlan100 (iif)
Vlan200
Activity 0:00:47 ago
```

Total counts is the sum of counts from all sources in that group.

The count value can be **N/A** if a mroute does not have an associated counter.

If the count value for any source in a **<G>** is **N/A**, then the total counts for **<G>** will be shown as **N/A**. However, the count values for other sources are still shown.

## 12.1.4 Route Management

When routing is enabled, the switch discovers the best route to a packet's destination address by exchanging routing information with other devices. IP routing is disabled by default.

The following sections describes routing features that the switch supports:

- [Route Redistribution](#)
- [Equal Cost Multipath Routing \(ECMP\) and Load Sharing](#)
- [Unicast Reverse Path Forwarding \(uRPF\)](#)
- [Routing Tables / Virtual Routing and Forwarding \(VRF\)](#)
- [RIB Route Control](#)

### 12.1.4.1 Route Redistribution

Route redistribution is the advertisement, into a dynamic routing protocol's routing domain, of connected (static) routes or routes established by other routing protocols. By default, the switch advertises only routes in a routing domain that are established by the protocol that defined the domain.

Route redistribution commands specify the scope of the redistribution action. By default, all routes from a specified protocol (or all static routes) are advertised into the routing domain. Commands can also filter routes by applying a route map, which defines the subset of routes to be advertised.

### 12.1.4.2 Equal Cost Multipath Routing (ECMP) and Load Sharing

Equal cost multi-path (ECMP) is a routing strategy where traffic is forwarded over multiple paths that have equal routing metric values.

---

## Configuring ECMP (IPv4)

All ECMP paths are assigned the same tag value; commands that change the tag value of a path also change the tag value of all paths in the ECMP route.

In a network topology using ECMP routing, hash polarization may result when all switches perform identical hash calculations. Hash polarization leads to uneven load distribution among the data paths. Hash polarization is avoided when switches use different hash seeds to perform hash calculations.

The [ip load-sharing](#) command provides the hash seed to an algorithm that the switch uses to distribute data streams among multiple equal-cost routes to a specified subnet.

### Example:

This command sets the IPv4 load sharing hash seed to 20:

```
switch(config)#ip load-sharing fm6000 20
switch(config)#
```

## Multicast Traffic Over ECMP

The switch attempts to spread outbound unicast and multicast traffic to all ECMP route paths equally. To disable the sending of multicast traffic over ECMP, use the [multipath none](#) command or the no version of the [multipath deterministic](#) command.

## Resilient ECMP

Resilient ECMP is used for those prefixes where it is not desirable for routes to be rehashed due to link flap, typically where ECMP is being used for load balancing. Resilient ECMP configures a fixed number of next-hop entries in the hardware ECMP table for all the routes within a specified IP address prefix. Implementing fixed table entries for a specified next-hop address allows data flows that are hashed to a valid next-hop number to remain intact even when some of the next hops go down or come back online.

Resilient ECMP is enabled for all routes within a specified prefix using the [ip hardware fib ecmp resilience](#) command. The command specifies the maximum number of next-hop addresses that the hardware ECMP table can contain for the specified IP prefix, and configures a redundancy factor that facilitates the duplication of next-hop addresses in the table. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor. When the table contains the maximum number of next-hop addresses, the redundancy factor specifies the number of times each address is listed in the table. When the table contains fewer than the maximum number of next-hop addresses, the table space entries are filled by additional duplication of the next-hop addresses.

Resilient ECMP is also available for IPv6 IP addresses.

### Example:

This command configures a hardware ECMP table space of 24 entries for the IP address *10.14.2.2/24*. A maximum of six next-hop addresses can be specified for the IP address. When the table contains six next-hop addresses, each appears in the table four times. When the table contains fewer than six next-hop addresses, each is duplicated until the 24 table entries are filled.

```
switch(config)#ip hardware fib ecmp resilience 10.14.2.2/24
capacity 6 redundancy 4
```

```
switch(config)#
```

### 12.1.4.3 Unicast Reverse Path Forwarding (uRPF)

Unicast Reverse Path Forwarding (uRPF) verifies the accessibility of source IP addresses in packets that the switch forwards. The switch drops a packet when uRPF determines that the routing table does not contain an entry with a valid path to that packet's source IP address.

IPv4 and IPv6 uRPF operate independently. uRPF is VRF aware. Commands that do not specify a VRF utilize the default instance. Multicast routing is not affected by uRPF.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode:** uRPF also verifies that a packet is received on the interface that its routing table entry will use for its return packet.
- **Loose mode:** uRPF validation does not consider the inbound packet's ingress interface.

#### 12.1.4.3.1 uRPF Operation

uRPF is configurable on interfaces. For packets arriving on a uRPF-enabled interfaces, the source IP address is verified by examining the source and destination addresses of unicast routing table entries.

uRPF requires a reconfigured routing table to support IP address verification. When uRPF is enabled for the first time, unicast routing is briefly disabled to facilitate the routing table reconfiguration. Multicast routing is not affected by the initial uRPF enabling.

A packet fails uRPF verification if the table does not contain an entry whose source or destination address matches the packet's source IP address. In strict mode, the uRPF also fails when the matching entry's outbound interface does not match the packet's ingress interface.

uRPF verification is not available for the following packets:

- DHCP (Source is *0.0.0.0* – Destination is *255.255.255.255*)
- IPv6 link local (*FE80::/10*)
- Multicast packets

#### ECMP uRPF

When verifying ECMP routes, strict mode checks all possible paths to determine that a packet is received on the correct interface. Strict mode is supported for ECMP groups with a maximum of eight routing table entries. The switch reverts to loose mode for ECMP groups that exceed eight entries.

#### Default Routes

uRPF strict mode provides an `allow-default` option that accepts default routes. On interfaces that enable `allow-default` and a default route is defined, uRPF strict mode validates a packet even when the routing table does not contain an entry that matches the packet's source IP address. When `allow-default` is not enabled, uRPF does not consider the default route when verifying an inbound packet.

#### Null Routes

NULL0 routes drop traffic destined to a specified prefix. When uRPF is enabled, traffic originating from a null route prefixes is dropped in strict and loose modes.

#### 12.1.4.3.2 uRPF Configuration

Unicast Reverse Path Forwarding (uRPF) is enabled for IPv4 packets ingressing the configuration mode interface through the `ip verify` command.

**Note:** uRPF cannot be enabled on interfaces with ECMP member FECs.

#### Examples:

- This command enables uRPF loose mode on *VLAN interface 17*.

```
switch(config)#interface vlan 17
switch(config-if-Vl17)#ip verify unicast source reachable-via
any
switch(config-if-Vl17)#show active
interface Vlan17
ip verify unicast source reachable-via any
switch(config-if-Vl17)#
```

- This command enables uRPF strict mode on *VLAN interface 18*.

```
switch(config)#interface vlan 18
switch(config-if-Vl18)#ip verify unicast source reachable-via
rx
switch(config-if-Vl18)#show active
interface Vlan18
ip verify unicast source reachable-via rx
switch(config-if-Vl18)#
```

### 12.1.4.4 Routing Tables / Virtual Routing and Forwarding (VRF)

An IP routing table is a data table that lists the routes to network destinations and metrics (distances) associated with those routes. A routing table is also known as a routing information base (RIB).

Virtual Routing and Forwarding (VRF) allows traffic separation by maintaining multiple routing tables. Arista switches support multiple VRF instances: one global or default VRF called “default” and multiple user-defined VRFs; the number of user-defined VRFs supported varies by platform. VRFs can be used as management or data plane VRFs.

- Management VRFs have routing disabled. They are typically used for management-related traffic.
- Dataplane VRFs have routing enabled. They support routing protocols and packet forwarding (hardware and software).

Dataplane VRFs are supported by Trident, FM6000, and Arad platform switches.

VRFs support unicast IPv4 and IPv6 traffic and multicast traffic. Loopback, SVI, and routed ports may be added to VRFs. Management ports may be added without any hardware forwarding.

To allow overlap in the sets of IP addresses used by different VRF instances, a route distinguisher (RD) may be prepended to each address. RDs are defined in *RFC 4364*.

#### 12.1.4.4.1 Default VRF

The default VRF on Arista switches is called “default.” It is created automatically and cannot be renamed or configured. Some configuration options accept “default” as a VRF input.

#### 12.1.4.4.2 User-Defined VRFs

A user-defined VRF is created with the [vrf instance](#) command. After its creation, a VRF may be assigned a route distinguisher (RD) with the [rd \(VRF configuration mode\)](#) command in the VRF submode of Router-BGP Configuration Mode.

**Examples:**

- These commands create a VRF named “purple,” place the switch in BGP VRF configuration mode for that VRF, and specify a route distinguisher for the VRF identifying the administrator as AS 530 and assigning 12 as its local number.

```
switch(config)#vrf instance purple
switch(config-vrf-purple)#router bgp 50
switch(config-router-bgp)#vrf purple
switch(config-router-bgp-vrf-purple)#rd 530:12
switch(config-router-bgp-vrf-purple)#
```

- To add interfaces to a user-defined VRF, enter configuration mode for the interface and use the `vrf (Interface mode)` command. Loopback, SVI, and routed ports can be added to a VRF.

These commands add VLAN 20 to the VRF named “purple.”

```
switch(config)#interface VLAN 20
switch(config-if-Vl20)#vrf purple
switch(config-if-Vl20)#
```

- The `show vrf` command shows information about user-defined VRFs on the switch.

This command displays information for the VRF named “purple”.

```
switch>show vrf purple
Vrf          RD          Protocols    State
-----
Interfaces
-----
purple      64496:237   ipv4         no routing
Vlan42, Vlan43

switch>
```

**12.1.4.4.3 Context-Active VRF**

The context-active VRF specifies the default VRF that VRF-context aware commands use when displaying or refreshing routing table data.

VRF-context aware commands include:

- `clear arp-cache`
- `show ip`
- `show ip arp`
- `show ip route`
- `show ip route gateway`
- `show ip route host`

The `cli vrf` command specifies the context-active VRF.

**Example:**

This command specifies *magenta* as the context-active VRF.

```
switch#cli vrf magenta
switch#show routing-context vrf
```

```
Current VRF routing-context is magenta
```

The `show routing-context vrf` command displays the context-active VRF.

**Example:**

This command displays the context-active VRF.

```
switch>show routing-context vrf
Current VRF routing-context is magenta

switch>
```

### 12.1.4.5 RIB Route Control

The routing database (RIB) is composed of the routing information learned by the routing protocols, including static routes. The forwarding database (FIB) is composed of the routes actually used to forward traffic through a router.

Forwarding Information Base (FIB) makes IP destination prefix-based switching decisions. The FIB is similar to a routing table or information base. It maintains the forwarding information for the winning routes from the RIB. When routing or topology changes occur in the network, the IP routing table information is updated, and those changes are reflected in the FIB.

#### 12.1.4.5.1 Configuring FIB policy

The RIB calculates the best/winning routes to each destination and place these routes in the forwarding table. Based on the FIB policy configured the best routes are advertised.

For example, a FIB policy can be configured to deny the routes for FIB programming, however, it does not prevent these routes from being advertised by a routing protocol, or to be redistributed into another routing domain, or to be used for recursive resolution in the IP RIB. FIB policies control the size and content of the routing tables, and the best route to take to reach a destination.

The `rib ipv4 | ipv6 fib policy` command is used to enable FIB policy for a particular VRF under router general configuration mode.

The following match statements are supported:

- match interface
- match { ip | ipv6 } address prefix-list
- match { ip | ipv6 } resolved-next-hop prefix-list
- match isis level
- match metric
- match source-protocol

**Example:**

The following example enables FIB policy for IPv4 in the default VRF, using the route map, *map1*.

```
switch(config)#router general
switch(config-router-general)#vrf default
```

```
switch(config-router-general-vrf-default)#rib ipv4 fib policy
map1
```

### 12.1.4.5.2 Displaying FIB Information

Use the **show rib route <ipv4 | ipv6> fib policy exclude** command to display the RIB information. The fib policy exclude option displays the RIB routes that have been excluded from being programmed into FIB, by FIB policy.

#### Example:

The following example displays the routes filtered by FIB policy using the fib policy excluded option of the **show rib route ip|ipv6** command.

```
switch#show rib route ipv6 fib policy excluded
switch#show rib route ip bgp fib policy excluded

VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>B 10.1.0.0/24 [200/0]
    via 10.2.2.1 [115/20] type tunnel
    via 10.3.5.1, Ethernet1
    via 10.2.0.1 [115/20] type tunnel
    via 10.3.4.1, Ethernet2
    via 10.3.6.1, Ethernet3
>B 10.1.0.0/24 [200/0]
    via 10.2.2.1 [115/20] type tunnel
    via 10.3.5.1, Ethernet1
    via 10.2.0.1 [115/20] type tunnel
    via 10.3.4.1, Ethernet2
    via 10.3.6.1, Ethernet3
```

### 12.1.4.5.3 Displaying RIB Route Information

Use the **show rib route ip** command to view the IPv4 RIB information.

#### Example:

This command displays IPv4 RIB static routes.

```
switch#show rib route ip static

VRF name: default, VRF ID: 0xfe, Protocol: static
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>S 10.80.0.0/12 [1/0]
    via 172.30.149.129 [0/1]
    via Management1, directly connected
>S 172.16.0.0/12 [1/0]
    via 172.30.149.129 [0/1]
    via Management1, directly connected
```

```
switch#
```

## 12.1.5 IPv4 Route Scale

IPv4 routes are optimized to achieve route scale when route distribution has a large number of routes of one or two parameters, with each parameter consisting of prefix lengths 12, 16, 20, 24, 28, and 32. If two separate prefix lengths are configured (in any order), one of them must be the prefix length of 32.

 **Note:** IPv4 Route Scale cannot be used with AlgoMatch.

The following sections describes IPv4 route scale configuration, show commands, and system log messages:

- [Configuring IPv4 Route Scale](#)
- [IPv4 Routescale with 2-to-1 Compression](#)
- [Show Commands](#)
- [Syslog](#)

### 12.1.5.1 Configuring IPv4 Route Scale

IPv4 route scale is enabled by the [ip hardware fib optimize](#) command for the configuration mode interface. The platform Layer 3 agent is restarted to ensure IPv4 routes are optimized with the [agent SandL3Unicast terminate](#) command for the configuration mode interface.

#### Example:

This configuration command allows configuring prefix lengths 12 and 32.

```
switch(config)#ip hardware fib optimize exact-match prefix-length
12 32
! Please restart layer 3 forwarding agent to ensure IPv4 routes
are optimized
```

One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform Layer 3 agent must be restarted.

#### Example:

This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

#### Example:

This configuration command allows configuring prefix lengths 32 and 16.

```
switch(config)#ip hardware fib optimize exact-match prefix-length
32 16
! Please restart layer 3 forwarding agent to ensure IPv4 routes
are optimized
```

One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform Layer 3 agent must be restarted.

#### Examples:

- This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

- This configuration command allows configuring prefix length 24.

```
switch(config)#ip hardware fib optimize exact-match prefix-
length 24
! Please restart layer 3 forwarding agent to ensure IPv4
routes are optimized
```

In this instance, there is only one prefix-length, so a prefix-length of 32 is not required. For this command to take effect, the platform Layer 3 agent must be restarted.

#### Examples:

- This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

- This configuration command allows configuring prefix length 32.

```
switch(config)#ip hardware fib optimize exact-match prefix-
length 32
! Please restart layer 3 forwarding agent to ensure IPv4
routes are optimized
```

For this command to take effect, the platform Layer 3 agent must be restarted.

- This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

---

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

- This configuration command disables configuring prefix lengths 12 and 32.

```
switch(config)#no ip hardware fib optimize exact-match prefix-length 12 32
! Please restart layer 3 forwarding agent to ensure IPv4 routes are not optimized
```

One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform Layer 3 agent must be restarted.

#### Examples:

- This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are not optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

- This configuration command attempts to configure prefix length 20 and 28 which triggers an error exception. One of the two prefixes in this command must be a prefix-length of 32, which is required in the instance where there are two prefixes.

```
switch(config)#ip hardware fib optimize exact-match prefix-length 20 28
% One of the prefix lengths must be 32
```

### 12.1.5.2 IPv4 Routescale with 2-to-1 Compression

The IPv4 routescale with 2-to-1 compression optimizes certain prefix lengths and enhances the route scale capabilities on 7500R, 7280R, 7500R2, and 7280R2 platforms. The compression is best suited to achieve route scale when route distribution has a large number of routes of one or two prefix lengths.

#### 12.1.5.2.1 Configuring IPv4 Routescale 2-to-1 Compression

Use the `compress` command to increase the hardware resources available for the specified prefix length. This command allows configuring up to one compressed prefix length, and this command is supported only on 7500R, 7280R, 7500R2, and 7280R2 platforms.

**Note:** The `compress` command takes effect only when you restart the platform layer3 agent on 7500R, 7280R, 7500R2, and 7280R2 platforms. Use command `agent SandL3Unicast terminate` to restart the platform layer3 agent.

#### Examples

- In the following example we are configuring prefix length 20 and 24, expanding prefix length 19 and 23, and compressing prefix length 25.

```
switch(config)#ip hardware fib optimize prefix-length 20 24 expand 19 23 compress 25
```

```
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

- In the following example we are configuring prefix length 20 and 23, expanding prefix length 19, compressing prefix length 24.

```
switch(config)#ip hardware fib optimize prefix-length 20 23 expand 19
compress 24
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

- Optionally, you can also use the **internet** profile to configure the IPv4 route scale compression.

```
switch(config)#ip hardware fib optimize prefixes profile internet
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

Configure a new TCAM profile for the **compress** configuration to work, and disable a few features in the new TCAM profile to make space for the flex-route feature in the hardware. Features like **acl vlan ip** and the **mirror ip** have to be disabled, if you need any of these features or any other features to be enabled with flex-route feature, please contact the Arista team.

The **internet** profile works differently based on whether the flex-route feature is enabled in the TCAM profile or not. If the flex-route feature is enabled, the **internet** profile behaves like **ip hardware fib optimize prefix-length 20 23 expand 19 22 compress 24**. If the flex-route feature is disabled, the **internet** profile behaves as **ip hardware fib optimize prefix-length 20 24 expand 19 23**.

### Example

```
switch(config)#hardware tcam
switch(config-hw-tcam)#profile flex-route copy default
switch(config-hw-tcam-profile-flex-route)#feature flex-route copy system-
feature-source-profile
switch(config-hw-tcam-profile-flex-route-feature-flex-route)#exit
switch(config-hw-tcam-profile-flex-route)#no feature acl vlan ip
switch(config-hw-tcam-profile-flex-route)#no feature mirror ip
switch(config-hw-tcam-profile-flex-route)#exit
Saving new profile 'flex-route'
switch(config-hw-tcam)#system profile flex-route
```

### 12.1.5.2.2 Troubleshooting

For 2-to-1 compression feature, the problem areas could be in the variations of:

- FEC could be missing or wrongly computed.
- LEM entry may not be programmed or incorrect.
- With the **compress** configuration enabled:
  - TCAM entry may not be programmed or incorrect.
  - TCAM profile may be incorrectly programmed that generates incorrect TCAM lookup key.

The following commands are used for verification, or to troubleshoot any issues related to 2-to-1 compression feature.

- Use `show platform fap ip route summary` command to check the usage of hardware resource of all IPv4 routes. Also, you can check which prefixes are looked up in LEM.

### Example

```
switch#show platform fap ip route summary
Total number of VRFs: 1
```

```
Total number of routes: 25
Total number of route-paths: 25
Total number of lem-routes: 4
Total number of /20 routes in lem: 1
Total number of /23 routes in lem: 3
```

- Use `show platform fap fec all` to verify if all the FECs.
- Use `show platform fap ip route` to verify all IPv4 routes present in the hardware.

```
switch#show platform fap ip route
Tunnel Type: M(mpls), G(gre), MoG(mpls-over-gre),
              vxlan-o(vxlan outer-rewrite info), vxlan-i(vxlan inner-
rewrite info)
* - Routes in LEM
D - ECMP is divergent across switching chips
-----
|
Routing Table
VRF
ECMP
ID
Code |Index| Index|T Value
-----
|0 |50.1.0.0/20* |ROUTE| Et8 | | | |
00:12:22:34:44:56 | - |32771 | - |1007 |4094 |
|0 |100.1.0.0/23* |ROUTE| Et3 | | | |
00:11:22:33:44:55 | - |32772 | - |1006 |4094 |
|0 |100.1.0.0/23* |ROUTE| Et8 | | | |
00:12:22:34:44:56 | - |32771 | - |1007 |4094 |
|0 |150.1.0.0/23* |ROUTE| Et3 | | | |
00:11:22:33:44:55 | - |32772 | - |1006 |4094 |
|0 |150.1.0.0/23* |ROUTE| Et8 | | | |
00:12:22:34:44:56 | - |32771 | - |1007 |4094 |
|0 |200.1.0.0/23* |ROUTE| Et3 | | | |
00:11:22:33:44:55 | - |32772 | - |1006 |4094 |
```

All optimized routes in LEM will be marked with a “\*” in the output of the above command. In addition, a repeated entry (with different FECs / ECMP FECs) means they are compressed.

- Use `show ip hardware ale routes` to check the IPv4 routes in the pre-compressed / pre-expanded form.

```
switch#show ip hardware ale routes
VrfName : default
^,*,$,@ - Routes are Optimized
Prefix Type FecId
L2AdjIndex Programmed
-----
*50.1.0.0/20 forwardRoute 4294967313 9
True
*$200.1.1.0/24 forwardRoute 4294967312
14 True
*$200.1.0.0/24 forwardRoute 4294967312
14 True
*$100.1.1.0/24 forwardRoute 4294967313 9
True
```

```
*$100.1.0.0/24      forwardRoute      4294967312
 14                True
*$150.1.0.0/23      forwardRoute      4294967313      9
                  True
*@150.1.0.0/24      forwardRoute      4294967312
 14                True
```

All optimized routes in LEM will be marked with a “\*” in the output of the above command. In addition, routes marked with a:

- ‘^’ specifies they are expanded.
  - ‘\$’ specifies two sibling prefixes are compressed.
  - ‘@’ specifies one of the sibling prefix is compressed with a parent prefix.
- Use the `show platform fap lem` to check LEM contents in the hardware.

```
switch#show platform fap lem
Jericho0 LEM:
[ 10272 ] = ( type: Ipv4, destIp: 200.1.0.0, vrf: 0 ) -> ( fec: 32772
(0x8004), eei: 98304 (0x18000) )
[ 24608 ] = ( type: Ipv4, destIp: 150.1.0.0, vrf: 0 ) -> ( fec: 32772
(0x8004), fec2: 32771 (0x8003) )
[ 49184 ] = ( type: Ipv4, destIp: 50.1.0.0, vrf: 0 ) -> ( fec: 32771
(0x8003), eei: 98304 (0x18000) )
[ 69664 ] = ( type: Ipv4, destIp: 100.1.0.0, vrf: 0 ) -> ( fec: 32772
(0x8004), fec2: 32771 (0x8003) )
```

In the above output, on 7500R, 7280R, 7500R2 and 7280R2 platforms, a compressed route will have two FECs in LEM denoted by “fec” and “fec2”.

- Use `show ip hardware fib diff` to check if there are any routes present in the FIB but missing in the hardware, or vice versa.

```
switch#show ip hardware fib diff
```

- Use `show hardware tcam profile` to see if configuring the TCAM profile was successful.

```
switch(config-hw-tcam)#show hardware tcam profile
Configuration      Status
FixedSystem        flex-route         flex-route
```

If there was an issue with the configuration of the TCAM profile, the “Status” would show as “ERROR” in the above show command output.

If the TCAM profile was not configured or there was some error in programming it, and the **compress** option of this feature is enabled, a syslog **SAND\_FLEXROUTE\_ROUTE\_UPDATE\_IGNORED** would be logged when a route that should have been compressed is encountered by the platform.

- Use `show platform fap tcam summary` to check which TCAM bank was allocated to this feature (dbFlexRoute).

```
switch#show platform fap tcam summary
          Tcam Allocation (Jericho0)
Bank      Used By      Reserved By
-----
0         dbFlexRoute      -
12        dbSystem6        -
12        dbTunnelTermination -
12        dbSystem        -
12        dbMplsSystem    -
```

```
13          dbEgressSystem          -
```

- Use `platform fap jericho0 diag diag field res` to figure out the TCAM lookup key.

```
switch#bash cat /var/log/agents/SandFap-* | grep "PMF DB.*dbFlexRoute"
2018-11-28 13:31:31.083455 3075 PmfSm          0 PMF DB 22
( dbFlexRoute )
```

In the output of the above command, PMF DB 22 implies Resource DB 22.

### 12.1.5.2.3 Limitations

- A maximum of two prefix lengths can be optimized directly at any point of time, of which only one can be a non-nibble aligned prefix length. Additional prefix lengths can be optimized using the **expand** or the **compress** options.
- A maximum of 1-to-4 way expansion and 2-to-1 way compression into any optimized prefix length is supported. Multiple expansion prefix lengths can be programmed at any time, however, there can be just one compression prefix length programmed at any given point in time.
- A maximum of 4096 next-hops can be reliably pointed to by the compressed prefixes using 2-to-1 way compression.
- The 2-to-1 compression cannot be enabled along with unicast RPF. When both features are enabled together, unicast RPF functionality may not be correct.
- The flex-route feature in TCAM profiles based only on the default profile, while disabling the **acl vlan ip** and the **mirror ip** features. Please contact the Arista team if any other feature, that is not available in the default TCAM profile, is required to be supported along with the flex-route feature, including support for Mirror to GRE tunnel or ACLs on SVI.
- VXLAN is not supported with the **compress** option of this feature. There is no syslog or a warning message when VXLAN is configured along with the 2-to-1 way compression feature.

### 12.1.5.3 Show Commands

The IPv4 route scale summary is displayed by the `show platform arad ip route summary` command for the configuration mode interface. Resources for all IPv4 route scale routes are displayed by the `show platform arad ip route` command for the configuration mode interface.

#### Examples:

- This command shows hardware resource usage of IPv4 routes.

```
switch(config)#show platform arad ip route summary

Total number of VRFs: 1
Total number of routes: 25
Total number of route-paths: 21
Total number of lem-routes: 4
```

- This command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

```
switch(config)#show platform arad ip route

Tunnel Type: M(mpls), G(gre)
* - Routes in LEM
-----
|                                     Routing Table
-----	-----	-----	-----
-----	-----	-----	-----
```

| VRF  | Destination      |           |                |       | Acl                 |                                |

|      | -  1027          |           | -              |       |                     |                                |

#### 12.1.5.4 Syslog

When the number of routes exceed additional hardware resources, the `ROUTING_LEM_RESOURCE_FULL` syslog message is displayed.

#### 12.1.6 IP Source Guard

IP Source Guard (IPSG) prevents IP spoofing attacks.

IP Source Guard (IPSG) filters inbound IP packets based on their source MAC and IP addresses. IPSG is supported in hardware. IPSG enabled on a Layer 2 port verifies IP packets received on this port. Packets are permitted if each packet source MAC and IP addresses match any of the user-configured IP-MAC binding entries on the receiving VLAN and port. Packets with no match are dropped immediately.

##### 12.1.6.1 Configuring IPSG

IPSG is applicable only to Layer 2 ports, and is enabled by the `ip verify source` command for the configuration mode interface. When configured on Layer 3 ports, IPSG does not take effect until this interface is converted to Layer 2.

IPSG is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Therefore, source IP MAC binding entries should be configured on port channels using the `ip source binding` command. When configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

#### Examples:

- These configuration commands exclude VLAN IDs 1 through 3 from IPSG filtering. When enabled on a trunk port, IPSG filters the inbound IP packets on all allowed VLANs. IP packets received on VLANs 4 through 10 on *Ethernet 36* will be filtered by IPSG, while those received on VLANs 1 through 3 are permitted.

```
switch(config)#no ip verify source vlan 1-3
```

```
switch(config)#interface ethernet 36
switch(config-if-Et36)#switchport mode trunk
switch(config-if-Et36)#switchport trunk allowed vlan 1-10
switch(config-if-Et36)#ip verify source
switch(config-if-Et36)#
```

- This configuration command configures source IP-MAC binding entries to IP address 10.1.1.1, MAC address 0000.aaaa.1111, VLAN ID 4094, and Ethernet interface 36.

```
switch(config)#ip source binding 10.1.1.1 0000.aaaa.1111 vlan
4094 interface ethernet 36
switch(config)#
```

### 12.1.6.2 Show Commands

The IPSG configuration and operational states and IP-MAC binding entries are displayed by the [show ip verify source](#) command for the configuration mode interface.

#### Examples:

- This command verifies the IPSG configuration and operational states.

```
switch(config)#show ip verify source
```

| Interface | Operational State        |
|-----------|--------------------------|
| Ethernet1 | IP source guard enabled  |
| Ethernet2 | IP source guard disabled |

- This command displays all VLANs configured in **no ip verify source vlan**. Hardware programming errors, e.g., VLAN classification failed, are indicated in the operational state. If an error occurs, this VLAN will be considered as enabled for IPSG. Traffic on this VLAN will still be filtered by IPSG.

```
switch(config)#show ip verify source vlan
```

```
IPSG disabled on VLANs: 1-2
VLAN          Operational State
-----
1              IP source guard disabled
2              Error: vlan classification failed
```

- This command displays all source IP-MAC binding entries configured for IPSG. A source binding entry is considered active if it is programmed in hardware. IP traffic matching any active binding entry will be permitted. If a source binding entry is configured on an interface or a VLAN whose operational state is IPSG disabled, this entry will not be installed in the hardware, in which case an “IP source guard disabled” state will be shown. If a port channel has no member port configured, binding entries configured for this port channel will not be installed in hardware, and a “Port-Channel down” state will be shown.

```
switch(config)#show ip verify source detail
```

| Interface     | IP Address | MAC Address    | VLAN | State                    |
|---------------|------------|----------------|------|--------------------------|
| Ethernet1     | 10.1.1.1   | 0000.aaaa.1111 | 5    | active                   |
| Ethernet1     | 10.1.1.5   | 0000.aaaa.5555 | 1    | IP source guard disabled |
| Port-Channel1 | 20.1.1.1   | 0000.bbbb.1111 | 4    | Port-Channel down        |

## 12.1.7 DHCP Relay Across VRF

The EOS DHCP relay agent supports forwarding of DHCP requests to DHCP servers located in a different VRF to the DHCP client interface VRF. In order to enable VRF support for the DHCP relay agent, Option 82 (DHCP Relay Agent Information Option) must first be enabled. The DHCP relay agent uses Option 82 to pass client specific information to the DHCP server.

These sections describe DHCP Relay across VRF features:

- [Global Configuration](#)
- [Show Commands](#)

The DHCP relay agent inserts Option 82 information into the DHCP forwarded request, which requires the DHCP server belongs to a network on an interface, and that interface belongs to a different VRF than the DHCP client interface. Option 82 information includes the following:

- VPN identifier: The VRF name for the ingress interface of the DHCP request, inserted as sub-option 151.

**Table 62: VPN Identifier**

| SubOpt | Len | ASCII VRF Identifier |   |   |   |   |   |   |
|--------|-----|----------------------|---|---|---|---|---|---|
| 151    | 7   | V                    | R | F | N | A | M | E |

- Link selection: The subnet address of the interface that receives the DHCP request, inserted as sub-option 5. When the DHCP smart relay is enabled, the link selection is filled with the subnet of the active address. The relay agent will set the Gateway IP address (gIPAddr) to its own IP address so that DHCP messages can be routed over the network to the DHCP server.

**Table 63: Link Selection**

| SubOpt | Len | Subnet IP Address |    |    |    |
|--------|-----|-------------------|----|----|----|
| 5      | 4   | A1                | A2 | A3 | A4 |

- Server identifier override: The primary IP address of the interface that receives the DHCP request, inserted as sub-option 11. When the DHCP smart relay is enabled, the server identifier is filled with the active address (one of the primary or secondary addresses chosen by smart relay mechanism).

**Table 64: Link Selection**

| SubOpt | Len | Overriding Server Identifier Address |    |    |    |
|--------|-----|--------------------------------------|----|----|----|
| 11     | 4   | B1                                   | B2 | B3 | B4 |

- VSS control suboption as suboption 152: The DHCP server will strip out this suboption when sending the response to the relay, indicating that the DHCP server used VPN information to allocate IP address.

 **Note:**

The DHCP server must be capable of handling VPN identifier information in option 82.

Direct communication between DHCP client and server may not be possible as they are in separate VRFs. The Server identifier override and Link Selection sub-options set the relay agent to act as the DHCP server, and enable all DHCP communication to flow through the relay agent.

---

The relay agent adds all the appropriate sub-options, and forwards all (including renew and release) request packets to the DHCP server. When the DHCP server response messages are received by the relay, Option 82 information is removed and the response is forwarded to the DHCP client in the client VRF.

### 12.1.7.1 Global Configuration

The DHCP relay agent information option is inserted in DHCP messages relayed to the DHCP server. The `ip helper-address` command enables DHCP relay on an interface; and relays DHCP messages to the specified IPv4 address.

**Example:**

This command enables DHCP relay on the interface *Ethernet 1/2*; and relays DHCP messages to the server at *1.1.1.1*.

```
switch(config)#interface ethernet 1/2
switch(config-if-Et1/2)#ip helper-address 1.1.1.1
switch(config-if-Et1/2)#
```

The commands provided in examples below will turn on the attachment of VRF-related tags in the relay agent information option. If both the DHCP client interface and server interface are on the same VRF (default or non-default), then no VRF-related DHCP relay agent information option is inserted.

**Examples:**

- This command configures the DHCP relay to add option 82 information.

```
switch(config)#ip dhcp relay information option
```

- These commands configures two new VRF instances and assign them Route Distinguishers (RDs).

```
switch(config)#vrf instance mtxxg-vrf
switch(config-vrf-mtxxg-vrf)#router bgp 50
switch(config-router-bgp)#vrf mtxxg-vrf
switch(config-router-bgp-vrf-mtxxg-vrf)#rd 5546:5546
switch(config)#vrf instance qchyh-vrf
switch(config-vrf-qchyh-vrf)#router bgp 50
switch(config-router-bgp)#vrf qchyh-vrf
switch(config-router-bgp-vrf-qchyh-vrf)#rd 218:218
```

- This command configures an interface connected to DHCP client in vrf *mtxxg-vrf* and assigns an IP address.

```
switch(config)#interface Ethernet 9
switch(config-if-Et9)#no switchport
```

- This command configures the DHCP client interface in VRF *mtxxg-vrf*.

```
switch(config-if-Et9)#vrf mtxxg-vrf
switch(config-if-Et9)#ip address 10.10.0.1/16
```

- This command configures the server interface in VRF *qchyh-vrf*.

```
switch(config-if-Et11)#vrf qchyh-vrf
switch(config-if-Et11)#ip address 10.40.0.1/16
```

- This command configures a helper address for a DHCP server in VRF *qchyh-vrf*.

```
switch(config-if-Et11)#ip helper-address 10.40.2.3 vrf qchyh-  
vrf
```

### 12.1.7.2 Show Command

#### Example:

This command displays the VRF specifier for the server:

```
rtr1#show ip dhcp relay  
DHCP Relay is active  
DHCP Relay Option 82 is enabled  
DHCP Smart Relay is disabled  
Interface: Ethernet9  
Option 82 Circuit ID: Ethernet9  
DHCP Smart Relay is disabled  
DHCP servers: 10.40.2.3  
10.40.2.3:vrf=qchyh-vrf
```

## 12.1.8 TCP MSS Clamping

TCP MSS clamping limits the value of the maximum segment size (MSS) in the TCP header of TCP SYN packets transiting a specified Ethernet or tunnel interface. Setting the MSS ceiling can avoid IP fragmentation in tunnel scenarios by ensuring that the MSS is low enough to account for the extra overhead of GRE and tunnel outer IP headers. TCP MSS clamping can be used when connecting via GRE to cloud providers that require asymmetric routing.

When MSS clamping is configured on an interface, if the TCP MSS value in a SYN packet transiting that interface exceeds the configured ceiling limit it will be overwritten with the configured limit and the TCP checksum will be recomputed and updated.

TCP MSS clamping is handled by default in the software data path, but the process can be supported through hardware configuration to minimize possible packet loss and a reduction in the number of TCP sessions which the switch can establish per second.

### 12.1.8.1 Cautions

*This feature should be used with caution.* When the TCP MSS clamping feature is enabled by issuing the `tcp mss ceiling` command on any routed interface, *all* routed IPv4 TCP SYN packets (TCP packets with the “SYN” flag set) are sent by default to the CPU and switched through software, even on interfaces where no TCP MSS ceiling has been configured, as long as TCP MSS clamping is enabled. This limits the number of TCP sessions that can be established through the switch per second, and, because throughput for software forwarding is limited, this feature can also cause packet loss if the rate at which TCP SYN packets are sent to the CPU exceeds the limits configured in the control-plane policy map.

Packet loss and TCP session reductions can be minimized by enabling TCP MSS clamping in hardware, but only SYN packets in which MSS is the first TCP option are clamped in the hardware data path; other TCP SYN packets are still switched through software.

To disable MSS clamping, the MSS ceiling must be removed from every interface on which it has been configured by issuing the `no tcp mss ceiling` command on each configured interface.

### 12.1.8.2 Enabling TCP MSS Clamping

There is no global configuration to enable TCP MSS clamping. It is enabled as soon as an MSS ceiling is configured on at least one interface.

### 12.1.8.3 Disabling TCP MSS Clamping

To disable TCP MSS clamping, the MSS ceiling configuration must be removed from every interface by using the **no** or **default** form of the **tcp mss ceiling** command on every interface where a ceiling has been configured.

### 12.1.8.4 Configuring the TCP MSS Ceiling on an Interface

The TCP MSS ceiling limit is set on an interface using the **tcp mss ceiling** command. This also enables TCP MSS clamping on the switch as a whole.

**Note:** Configuring a TCP MSS ceiling on any interface enables TCP MSS clamping on the switch as a whole. Without hardware support, clamping routes all TCP SYN packets through software, even on interfaces where no TCP MSS ceiling has been configured. This significantly limits the number of TCP sessions the switch can establish per second, and can potentially cause packet loss if the CPU traffic exceeds control plane policy limits.

On Sand platform switches (Qumran-MX, Qumran-AX, Jericho, Jericho+), the following limitations apply:

- This command works only on egress.
- TCP MSS ceiling is supported on IPv4 unicast packets entering the switch; the configuration has no effect on GRE transit packets.
- The feature is supported only on IPv4 routed interfaces. It is not supported on L2 (switchport) interfaces or IPv6 routed interfaces.
- The feature is not supported for IPv6 packets even if they are going to be tunneled over an IPv4 GRE tunnel.
- The feature is not supported on VXLAN, loopback or management interfaces.
- The feature is only supported on IPv4 unicast packets entering the switch. The configuration has no effect on GRE transit packets or GRE decap, even if the egress interface has a TCP MSS ceiling configured.
- The feature cannot co-exist with Policy Based Routing (PBR) on switches running releases 4.21.5F or older.

#### Example:

These commands configure *Ethernet interface 5* as a routed port, then specify a maximum MSS ceiling value of *1458* bytes for TCP SYN packets exiting that port.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no switchport
switch(config-if-Et5)#tcp mss ceiling ipv4 1458 egress
switch(config-if-Et5)#
```

### 12.1.8.5 Configuring Hardware Support for TCP MSS Clamping

TCP MSS clamping can be supported in hardware, but some packets are still routed through the software data path, and an MSS ceiling value must be configured on each interface where clamping is to be applied.

Hardware support for clamping is accomplished through the use of a user-defined TCAM profile. The TCAM profile can be created from scratch or copied from an existing profile, but in either case it must include the `tcp-mss-ceiling ip` feature.

### Guidelines

- When the system TCAM profile is changed, some agents will restart.
- To ensure that the TCP MSS feature is allocated a TCAM DB, it may be necessary to remove some unused features from the TCAM profile.
- Hardware TCP MSS clamping only works for TCP packets with MSS as the first TCP option. Other TCP SYN packets are still trapped to the CPU for clamping in software.
- Hardware TCP MSS clamping is not supported with host routes when the clamping is applied on a non-tunnel interface. This limitation does not apply to GRE tunnel interfaces.
- The maximum MSS ceiling limit with hardware MSS clamping is 32727 even though the CLI allows configuration of much larger values.
- For more information on the creation of user-defined TCAM profiles, see <https://eos.arista.com/eos-4-20-5f/user-defined-pmf-profile/>

To configure hardware support for TCP MSS clamping, create a TCAM profile that includes the `tcp-mss-ceiling ip` feature, then apply it to the system.

#### 12.1.8.5.1 Creating the TCAM Profile

A TCAM profile that supports TCP MSS clamping can be created from scratch, or the feature can be added to a copy of the default TCAM profile. When creating a profile from scratch, care must be taken to ensure that all needed TCAM features are included in the profile.

#### Modifying a Copy of the Default TCAM Profile

The following commands create a copy of the default TCAM profile, name it “`tcp-mss-clamping`,” and configure it to enable MSS clamping in hardware, then remove some unused features included in the default profile to ensure that there are sufficient TCAM resources for the clamping feature.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#profile tcp-mss-clamping copy default
switch(config-hw-tcam-profile-tcp-mss-clamping1)#feature tcp-mss-ceiling
ip copy
system-feature-source-profile
switch(config-hw-tcam-profile-tcp-mss-clamping-feature-tcp-mss-c
eiling)#key
size limit 160
switch(config-hw-tcam-profile-tcp-mss-clamping-feature-tcp-mss-c
eiling)#packet
ipv4 forwarding routed
switch(config-hw-tcam-profile-tcp-mss-clamping-feature-tcp-mss-c
eiling)#exit

switch(config-hw-tcam-profile-tcp-mss-clamping)#no feature mirror ip
switch(config-hw-tcam-profile-tcp-mss-clamping)#no feature acl port mac
switch(config-hw-tcam-profile-tcp-mss-clamping1)#exit

switch(config-hw-tcam)#exit

switch(config)#
```

### 12.1.8.5.2 Applying the TCAM Profile to the System

The following commands enter Hardware TCAM Configuration Mode and set the “tcp-mss-clamping” profile as the system profile.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#system profile tcp-mss-clamping
switch(config-hw-tcam)#
```

### 12.1.8.5.3 Verifying the TCAM Profile Configuration

The following command displays hardware TCAM profile information to verify that the user-defined TCAM profile has been applied correctly.

```
switch(config)#show hardware tcam profile

Configuration      Status
FixedSystem        tcp-mss-clamping      tcp-mss-clamping

switch(config)#
```

## 12.1.9 IPv4 GRE Tunneling

GRE tunneling supports the forwarding over IPv4 GRE tunnel interfaces. The GRE tunnel interfaces act as a logical interface that performs GRE encapsulation or decapsulation.

The following switches support the IPv4 forwarding of GRE tunnel interface.

- DCS-7020R
- DCS-7280R
- DCS-7500R

**Note:** The forwarding over GRE tunnel interface on DCS-7500R is supported only if all the line cards on the system have Jericho family chip-set.

### 12.1.9.1 Configuring GRE Tunneling Interface

#### On a local Arista switch

```
switch(config)#ip routing
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#tunnel mode gre
switch(config-if-Tu10)#ip address 192.168.1.1/24
switch(config-if-Tu10)#tunnel source 10.1.1.1
switch(config-if-Tu10)#tunnel destination 10.1.1.2
switch(config-if-Tu10)#tunnel path-mtu-discovery
switch(config-if-Tu10)#tunnel tos 10
switch(config-if-Tu10)#tunnel ttl 10
```

#### On a remote Arista switch

```
switch(config)#ip routing
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#tunnel mode gre
switch(config-if-Tu10)#ip address 192.168.1.2/24
switch(config-if-Tu10)#tunnel source 10.1.1.2
switch(config-if-Tu10)#tunnel destination 10.1.1.1
```

```
switch(config-if-Tu10) #tunnel path-mtu-discovery
switch(config-if-Tu10) #tunnel tos 10
switch(config-if-Tu10) #tunnel ttl 10
```

### Alternative configuration for tunnel source IPv4 address

```
switch(config) #interface Loopback 10
switch(config-if-Lo10) #ip add 10.1.1.1/32
switch(config-if-Lo10) #exit

switch(config) #conf terminal
switch(config) #interface Tunnel 10
switch(config-if-Tu10) #tunnel source interface Loopback 10
```

### Configuration for adding an IPv4 route over the GRE tunnel interface

```
switch(config) #ip route 192.168.100.0/24 Tunnel 10
```

### Tunnel Mode

Tunnel Mode needs to be configured as gre, for GRE tunnel interface. Default value is tunnel mode gre.

### IP address

Configures the IP address for the GRE tunnel interface. The IP address can be used for routing over the GRE tunnel interface. The configured subnet is reachable over the GRE tunnel interface and the packets to the subnet are encapsulated in the GRE header.

### Tunnel Source

Specifies the source IP address for the outer IPv4 encapsulation header for packets going over the GRE tunnel interface. The tunnel source IPv4 address should be a valid local IPv4 address configured on the Arista Switch. The tunnel source can also be specified as any routed interface on the Arista Switch. The routed interface's IPv4 address is assigned as the tunnel source IPv4 address.

### Tunnel Destination

Specifies the destination IPv4 address for the outer IPv4 encapsulation header for packets going over the GRE tunnel interface. The tunnel destination IPv4 should be reachable from the Arista Switch.

### Tunnel Path Mtu Discovery

Specifies if the "Do not Fragment" flag needs to set in the outer IPv4 encapsulation header for packets going over the GRE tunnel interface.

### Tunnel TOS

Specifies the Tunnel type of service (ToS) value to be assigned to the outer IPv4 encapsulation header for packets going over the GRE tunnel interface. Default TOS value of 0 will be assigned if tunnel TOS is not configured.

### Tunnel TTL

Specifies the TTL value to be assigned to the outer IPv4 encapsulation header for packet going over the GRE tunnel interface. The TTL value is copied from the inner IPv4 header if tunnel TTL is not configured. The tunnel TTL configuration requires the tunnel Path MTU Discovery to be configured.

### 12.1.9.2 Displaying GRE tunnel Information

- The following commands display the tunnel configuration.

```
switch#show interfaces Tunnel 10
Tunnel10 is up, line protocol is up (connected)
Hardware is Tunnel, address is 0a01.0101.0800
Internet address is 192.168.1.1/24
Broadcast address is 255.255.255.255
Tunnel source 10.1.1.1, destination 10.1.1.2
Tunnel protocol/transport GRE/IP
  Key disabled, sequencing disabled
  Checksumming of packets disabled
Tunnel TTL 10, Hardware forwarding enabled
Tunnel TOS 10
Path MTU Discovery
Tunnel transport MTU 1476 bytes
Up 3 seconds
```

- ```
switch#show gre tunnel static
```

Name	Index	Source	Destination	Nexthop	Interface
Tunnel10	10	10.1.1.1	10.1.1.2	10.6.1.2	Ethernet6/1

```
switch#show tunnel fib static interface gre 10
Type 'Static Interface', index 10, forwarding Primary
  via 10.6.1.2, 'Ethernet6/1'
  GRE, destination 10.1.1.2, source 10.1.1.1, ttl 10, tos 0xa
```

- Use **show platform fap tcam summary** to verify if the TCAM bank is allocated for GRE packet termination lookup.

```
switch#show platform fap tcam summary
```

Bank	Tcam Allocation (Jericho0)
Used By	Reserved By
0	dbGreTunnel -

- Use **show ip route** to verify if the routes over tunnel is setup properly.

```
switch#show ip route

VRF: default
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,

## 12.1.10 IPv4 Commands

### IP Routing and Address Commands

- agent SandL3Unicast terminate
- clear arp inspection statistics
- compress
- ip arp inspection limit
- ip arp inspection logging
- ip arp inspection trust
- ip arp inspection vlan
- ip hardware fib ecmp resilience
- ip hardware fib optimize
- ip icmp redirect
- ip load-sharing
- ip route
- ip routing
- ip source binding
- ip verify
- ip verify source
- rib fib policy
- show ip
- show ip arp inspection vlan
- show ip arp inspection statistics
- show ip interface
- show ip interface brief
- show ip route
- show ip route age
- show ip route gateway
- show ip route host
- show ip route match tag
- show ip route summary
- show rib route ip
- show rib route <ipv4 | ipv6> fib policy excluded
- show routing-context vrf
- show vrf
- show ip verify source
- show platform arad ip route
- show platform arad ip route summary
- tcp mss ceiling

### IPv4 DHCP Relay

- clear ip dhcp relay counters
- ip dhcp relay all-subnets
- ip dhcp relay all-subnets default
- ip dhcp relay always-on
- ip dhcp snooping information option
- ip dhcp relay information option circuit-id
- ip helper-address

- show ip dhcp relay
- show ip dhcp relay counters

#### **IPv4 DHCP Snooping**

- clear ip dhcp snooping counters
- ip dhcp snooping
- ip dhcp snooping information option
- ip dhcp snooping vlan
- show ip dhcp snooping
- show ip dhcp snooping counters
- show ip dhcp snooping hardware

#### **IPv4 Multicast Counters**

- clear ip multicast count
- ip multicast count

#### **ARP Table**

- arp
- arp aging timeout
- arp cache persistent
- arp gratuitous accept
- clear arp-cache
- clear arp
- ip local-proxy-arp
- ip proxy-arp
- show arp
- show ip arp

#### **VRF Commands**

- cli vrf
- description (VRF)
- rd (VRF configuration mode)
- show routing-context vrf
- show vrf
- vrf (Interface mode)
- vrf instance

#### **Trident Forwarding Table Commands**

- platform trident forwarding-table partition
- platform trident routing-table partition
- show platform trident forwarding-table partition

#### **IPv4 GRE Tunneling Commands**

- interface tunnel
- tunnel
- show interface tunnel
- show platform fap eedb ip-tunnel gre interface tunnel
- show tunnel fib static interface gre

- 
- [show platform fap tcam summary](#)

### 12.1.10.1 rd (VRF configuration mode)

The `rd` command issued in VRF Configuration Mode is a legacy command supported for backward compatibility. To configure a route distinguisher (RD) for a VRF, use the [rd \(VRF configuration mode\)](#) command.

**Note:** Legacy RDs that were assigned to a VRF in VRF Configuration Mode will still appear in `show vrf` outputs if an RD has not been configured in Router-BGP VRF Configuration Mode, but they no longer have an effect on the system.

---

### 12.1.10.2 agent SandL3Unicast terminate

The `agent SandL3Unicast terminate` command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

#### Command Mode

Global Configuration

#### Command Syntax

```
agent SandL3Unicast terminate
```

#### Related Commands

- [ip hardware fib optimize](#) enables IPv4 route scale.
- [show platform arad ip route](#) shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.
- [show platform arad ip route summary](#) shows hardware resource usage of IPv4 routes.

#### Example:

This configuration command restarts the platform Layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate  
SandL3Unicast was terminated
```

Restarting the platform Layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

### 12.1.10.3 arp aging timeout

The **arp aging timeout** command specifies the duration of dynamic address entries in the Address Resolution Protocol (ARP) cache for addresses learned through the configuration mode interface. The default duration is *14400* seconds (four hours).

The **arp aging timeout** and **default arp aging timeout** commands restores the default ARP aging timeout for addresses learned on the configuration mode interface by deleting the corresponding **arp aging timeout** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
arp aging timeout arp_time
```

```
no arp aging timeout
```

```
default arp aging timeout
```

#### Parameters

- **arp\_time** ARP aging timeout period (seconds). Values range from 60 to 65535. Default value is *14400*.

#### Example:

This command specifies an ARP cache duration of *7200* seconds (two hours) for dynamic addresses added to the ARP cache that were learned through *VLAN 200*.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#arp aging timeout 7200
switch(config-if-Vl200)#show active
interface Vlan200
    arp timeout 7200
switch(config-if-Vl200)#
```

---

#### 12.1.10.4 arp cache persistent

The **arp cache persistent** command restores the dynamic entries in the Address Resolution Protocol (ARP) cache after reboot.

The **no arp cache persistent** and **default arp cache persistent** commands remove the ARP cache persistent configuration from the running-config.

##### Command Mode

Global Configuration

##### Command Syntax

```
arp cache persistent
```

```
no arp cache persistent
```

```
default arp cache persistent
```

##### Example:

This command restores the ARP cache after reboot.

```
switch(config)#arp cache persistent  
switch(config)#
```

### 12.1.10.5 arp gratuitous accept

The **arp gratuitous accept** command configures the configuration mode interface to accept gratuitous ARP request packets received on that interface. Accepted gratuitous ARP requests are then learned by the ARP table.

The **no** and **default** forms of the command prevent the interface from accepting gratuitous ARP requests. Configuring gratuitous ARP acceptance on an L2 interface has no effect.

#### Command Mode

Interface-Ethernet Configuration

Interface-VLAN Configuration

Interface Port-channel Configuration

#### Command Syntax

```
arp gratuitous accept
```

```
no arp gratuitous accept
```

```
default arp gratuitous accept
```

#### Example:

These commands configure *Ethernet interface 2/1* to accept gratuitous ARP request packets.

```
switch (config)#interface ethernet 2/1  
switch (config-if-Et2/1)#arp gratuitous accept  
switch (config-if-Et2/1)#
```

---

## 12.1.10.6 arp

The **arp** command adds a static entry to an Address Resolution Protocol (ARP) cache. The switch uses ARP cache entries to correlate 32-bit IP addresses to 48-bit hardware addresses.

The **no arp** and **default arp** commands remove the ARP cache entry with the specified IP address. When multiple VRFs contain ARP cache entries for identical IP addresses, each entry can only be removed individually.

### Command Mode

Global Configuration

### Command Syntax

```
arp [VRF_INSTANCE] ipv4_addr mac_addr arpa
```

```
no arp [VRF_INSTANCE] ipv4_addr
```

```
default arp [VRF_INSTANCE] ipv4_addr
```

### Parameters

- **VRF\_INSTANCE** Specifies the VRF instance being modified.
  - **<no parameter>** Changes are made to the default VRF.
  - **vrf vrf\_name** Changes are made to the specified user-defined VRF.
- **ipv4\_addr** IPv4 address of ARP entry.
- **mac\_addr** Local data-link (hardware) address (48-bit dotted hex notation – H.H.H).

### Examples:

- This command adds a static entry to the ARP cache in the default VRF.

```
switch(config)#arp 172.22.30.52 0025.900e.c63c arpa
switch(config)#
```

- This command adds the same static entry to the ARP cache in the VRF named “purple.”

```
switch(config)#arp vrf purple 172.22.30.52 0025.900e.c63c arpa
switch(config)#
```

### 12.1.10.7 clear arp inspection statistics

The `clear arp inspection statistics` command clears ARP inspection statistics.

#### Command Mode

EXEC

#### Command Syntax

```
clear arp inspection statistics
```

#### Related Commands

- [ip arp inspection limit](#)
- [ip arp inspection logging](#)
- [ip arp inspection trust](#)
- [ip arp inspection vlan](#)
- [show ip arp inspection vlan](#)
- [show ip arp inspection statistics](#)

#### Example:

This command clears ARP inspection statistics.

```
switch(config)#clear arp inspection statistics
switch(config)#
```

### 12.1.10.8 clear arp

The **clear arp** command removes the specified dynamic ARP entry for the specified IP address from the Address Resolution Protocol (ARP) table.

#### Command Mode

Privileged EXEC

#### Command Syntax

`clear arp [VRF_INSTANCE] ipv4_addr Parameters`

- **VRF\_INSTANCE** Specifies the VRF instance for which arp data is removed.
  - **<no parameter>** Specifies the context-active VRF.
  - **vrf vrf\_name** Specifies name of VRF instance. System default VRF is specified by **default**.
- **ipv4\_addr** IPv4 address of dynamic ARP entry.
- 

#### Example:

These commands display the ARP table before and after the removal of dynamic ARP entry for IP address 172.22.30.52.

```
switch#show arp
Address          Age (min)  Hardware Addr  Interface
172.22.30.1     0         001c.730b.1d15  Management1
172.22.30.52    0         0025.900e.c468  Management1
172.22.30.53    0         0025.900e.c63c  Management1
172.22.30.133   0         001c.7304.3906  Management1

switch#clear arp 172.22.30.52
switch#show arp
Address          Age (min)  Hardware Addr  Interface
172.22.30.1     0         001c.730b.1d15  Management1
172.22.30.53    0         0025.900e.c63c  Management1
172.22.30.133   0         001c.7304.3906  Management1

switch#
```

### 12.1.10.9 clear arp-cache

The `clear arp-cache` command refreshes dynamic entries in the Address Resolution Protocol (ARP) cache. Refreshing the ARP cache updates current ARP table entries and removes expired ARP entries not yet deleted by an internal, timer-driven process.

The command, without arguments, refreshes ARP cache entries for all enabled interfaces. With arguments, the command refreshes cache entries for the specified interface. Executing `clear arp-cache` for all interfaces can result in extremely high CPU usage while the tables are resolving.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear arp-cache [VRF_INSTANCE][INTERFACE_NAME]
```

#### Parameters

- **VRF\_INSTANCE** Specifies the VRF instance for which arp data is refreshed.
  - *<no parameter>* Specifies the context-active VRF.
  - **vrf vrf\_name** Specifies name of VRF instance. System default VRF is specified by **default**.
- **INTERFACE\_NAME** Interface upon which ARP cache entries are refreshed. Options include:
  - *<no parameter>* All ARP cache entries.
  - **interface ethernet e\_num** ARP cache entries of specified Ethernet interface.
  - **interface loopback l\_num** ARP cache entries of specified loopback interface.
  - **interface management m\_num** ARP cache entries of specified management interface.
  - **interface port-channel p\_num** ARP cache entries of specified port-channel Interface.
  - **interface vlan v\_num** ARP cache entries of specified VLAN interface.
  - **interface vxlan vx\_num** VXLAN interface specified by **vx\_num**.

#### Related Commands

- [cli vrf](#) specifies the context-active VRF.

#### Example:

These commands display the ARP cache before and after ARP cache entries are refreshed.

```
switch#show arp

Address          Age (min)  Hardware Addr  Interface
172.22.30.1      0          001c.730b.1d15  Management1
172.22.30.118    0          001c.7301.6015  Management1

switch#clear arp-cache
switch#show arp

Address          Age (min)  Hardware Addr  Interface
172.22.30.1      0          001c.730b.1d15  Management1

switch#
```

### 12.1.10.10 clear ip dhcp relay counters

The `clear ip dhcp relay counters` command resets the DHCP relay counters. The configuration mode determines which counters are reset:

- **Interface configuration:** command clears the counter for the configuration mode interface.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ip dhcp relay counters [INTERFACE_NAME]
```

#### Parameters

- **INTERFACE\_NAME** Entity for which counters are cleared. Options include:
  - **<no parameter>** Clears counters for the switch and for all interfaces.
  - **interface ethernet e\_num** Clears counters for the specified Ethernet interface.
  - **interface loopback l\_num** Clears counters for the specified loopback interface.
  - **interface port-channel p\_num** Clears counters for the specified port-channel Interface.
  - **interface vlan v\_num** Clears counters for the specified VLAN interface.

#### Examples:

- These commands clear the DHCP relay counters for *VLAN 1045* and shows the counters before and after the `clear` command.

```
switch#show ip dhcp relay counters
```

Interface	Dhcp Packets			Last Cleared
	Rcvd	Fwdd	Drop	
All Req	376	376	0	4 days, 19:55:12 ago
All Resp	277	277	0	
Vlan1001	207	148	0	4 days, 19:54:24 ago
Vlan1045	376	277	0	4 days, 19:54:24 ago

```
switch#clear ip dhcp relay counters interface vlan 1045
```

Interface	Dhcp Packets			Last Cleared
	Rcvd	Fwdd	Drop	
All Req	380	380	0	4 days, 21:19:17 ago
All Resp	281	281	0	
Vlan1000	207	148	0	4 days, 21:18:30 ago
Vlan1045	0	0	0	0:00:07 ago

- These commands clear all DHCP relay counters on the switch.

```
switch(config-if-Vl1045)#exit
switch(config)#clear ip dhcp relay counters
switch(config)#show ip dhcp relay counters
```

Interface	Dhcp Packets			Last Cleared
	Rcvd	Fwdd	Drop	
All Req	0	0	0	0:00:03 ago
All Resp	0	0	0	

```
Vlan1000 | 0 0 0 | 0:00:03 ago  
Vlan1045 | 0 0 0 | 0:00:03 ago
```

### 12.1.10.11 clear ip dhcp snooping counters

The `clear ip dhcp snooping counters` command resets the DHCP snooping packet counters.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ip dhcp snooping counters [COUNTER_TYPE]
```

#### Parameters

- **COUNTER\_TYPE** The type of counter that the command resets. Options include:
  - **<no parameter>** Counters for each VLAN.
  - **debug** Aggregate counters and drop cause counters.

#### Examples:

- This command clears the DHCP snooping counters for each VLAN.

```
switch#clear ip dhcp snooping counters
switch#show ip dhcp snooping counters

      | Dhcp Request Pkts | Dhcp Reply Pkts |
Vlan |  Rcvd  Fwdd  Drop |  Rcvd Fwdd  Drop | Last Cleared
-----|-----|-----|-----|-----|-----|-----|
 100 |    0    0    0 |    0    0    0 | 0:00:10 ago

switch#
```

- This command clears the aggregate DHCP snooping counters.

```
switch#clear ip dhcp snooping counters debug
switch#show ip dhcp snooping counters debug

Counter                               Snooping to Relay Relay to

switch#
```

### 12.1.10.12 clear ip multicast count

The `clear ip multicast count` command clears all counters associated with the multicast traffic.

#### Command Mode

Global Configuration

#### Command Syntax

```
clear ip multicast count [group_address [source_address]]
```

#### Parameters

- **<no parameters>** Clears all counts of the multicast route traffic.
- **group\_address** Clears the multicast traffic count of the specified group address.
  - **source\_address** Clears the multicast traffic count of the specified group and source addresses.

#### Guidelines

- This command functions only when the `ip multicast count` command is enabled.

#### Examples:

- This command clears all counters associated with the multicast traffic.

```
switch(config)#clear ip multicast count
```

- This command clears the multicast traffic count of the specified group address.

```
switch(config)#clear ip multicast count 16.39.24.233
```

---

### 12.1.10.13 cli vrf

The `cli vrf` command specifies the context-active VRF. The context-active VRF determines the default VRF that VRF-context aware commands use when displaying routing table data.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
cli vrf [VRF_ID]
```

#### Parameters

- **VRF\_ID** Name of VRF assigned as the current VRF scope. Options include:
  - **vrf\_name** Name of user-defined VRF.
  - **default** System-default VRF.

#### Guidelines

VRF-context aware commands include:

[clear arp-cache](#)

[show ip](#)

[show ip arp](#)

[show ip route](#)

[show ip route gateway](#)

[show ip route host](#)

#### Related Commands

- [show routing-context vrf](#) displays the context-active VRF.

#### Example:

These commands specify *magenta* as the context-active VRF, then display the context-active VRF.

```
switch#cli vrf magenta
switch#show routing-context vrf
Current VRF routing-context is magenta
switch#
```

### 12.1.10.14 compress

The **compress** command increases the hardware resources available for the specified prefix lengths.

The **no compress** command removes the 2-to-1 compression configuration from the running-config.

**Note:** The **compress** command is supported only on 7500R, 7280R, 7500R2 and 7280R2 platforms.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip hardware fib optimize prefix-length<prefix-length>expand<prefix-length>compress
no ip hardware fib optimize prefix-length<prefix-length>expand<prefix-length>compress
```

#### Parameters

- **compress** Allows configuring up to one compressed prefix length.

#### Example:

In the following example we are configuring prefix length 20 and 24, expanding prefix length 19 and 23, and compressing prefix length 25.

```
switch(config)#ip hardware fib optimize prefix-length 20 24
expand 19 23 compress 25
! Please restart layer 3 forwarding agent to ensure IPv4 routes
are optimized
```

---

### 12.1.10.15 description (VRF)

The **description** command adds a text string to the configuration mode VRF. The string has no functional impact on the VRF.

The **no description** and **default description** commands remove the text string from the configuration mode VRF by deleting the corresponding **description** command from **running-config**.

#### Command Mode

VRF Configuration

#### Command Syntax

```
description label_text
```

```
no description
```

```
default description
```

#### Parameters

- **label\_text** Character string assigned to the VRF configuration.

#### Related Commands

- [vrf instance](#) places the switch in VRF configuration mode.

#### Example:

These commands add description text to the *magenta* VRF.

```
switch(config)#vrf instance magenta
switch(config-vrf-magenta)#description This is the first vrf
switch(config-vrf-magenta)#show active
vrf instance magenta
    description This is the first vrf

switch(config-vrf-magenta)#
```

### 12.1.10.16 interface tunnel

The **interface tunnel** command places the switch in interface-tunnel configuration mode.

Interface-tunnel configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed.

The **no interface tunnel** command deletes the specified interface tunnel configuration.

The **exit** command returns the switch to the global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
interface tunnel <number>
```

```
no interface tunnel <number>
```

#### Parameter

- **number** Tunnel interface number. Values range from 0 to 255.

#### Example:

This command places the switch in interface-tunnel configuration mode for tunnel interface 10.

```
switch(config)#interface tunnel 10  
switch(config-if-Tu10)#
```

### 12.1.10.17 ip arp inspection limit

The `ip arp inspection limit` command err-disables the interface if the incoming ARP rate exceeds the configured value rate limit the incoming ARP packets on an interface.

#### Command Mode

EXEC

#### Command Syntax

```
ip arp inspection limit [ RATE <pps>] [BURST_INTERVAL <sec> | none]
```

```
no ip arp inspection limit [ RATE <pps>] [BURST_INTERVAL <sec> | none]
```

```
default ip arp inspection limit [ RATE <pps>] [BURST_INTERVAL <sec> | none]
```

#### Parameters

- **RATE** Specifies the ARP inspection limit rate in packets per second.
  - **<pps>** ARP inspection limit rate packets per second.
- **BURST\_INTERVAL** Specifies the ARP inspection limit burst interval.
  - **<sec>** Burst interval second.

#### Related Commands

- [ip arp inspection limit](#)
- [ip arp inspection trust](#)
- [ip arp inspection vlan](#)
- [show ip arp inspection vlan](#)

#### Examples:

- This command configures the rate limit of incoming ARP packets to err-disable the interface when the incoming ARP rate exceeds the configured value, sets the rate to 512 (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to 11 seconds.

```
switch(config)#ip arp inspection limit rate 512 burst interval
11
switch(config)#
```

- This command displays verification of the interface specific configuration.

```
switch(config)#interface Ethernet 3/1
switch(config)#ip arp inspection limit rate 20 burst interval
5
switch(config)#interface Ethernet 3/3
switch(config)#ip arp inspection trust
switch(config)#show ip arp inspection interfaces
```

Interface	Trust State	Rate (pps)	Burst Interval
Et3/1	Untrusted	20	5
Et3/3	Trusted	None	N/A

```
switch(config)#
```

### 12.1.10.18 ip arp inspection logging

The `ip arp inspection logging` command enables logging of incoming ARP packets on the interface if the rate exceeds the configured value.

#### Command Mode

EXEC

#### Command Syntax

```
ip arp inspection logging [RATE <pps> ][BURST_INTERVAL <sec> | none]
```

```
no ip arp inspection logging [RATE <pps> ][BURST_INTERVAL <sec> | none]
```

```
default ip arp inspection logging [RATE <pps> ][BURST_INTERVAL <sec> | none]
```

#### Parameters

- **RATE** Specifies the ARP inspection limit rate in packets per second.
  - **<pps>** ARP inspection limit rate packets per second.
- **BURST\_INTERVAL** Specifies the ARP inspection limit burst interval.
  - **<sec>** Burst interval second.

#### Related Commands

- [ip arp inspection limit](#)
- [ip arp inspection trust](#)
- [ip arp inspection vlan](#)
- [show ip arp inspection vlan](#)

#### Example:

This command enables logging of incoming ARP packets when the incoming ARP rate exceeds the configured value on the interface, sets the rate to 2048 (which is the upper limit for the number of invalid ARP packets allowed per second), and sets the burst consecutive interval over which the interface is monitored for a high ARP rate to 15 seconds.

```
switch(config)#ip arp inspection logging rate 2048 burst interval  
15  
switch(config)#
```

---

### 12.1.10.19 ip arp inspection trust

The `ip arp inspection trust` command configures the trust state of an interface. By default, all interfaces are untrusted.

#### Command Mode

EXEC

#### Command Syntax

```
ip arp inspection trust
no ip arp inspection trust
default ip arp inspection trust
```

#### Related Commands

- [ip arp inspection limit](#)
- [ip arp inspection logging](#)
- [ip arp inspection vlan](#)
- [show ip arp inspection vlan](#)

#### Examples:

- This command configures the trust state of an interface.

```
switch(config)#ip arp inspection trust
switch(config)#
```

- This command configures the trust state of an interface to untrusted.

```
switch(config)#no ip arp inspection trust
switch(config)#
```

- This command configures the trust state of an interface to its default (untrusted).

```
switch(config)#default ip arp inspection trust
switch(config)#
```

### 12.1.10.20 ip arp inspection vlan

The **ip arp inspection vlan** command enables ARP inspection. ARP requests and responses on untrusted interfaces are intercepted on specified VLANs, and intercepted packets are verified to have valid IP-MAC address bindings. All invalid ARP packets are dropped. On trusted interfaces, all incoming ARP packets are processed and forwarded without verification. By default, ARP inspection is disabled on all VLANs.

#### Command Mode

EXEC

#### Command Syntax

```
ip arp inspection vlan [LIST]
```

#### Parameters

- **LIST** Specifies the VLAN interface number.

#### Related Commands

- [ip arp inspection limit](#)
- [ip arp inspection trust](#)
- [ip arp inspection vlan](#)

#### Example:

- This command enables ARP inspection on VLANs 1 through 150.

```
switch(config)#ip arp inspection vlan 1 - 150
switch(config)#
```

- This command disables ARP inspection on VLANs 1 through 150.

```
switch(config)#no ip arp inspection vlan 1 - 150
switch(config)#
```

- This command sets the ARP inspection default to VLANs 1 through 150.

```
switch(config)#default ip arp inspection vlan 1 - 150
switch(config)#
```

- These commands enable ARP inspection on multiple VLANs 1 through 150 and 200 through 250.

```
switch(config)#ip arp inspection vlan 1-150,200-250
switch(config)#
```

---

### 12.1.10.21 ip dhcp relay all-subnets default

The `ip dhcp relay all-subnets default` command configures the global DHCP smart relay setting. DHCP smart relay supports forwarding DHCP requests with a client's secondary IP addresses in the gateway address field. The default global DHCP smart relay setting is disabled.

The global DHCP smart relay setting is applied to all interfaces for which an `ip dhcp relay all-subnets` statement is not configured. Enabling DHCP smart relay on an interface requires that DHCP relay is also enabled on that interface.

The `no ip dhcp relay all-subnets default` and `default ip dhcp relay all-subnets default` commands restore the global DHCP smart relay default setting of disabled by removing the `ip dhcp relay all-subnets default` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip dhcp relay all-subnets default
no ip dhcp relay all-subnets default
default ip dhcp relay all-subnets default
```

#### Related Commands

- [ip helper-address](#) Enables the DHCP relay agent on a configuration mode interface.
- [ip dhcp relay all-subnets](#) Enables the DHCP smart relay agent on a configuration mode interface.

#### Example:

This command configures the global DHCP smart relay setting to **enabled**.

```
switch(config)#ip dhcp relay all-subnets default
switch(config)#
```

### 12.1.10.22 ip dhcp relay all-subnets

The `ip dhcp relay all-subnets` command configures the DHCP smart relay status on the configuration mode interface. DHCP smart relay supports forwarding DHCP requests with a client's secondary IP addresses in the gateway address field. Enabling DHCP smart relay on an interface requires that DHCP relay is also enabled on that interface.

By default, an interface assumes the global DHCP smart relay setting as configured by the `ip dhcp relay all-subnets default` command. The `ip dhcp relay all-subnets` command, when configured, takes precedence over the global smart relay setting.

The `no ip dhcp relay all-subnets` command disables DHCP smart relay on the configuration mode interface. The `default ip dhcp relay all-subnets` command restores the interface's to the default DHCP smart relay setting, as configured by the `ip dhcp relay all-subnets default` command, by removing the corresponding `ip dhcp relay all-subnets` or `no ip dhcp relay all-subnets` statement from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip dhcp relay all-subnets
no ip dhcp relay all-subnets
default ip dhcp relay all-subnets
```

#### Examples:

- This command enables DHCP smart relay on VLAN interface 100.

```
switch(config)#interface vlan 100
switch(config-if-Vl100)#ip helper-address 10.4.4.4
switch(config-if-Vl100)#ip dhcp relay all-subnets
switch(config-if-Vl100)#show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
    DHCP Smart Relay is enabled
    DHCP servers: 10.4.4.4
switch(config-if-Vl100)#
```

- This command disables DHCP smart relay on VLAN interface 100.

```
switch(config-if-Vl100)#no ip dhcp relay all-subnets
switch(config-if-Vl100)#show active
interface Vlan100
    no ip dhcp relay all-subnets
    ip helper-address 10.4.4.4
switch(config-if-Vl100)#show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
    DHCP Smart Relay is disabled
    DHCP servers: 10.4.4.4
switch(config-if-Vl100)#
```

- 
- This command enables DHCP smart relay globally, configures VLAN interface 100 to use the global setting, then displays the DHCP relay status.

```
switch(config)#ip dhcp relay all-subnets default
switch(config)#interface vlan 100
switch(config-if-Vl100)#ip helper-address 10.4.4.4
switch(config-if-Vl100)#default ip dhcp relay
switch(config-if-Vl100)#show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCP Smart Relay is enabled
Interface: Vlan100
  Option 82 Circuit ID: 333
  DHCP Smart Relay is enabled
  DHCP servers: 10.4.4.4
switch(config-if-Vl100)#
```

### 12.1.10.23 ip dhcp relay always-on

The `ip dhcp relay always-on` command enables the switch DHCP relay agent on the switch regardless of the DHCP relay agent status on any interface. By default, the DHCP relay agent is enabled only if at least one routable interface is configured with an `ip helper-address` statement.

The `no ip dhcp relay always-on` and `default ip dhcp relay always-on` commands remove the `ip dhcp relay always-on` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip dhcp relay always-on
no ip dhcp relay always-on
default ip dhcp relay always-on
```

#### Related Commands

These commands implement DHCP relay agent.

- [ip helper-address](#)
- [ip dhcp relay information option \(Global\)](#)
- [ip dhcp relay information option circuit-id](#)

#### Example:

This command enables the DHCP relay agent.

```
switch(config)#ip dhcp relay always-on
switch(config)#
```

---

#### 12.1.10.24 ip dhcp relay information option (Global)

The **ip dhcp relay information option** command configures the switch to attach tags to DHCP requests before forwarding them to the DHCP servers designated by [ip helper-address](#) commands. The command specifies the tag contents for packets forwarded by the interface that it configures.

The **no ip dhcp relay information option** and **default ip dhcp relay information option** commands restore the switch's default setting of not attaching tags to DHCP requests by removing the **ip dhcp relay information option** command from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

```
ip dhcp relay information option
no ip dhcp relay information option
default ip dhcp relay information option
```

##### Related Commands

These commands implement DHCP relay agent.

- [ip helper-address](#)
- [ip dhcp relay always-on](#)
- [ip dhcp relay information option circuit-id](#)

##### Example:

This command enables the attachment of tags to DHCP requests that are forwarded to DHCP server addresses.

```
switch(config)#ip dhcp relay information option
switch(config)#
```

### 12.1.10.25 ip dhcp relay information option circuit-id

The `ip dhcp relay information option circuit-id` command specifies the content of tags that the switch attaches to DHCP requests before they are forwarded from the configuration mode interface to DHCP server addresses specified by `ip helper-address` commands. Tags are attached to outbound DHCP requests only if the information option is enabled on the switch (`ip dhcp relay information option circuit-id`). The default value for each interface is the name and number of the interface.

The `no ip dhcp relay information option circuit-id` and `default ip dhcp relay information option circuit-id` commands restore the default content setting for the configuration mode interface by removing the corresponding command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip dhcp relay information option circuit-id id_label
```

```
no ip dhcp relay information option circuit-id
```

```
default ip dhcp relay information option circuit-id
```

#### Parameters

- *id\_label* Tag content. Format is alphanumeric characters (maximum 15 characters).

#### Related Commands

- [ip helper-address](#)
- [ip dhcp relay always-on](#)
- [ip dhcp relay information option \(Global\)](#)

#### Example:

This command configures `x-1234` as the tag content for packets send from VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip dhcp relay information option circuit-
id x-1234
switch(config-if-Vl200)#
```

### 12.1.10.26 ip dhcp snooping information option

The **ip dhcp snooping information option** command enables the insertion of option-82 DHCP snooping information in DHCP packets on VLANs where DHCP snooping is enabled. DHCP snooping is a layer 2 switch process that allows relay agents to provide remote-ID and circuit-ID information to DHCP reply and request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port.

DHCP snooping uses information option (Option-82) to include the switch MAC address (router-ID) along with the physical interface name and VLAN number (circuit-ID) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server through DHCP protocol processes.

DHCP snooping on a specified VLAN requires all of these conditions to be met:

- DHCP snooping is globally enabled.
- Insertion of option-82 information in DHCP packets is enabled.
- DHCP snooping is enabled on the specified VLAN.
- DHCP relay is enabled on the corresponding VLAN interface.

When global DHCP snooping is not enabled, the **ip dhcp snooping information option** command persists in **running-config** without any operational effect.

The **no ip dhcp snooping information option** and **default ip dhcp snooping information option** commands disable the insertion of option-82 DHCP snooping information in DHCP packets by removing the **ip dhcp snooping information option** statement from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip dhcp snooping information option
no ip dhcp snooping information option
default ip dhcp snooping information option
```

#### Related Commands

- [ip dhcp snooping](#) globally enables DHCP snooping.
- [ip helper-address](#) enables the DHCP relay agent on a configuration mode interface.

#### Example:

These commands enable DHCP snooping on DHCP packets from ports on snooping-enabled VLANs. DHCP snooping was previously enabled on the switch.

```
switch(config)#ip dhcp snooping information option
switch(config)#show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
 100
DHCP Snooping is operational on following VLANs:
 100
Insertion of Option-82 is enabled
Circuit-id format: Interface name:Vlan ID
Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
```

```
switch(config)#
```

### 12.1.10.27 ip dhcp snooping vlan

The **ip dhcp snooping vlan** command enables DHCP snooping on specified VLANs. DHCP snooping is a Layer 2 process that allows relay agents to provide remote-ID and circuit-ID information in DHCP packets. DHCP servers use this data to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP snooping is configured on a global and VLAN basis.

VLAN snooping on a specified VLAN requires each of these conditions:

- DHCP snooping is globally enabled.
- Insertion of option-82 information in DHCP packets is enabled.
- DHCP snooping is enabled on the specified VLAN.
- DHCP relay is enabled on the corresponding VLAN interface.

When global DHCP snooping is not enabled, the **ip dhcp snooping vlan** command persists in **running-config** without any operational affect.

The **no ip dhcp snooping information option** and **default ip dhcp snooping information option** commands disable DHCP snooping operability by removing the **ip dhcp snooping information option** statement from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip dhcp snooping vlan v_range
no ip dhcp snooping vlan v_range
default ip dhcp snooping vlan v_range
```

#### Parameters

- **v\_range** VLANs upon which snooping is enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

#### Related Commands

- [ip dhcp snooping](#) globally enables DHCP snooping.
- [ip dhcp snooping vlan](#) enables insertion of option-82 snooping data.
- [ip helper-address](#) enables the DHCP relay agent on a configuration mode interface.

#### Example:

These commands enable DHCP snooping globally, DHCP on VLAN interface 100, and DHCP snooping on VLAN 100.

```
switch(config)#ip dhcp snooping
switch(config)#ip dhcp snooping information option
switch(config)#ip dhcp snooping vlan 100
switch(config)#interface vlan 100
switch(config-if-Vl100)#ip helper-address 10.4.4.4
switch(config-if-Vl100)#show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
 100
DHCP Snooping is operational on following VLANs:
 100
Insertion of Option-82 is enabled
Circuit-id format: Interface name:Vlan ID
Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
```

```
switch(config)#
```

---

### 12.1.10.28 ip dhcp snooping

The **ip dhcp snooping** command enables DHCP snooping globally on the switch. DHCP snooping is a set of layer 2 processes that can be configured on LAN switches and used with DHCP servers to control network access to clients with specific IP/MAC addresses. The switch supports Option-82 insertion, which is a DHCP snooping process that allows relay agents to provide remote-ID and circuit-ID information to DHCP reply and request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP servers use port information to track host location and IP address usage by authorized physical ports.

DHCP snooping uses the information option (Option-82) to include the switch MAC address (router-ID) along with the physical interface name and VLAN number (circuit-ID) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server as specified by the DHCP protocol.

DHCP snooping on a specified VLAN requires all of these conditions to be met:

- DHCP snooping is globally enabled.
- Insertion of option-82 information in DHCP packets is enabled.
- DHCP snooping is enabled on the specified VLAN.
- DHCP relay is enabled on the corresponding VLAN interface.

The **no ip dhcp snooping** and **default ip dhcp snooping** commands disables global DHCP snooping by removing the **ip dhcp snooping** command from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip dhcp snooping
```

```
no ip dhcp snooping
```

```
default ip dhcp snooping
```

#### Related Commands

- [ip dhcp snooping information option](#) enables insertion of option-82 snooping data.
- [ip helper-address](#) enables the DHCP relay agent on a configuration mode interface.

#### Example:

This command globally enables snooping on the switch, displaying DHCP snooping status prior and after invoking the command.

```
switch(config)#show ip dhcp snooping
DHCP Snooping is disabled
switch(config)#ip dhcp snooping
switch(config)#show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is not operational
DHCP Snooping is configured on following VLANs:
  None
DHCP Snooping is operational on following VLANs:
  None
Insertion of Option-82 is disabled
switch(config)#
```

### 12.1.10.29 ip hardware fib ecmp resilience

The **ip hardware fib ecmp resilience** command enables resilient ECMP for the specified IP address prefix and configures a fixed number of next hop entries in the hardware ECMP table for that prefix. In addition to specifying the maximum number of next hop addresses that the table can contain for the prefix, the command includes a redundancy factor that allows duplication of each next hop address. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor.

Resilient ECMP is useful when it is not desirable for routes to be rehashed due to link flap, as when ECMP is being used for load balancing.

The **no ip hardware fib ecmp resilience** and **default ip hardware fib ecmp resilience** commands restore the default hardware ECMP table management by removing the **ip hardware fib ecmp resilience** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip hardware fib ecmp resilience net_addr capacity nhop_max redundancy duplicates
```

```
no ip hardware fib ecmp resilience net_addr
```

```
default ip hardware fib ecmp resilience net_addr
```

#### Parameters

- **net\_addr** IP address prefix managed by command. (CIDR or address-mask).
- **nhop\_max** Maximum number of nexthop addresses for specified IP address prefix. Value range varies by platform:
  - Helix: <2 to 64>
  - Trident: <2 to 32>
  - Trident II: <2 to 64>
- **duplicates** Specifies the redundancy factor. Value ranges from 1 to 128.

#### Example:

This command configures a hardware ECMP table space of 24 entries for the IP address 10.14.2.2/24. A maximum of six next-hop addresses can be specified for the IP address. When the table contains six next-hop addresses, each appears in the table four times. When the table contains fewer than six next-hop addresses, each is duplicated until the 24 table entries are filled.

```
switch(config)#ip hardware fib ecmp resilience 10.14.2.2/24
  capacity 6 redundancy 4
switch(config)#
```

### 12.1.10.30 ip hardware fib optimize

The `ip hardware fib optimize` command enables IPv4 route scale. The platform layer 3 agent is restarted to ensure IPv4 routes are optimized with the `agent SandL3Unicast terminate` command for the configuration mode interface.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip hardware fib optimize exact-match prefix-length <prefix-length> <optional: prefix-length>
```

```
ip hardware fib optimize exact-match prefix-length <prefix-length> <optional: prefix-length>
```

#### Parameters

- **prefix-length** The length of the prefix equal to 12, 16, 20, 24, 28, or 32. One additional prefix-length limited to the prefix-length of 32 is optional.

#### Related Commands

- `agent SandL3Unicast terminate` enables restarting the layer 3 agent to ensure IPv4 routes are optimized.
- `show platform arad ip route` shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.
- `show platform arad ip route summary` shows hardware resource usage of IPv4 routes.

#### Examples:

- This configuration command allows configuring prefix lengths 12 and 32.

```
switch(config)#ip hardware fib optimize exact-match prefix-length 12 32
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

- One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.
- This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

- Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.
- This configuration command allows configuring prefix lengths 32 and 16.

```
switch(config)#ip hardware fib optimize exact-match prefix-length 32 16
! Please restart layer 3 forwarding agent to ensure IPv4 routes are optimized
```

- One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.

- This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

- Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

- This configuration command allows configuring prefix length 24.

```
switch(config)#ip hardware fib optimize exact-match prefix-
length 24
! Please restart layer 3 forwarding agent to ensure IPv4
routes are optimized
```

- In this instance, there is only one prefix-length, so a prefix-length of 32 is not required. For this command to take effect, the platform layer 3 agent must be restarted.

- This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

- Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

- This configuration command allows configuring prefix length 32.

```
switch(config)#ip hardware fib optimize exact-match prefix-
length 32
! Please restart layer 3 forwarding agent to ensure IPv4
routes are optimized
```

- For this command to take effect, the platform layer 3 agent must be restarted.

- This configuration command restarts the platform layer 3 agent to ensure IPv4 routes are optimized.

```
switch(config)#agent SandL3Unicast terminate
SandL3Unicast was terminated
```

- Restarting the platform layer 3 agent results in deletion of all IPv4 routes, which are re-added to the hardware.

- This configuration command disables configuring prefix lengths 12 and 32.

```
switch(config)#no ip hardware fib optimize exact-match
prefix-length 12 32
! Please restart layer 3 forwarding agent to ensure IPv4
routes are not optimized
```

- One of the two prefixes in this command is a prefix-length of 32, which is required in the instance where there are two prefixes. For this command to take effect, the platform layer 3 agent must be restarted.

---

### 12.1.10.31 ip helper-address

The **ip helper-address** command enables the DHCP relay agent on the configuration mode interface and specifies a forwarding address for DHCP requests. An interface that is configured with multiple helper-addresses forwards DHCP requests to all specified addresses.

The **no ip helper-address** and **default ip helper-address** commands remove the corresponding **ip helper-address** command from **running-config**. Commands that do not specify an IP helper-address remove all helper-addresses from the interface.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip helper-address ipv4_addr [vrf vrf_name][source-address ipv4_addr | source-interface INTERFACES]
```

```
no ip helper-address [ipv4_addr]
```

```
default ip helper-address [ipv4_addr]
```

#### Parameters

- **vrf *vrf\_name*** Specifies the user-defined VRF for DHCP server.
- ***ipv4\_addr*** Specifies the DHCP server address accessed by interface.
- **source-address *ipv4\_addr*** Specifies the source IPv4 address to communicate with DHCP server.
- **source-interface INTERFACES** Specifies the source interface to communicate with DHCP server. Options include:
  - **Ethernet *eth\_num*** Specifies the Ethernet interface number.
  - **Loopback *lbck\_num*** Specifies the loopback interface number. Value ranges from 0 to 1000.
  - **Management *mgmt\_num*** Specifies the management interface number. Accepted values are 1 and 2.
  - **Port-Channel {*int\_num* | *sub\_int\_num*}** Specifies the port-channel interface or subinterface number. Value of interface ranges from 1 to 2000. Value of sub-interface ranges from 1 to 4094.
  - **Tunnel *tnl\_num*** Specifies the tunnel interface number. Value ranges from 0 to 255.
  - **VLAN *vlan\_num*** Specifies the Ethernet interface number. Value ranges from 1 to 4094.

#### Related Commands

- [ip dhcp relay always-on](#)
- [ip dhcp relay information option \(Global\)](#)
- [ip dhcp relay information option circuit-id](#)

#### Guidelines

If the source-address parameter is specified, then the DHCP client receives an IPv4 address from the subnet of source IP address. The source-address must be one of the configured addresses on the interface.

**Examples:**

- This command enables DHCP relay on the VLAN interface 200; and configure the switch to forward DHCP requests received on this interface to the server at 10.10.41.15.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip helper-address 10.10.41.15
switch(config-if-Vl200)#show active
interface Vlan200
    ip helper-address 10.10.41.15
switch(config-if-Vl200)#
```

- This command enables DHCP relay on the interface Ethernet 1/2; and configures the switch to use 2.2.2.2 as the source IP address when relaying IPv4 DHCP messages to the server at 1.1.1.1.

```
switch(config)#interface ethernet 1/2
switch(config-if-Et1/2)#ip helper-address 1.1.1.1 source-
address 2.2.2.2
switch(config-if-Et1/2)#
```

---

### 12.1.10.32 ip icmp redirect

The **ip icmp redirect** command enables the transmission of ICMP redirect messages. Routers send ICMP redirect messages to notify data link hosts of the availability of a better route for a specific destination.

The **no ip icmp redirect** disables the switch from sending ICMP redirect messages.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip icmp redirect
```

```
no ip icmp redirect
```

```
default ip icmp redirect
```

#### Example:

This command disables the redirect messages.

```
switch(config)#no ip icmp redirect
switch(config)#show running-config
<-----OUTPUT OMITTED FROM EXAMPLE----->
!
no ip icmp redirect
ip routing
!
<-----OUTPUT OMITTED FROM EXAMPLE----->
switch(config)#
```

### 12.1.10.33 ip load-sharing

The **ip load-sharing** command provides the hash seed to an algorithm that the switch uses to distribute data streams among multiple equal-cost routes to an individual IPv4 subnet.

In a network topology using Equal-Cost Multipath routing, all switches performing identical hash calculations may result in hash polarization, leading to uneven load distribution among the data paths. Hash polarization is avoided when switches use different hash seeds to perform different hash calculations.

The **no ip load-sharing** and **default ip load-sharing** commands return the hash seed to the default value of zero by removing the **ip load-sharing** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip load-sharing HARDWARE seed
no ip load-sharing HARDWARE
default ip load-sharing HARDWARE
```

#### Parameters

- **HARDWARE** The ASIC switching device. The available option depend on the switch platform. Verify available options with the CLI ? command.
  - **arad**
  - **fm6000**
  - **petraA**
  - **trident**
- **seed** The hash seed. Value range varies by switch platform. The default value on all platforms is 0.
  - when **HARDWARE=arad** **seed** ranges from 0 to 2.
  - when **HARDWARE=fm6000** **seed** ranges from 0 to 39.
  - when **HARDWARE=petraA** **seed** ranges from 0 to 2.
  - when **HARDWARE=trident** **seed** ranges from 0 to 5.

#### Example:

This command sets the IPv4 load sharing hash seed to one on FM6000 platform switches.

```
switch(config)#ip load-sharing fm6000 1
switch(config)#
```

---

### 12.1.10.34 ip local-proxy-arp

The **ip local-proxy-arp** command enables local proxy ARP (Address Resolution Protocol) on the configuration mode interface. When local proxy ARP is enabled, ARP requests received on the configuration mode interface will return an IP address even when the request comes from within the same subnet.

The **no ip local-proxy-arp** and **default ip local-proxy-arp** commands disable local proxy ARP on the configuration mode interface by removing the corresponding **ip local-proxy-arp** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip local-proxy-arp
```

```
no ip local-proxy-arp
```

```
default ip local-proxy-arp
```

#### Example:

These commands enable local proxy ARP on VLAN interface 140.

```
switch(config)#interface vlan 140
switch(config-if-Vl140)#ip local-proxy-arp
switch(config-if-Vl140)#show active
interface Vlan140
    ip local-proxy-arp
switch(config-if-Vl140)#
```

### 12.1.10.35 ip multicast count

The **ip multicast count** command enables the IPv4 multicast route traffic counter of group and source addresses in either bytes or packets.

The **no ip multicast count** command deletes all multicast counters including the routes of group and source addresses.

The **no ip multicast count *group\_address source\_address*** command removes the current configuration of the specified group and source addresses. It does not delete the counter because the wildcard is still active.

The **default ip multicast count** command reverts the current counter configuration of multicast route to the default state.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip multicast count [group_address [source_address] | bytes | packets]
```

```
no ip multicast count [group_address [source_address] | bytes | packets]
```

```
default ip multicast count [group_address [source_address] | bytes | packets]
```

#### Parameters

- **group\_address** Configures the multicast route traffic count of the specified group address.
  - **source\_address** Configures the multicast route traffic count of the specified group and source addresses.
- **bytes** Configures the multicast route traffic count to bytes.
- **packets** Configures the multicast route traffic count to packets.

#### Guidelines

This command is supported on the FM6000 platform only.

#### Examples:

- This command configures the multicast route traffic count to bytes.

```
switch(config)#ip multicast count bytes
```

- This command configures the multicast route traffic count of the specified group and source addresses.

```
switch(config)#ip multicast count 10.50.30.23 45.67.89.100
```

- This command deletes all multicast counters including the routes of group and source addresses.

```
switch(config)#no ip multicast count
```

- This command reverts the current multicast route configuration to the default state.

```
switch(config)#default ip multicast count
```

---

### 12.1.10.36 ip proxy-arp

The **ip proxy-arp** command enables proxy ARP on the configuration mode interface. Proxy ARP is disabled by default.

The **no ip proxy-arp** and **default ip proxy-arp** commands disable proxy ARP on the configuration mode interface by removing the corresponding **ip proxy-arp** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip proxy-arp
```

```
no ip proxy-arp
```

```
default ip proxy-arp
```

#### Example:

This command enables proxy ARP on Ethernet interface 4.

```
switch(config)#interface ethernet 4  
switch(config-if-Et4)#ip proxy-arp  
switch(config-if-Et4)#
```

### 12.1.10.37 ip route

The `ip route` command creates a static route. The destination is a network segment; the nexthop address is either an IPv4 address or a routable port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with an administrative distance value of 200 is overridden by OSPF intra-area routes, which have a default administrative distance of 110.

Tags are used by route maps to filter routes. The default tag value on static routes is 0.

Multiple routes with the same destination and the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic equally through all ECMP route paths. All paths comprising an ECMP are assigned identical tag values; commands that change the tag value of a path change the tag value of all paths in the ECMP.

The `no ip route` and `default ip route` commands delete the specified static route by removing the corresponding `ip route` command from *running-config*. Commands that do not list a nexthop address remove all `ip route` statements with the specified destination from *running-config*. If an `ip route` statement exists for the same IP address in multiple VRFs, each must be removed separately. All static routes in a user-defined VRF are deleted when the VRF is deleted.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip route [VRF_INSTANCE]dest_net NEXTHOP [DISTANCE][TAG_OPTION][RT_NAME]
```

```
no ip route [VRF_INSTANCE]dest_net [NEXTHOP][DISTANCE]
```

```
default ip route [VRF_INSTANCE] dest_net [NEXTHOP][DISTANCE]
```

#### Parameters

- **VRF\_INSTANCE** Specifies the VRF instance being modified.
  - **<no parameter>** Changes are made to the default VRF.
  - **vrf vrf\_name** Changes are made to the specified VRF.
- **dest\_net** Destination IPv4 subnet (CIDR or address-mask notation).
- **NEXTHOP** Location or access method of next hop device. Options include:
  - **ipv4\_addr** An IPv4 address.
  - **null0** Null0 interface.
  - **ethernet e\_num** Ethernet interface specified by **e\_num**.
  - **loopback l\_num** Loopback interface specified by **l\_num**.
  - **management m\_num** Management interface specified by **m\_num**.
  - **port-channel p\_num** Port-channel interface specified by **p\_num**.
  - **vlan v\_num** VLAN interface specified by **v\_num**.
  - **vxlan vx\_num** VXLAN interface specified by **vx\_num**.
- **DISTANCE** Administrative distance assigned to route. Options include:
  - **<no parameter>** Route assigned default administrative distance of one.
  - **<1-255>** The administrative distance assigned to route.
- **TAG\_OPTION** Static route tag. Options include:
  - **<no parameter>** Assigns default static route tag of 0.
  - **tag t\_value** Static route tag value. **t\_value** ranges from 0 to 4294967295.
- **RT\_NAME** Associates descriptive text to the route. Options include:

- 
- **<no parameter>** No text is associated with the route.
  - **name *descriptive\_text*** The specified text is assigned to the route.

#### Related Command

The [ip route nexthop-group](#) command creates a static route that specifies a Nexthop Group to determine the Nexthop address.

#### Example

This command creates a static route in the default VRF.

```
switch(config)#ip route 172.17.252.0/24 vlan 2000
switch(config)#
```

### 12.1.10.38 ip routing

The **ip routing** command enables IPv4 routing. When IPv4 routing is enabled, the switch attempts to deliver inbound packets to destination IPv4 addresses by forwarding them to interfaces or next hop addresses specified by the forwarding table.

The **no ip routing** and **default ip routing** commands disable IPv4 routing by removing the **ip routing** command from *running-config*. When IPv4 routing is disabled, the switch attempts to deliver inbound packets to their destination MAC addresses. When this address matches the switch's MAC address, the packet is delivered to the CPU. IP packets with IPv4 destinations that differ from the switch's address are typically discarded. The **delete-static-routes** option removes static entries from the routing table.

IPv4 routing is disabled by default.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip routing [VRF_INSTANCE]
no ip routing [DELETE_ROUTES][VRF_INSTANCE]
default ip routing [DELETE_ROUTES][VRF_INSTANCE]
```

#### Parameters

- **DELETE\_ROUTES** Resolves routing table static entries when routing is disabled.
  - **<no parameter>** Routing table retains static entries.
  - **delete-static-routes** Static entries are removed from the routing table.
- **VRF\_INSTANCE** Specifies the VRF instance being modified.
  - **<no parameter>** Changes are made to the default VRF.
  - **vrf vrf\_name** Changes are made to the specified user-defined VRF.

#### Example:

This command enables IPv4 routing.

```
switch(config)#ip routing
switch(config)#
```

### 12.1.10.39 ip source binding

IP source guard (IPSG) is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Hence, source IP MAC binding entries should be configured on port channels. When configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

**Note:** IP source bindings are also used by static ARP inspection.

The `no ip source binding` and `default ip source binding` commands exclude parameters from IPSG filtering, and set the default for `ip source binding`.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
ip source binding [IP_ADDRESS][MAC_ADDRESS]vlan [VLAN_RANGE] interface [INTERFACE]
```

```
no ip source binding [IP_ADDRESS][MAC_ADDRESS] vlan [VLAN_RANGE] interface [INTERFACE]
```

```
default ip source binding [IP_ADDRESS][MAC_ADDRESS] vlan [VLAN_RANGE] interface [INTERFACE]
```

#### Parameters

- **IP\_ADDRESS** Specifies the IP ADDRESS.
- **MAC\_ADDRESS** Specifies the MAC ADDRESS.
- **VLAN\_RANGE** Specifies the VLAN ID range.
- **INTERFACE** Specifies the Ethernet interface.

#### Related Commands

- [ip verify source](#)
- [show ip verify source](#)

#### Example:

This command configures source IP-MAC binding entries to IP address *10.1.1.1*, MAC address *0000.aaaa.1111*, VLAN ID *4094*, and *Ethernet interface 36*.

```
switch(config)#ip source binding 10.1.1.1 0000.aaaa.1111 vlan
4094 interface
ethernet 36
switch(config)#
```

### 12.1.10.40 ip verify source

The **ip verify source** command configures IP source guard (IPSG) applicable only to Layer 2 ports. When configured on Layer 3 ports, IPSG does not take effect until this interface is converted to Layer 2.

IPSG is supported on Layer 2 Port-Channels, not member ports. The IPSG configuration on port channels supersedes the configuration on the physical member ports. Therefore, source IP MAC binding entries should be configured on port channels. When configured on a port channel member port, IPSG does not take effect until this port is deleted from the port channel configuration.

The **no ip verify source** and **default ip verify source** commands exclude VLAN IDs from IPSG filtering, and set the default for **ip verify source**.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
ip verify source vlan [VLAN_RANGE]
no ip verify source [VLAN_RANGE]
default ip verify source
```

#### Parameters

- **VLAN\_RANGE** Specifies the VLAN ID range.

#### Related Commands

- [ip source binding](#)
- [show ip verify source](#)

#### Example:

This command excludes VLAN IDs 1 through 3 from IPSG filtering. When enabled on a trunk port, IPSG filters the inbound IP packets on all allowed VLANs. IP packets received on VLANs 4 through 10 on *Ethernet* 36 will be filtered by IPSG, while those received on VLANs 1 through 3 are permitted.

```
switch(config)#no ip verify source vlan 1-3
switch(config)#interface ethernet 36
switch(config-if-Et36)#switchport mode trunk
switch(config-if-Et36)#switchport trunk allowed vlan 1-10
switch(config-if-Et36)#ip verify source
switch(config-if-Et36)#
```

### 12.1.10.41 ip verify

The **ip verify** command configures Unicast Reverse Path Forwarding (uRPF) for inbound IPv4 packets on the configuration mode interface. uRPF verifies the accessibility of source IP addresses in packets that the switch forwards.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode:** uRPF verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- **Loose mode:** uRPF validation does not consider the inbound packet's ingress interface only that there is a valid return path.

The **no ip verify** and **default ip verify** commands disable uRPF on the configuration mode interface by deleting the corresponding **ip verify** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip verify unicast source reachable-via RPF_MODE
```

```
no ip verify unicast
```

```
default ip verify unicast
```

#### Parameters

- **RPF\_MODE** Specifies the uRPF mode. Options include:
  - **any** Loose mode.
  - **rx** Strict mode.
  - **rx allow-default** Strict mode. All inbound packets are forwarded if a default route is defined.

#### Guidelines

The first IPv4 uRPF implementation briefly disrupts IPv4 unicast routing. Subsequent **ip verify** commands on any interface do not disrupt IPv4 routing.

#### Examples:

- This command enables uRPF loose mode on *VLAN interface 17*.

```
switch(config)#interface vlan 17
switch(config-if-Vl17)#ip verify unicast source reachable-via
any
switch(config-if-Vl17)#show active
interface Vlan17
ip verify unicast source reachable-via any
switch(config-if-Vl17)#
```

- This command enables uRPF strict mode on *VLAN interface 18*.

```
switch(config)#interface vlan 18
switch(config-if-Vl18)#ip verify unicast source reachable-via
rx
```

```
switch(config-if-Vl18)#show active
interface Vlan18
  ip verify unicast source reachable-via rx
switch(config-if-Vl18)#
```

## 12.1.10.42 platform trident forwarding-table partition

The **platform trident forwarding-table partition** command provides a shared table memory for L2, L3 and algorithmic LPM entries that can be partitioned in different ways.

Instead of having fixed-size tables for L2 MAC entry tables, L3 IP forwarding tables, and Longest Prefix Match (LPM) routes, the tables can be unified into a single shareable forwarding table.

**Note:** Changing the Unified Forwarding Table mode causes the forwarding agent to restart, briefly disrupting traffic forwarding on all ports.

The **no platform trident forwarding-table partition** and **default platform trident forwarding-table partition** commands remove the **platform trident forwarding-table partition** command from *running-config*.

### Command Mode

Global Configuration

### Command Syntax

```
platform trident forwarding-table partition SIZE
```

```
no platform trident forwarding-table partition
```

```
default platform trident forwarding-table partition
```

### Parameters

- **SIZE** Size of partition. Options include:
  - **0** 288k l2 entries, 16k host entries, 16k lpm entries
  - **1** 224k l2 entries, 80k host entries, 16k lpm entries
  - **2** 160k l2 entries, 144k host entries, 16k lpm entries
  - **3** 96k l2 entries, 208k host entries, 16k lpm entries

The default value is **2** (160k l2 entries, 144k host entries, 16k lpm entries).

### Examples:

- This command sets the single shareable forwarding table to option 2 that supports 160k L2 entries, 144k host entries, and 16k LPM entries.

```
switch(config)#platform trident forwarding-table partition 2
switch(config)
```

- This command sets the single shareable forwarding table to option 3 that supports 96k L2 entries, 208k host entries, and 16k LPM entries. Since the switch was previously configured to option 2, you'll see a warning notice before the changes are implemented.

```
#switch(config)#platform trident forwarding-table partition 3
Warning: StrataAgent will restart immediately
```

### 12.1.10.43 platform trident routing-table partition

The **platform trident routing-table partition** command manages the partition sizes for the hardware LPM table that stores IPv6 routes of varying sizes.

An IPv6 route of length /64 (or shorter) requires half the hardware resources of an IPv6 route that is longer than /64. The switch installs routes of varying lengths in different table partitions. This command specifies the size of these partitions to optimize table usage.

**Note:** Changing the routing table partition mode causes the forwarding agent to restart, briefly disrupting traffic forwarding on all ports.

The **no platform trident routing-table partition** and **default platform trident routing-table partition** commands restore the default partitions sizes by removing the **platform trident routing-table partition** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform trident routing-table partition SIZE
no platform trident routing-table partition
default platform trident routing-table partition
```

#### Parameters

- **SIZE** Size of partition. Options include:
  - **1** 16k IPv4 entries, 6k IPv6 (/64 and smaller) entries, 1k IPv6 (any prefix length)
  - **2** 16k IPv4 entries, 4k IPv6 (/64 and smaller) entries, 2k IPv6 (any prefix length)
  - **3** 16k IPv4 entries, 2k IPv6 (/64 and smaller) entries, 3k IPv6 (any prefix length)

The default value is **2** (16k IPv4 entries, 4k IPv6 (/64 and smaller) entries, 2k IPv6 (any prefix length)).

#### Restrictions

Partition allocation cannot be changed from the default setting when uRPF is enabled for IPv6 traffic.

#### Example:

This command sets the shareable routing table to option **1** that supports 6K prefixes equal to or shorter than /64 and 1K prefixes longer than /64.

```
switch(config)#platform trident routing-table partition 1
switch(config)
```

---

#### 12.1.10.44 rib fib policy

The **rib fib policy** command enables FIB policy for a particular VRF under router general configuration mode. The FIB policy can be configured to advertise only specific RIB routes and exclude all other routes.

For example, a FIB policy can be configured that will not place routes associated with a specific origin in the routing table. These routes will not be used to forward data packets and these routes are not advertised by the routing protocol to neighbors.

The **no rib fib policy** and **default rib fib policy** commands restore the switch to its default state by removing the corresponding rib fib policy command from *running-config*.

##### Command Mode

Router General Configuration

##### Command Syntax

```
rib [ipv4 | ipv6] fib policy name
no rib [ipv4 | ipv6] fib policy name
default rib [ipv4 | ipv6] fib policy name
```

##### Parameters

- **ipv4** IPv4 configuration commands.
- **ipv6** IPv6 configuration commands.
- **name** Route map name.

##### Example:

The following example enables FIB policy for IPv4 in the default VRF, using the route map, *map1*.

```
Switch(config)#router general
Switch(config-router-general)#vrf default
Switch(config-router-general-vrf-default)#rib ipv4 fib policy
map1
```

### 12.1.10.45 show arp

The **show arp** command displays all ARP tables. This command differs from the **show ip arp** command in that it shows MAC bindings for all protocols, whereas **show ip arp** only displays MAC address – IP address bindings. Addresses are displayed as their host name by including the **resolve** argument.

#### Command Mode

EXEC

```
show arp [VRF_INST][FORMAT][HOST_ADD][HOST_NAME][INTF][MAC_ADDR][DATA]
```

#### Parameters

The **VRF\_INST** and **FORMAT** parameters are always listed first and second. The **DATA** parameter is always listed last. All other parameters can be placed in any order.

- **VRF\_INST** Specifies the VRF instance for which data is displayed.
  - *<no parameter>* Context-active VRF.
  - **vrf vrf\_name** Specifies name of VRF instance. System default VRF is specified by **default**.
- **FORMAT** Displays format of host address. Options include:
  - *<no parameter>* Entries associate hardware address with an IPv4 address.
  - **resolve** Enter associate hardware address with a host name (if it exists).
- **HOST\_ADD** IPv4 address by which routing table entries are filtered. Options include:
  - *<no parameter>* Routing table entries are not filtered by host address.
  - **ipv4\_addr** Table entries matching specified IPv4 address.
- **HOST\_NAME** Host name by which routing table entries are filtered. Options include:
  - *<no parameter>* Routing table entries are not filtered by host name.
  - **host hostname** Entries matching **hostname** (text).
- **INTF** Interfaces for which command displays status.
  - *<no parameter>* Routing table entries are not filtered by interface.
  - **interface ethernet e\_num** Routed Ethernet interface specified by **e\_num**.
  - **interface loopback l\_num** Routed loopback interface specified by **l\_num**.
  - **interface management m\_num** Routed management interface specified by **m\_num**.
  - **interface port-channel p\_num** Routed port channel Interface specified by **p\_num**.
  - **interface vlan v\_num** VLAN interface specified by **v\_num**.
  - **interface vxlan vx\_num** VXLAN interface specified by **vx\_num**.
- **MAC\_ADDR** MAC address by which routing table entries are filtered. Options include:
  - *<no parameter>* Routing table entries are not filtered by interface MAC address.
  - **mac\_address mac\_address** Entries matching **mac\_address** (dotted hex notation – H.H.H).
- **DATA** Detail of information provided by command. Options include:
  - *<no parameter>* Routing table entries.
  - **summary** Summary of ARP table entries.
  - **summary total** Number of ARP table entries.

#### Related Commands

- **cli vrf** specifies the context-active VRF.

**Example:**

---

This command displays the ARP table.

```
switch>show arp
Address          Age (min)  Hardware Addr  Interface
172.22.30.1      0         001c.730b.1d15  Management1
172.22.30.133   0         001c.7304.3906  Management1
switch>
```

### 12.1.10.46 show interface tunnel

The **show interface tunnel** command displays the interface tunnel information.

#### Command Mode

EXEC

#### Command Syntax

```
show interface tunnel <number>
```

#### Parameter

- **number** Specifies the tunnel interface number.

#### Example:

This command displays tunnel interface configuration information for tunnel interface 10.

```
switch#show interface tunnel 10

Tunnel10 is up, line protocol is up (connected)
Hardware is Tunnel, address is 0a01.0101.0800
Internet address is 192.168.1.1/24
Broadcast address is 255.255.255.255
Tunnel source 10.1.1.1, destination 10.1.1.2
Tunnel protocol/transport GRE/IP
  Key disabled, sequencing disabled
  Checksumming of packets disabled
Tunnel TTL 10, Hardware forwarding enabled
Tunnel TOS 10
Path MTU Discovery
Tunnel transport MTU 1476 bytes
Up 3 seconds
```

## 12.1.10.47 show ip arp inspection statistics

The **show ip arp inspection statistics** command displays the statistics of inspected ARP packets. For a VLAN specified, only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed.

### Command Mode

EXEC

### Command Syntax

```
show ip arp inspection statistics [vlan [VID]][[INTERFACE] interface < intf_slot/intf_port>]
```

### Parameters

- **VID** Specifies the VLAN interface ID.
- **INTERFACE** Specifies the interface (e.g., Ethernet).
  - <intf\_slot> Interface slot.
  - <intf\_port> Interface port.
- **INTF** Specifies the VLAN interface slot and port.

### Related Commands

- [ip arp inspection limit](#)
- [ip arp inspection trust](#)
- [ip arp inspection vlan](#)

### Examples:

- This command displays statistics of inspected ARP packets for VLAN 10.

```
switch(config)#show ip arp inspection statistics vlan 10

Vlan : 10
-----
ARP
Req Forwarded = 20
ARP Res Forwarded = 20
ARP Req Dropped = 1
ARP Res Dropped = 1
Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: Ethernet 3/1
Packet:
  Source MAC: 00:01:00:01:00:01
  Dest MAC: 00:02:00:02:00:02
  ARP Type: Request
  ARP Sender MAC: 00:01:00:01:00:01
  ARP Sender IP: 1.1.1

switch(config)#
```

- This command displays ARP inspection statistics for Ethernet interface 3/1.

```
switch(config)#show ip arp inspection statistics ethernet
interface 3/1
-----
ARP Req Forwarded = 10
ARP Res Forwarded = 10
ARP Req Dropped = 1
```

```
ARP Res Dropped = 1

Last invalid ARP:
Time: 10:20:30 ( 5 minutes ago )
Reason: Bad IP/Mac match
Received on: VLAN 10
Packet:
  Source MAC: 00:01:00:01:00:01
  Dest MAC: 00:02:00:02:00:02
  ARP Type: Request
  ARP Sender MAC: 00:01:00:01:00:01
  ARP Sender IP: 1.1.1

switch(config)#
```

---

### 12.1.10.48 show ip arp inspection vlan

The **show ip arp inspection vlan** command displays the configuration and operation state of ARP inspection. For a VLAN range specified, only VLANs with ARP inspection enabled will be displayed. If no VLAN is specified, all VLANs with ARP inspection enabled are displayed. The operation state turns to **Active** when hardware is ready to trap ARP packets for inspection.

#### Command Mode

EXEC

#### Command Syntax

```
show ip arp inspection vlan [LIST]
```

#### Parameters

- **LIST** Specifies the VLAN interface number.

#### Related Commands

- [ip arp inspection limit](#)
- [ip arp inspection trust](#)
- [show ip arp inspection statistics](#)

#### Example:

This command displays the configuration and operation state of ARP inspection for VLANs 1 through 150.

```
switch(config)#show ip arp inspection vlan 1 - 150

VLAN 1
-----
Configuration
: Enabled
Operation State : Active
VLAN 2
-----
Configuration
: Enabled
Operation State : Active
{...}
VLAN 150
-----
Configuration
: Enabled
Operation State : Active

switch(config)#
```

### 12.1.10.49 show ip arp

The `show ip arp` command displays ARP cache entries that map an IPv4 address to a corresponding MAC address. The table displays addresses by their host names when the command includes the **resolve** argument.

#### Command Mode

EXEC

#### Command Syntax

```
show ip arp [VRF_INST][FORMAT][HOST_ADDR][HOST_NAME][INTF][MAC_ADDR][DATA]
```

#### Parameters

The **VRF\_INST** and **FORMAT** parameters are always listed first and second. The **DATA** parameter is always listed last. All other parameters can be placed in any order.

- **VRF\_INST** Specifies the VRF instance for which data is displayed.
  - **<no parameter>** Context-active VRF.
  - **vrf vrf\_name** Specifies name of VRF instance. System default VRF is specified by **default**.
- **FORMAT** Displays format of host address. Options include:
  - **<no parameter>** Entries associate hardware address with an IPv4 address.
  - **resolve** Enter associate hardware address with a host name (if it exists).
- **HOST\_ADDR** IPv4 address by which routing table entries are filtered. Options include:
  - **<no parameter>** Routing table entries are not filtered by host address.
  - **ipv4\_addr** Table entries matching specified IPv4 address.
- **HOST\_NAME** Host name by which routing table entries are filtered. Options include:
  - **<no parameter>** Routing table entries are not filtered by host name.
  - **host hostname** Entries matching **hostname** (text).
- **INTERFACE\_NAME** Interfaces for which command displays status.
  - **<no parameter>** Routing table entries are not filtered by interface.
  - **interface ethernet e\_num** Routed Ethernet interface specified by **e\_num**.
  - **interface loopback l\_num** Routed loopback interface specified by **l\_num**.
  - **interface management m\_num** Routed management interface specified by **m\_num**.
  - **interface port-channel p\_num** Routed port channel Interface specified by **p\_num**.
  - **interface vlan v\_num** VLAN interface specified by **v\_num**.
  - **interface vxlan vx\_num** VXLAN interface specified by **vx\_num**.
- **MAC\_ADDR** MAC address by which routing table entries are filtered. Options include:
  - **<no parameter>** Routing table entries are not filtered by interface MAC address.
  - **mac\_address mac\_address** entries matching **mac\_address** (dotted hex notation – H.H.H).
- **DATA** Detail of information provided by command. Options include:
  - **<no parameter>** Routing table entries.
  - **summary** Summary of ARP table entries.
  - **summary total** Number of ARP table entries.

#### Related Commands

- [cli vrf](#) specifies the context-active VRF.

**Examples:**

- This command displays ARP cache entries that map MAC addresses to IPv4 addresses.

```
switch>show ip arp

### 12.1.10.50 show ip dhcp relay counters

The **show ip dhcp relay counters** command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

#### Command Mode

EXEC

#### Command Syntax

```
show ip dhcp relay counters
```

#### Example:

This command displays the IP DHCP relay counter table.

```
switch>show ip dhcp relay counters
```

Interface	Dhcp Packets			Last Cleared
	Rcvd	Fwdd	Drop	
All Req	376	376	0	4 days, 19:55:12 ago
All Resp	277	277	0	
Vlan1000	0	0	0	4 days, 19:54:24 ago
Vlan1036	376	277	0	4 days, 19:54:24 ago

```
switch>
```

---

### 12.1.10.51 show ip dhcp relay

The **show ip dhcp relay** command displays the DHCP relay agent configuration status on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ip dhcp relay
```

#### Example:

This command displays the DHCP relay agent configuration status.

```
switch>show ip dhcp relay  
DHCP Relay is active  
DHCP Relay Option 82 is disabled  
DHCP Smart Relay is enabled  
Interface: Vlan100  
    DHCP Smart Relay is disabled  
    DHCP servers: 10.4.4.4  
switch>
```

### 12.1.10.52 show ip dhcp snooping counters

The **show ip dhcp snooping counters** command displays counters that track the quantity of DHCP request and reply packets that the switch receives. Data is either presented for each VLAN or aggregated for all VLANs with counters for packets dropped.

#### Command Mode

EXEC

#### Command Syntax

```
show ip dhcp snooping counters [COUNTER_TYPE]
```

#### Parameters

- **COUNTER\_TYPE** The type of counter that the command resets. Formats include:
  - **<no parameter>** Command displays counters for each VLAN.
  - **debug** Command displays aggregate counters and drop cause counters.

#### Examples:

- This command displays the number of DHCP packets sent and received on each VLAN.

```
switch>show ip dhcp snooping counters

Vlan | Dhcp Request Pkts | Dhcp Reply Pkts |
      | Rcvd  Fwdd  Drop | Rcvd Fwdd  Drop | Last Cleared
-----|-----|-----|-----|-----|
 100 |      0      0      0 |      0      0      0 | 0:35:39 ago

switch>
```

- This command displays the number of DHCP packets sent on the switch.

```
switch>show ip dhcp snooping counters debug
Counter                               Snooping to Relay Relay to

### 12.1.10.53 show ip dhcp snooping hardware

The **show ip dhcp snooping hardware** command displays internal hardware DHCP snooping status on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ip dhcp snooping hardware
```

#### Example:

This command DHCP snooping hardware status.

```
switch>show ip dhcp snooping hardware  
DHCP Snooping is enabled  
DHCP Snooping is enabled on following VLANs:  
  None  
  Vlans enabled per Slice  
    Slice: FixedSystem  
    None  
switch>
```

### 12.1.10.54 show ip dhcp snooping

The `show ip dhcp snooping` command displays the DHCP snooping configuration.

#### Command Mode

EXEC

#### Command Syntax

```
show ip dhcp snooping
```

#### Related Commands

- [ip dhcp snooping](#) globally enables DHCP snooping.
- [ip dhcp snooping vlan](#) enables DHCP snooping on specified VLANs.
- [ip dhcp relay information option \(Global\)](#) enables insertion of option-82 snooping data.
- [ip helper-address](#) enables the DHCP relay agent on a configuration mode interface.

#### Example:

This command displays the switch's DHCP snooping configuration.

```
switch>show ip dhcp snooping
DHCP Snooping is enabled
DHCP Snooping is operational
DHCP Snooping is configured on following VLANs:
 100
DHCP Snooping is operational on following VLANs:
 100
Insertion of Option-82 is enabled
  Circuit-id format: Interface name:Vlan ID
  Remote-id: 00:1c:73:1f:b4:38 (Switch MAC)
switch>
```

## 12.1.10.55 show ip interface brief

Use the `show ip interface brief` command output to display the status summary of the specified interfaces that are configured as routed ports. The command provides the following information for each specified interface:

- IP address
- Operational status
- Line protocol status
- MTU size

### Command Mode

EXEC

### Command Syntax

```
show ip interface [INTERFACE_NAME][VRF_INST] brief
```

### Parameters

- **INTERFACE\_NAME** Interfaces for which command displays status.
  - **<no parameter>** All routed interfaces.
  - **ipv4\_addr** Neighbor IPv4 address.
  - **ethernet e\_range** Routed Ethernet interfaces specified by **e\_range**.
  - **loopback l\_range** Routed loopback interfaces specified by **l\_range**.
  - **management m\_range** Routed management interfaces specified by **m\_range**.
  - **port-channel p\_range** Routed port channel Interfaces specified by **p\_range**.
  - **vlan v\_range** VLAN interfaces specified by **v\_range**.
  - **vxlan vx\_range** VXLAN interface range specified by **vx\_range**.
- **VRF\_INST** Specifies the VRF instance for which data is displayed.
  - **<no parameter>** Context-active VRF.
  - **vrf vrf\_name** Specifies name of VRF instance. System default VRF is specified by **default**.

### Example:

This command displays the summary status of VLAN interfaces 900-910.

```
switch>show ip interface vlan 900-910 brief

! Some interfaces do not exist
Interface          IP Address      Status    Protocol
  MTU
Vlan901            170.33.254.1/30 up        up
  9212
Vlan902            170.33.254.14/29 up        up
  9212
Vlan905            170.33.254.17/29 up        up
  1500
Vlan907            170.33.254.67/29 up        up
  9212
Vlan910            170.33.254.30/30 up        up
  9212
```

### 12.1.10.56 show ip interface

The **show ip interface** command displays the status of specified interfaces that are configured as routed ports. The command provides the following information:

- Interface description
- Internet address
- Broadcast address
- Address configuration method
- Proxy-ARP status
- MTU size

#### Command Mode

EXEC

#### Command Syntax

```
show ip interface [INTERFACE_NAME][VRF_INST]
```

#### Parameters

- **INTERFACE\_NAME** Interfaces for which command displays status.
  - **<no parameter>** All routed interfaces.
  - **ipv4\_addr** Neighbor IPv4 address.
  - **ethernet e\_range** Routed Ethernet interfaces specified by **e\_range**.
  - **loopback l\_range** Routed loopback interfaces specified by **l\_range**.
  - **management m\_range** Routed management interfaces specified by **m\_range**.
  - **port-channel p\_range** Routed port channel Interfaces specified by **p\_range**.
  - **vlan v\_range** VLAN interfaces specified by **v\_range**.
  - **vxlan vx\_range** VXLAN interfaces specified by **vx\_range**.
- **VRF\_INST** Specifies the VRF instance for which data is displayed.
  - **<no parameter>** Context-active VRF.
  - **vrf vrf\_name** Specifies name of VRF instance. System default VRF is specified by **default**.

#### Example:

- This command displays IP status of configured VLAN interfaces numbered between **900** and **910**.

```
switch>show ip interface vlan 900-910
! Some interfaces do not exist
Vlan901 is up, line protocol is up (connected)
  Description: ar.pqt.mlag.peer
  Internet address is 170.23.254.1/30
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  Proxy-ARP is disabled
  MTU 9212 bytes
Vlan903 is up, line protocol is up (connected)
  Description: ar.pqt.rn.170.23.254.16/29
  Internet address is 170.23.254.19/29
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  Proxy-ARP is disabled
  MTU 9212 bytes
```

- 
- This command displays the configured TCP maximum segment size (MSS) ceiling value of 1436 bytes for an Ethernet interface 25.

```
switch>show ip interface ethernet 25
Ethernet25 is up, line protocol is up (connected)
  Internet address is 10.1.1.1/24
  Broadcast address is 255.255.255.255
  IPv6 Interface Forwarding : None
  Proxy-ARP is disabled
  Local Proxy-ARP is disabled
  Gratuitous ARP is ignored
  IP MTU 1500 bytes
  IPv4 TCP MSS egress ceiling is 1436 bytes
```

### 12.1.10.57 show ip route age

The **show ip route age** command displays the time when the route for the specified network was present in the routing table. It does not account for the changes in parameters like metric, next-hop etc.

#### Command Mode

EXEC

#### Command Syntax

```
show ip route ADDRESS age
```

#### Parameters

- **ADDRESS** Filters routes by IPv4 address or subnet.
  - **ipv4\_addr** Routing table entries matching specified address.
  - **ipv4\_subnet** Routing table entries matching specified subnet (CIDR or address-mask).

#### Example:

This command shows the amount of time since the last update to ip route *172.17.0.0/20*.

```
switch>show ip route 172.17.0.0/20 age
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I - ISIS, A - Aggregate

B E    172.17.0.0/20 via 172.25.0.1, age 3d01h
switch>
```

---

### 12.1.10.58 show ip route gateway

The **show ip route gateway** command displays IP addresses of all gateways (next hops) used by active routes.

#### Command Mode

EXEC

#### Command Syntax

```
show ip route [VRF_INSTANCE] gateway
```

#### Parameters

- **VRF\_INSTANCE** Specifies the VRF instance for which data is displayed.
  - **<no parameter>** Context-active VRF.
  - **vrf vrf\_name** Specifies name of VRF instance. System default VRF is specified by **default**.

#### Related Commands

- [cli vrf](#) specifies the context-active VRF.

#### Example:

This command displays next hops used by active routes.

```
switch>show ip route gateway
The following gateways are in use:
 172.25.0.1 Vlan101
 172.17.253.2 Vlan3000
 172.17.254.2 Vlan3901
 172.17.254.11 Vlan3902
 172.17.254.13 Vlan3902
 172.17.254.17 Vlan3903
 172.17.254.20 Vlan3903
 172.17.254.66 Vlan3908
 172.17.254.67 Vlan3908
 172.17.254.68 Vlan3908
 172.17.254.29 Vlan3910
 172.17.254.33 Vlan3911
 172.17.254.35 Vlan3911
 172.17.254.105 Vlan3912
 172.17.254.86 Vlan3984
 172.17.254.98 Vlan3992
 172.17.254.99 Vlan3992
switch>
```

### 12.1.10.59 show ip route host

The **show ip route host** command displays all host routes in the host forwarding table. Host routes are those whose destination prefix is the entire address (mask = 255.255.255.255 or prefix = /32). Each entry includes a code of the route's purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **B** broadcast address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

#### Command Mode

EXEC

#### Command Syntax

```
show ip route [VRF_INSTANCE] host
```

#### Parameters

- **VRF\_INSTANCE** Specifies the VRF instance for which data is displayed.
  - **<no parameter>** Context-active VRF.
  - **vrf vrf\_name** Specifies name of VRF instance. System default VRF is specified by **default**.

#### Related Commands

- [cli vrf](#) specifies the context-active VRF.

#### Example:

This command displays all host routes in the host forwarding table.

```
switch>show ip route host
R - receive B - broadcast F - FIB, A - attached

F 127.0.0.1 to cpu
B 172.17.252.0 to cpu
A 172.17.253.2 on Vlan2000
R 172.17.253.3 to cpu
A 172.17.253.10 on Vlan2000
B 172.17.253.255 to cpu
B 172.17.254.0 to cpu
R 172.17.254.1 to cpu
B 172.17.254.3 to cpu
B 172.17.254.8 to cpu
A 172.17.254.11 on Vlan2902
R 172.17.254.12 to cpu

F 172.26.0.28 via 172.17.254.20 on Vlan3003
via 172.17.254.67 on Vlan3008
via 172.17.254.98 on Vlan3492
via 172.17.254.2 on Vlan3601
via 172.17.254.13 on Vlan3602
via 172.17.253.2 on Vlan3000
F 172.26.0.29 via 172.25.0.1 on Vlan101
F 172.26.0.30 via 172.17.254.29 on Vlan3910
F 172.26.0.32 via 172.17.254.105 on Vlan3912
switch>
```

### 12.1.10.60 show ip route match tag

The **show ip route match tag** command displays the route tag assigned to the specified IPv4 address or subnet. Route tags are added to static routes for use by route maps.

#### Command Mode

EXEC

#### Command Syntax

```
show ip route [VRF_INSTANCE] ADDRESS match tag
```

#### Parameters

- **VRF\_INSTANCE** Specifies the VRF instance for which data is displayed.
  - **<no parameter>** Context-active VRF.
  - **vrf vrf\_name** Specifies name of VRF instance. System default VRF is specified by **default**.
- **ADDRESS** Displays routes of specified IPv4 address or subnet.
  - **ipv4\_addr** Routing table entries matching specified IPv4 address.
  - **ipv4\_subnet** Routing table entries matching specified IPv4 subnet (CIDR or address-mask).

#### Example:

This command displays the route tag for the specified subnet.

```
switch>show ip route 172.17.50.0/23 match tag
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control
Service,
       DH - DHCP client installed default route, M - Martian

O E2   172.17.50.0/23 tag 0

switch>
```

### 12.1.10.61 show ip route summary

The **show ip route summary** command displays the number of routes, categorized by destination prefix, in the routing table.

#### Command Mode

EXEC

#### Command Syntax

`show ip route [VRF_INSTANCE] summary Parameters`

- **VRF\_INSTANCE** Specifies the VRF instance for which data is displayed.
  - *<no parameter>* Context-active VRF.
  - **vrf vrf\_name** Specifies name of VRF instance. System default VRF is specified by **default**.

#### Example:

This command displays a summary of the routing table contents.

```
switch>show ip route summary
Route Source          Number Of Routes
-----
connected              15
static                 0
ospf                   74
  Intra-area: 32 Inter-area:33 External-1:0 External-2:9
  NSSA External-1:0 NSSA External-2:0
bgp                    7
  External: 6 Internal: 1
internal              45
attached              18
aggregate              0
switch>
```

## 12.1.10.62 show ip route

The **show ip route** command displays routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal-cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The **show running-config** command displays configured commands not in the FIB.

### Command Mode

EXEC

### Command Syntax

```
show ip route [VRF_INSTANCE][ADDRESS][ROUTE_TYPE][INFO_LEVEL][PREFIX]
```

### Parameters

The **VRF\_INSTANCE** and **ADDRESS** parameters are always listed first and second, respectively. All other parameters can be placed in any order.

- **VRF\_INSTANCE** Specifies the VRF instance for which data is displayed.
  - *<no parameter>* Context-active VRF.
  - **vrf vrf\_name** Specifies name of VRF instance. System default VRF is specified by **default**.
- **ADDRESS** Filters routes by IPv4 address or subnet.
  - *<no parameter>* All routing table entries.
  - **ipv4\_addr** Routing table entries matching specified address.
  - **ipv4\_subnet** Routing table entries matching specified subnet (CIDR or address-mask).
- **ROUTE\_TYPE** Filters routes by specified protocol or origin. Options include:
  - *<no parameter>* All routing table entries.
  - **aggregate** Entries for BGP aggregate routes.
  - **bgp** Entries added through BGP protocol.
  - **connected** Entries for routes to networks directly connected to the switch.
  - **isis** Entries added through ISIS protocol.
  - **kernel** Entries appearing in Linux kernel but not added by EOS software.
  - **ospf** Entries added through OSPF protocol.
  - **rip** Entries added through RIP protocol.
  - **static** Entries added through CLI commands.
  - **vrf** Displays routes in a VRF.
- **INFO\_LEVEL** Filters entries by next hop connection. Options include:
  - *<no parameter>* Filters routes whose next hops are directly connected.
  - **detail** Displays all routes.
- **PREFIX** Filters routes by prefix.
  - *<no parameter>* Specific route entry that matches the ADDRESS parameter.
  - **longer-prefixes** All subnet route entries in range specified by ADDRESS parameter.

### Related Commands

- [cli vrf](#) specifies the context-active VRF.

#### Examples:

- This command displays IPv4 routes learned through BGP.

```
switch>show ip route bgp
Codes: C - connected, S - static, K - kernel,
```

```

O - OSPF, IA - OSPF inter area, E1 - OSPF external type
1,
E2 - OSPF external type 2, N1 - OSPF NSSA external type
1,
N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
R - RIP, A - Aggregate

B E    170.44.48.0/23 [20/0] via 170.44.254.78
B E    170.44.50.0/23 [20/0] via 170.44.254.78
B E    170.44.52.0/23 [20/0] via 170.44.254.78
B E    170.44.54.0/23 [20/0] via 170.44.254.78
B E    170.44.254.112/30 [20/0] via 170.44.254.78
B E    170.53.0.34/32 [1/0] via 170.44.254.78
B I    170.53.0.35/32 [1/0] via 170.44.254.2
                               via 170.44.254.13
                               via 170.44.254.20
                               via 170.44.254.67
                               via 170.44.254.35
                               via 170.44.254.98

```

- This command displays the unicast IP routes installed in the system.

```

switch#show ip route
VRF name: default
Codes: C - connected, S - static, K - kernel,
O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
R - RIP, I - ISIS, A B - BGP Aggregate, A O - OSPF Summary,
NG - Nexthop Group Static Route

Gateway of last resort is not set
C 10.1.0.0/16 is directly connected, Vlan2659
C 10.2.0.0/16 is directly connected, Vlan2148
C 10.3.0.0/16 is directly connected, Vlan2700
S 172.17.0.0/16 [1/0] via 172.24.0.1, Management1
S 172.18.0.0/16 [1/0] via 172.24.0.1, Management1
S 172.19.0.0/16 [1/0] via 172.24.0.1, Management1
S 172.20.0.0/16 [1/0] via 172.24.0.1, Management1
S 172.22.0.0/16 [1/0] via 172.24.0.1, Management1
C 172.24.0.0/18 is directly connected, Management1

```

- This command displays the leaked routes from a source VRF.

```

switch#show ip route vrf VRF2 20.0.0.0/8
...
S L    20.0.0.0/8 [1/0] (source VRF VRF1) via 10.1.2.10,
Ethernet1

```

### 12.1.10.63 show ip verify source

The **show ip verify source** command displays the IP source guard (IPSG) configuration, operational states, and IP-MAC binding entries for the configuration mode interface.

#### Command Mode

EXEC

#### Command Syntax

```
show ip verify source [VLAN | DETAIL]
```

#### Parameters

- **VLAN** Displays all VLANs configured in **no ip verify source vlan**.
- **DETAIL** Displays all source IP-MAC binding entries configured for IPSG.

#### Related Commands

- [ip source binding](#)
- [ip verify source](#)

#### Examples:

- This command verifies the IPSG configuration and operational states.

```
switch(config)#show ip verify source
Interface      Operational State
-----
Ethernet1     IP source guard enabled
Ethernet2     IP source guard disabled
```

- This command displays all VLANs configured in **no ip verify source vlan**. Hardware programming errors, e.g., VLAN classification failed, are indicated in the operational state. If an error occurs, this VLAN will be considered as enabled for IPSG. Traffic on this VLAN will still be filtered by IPSG.

```
switch(config)#show ip verify source vlan
IPSG disabled on VLANs: 1-2
VLAN          Operational State
-----
1             IP source guard disabled
2             Error: vlan classification failed
```

- This command displays all source IP-MAC binding entries configured for IPSG. A source binding entry is considered active if it is programmed in hardware. IP traffic matching any active binding entry will be permitted. If a source binding entry is configured on an interface or a VLAN whose operational state is IPSG disabled, this entry will not be installed in the hardware, in which case an “IP source guard disabled” state will be shown. If a port channel has no member port configured, binding entries configured for this port channel will not be installed in hardware, and a “Port-Channel down” state will be shown.

```
switch(config)#show ip verify source detail
Interface      IP Address      MAC Address      VLAN      State
-----
Ethernet1     10.1.1.1       0000.aaaa.1111  5         active
Ethernet1     10.1.1.5       0000.aaaa.5555  1         IP
source guard disabled
```

```
Port-Channell1 20.1.1.1 0000.bbbb.1111 4 Port-  
Channel down
```

---

## 12.1.10.64 show ip

The **show ip** command displays IPv4 routing, IPv6 routing, IPv4 multicast routing, and VRRP status on the switch.

### Command Mode

EXEC

### Command Syntax

```
show ip
```

#### Example:

This command displays IPv4 routing status.

```
switch>show ip

IP Routing : Enabled
IP Multicast Routing : Disabled
VRRP: Configured on 0 interfaces

IPv6 Unicast Routing : Enabled
IPv6 ECMP Route support : False
IPv6 ECMP Route nexthop index: 5
IPv6 ECMP Route num prefix bits for nexthop index: 10

switch>
```

### 12.1.10.65 show platform arad ip route summary

The **show platform arad ip route summary** command shows hardware resource usage of IPv4 routes.

#### Command Mode

EXEC

#### Command Syntax

```
show platform arad ip route summary
```

#### Related Commands

- [agent SandL3Unicast terminate](#) enables restarting the layer 3 agent to ensure IPv4 routes are optimized.
- [ip hardware fib optimize](#) enables IPv4 route scale.
- [show platform arad ip route](#) shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

#### Example:

This command shows hardware resource usage of IPv4 routes.

```
switch(config)#show platform arad ip route summary
Total number of VRFs: 1
Total number of routes: 25
Total number of route-paths: 21
Total number of lem-routes: 4

switch(config)#
```

## 12.1.10.66 show platform arad ip route

The `show platform arad ip route` command shows resources for all IPv4 routes in hardware. Routes that use the additional hardware resources will appear with an asterisk.

### Command Mode

EXEC

### Command Syntax

```
show platform arad ip route
```

#### Examples:

- This command displays the platform unicast forwarding routes. In this example, the ACL label field in the following table is `4094` by default for all routes. If an IPv4 egress RACL is applied to an SVI, all routes corresponding to that VLAN will have an ACL label value. In this case, the ACL Label field value is `2`.

```
switch#show platform arad ip route
Tunnel Type: M(mpls), G(gre)

### 12.1.10.67 show platform fap eedb ip-tunnel gre interface tunnel

The `show platform fap eedb ip-tunnel gre interface tunnel` command verifies the tunnel encapsulation programming for the tunnel interface.

#### Command Mode

EXEC

#### Command Syntax

```
show platform fap eedb ip-tunnel gre interface tunnel <number>
```

#### Parameter

- *number* Specifies the tunnel interface number.

#### Example:

These commands verify the tunnel encapsulation programming for the tunnel interface 10.

```
switch#show platform fap eedb ip-tunnel gre interface tunnel 10
-----
|                                     Jericho0                               |

```

### 12.1.10.68 show platform fap tcam summary

The **show platform fap tcam summary** command displays information about the TCAM bank that is allocated for GRE packet termination lookup.

#### Command Mode

EXEC

#### Command Syntax

```
show platform fap tcam summary
```

#### Example:

This command verifies if the TCAM bank is allocated for GRE packet termination lookup.

```
switch#show platform fap tcam summary

Tcam Allocation (Jericho0)
Bank          Used By          Reserved By
-----
0             dbGreTunnel         -
```

---

### 12.1.10.69 show platform trident forwarding-table partition

The **show platform trident forwarding-table partition** command displays the size of the L2 MAC entry tables, L3 IP forwarding tables, and Longest Prefix Match (LPM) routes.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show platform trident forwarding-table partition
```

#### Example:

This command shows the Trident forwarding table information.

```
switch(config)#show platform trident forwarding-table partition  
L2 Table Size: 96k  
L3 Host Table Size: 208k  
LPM Table Size: 16k  
switch(config)#
```

### 12.1.10.70 show rib route ip

The `show rib route ip` command displays a list of IPv4 Routing Information Base (RIB) routes.

#### Command Mode

EXEC

#### Command Syntax

```
show rib route ip [vrf vrf_name][PREFIX][ROUTE TYPE]
```

#### Parameters

- **vrf vrf\_name** Displays RIB routes from the specified VRF.
- **PREFIX** dDisplays routes filtered by the specified IPv4 information. Options include:
  - **ip\_address** Displays RIB routes filtered by the specified IPv4 address.
  - **ip\_subnet\_mask** Displays RIB routes filtered by the specified IPv4 address and subnet mask.
  - **ip\_prefix** Displays RIB routes filtered by the specified IPv4 prefix.
- **ROUTE TYPE** Displays routes filtered by the specified route type. Options include:
  - **bgp** Displays RIB routes filtered by BGP.
  - **connected** Displays RIB routes filtered by connected routes.
  - **dynamicPolicy** Displays RIB routes filtered by dynamic policy routes.
  - **host** Displays RIB routes filtered by host routes.
  - **isis** Displays RIB routes filtered by ISIS routes.
  - **ospf** Displays RIB routes filtered by OSPF routes.
  - **ospf3** Displays RIB routes filtered by OSPF3 routes.
  - **reserved** Displays RIB routes filtered by reserved routes.
  - **route-input** Displays RIB routes filtered by route-input routes.
  - **static** Displays RIB routes filtered by static routes.
  - **vrf** Displays routes in a VRF.
  - **vrf-leak** Displays leaked routes in a VRF.

#### Examples:

- This command displays IPv4 RIB static routes.

```
switch#show rib route ip static
VRF name: default, VRF ID: 0xfe, Protocol: static
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>S    10.80.0.0/12 [1/0]
      via 172.30.149.129 [0/1]
      via Management1, directly connected
>S    172.16.0.0/12 [1/0]
      via 172.30.149.129 [0/1]
      via Management1, directly connected
switch#
```

- This command displays IPv4 RIB connected routes.

```
switch#show rib route ip connected
VRF name: default, VRF ID: 0xfe, Protocol: connected
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
```

---

```
L - Part of a recursive route resolution loop
>C 10.1.0.0/24 [0/1]
    via 10.1.0.102, Ethernet1
>C 10.2.0.0/24 [0/1]
    via 10.2.0.102, Ethernet2
>C 10.3.0.0/24 [0/1]
    via 10.3.0.102, Ethernet3
switch#
```

- This command displays routes leaked through VRF leak agent.

```
switch#show rib route ip vrf VRF2 vrf-leak
VRF: VRF2, Protocol: vrf-leak
...
>VL 20.0.0.0/8 [1/0] source VRF: VRF1
    via 10.1.2.10 [0/0] type ipv4
    via 10.1.2.10, Ethernet1
```

### 12.1.10.71 show rib route <ipv4 | ipv6> fib policy excluded

The **show rib route <ipv4 | ipv6> fib policy excluded** command displays the RIB routes filtered by FIB policy. The **fib policy exclude** option displays the RIB routes that have been excluded from being programmed into FIB, by FIB policy.

#### Command Mode

EXEC

#### Command Syntax

```
show rib route<ipv4 | ipv6> fib policy excluded
```

#### Example:

The following example displays the RIB routes excluded by the FIB policy using the **fib policy excluded** option of the **show rib route <ipv4 | ipv6>** command.

```
Switch#show rib route ipv6 fib policy excluded
switch#show rib route ip bgp fib policy excluded

VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
>B 10.1.0.0/24 [200/0]
    via 10.2.2.1 [115/20] type tunnel
      via 10.3.5.1, Ethernet1
    via 10.2.0.1 [115/20] type tunnel
      via 10.3.4.1, Ethernet2
      via 10.3.6.1, Ethernet3
>B 10.1.0.0/24 [200/0]
    via 10.2.2.1 [115/20] type tunnel
      via 10.3.5.1, Ethernet1
    via 10.2.0.1 [115/20] type tunnel
      via 10.3.4.1, Ethernet2
      via 10.3.6.1, Ethernet3
```

---

### 12.1.10.72 show routing-context vrf

The **show routing-context vrf** command displays the context-active VRF. The context-active VRF determines the default VRF that VRF-context aware commands use when displaying routing table data from a specified VRF.

#### Command Mode

EXEC

#### Command Syntax

```
show routing-context vrf
```

#### Related Commands

- [cli vrf](#) specifies the context-active VRF.

#### Example:

This command displays the context-active VRF.

```
switch>show routing-context vrf  
Current VRF routing-context is PURPLE  
switch>
```

### 12.1.10.73 show tunnel fib static interface gre

The **show tunnel fib static interface gre** command displays the forwarding information base (FIB) information for a static interface GRE tunnel.

#### Command Mode

EXEC

#### Command Syntax

```
show tunnel fib static interface gre <number>
```

#### Parameter

- *number* Specifies the tunnel index number.

#### Example:

This command display the interface tunnel configuration with GRE configured.

```
switch#show tunnel fib static interface gre 10

Type 'Static Interface', index 10, forwarding Primary
  via 10.6.1.2, 'Ethernet6/1'
  GRE, destination 10.1.1.2, source 10.1.1.1, ttl 10, tos 0xa
```

## 12.1.10.74 show vrf

The **show vrf** command displays the VRF name, RD, supported protocols, state and included interfaces for the specified VRF or for all VRFs on the switch.

### Command Mode

EXEC

### Command Syntax

```
show vrf [VRF_INSTANCE]
```

### Parameters

- **VRF\_INSTANCE** Specifies the VRF instance to display.
  - *<no parameter>* Information is displayed for all VRFs.
  - **vrf vrf\_name** Information is displayed for the specified user-defined VRF.

### Example:

This command displays information for the VRF named “purple.”

```
switch>show vrf purple
Vrf          RD          Protocols    State
Interfaces
-----
purple      64496:237   ipv4         no routing   Vlan42,
Vlan43
switch>
```

### 12.1.10.75 tcp mss ceiling

The `tcp mss ceiling` command configures the maximum segment size (MSS) limit in the TCP header on the configuration mode interface and enables TCP MSS clamping.

The `no tcp mss ceiling` and the `default tcp mss ceiling` commands remove any MSS ceiling limit previously configured on the interface.

**Note:** Configuring a TCP MSS ceiling on any Ethernet or tunnel interface enables TCP MSS clamping on the switch as a whole. Without hardware support, clamping routes all TCP SYN packets through software, even on interfaces where no TCP MSS ceiling has been configured. This significantly limits the number of TCP sessions the switch can establish per second, and can potentially cause packet loss if the CPU traffic exceeds control plane policy limits.

#### Command Mode

Interface-Ethernet Configuration

Subinterface-Ethernet Configuration

Interface-Port-channel Configuration

Subinterface-Port-channel Configuration

Interface-Tunnel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
tcp mss ceiling {ipv4 segment size | ipv6 segment size} {egress | ingress}
```

```
no tcp mss ceiling
```

```
default tcp mss ceiling
```

#### Parameters

- **ipv4 segment size** The IPv4 segment size value in bytes. Values range from **64** to **65515**.
- **ipv6 segment size** The IPv6 segment size value in bytes. Values range from **64** to **65495**. This option is not supported on Sand platform switches (Qumran-MX, Qumran-AX, Jericho, Jericho+).
- **egress** The TCP SYN packets that are forwarded from the interface to the network.
- **ingress** The TCP SYN packets that are received from the network to the interface. Not supported on Sand platform switches.

#### Guidelines

- On Sand platform switches (Qumran-MX, Qumran-AX, Jericho, Jericho+), this command works only for egress, and is supported only on IPv4 unicast packets entering the switch.
- Clamping can only be configured in one direction per interface and works only on egress on Sand platform switches.
- To configure ceilings for both IPv4 and IPv6 packets, both configurations must be included in a single command; re-issuing the command overwrites any previous settings.
- Clamping configuration has no effect on GRE transit packets.

#### Example:

These commands configure *Ethernet interface 5* as a routed port, then specify a maximum MSS ceiling value of *1458* bytes in TCP SYN packets exiting that port. This enables TCP MSS clamping on the switch.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no switchport
switch(config-if-Et5)#tcp mss ceiling ipv4 1458 egress
```

---

```
switch(config-if-Et5) #
```

### 12.1.10.76 tunnel

The **tunnel** command configures options for protocol-over-protocol tunneling. Because interface-tunnel configuration mode is not a group change mode, **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The **no tunnel** command deletes the specified tunnel configuration.

#### Command Mode

Interface-tunnel Configuration

#### Command Syntax

```
tunnel <options>
```

```
no tunnel <options>
```

#### Parameters

- **options** Specifies the various tunneling options as listed below.
  - **destination** Destination address of the tunnel.
  - **ipsec** Secures the tunnel with the IPsec address.
  - **key** Sets the tunnel key.
  - **mode** Tunnel encapsulation method.
  - **path-mtu-discovery** Enables the Path MTU discovery on tunnel.
  - **source** Source of the tunnel packets.
  - **tos** Sets the IP type of service value.
  - **ttl** Sets time to live value.
  - **underlay** Tunnel underlay.

#### Example:

These commands place the switch in interface-tunnel configuration mode for *tunnel interface 10* and with GRE tunnel configured on the interfaces specified.

```
switch(config)#ip routing
switch(config)#interface Tunnel 10
switch(config-if-Tu10)#tunnel mode gre
switch(config-if-Tu10)#ip address 192.168.1.1/24
switch(config-if-Tu10)#tunnel source 10.1.1.1
switch(config-if-Tu10)#tunnel destination 10.1.1.2
switch(config-if-Tu10)#tunnel path-mtu-discovery
switch(config-if-Tu10)#tunnel tos 10
switch(config-if-Tu10)#tunnel ttl 10
```

---

### 12.1.10.77 vrf (Interface mode)

The **vrf** command adds the configuration mode interface to the specified VRF. You must create the VRF first, using the [vrf instance](#) command.

The **no vrf** and **default vrf** commands remove the configuration mode interface from the specified VRF by deleting the corresponding **vrf** command from *running-config*.

All forms of the **vrf** command remove all IP addresses associated with the configuration mode interface.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
vrf [vrf_name]
```

```
no vrf [vrf_name]
```

```
default vrf [vrf_name]
```

#### Parameters

- **vrf\_name** Name of configured VRF.

#### Examples:

- These commands add the configuration mode interface (*VLAN 20*) to the VRF named *“purple”*.

```
switch(config)#interface vlan 20  
switch(config-if-Vl20)#vrf purple  
switch(config-if-Vl20)#
```

- These commands remove the configuration mode interface from VRF *“purple”*.

```
switch(config)#interface vlan 20  
switch(config-if-Vl20)#no vrf purple  
switch(config-if-Vl20)#
```

### 12.1.10.78 vrf instance

The **vrf instance** command places the switch in VRF configuration mode for the specified VRF. If the named VRF does not exist, this command creates it. The number of user-defined VRFs supported varies by platform.

To add an interface to the VRF once it is created, use the [vrf \(Interface mode\)](#) command.

The **no vrf instance** and **default vrf instance** commands delete the specified VRF instance by removing the corresponding **vrf instance** command from *running-config*. This also removes all IP addresses associated with interfaces that belong to the deleted VRF.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
vrf instance [vrf_name]
```

```
no vrf instance [vrf_name]
```

```
default vrf instance [vrf_name]
```

#### Parameters

- **vrf\_name** Name of VRF being created, deleted or configured. The names “main” and “default” are reserved.

#### Example:

This command creates a VRF named “purple” and places the switch in VRF configuration mode for that VRF.

```
switch(config)#vrf instance purple
switch(config-vrf-purple)#
```

## 12.2 IPv6

Arista switches support Internet Protocol version 4 (IPv4) and Internet Protocol version 6 (IPv6) for routing packets across network boundaries. This section describes Arista’s implementation of IPv6 and includes these topics:

- [Introduction](#)
- [IPv6 Description](#)
- [Configuring IPv6](#)
- [IPv6 Commands](#)

### 12.2.1 Introduction

Routing transmits network layer data packets over connected independent subnets. Each subnet is assigned an IP address range and each device on the subnet is assigned an IP address from that range.

Connected subnets have IP address ranges that do not overlap. A router is a network device connecting multiple subnets. Routers forward inbound packets to the subnet whose address range includes the packets’ destination address.

---

IPv4 and IPv6 are Internet layer protocols that define packet-switched inter-networking, including source-to-destination datagram transmission across multiple networks. The switch supports IP Version 4 (IPv4) and IP Version 6 (IPv6).

IPv6 is described by RFC 2460: Internet Protocol, Version 6 (IPv6) Specification. RFC 2463 describes ICMPv6 for IPv6. ICMPv6 is a core protocol of the Internet Protocol suite.

## 12.2.2 IPv6 Description

Internet Protocol Version 6 is a communications protocol used for relaying network packets across a set of connected networks using the Internet Protocol suite. Each network device is assigned a 128 bit IP address that identifies its network location.

IPv6 specifies a packet format that minimizes router processing of packet headers. Since the IPv4 and IPv6 packet headers differ significantly, the protocols are not interoperable. Many transport and application-layer protocols require little or no change to operate over IPv6.

- [IPv6 Address Format](#)
- [IPv6 DHCP Snooping](#)
- [Neighbor Discovery Protocol](#)

### 12.2.2.1 IPv6 Address Format

IPv6 addresses have 128 bits, represented by eight 16-bit hexadecimal numbers separated by colons. IPv6 addresses are abbreviated as follows:

- Leading zeros in each 16-bit number may be omitted.
- One set of consecutive 16-bit numbers that equal zero may be replaced by a double colon.

#### Example

- The following three IPv6 hexadecimal number representations refer to the same address:

```
d28e:0000:0000:0000:0234:812f:61ed:4419
d28e:0:0:0:234:812f:61ed:4419
d28e::234:812f:61ed:4419
```

IPv6 addresses typically denote a 64-bit network prefix and a 64-bit host address.

#### Unicast and Anycast Addressing

Unicast addressing defines a one-to-one association between the destination address and a network endpoint. Each destination address uniquely identifies a single receiver endpoint. Anycast addressing defines a one-to-one-of-many association: packets to a single member of a group of potential receivers identified by the same destination address.

Unicast and anycast addresses are typically composed as follows:

- a 64-bit network prefix that identifies the network segment.
- a 64-bit interface identifier that is based on interface MAC address.

The format of a network address identifies the scope of the address

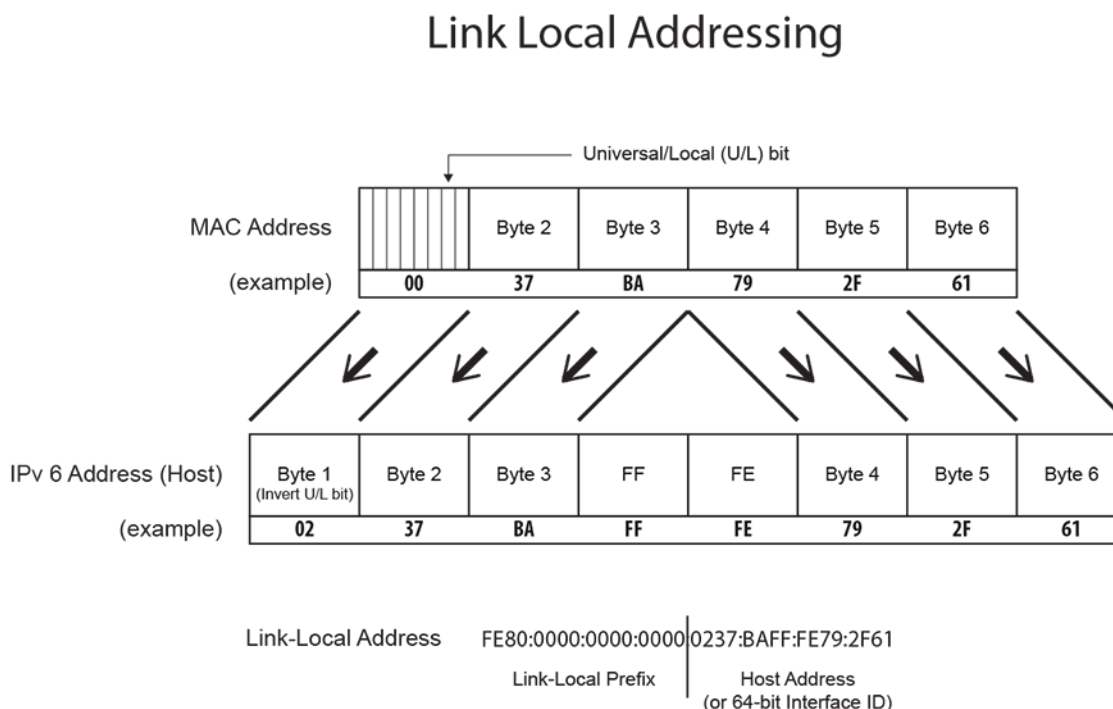

- Global address: valid in all networks and connect with other addresses with global scope anywhere or to addresses with link-local scope on the directly attached network.
- Link-local address: scope extends only to the link to which the interface is directly connected. Link-local addresses are not routable off the link.

Link-local addresses are created by the switch and are not configurable. The following figure depicts the switch's link local address derivation method.

**Figure 14: Link Local Address Derivation**

**Multicast Addressing**

Multicast addressing defines a one-to-many association: packets are simultaneously routed from a single sender to multiple endpoints in a single transmission. The network replicates packets as required by network links that contain a recipient endpoint. One multicast address is assigned to an interface for each multicast group to which the interface belongs.

**Figure 15: Link Local Address Derivation**

A solicited-node multicast address is an IPv6 multicast address whose scope extends only to the link to which the interface is directly connected. All IPv6 hosts have at least one such address per interface. Solicited-node multicast addresses are used by the Neighbor Discovery Protocol to obtain layer 2 link-layer addresses of other nodes.

**12.2.2.2 IPv6 DHCP Snooping**

DHCP (Dynamic Host Configuration Protocol) snooping is a layer 2 feature that is configured on LAN switches. The Arista EOS switch supports Option-37 insertion that allows relay agents to provide remote-ID information in DHCP request packets. DHCP servers use this information to determine the originating port of DHCP requests and associate a corresponding IP address to that port. DHCP servers use port information to track host location and IP address usage by authorized physical ports.

DHCP snooping uses the information option (Option-37) to include the switch MAC address (router-ID) along with the physical interface name and VLAN number (remote-ID) in DHCP packets. After adding the information to the packet, the DHCP relay agent forwards the packet to the DHCP server as specified by the DHCP protocol.

**Platform Compatibility**

- DCS-7010

- 
- DCS-7050
  - DCS-7060
  - DCS-7250
  - DCS-7260
  - DCS-7300

### 12.2.2.3 Neighbor Discovery Protocol

The Neighbor Discovery Protocol (RFC 4861) operates with IPv6 to facilitate the following tasks for nodes within a specified prefix space:

- autoconfiguring a node's IPv6 address
- sensing other nodes on the link
- discovering the link-local addresses of other nodes on the link
- detecting duplicate addresses
- discovering available routers
- discovering DNS servers
- discovering the link's address prefix
- maintaining path reachability data to other active neighbor nodes

The Neighbor Discovery Protocol protocol defines five different ICMPv6 packet types:

- Router Solicitation
- Router Advertisement
- Neighbor Solicitation
- Neighbor Advertisement
- Redirect

## 12.2.3 Configuring IPv6

These sections describe IPv6 configuration tasks:

- [Configuring IPv6 on the Switch](#)
- [Configuring IPv6 on an Interface](#)
- [Configuring IPv6 DHCP Snooping](#)
- [Viewing IPv6 Network Components](#)
- [DHCP Relay Agent for IPv6](#)

### 12.2.3.1 Configuring IPv6 on the Switch

#### 12.2.3.1.1 Enabling IPv6 Unicast Routing on the Switch

The `ipv6 unicast-routing` command enables the forwarding of IPv6 unicast packets. When routing is enabled, the switch attempts to deliver inbound packets to destination addresses by forwarding them to interfaces or next hop addresses specified by the IPv6 routing table.

#### Example

This command enables IPv6 unicast-routing.

```
switch(config) #ipv6 unicast-routing
switch(config) #
```

### 12.2.3.1.2 Configuring Default and Static IPv6 Routes

The `ipv6 route` command creates an IPv6 static route. The destination is a IPv6 prefix; the source is an IPv6 address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of 200 is overridden by OSPF intra-area routes, which have a default distance of 110.

#### Example

This command creates an IPv6 static route.

```
switch(config)#ipv6 route 10:23:31:00:01:32:93/24 vlan 300
switch(config)#
```

The default route denotes the packet forwarding rule that takes effect when no other route is configured for a specified IPv6 address. All packets with destinations that are not established in the routing table are sent to the destination specified by the default route.

The IPv6 default route source is `::/0`. The default route destination is referred to as the default gateway.

#### Example

This command creates a default route and establishes `fd7a:629f:52a4:fe61::2` as the default gateway address.

```
switch(config)#ipv6 route ::/0 fd7a:629f:52a4:fe61::2
switch(config)#
```

### 12.2.3.1.3 IPv6 ECMP

Multiple routes that are configured to the same destination with the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic across all ECMP route paths equally. All ECMP paths are assigned the same tag value; commands that change the tag value of any ECMP path change the tag value of all paths in the ECMP.

Resilient ECMP is available for IPv6 routes. [Equal Cost Multipath Routing \(ECMP\) and Load Sharing](#) describes resilient ECMP. The `ipv6 hardware fib ecmp resilience` command implements IPv6 resilient ECMP.

#### Example

This command implements IPv6 resilient ECMP by configuring a hardware ECMP table space of 15 entries for IPv6 address `2001:db8:0::/64`. A maximum of five nexthop addresses can be specified for the address. When the table contains five addresses, each appears in the table three times. When the table contains fewer than five addresses, each is duplicated until the 15 table entries are filled.

```
switch(config)#ipv6 hardware fib ecmp resilience 2001:db8:0::/64 capacity
5
redundancy 3
switch(config)#
```

---

## 12.2.3.2 Configuring IPv6 on an Interface

### 12.2.3.2.1 Enabling IPv6 on an Interface

The **ipv6 enable** command enables IPv6 on the configuration mode interface if it does not have a configured IPv6 address. It also configures the interface with an IPv6 address.

The **no ipv6 enable** command disables IPv6 on a configuration mode interface not configured with an IPv6 address. Interfaces configured with an IPv6 address are not disabled by this command.

#### Example

This command enables IPv6 on *VLAN interface 200*.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 enable
switch(config-vl200)#
```

### 12.2.3.2.2 Assigning an IPv6 Address to an Interface

The **ipv6 address** command enables IPv6 on the configuration mode interface, assigns a global IPv6 address to the interface, and defines the prefix length. This command is supported on routable interfaces. Multiple global IPv6 addresses can be assigned to an interface.

#### Example

- These commands configure an IPv6 address with subnet mask for VLAN 200:

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 address 10:23:31::1:32:93/64
switch(config-if-Vl200)#
```

### 12.2.3.2.3 IPv6 Neighbor Discovery

The IPv6 Neighbor Discovery protocol defines a method for nodes to perform the following network maintenance tasks:

- determine layer 2 addresses for neighbors known to reside on attached links
- detect changed layer 2 addresses
- purge invalid values from the neighbor cache table
- (hosts) find neighboring routers to forward packets
- track neighbor reachability status

IPv6 Neighbor Discovery is defined by RFC 2461. IPv6 Stateless Address Autoconfiguration is described by RFC 2462.

The following sections describe Neighbor Discovery configuration tasks.

#### 12.2.3.2.3.1 Reachable Time

The **ipv6 nd reachable-time** command specifies the time period that the switch includes in the reachable time field of Router Advertisements (RAs) sent from the configuration mode interface. The reachable time defines the period that a remote IPv6 node is considered reachable after a reachability confirmation event.

**Example**

These commands configure the entry of 25000 (25 seconds) in the reachable time field of RAs sent from VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd reachable-time 25000
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 address fd7a:4321::1/64
  ipv6 nd reachable-time 25000
switch(config-if-Vl200)#
```

**12.2.3.2.3 Router Advertisement Interval**

The `ipv6 nd ra interval` command configures the interval between IPv6 RA transmissions from the configuration mode interface.

**Example**

These commands configure a RA transmission interval of 60 seconds on VLAN interface 200, then displays the interface status.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra interval 60
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 nd ra interval 60
switch(config-if-Vl200)#
```

**12.2.3.2.3.3 Router Lifetime**

The `ipv6 nd ra lifetime` command specifies the value that the switch places in the **router lifetime** field of IPv6 RAs sent from the configuration mode interface.

If the value is set to 0, IPv6 peers connected to the specified interface will remove the switch from their lists of default routers. Values greater than 0 indicate the time in seconds that peers should keep the router on their default router lists without receiving further RAs from the switch. Unless the value is 0, the router lifetime value should be equal to or greater than the interval between unsolicited RAs sent on the interface.

**Example**

This command configures the switch to enter 2700 in the router lifetime field of RAs transmitted from VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra lifetime 2700
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 nd ra lifetime 2700
switch(config-if-Vl200)#
```

**12.2.3.2.3.4 Router Advertisement Prefix**

The `ipv6 nd prefix` command configures neighbor discovery router advertisement prefix inclusion for RAs sent from the configuration mode interface.

---

By default, all prefixes configured as IPv6 addresses are advertised in the interface's RAs. The `ipv6 nd prefix` command with the `no-advertise` option prevents advertising of the specified prefix without affecting the advertising of other prefixes specified as IPv6 addresses. When an interface configuration includes at least one `ipv6 nd prefix` command that enables prefix advertising, RAs advertise only prefixes specified through `ipv6 nd prefix` commands.

Commands enabling prefix advertising also specify the advertised valid and preferred lifetime periods. Default periods are 2,592,000 (valid) and 604,800 (preferred) seconds.

### Example

These commands enable neighbor discovery advertising for IPv6 address `3012:D678::/64`, specifying a valid lifetime of `1,296,000` seconds and the default preferred lifetime.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd prefix 3012:D678::/64 1296000
switch(config-if-Vl200)#
```

#### 12.2.3.2.3.5 Router Advertisement Suppression

The `ipv6 nd ra disabled` command suppress IPv6 RA transmissions on the configuration mode interface. By default, only unsolicited RAs that are transmitted periodically are suppressed. The `all` option configures the switch to suppress all RAs, including those responding to a router solicitation.

### Example

- This command suppresses all RAs on VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 nd ra disabled all
switch(config-vl200)#
```

#### 12.2.3.2.3.6 Router Advertisement MTU Suppression

The `ipv6 nd ra mtu suppress` command suppresses the router advertisement MTU option on the configuration mode interface. The MTU option causes an identical MTU value to be advertised by all nodes on a link. By default, the router advertisement MTU option is not suppressed.

### Example

This command suppresses the MTU option on VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 nd ra mtu suppress
switch(config-vl200)#
```

#### 12.2.3.2.3.7 Router Advertisement Flag Configuration

The following commands sets the specified configuration flag in IPv6 RAs transmitted from the configuration mode interface:

- The `ipv6 nd managed-config-flag` command sets the **managed address configuration** flag. This bit instructs hosts to use stateful address autoconfiguration.
- The `ipv6 nd other-config-flag` command sets the other **stateful configuration** flag. This bit indicates availability of autoconfiguration information, other than addresses. Hosts should use stateful autoconfiguration when available. The setting of this flag has no effect if the **managed address configuration** flag is set.

- These commands configure the switch to set the **managed address configuration** flag in advertisements sent from VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd managed-config-flag
switch(config-if-Vl200)#
```

- These commands configure the switch to set the **other stateful configuration** flag in advertisements sent from VLAN interface 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd other-config-flag
switch(config-if-Vl200)#
```

#### 12.2.3.2.4 IPv6 Router Preference

The IPv6 Router Preference protocol supports an extension to RA messages for communicating default router preferences and more specific routes from routers to hosts. This provides assistance to hosts when selecting a router. RFC 4191 describes the IPv6 Router Preference Protocol.

The **ipv6 nd router-preference** command specifies the value that the switch enters in the Default Router Preference (DRP) field of RAs that it sends from the configuration mode interface. The default field entry value is **medium**.

#### Example

This command configures the switch as a medium preference router on RAs sent from *VLAN 200*.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd router-preference medium
switch(config-if-Vl200)#
```

#### 12.2.3.2.5 uRPF Configuration

Unicast Reverse Path Forwarding (uRPF) verifies the accessibility of source IP addresses in packets that the switch forwards. [Unicast Reverse Path Forwarding \(uRPF\)](#) describes uRPF. uRPF is enabled for IPv6 packets entering the configuration mode interface through the **ipv6 verify** command.

uRPF defines two operational modes: strict mode and loose mode.

- **Strict mode:** uRPF verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
  - **Loose mode:** uRPF validation does not consider the inbound packet's ingress interface only that there is a valid return path.

#### Example

This command enables uRPF strict mode on VLAN interface 100. If a default route is configured on the interface, all inbound packets will pass the uRPF check as valid.

```
switch(config)#interface vlan 100
switch(config-if-Vl100)#ipv6 verify unicast source reachable-via rx
allow-default
switch(config-if-Vl100)#show active
interface Vlan100
  ipv6 verify unicast source reachable-via rx allow-default
switch(config-if-Vl100)#
```

---

### 12.2.3.3 Configuring IPv6 DHCP Snooping

#### 12.2.3.3.1 Enabling IPv6 DHCP Snooping on the Switch

The `ipv6 dhcp snooping` command enables DHCP snooping globally on the switch. DHCP snooping is a layer 2 feature that can be configured on LAN switches. The Arista switch supports Option-37 insertion that allows relay agents to provide remote-ID information in DHCP request packets.

**Note:** DHCPv6 VLAN classification and DHCPv4 VLAN classification share same hardware resource.

#### Example

- The following configuration enables IPv6 DHCP snooping feature at the global level.

```
switch(config)#ipv6 dhcp snooping
switch(config)#ipv6 dhcp snooping remote-id option
switch(config)#ipv6 dhcp snooping vlan <vlan|vlan-range>
```

- The following command display IPv6 DHCP snooping state.

```
switch(config)#ipv6 dhcp snooping
switch(config)#show ipv6 dhcp snooping
DHCPv6 Snooping is enabled
DHCPv6 Snooping is operational
DHCPv6 Snooping is configured on following VLANs:
 2789-2790
DHCPv6 Snooping is operational on following VLANs:
 2789
Insertion of Option-37 is enabled
```

### 12.2.3.4 Viewing IPv6 Network Components

#### 12.2.3.4.1 Displaying RIB Route Information

Use the `show rib route ipv6` command view the IPv6 Routing Information Base (RIB) information.

#### Example

This command displays IPv6 RIB BGP routes.

```
switch#show rib route ipv6 bgp
VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
B      2001:10:1::/64 [200/42]
       via 2001:10:1::100 [0/1]
       via Ethernet1, directly connected
>B     2001:10:100::/64 [200/200]
       via 2001:10:1::100 [0/1]
       via Ethernet1, directly connected
>B     2001:10:100:1::/64 [200/0]
       via 2001:10:1::100 [0/1]
       via Ethernet1, directly connected
>B     2001:10:100:2::/64 [200/42]
       via 2001:10:1::100 [0/1]
       via Ethernet1, directly connected
```

```
switch#
```

#### 12.2.3.4.2 Displaying the FIB and Routing Table

The **show ipv6 route** command displays routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

##### Example

This command displays a route table entry for a specific IPv6 route.

```
switch>show ipv6 route fd7a:3418:52a4:fe18::/64
IPv6 Routing Table - 77 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP,
A -
Aggregate

O   fd7a:3418:52a4:fe18::/64 [10/20]
    via f180::21c:73ff:fe00:1319, Vlan3601
    via f180::21c:73ff:fe00:1319, Vlan3602
    via f180::21c:73ff:fe00:1319, Vlan3608
    via f180::21c:73ff:fe0f:6a80, Vlan3610
    via f180::21c:73ff:fe00:1319, Vlan3611

switch>
```

#### 12.2.3.4.3 Displaying the Route Age

The **show ipv6 route age** command displays the IPv6 route age to the specified IPv6 address or prefix.

##### Example

This command displays the route age for the specified prefix.

```
switch>show ipv6 route 2001::3:0/11 age
IPv6 Routing Table - 74 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP,
A -
Aggregate

C 2001::3:0/11 age 00:02:34

switch>
```

#### 12.2.3.4.4 Displaying Host Routes

The **show ipv6 route host** command displays all host routes in the IPv6 host forwarding table. Host routes are those whose destination prefix is the entire address (prefix = /128). Each displayed host route is labeled with its purpose:

- **F** static routes from the FIB.
- **R** routes defined because the IP address is an interface address.
- **A** routes to any neighboring host for which the switch has an ARP entry.

## Example

This command displays all IPv6 host routes in the host forwarding table.

```
switch#show ipv6 route host
R - receive F - FIB, A - attached

F  ::1 to cpu
A  fee7:48a2:0c11:1900:400::1 on Vlan102
R  fee7:48a2:0c11:1900:400::2 to cpu
F  fee7:48a2:0c11:1a00::b via fe80::21c:73ff:fe0b:a80e on Vlan3902
R  fee7:48a2:0c11:1a00::17 to cpu
F  fee7:48a2:0c11:1a00::20 via fe80::21c:73ff:fe0b:33e on Vlan3913
F  fee7:48a2:0c11:1a00::22 via fe80::21c:73ff:fe01:5fe1 on Vlan3908
                               via fe80::21c:73ff:fe01:5fe1 on Vlan3902

switch#
```

### 12.2.3.4.5 Displaying Route Summaries

The `show ipv6 route summary` command displays the current number of routes of the IPv6 routing table in summary format.

## Example

This command displays the route source and the corresponding number of routes in the IPv6 routing table.

```
switch>show ipv6 route summary
Route Source      Number Of Routes
-----
connected         2
static            0
ospf              5
bgp               7
isis              0
internal          1
attached          0
aggregate         2

Total Routes      17
switch>
```

### 12.2.3.5 DHCP Relay Agent for IPv6

#### 12.2.3.5.1 Configuring IPv6 DHCP Relay

##### 12.2.3.5.1.1 Configuring the IPv6 DHCP Relay Agent (Global)

The `ipv6 dhcp relay always-on` command enables the switch DHCP relay agent globally regardless of the DHCP relay agent status on any interface. The DHCP relay agent is enabled by default if at least one routable interface is configured with an `ipv6 dhcp relay destination` statement.

**Example**

This command enables the DHCP relay agent.

```
switch(config)# ipv6 dhcp relay always-on
switch(config)#
```

**12.2.3.5.1.2 Configuring DHCP for IPv6 relay agent**

The `ipv6 dhcp relay destination` command enables the DHCPv6 relay agent function and specifies the client message destination address on an interface.

**Example**

This command enables the DHCPv6 relay agent function and sets the client message destination address to 2001:0db8:0:1::1 on Ethernet interface 4.

```
switch(config)# interface ethernet 4
switch(config-if-Et4)# ipv6 dhcp relay destination 2001:0db8:0:1::1
switch(config-if-Et4)
```

**12.2.3.5.1.3 Configuring the Client Link Layer Address for the IPv6 DHCP relay agent**

The `ipv6 dhcp relay option link-layer address` command enables the DHCPv6 relay agent to configure the client link layer address option to solicit and request messages. In other words, the command enables the link layer address option (79) in the global configuration mode. The `no ipv6 dhcp relay option link-layer address` command disables the link layer address option (79) in the global configuration mode.

**Example**

This command enables the insertion of link layer address option (79) in the global configuration mode.

```
switch(config)# ipv6 dhcp relay option link-layer address
```

**12.2.3.5.1.4 Clearing IPv6 DHCP Relay Counters**

The `clear ipv6 dhcp relay counters` command resets the DHCP relay counters. The configuration mode determines which counters are reset:

- Global configuration: command clears the counters for the switch and for all interfaces.
- Interface configuration: command clears the counter for the configuration mode interface.

**Example**

- These commands clear all DHCP relay counters on the switch.

```
switch(config-if-Et4)# exit
switch(config)# clear ipv6 dhcp relay counters
switch(config)#
```

- These commands clear the DHCP relay counters for Ethernet interface 4.

```
switch(config)# interface ethernet 4
switch(config-if-Et4)# clear ipv6 dhcp relay counters
switch(config)#
```

---

## 12.2.3.5.2 Viewing IPv6 DHCP Relay Information

### 12.2.3.5.2.1 IPv6 DHCP Status

The **show ip dhcp relay** command displays the status of DHCP relay agent parameters on the switch and each interface where at least one feature parameter is listed. The command displays the status for both global and interface configurations.

#### Example

This command displays the DHCP Agent Relay parameter status.

```
switch(config)#interface ethernet 1/2
switch(config-if-Et1/2)#show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCPv6 Relay Link-layer Address Option (79) is disabled
DHCP Smart Relay is disabled
Interface: Ethernet1/2
  DHCP Smart Relay is disabled
  DHCP servers: 1::1
                2001:db8:0:1::1
switch(config-if-Et1/2)#
```

### 12.2.3.5.2.2 IPv6 DHCP Relay Counters

The **show ipv6 dhcp relay counters** command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

#### Example

This command displays the IP DHCP relay counter table.

```
switch>show ipv6 dhcp relay counters
```

Interface	Dhcp Packets			Last Cleared
	Rcvd	Fwdd	Drop	
All Req	376	376	0	4 days, 19:55:12 ago
All Resp	277	277	0	
Ethernet4	207	148	0	4 days, 19:54:24 ago

```
switch>
```

## 12.2.4 IPv6 Commands

### Global Configuration Commands

- `ipv6 dhcp relay always-on`
- `ipv6 dhcp relay option link-layer address`
- `ipv6 hardware fib aggregate-address`
- `ipv6 hardware fib ecmp resilience`
- `ipv6 hardware fib nexthop-index`
- `ipv6 neighbor`
- `ipv6 neighbor cache persistent`
- `ipv6 route`
- `ipv6 unicast-routing`

### Interface Configuration Commands

- `ipv6 address`
- `ipv6 dhcp relay destination`
- `ipv6 dhcp snooping`
- `ipv6 enable`
- `ipv6 nd managed-config-flag`
- `ipv6 nd managed-config-flag`
- `ipv6 nd ns-interval`
- `ipv6 nd other-config-flag`
- `ipv6 nd prefix`
- `ipv6 nd ra dns-server`
- `ipv6 nd ra dns-servers lifetime`
- `ipv6 nd ra dns-suffix`
- `ipv6 nd ra dns-suffixes lifetime`
- `ipv6 nd ra hop-limit`
- `ipv6 nd ra interval`
- `ipv6 nd ra lifetime`
- `ipv6 nd ra mtu suppress`
- `ipv6 nd ra disabled`
- `ipv6 nd reachable-time`
- `ipv6 nd router-preference`
- `ipv6 verify`

### Privileged EXEC Commands

- `clear ipv6 dhcp relay counters`
- `clear ipv6 dhcp snooping counters`
- `clear ipv6 neighbors`

### EXEC Commands

- `show ipv6 dhcp relay counters`
- `show ipv6 dhcp snooping`
- `show ipv6 dhcp snooping counters`
- `show ipv6 dhcp snooping hardware`
- `show ipv6 hardware fib aggregate-address`

- 
- `show ipv6 interface`
  - `show ipv6 nd ra internal state`
  - `show ipv6 neighbors`
  - `show ipv6 route`
  - `show ipv6 route age`
  - `show ipv6 route host`
  - `show ipv6 route interface`
  - `show ipv6 route match tag`
  - `show ipv6 route summary`
  - `show rib route ipv6`

### 12.2.4.1 clear ipv6 dhcp relay counters

The `clear ipv6 dhcp relay counters` command resets the DHCP relay counters. When no port is specified, the command clears the counters for the switch and for all interfaces. Otherwise, the command clears the counter for the specified interface.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ipv6 dhcp relay counters [PORT]
```

#### Parameters

- PORT Interface through which neighbor is accessed. Options include:
  - <no parameter> all dynamic entries are removed.
  - interface ethernet *e\_num* Ethernet interface specified by *e\_num*.
  - interface loopback *l\_num* Loopback interface specified by *l\_num*.
  - interface port-channel *p\_num* Port-channel interface specified by *p\_num p\_num*.
  - interface vlan *v\_num* VLAN interface specified by *v\_num*.

#### Example

These commands clear the DHCP relay counters for Ethernet interface 4 and shows the counters before and after the `clear` command.

```
switch(config)#show ipv6 dhcp relay counters
```

Interface	Dhcp Packets			Last Cleared
	Rcvd	Fwdd	Drop	
All Req	376	376	0	4 days, 19:55:12 ago
All Resp	277	277	0	
Ethernet4	207	148	0	4 days, 19:54:24 ago

```
switch(config)#interface ethernet 4
switch(config-if-Et4)#clear ipv6 dhcp relay counters
```

Interface	Dhcp Packets			Last Cleared
	Rcvd	Fwdd	Drop	
All Req	380	380	0	4 days, 21:19:17 ago
All Resp	281	281	0	
Ethernet4	0	0	0	4 days, 21:18:30 ago

These commands clear all DHCP relay counters on the switch.

```
switch(config-if-Et4)#exit
switch(config)#clear ipv6 dhcp relay counters
switch(config)#show ipv6 dhcp relay counters
```

Interface	Dhcp Packets			Last Cleared
	Rcvd	Fwdd	Drop	
All Req	0	0	0	0:00:03 ago
All Resp	0	0	0	
Ethernet4	0	0	0	0:00:03 ago

```
switch(config)#
```

## 12.2.4.2 clear ipv6 dhcp snooping counters

The `clear ipv6 dhcp snooping counters` command resets the DHCP snooping packet counters.

### Command Mode

Privileged EXEC

### Command Syntax

```
clear ipv6 dhcp snooping counters [COUNTER_TYPE]
```

### Parameters

- **COUNTER\_TYPE** The type of counter that the command resets.
- *<no parameter>* command clears the counters for each VLAN.
- `debug` command clears aggregate counters and drop cause counters.

### Examples

- This command clears the number of DHCP packets sent and received on each VLAN.

```
switch#clear ipv6 dhcp snooping counters
switch# show ipv6 dhcp snooping counters
```

Vlan	Dhcpv6 Request Pkts			Dhcpv6 Reply Pkts			Last Cleared
-----	Rcvd	Fwdd	Drop	Rcvd	Fwdd	Drop	-----
2789	1	1	0	1	1	0	0:03:09 ago

- This command clears the number of DHCP packets sent on the switch.

```
switch#clear ipv6 dhcp snooping counters debug
switch#show ipv6 dhcp snooping counters debug
```

Counter	Snooping to Relay	Relay to Snooping
-----	-----	-----
Received	1	1
Forwarded	1	1
Dropped - Invalid VlanId	0	0
Dropped - Parse error	0	0
Dropped - Invalid Dhcp Optype	0	0
Dropped - Invalid Remote-ID Option	0	0
Dropped - Snooping disabled	0	0

Last Cleared: 0:04:29 ago

### 12.2.4.3 clear ipv6 neighbors

The `clear ipv6 neighbors` command removes the specified dynamic IPv6 neighbor discovery cache entries. Commands that do not specify an IPv6 address remove all dynamic entries for the listed interface. Commands that do not specify an interface remove all dynamic entries.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ipv6 neighbors [PORT][DYNAMIC_IPV6]
```

#### Parameters

- **PORT** Interface through which neighbor is accessed. Options include:
  - `<no parameter>` all dynamic entries are removed.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-channel interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- **DYNAMIC\_IPV6** Address of entry removed by the command. Options include:
  - `<no parameter>` All dynamic entries for specified interface are removed.
  - `ipv6_addr` IPv6 address of entry.

#### Example

This command removes all dynamic neighbor entries for **VLAN interface 200**.

```
switch#clear ipv6 neighbors vlan 200
switch#
```

---

#### 12.2.4.4 ipv6 address

The **ipv6 address** command assigns a global IPv6 address to the IPv6 interface, and defines the prefix length. This command is supported on routable interfaces. Multiple global IPv6 addresses can be assigned to an interface.

The **no ipv6 address** and **default ipv6 address** commands remove the IPv6 address assignment from the configuration mode interface by deleting the corresponding **ipv6 address** command from **running-config**. If the command does not include an address, all address assignments are removed from the interface. IPv6 remains enabled on the interface after the removal of all IPv6 addresses only if an **ipv6 enable** command is configured on the interface.

##### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
ipv6 address [ipv6_prefix]
```

```
no ipv6 address [ipv6_prefix]
```

```
default ipv6 address [ipv6_prefix]
```

##### Parameters

*ipv6\_prefix* address assigned to the interface (CIDR notation).

##### Guidelines

This command is supported on routable interfaces.

##### Example

These commands configure an IPv6 address and prefix length for *VLAN 200*:

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 address 10:23:31:00:01:32:93/64
switch(config-if-Vl200)#
```

### 12.2.4.5 ipv6 dhcp relay always-on

The `ipv6 dhcp relay always-on` command enables the switch DHCP relay agent on the switch regardless of the DHCP relay agent status on any interface. By default, the DHCP relay agent is enabled only if at least one routable interface is configured with an `ipv6 dhcp relay destination` statement.

The `no ipv6 dhcp relay always-on` and `default ipv6 dhcp relay always-on` commands remove the `ipv6 dhcp relay always-on` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ipv6 dhcp relay always-on
no ipv6 dhcp relay always-on
default ipv6 dhcp relay always-on
```

#### Example

This command enables the DHCP relay agent.

```
switch(config)#ipv6 dhcp relay always-on
switch(config)#
```

---

### 12.2.4.6 ipv6 dhcp relay destination

The **ipv6 dhcp relay destination** command enables the DHCPv6 relay agent and sets the destination address on the configuration mode interface.

The **no ipv6 dhcp relay destination** and **default ipv6 dhcp relay destination** commands remove the corresponding **ipv6 dhcp relay destination** command from **running-config**. When the commands do not list an IPv6 address, all **ipv6 dhcp relay destination** commands are removed from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ipv6 dhcp relay destination [ipv6_addr][source-address ipv6_addr]
```

```
no ipv6 dhcp relay destination [ipv6_addr]
```

```
default ipv6 dhcp relay destination [ipv6_addr]
```

#### Parameters

- *ipv6\_addr* DHCP Server's IPv6 address.
- source-address *ipv6\_addr* specify the source IPv6 address to communicate with DHCP server.

#### Guidelines

If the source-address parameter is specified, then the DHCP client receives an IPv6 address from the subnet of source IP address. The source-address must be one of the configured addresses on the interface.

#### Example

This command enables the DHCPv6 relay agent and sets the destination address to *2001:0db8:0:1::1* on *Ethernet interface 4*.

```
switch(config)#interface ethernet 4
switch(config-if-Et4)#ipv6 dhcp relay destination 2001:0db8:0:1::1
switch(config-if-Et4)#show ip dhcp relay
DHCP Relay is active
DHCP Relay Option 82 is disabled
DHCPv6 Relay Link-layer Address Option (79) is disabled
DHCP Smart Relay is disabled
Interface: Ethernet4
    DHCP Smart Relay is disabled
    DHCP servers: 1::1
                  2001:db8:0:1::1
switch(config-if-Et4)#
```

### 12.2.4.7 ipv6 dhcp relay option link-layer address

The **ipv6 dhcp relay option link-layer address** command enables the DHCPv6 relay agent to configure the client link layer address option to solicit and request messages. In other words, the command enables the link layer address option (79) in the global configuration mode.

The **no ipv6 dhcp relay option link-layer address** command disables the link layer address option (79) in the global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
ipv6 dhcp relay option link-layer address
no ipv6 dhcp relay option link-layer address
default ipv6 dhcp relay option link-layer address
```

#### Example

This command enables the insertion of link layer address option (79) in the global configuration mode.

```
switch(config)#ipv6 dhcp relay option link-layer address
```

---

### 12.2.4.8 ipv6 enable

The **ipv6 enable** command enables IPv6 on the configuration mode interface. Assigning an IPv6 address to an interface also enables IPv6 on the interface.

The **no ipv6 enable** and **default ipv6 enable** command remove the corresponding **ipv6 enable** command from *running-config*. This action disables IPv6 on interfaces that are not configured with an IPv6 address.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ipv6 enable
```

```
no ipv6 enable
```

```
default ipv6 enable
```

#### Example

This command enables IPv6 on *VLAN interface 200*.

```
switch(config)#interface vlan 200  
switch(config-vl200)#ipv6 enable  
switch(config-vl200)#
```

### 12.2.4.9 ipv6 hardware fib aggregate-address

The **ipv6 hardware fib aggregate-address** command specifies the routing table repository of specified IPv6 route.

By default, routes that are created statically through the CLI or dynamically through routing protocols are initially stored in software routing tables, then entered in the hardware routing table by the routing agent. This command prevents the entry of the specified route into the hardware routing table. Specified routes that are in the hardware routing table are removed by this command. Specific routes that are encompassed within the specified route prefix are affected by this command.

The **no ipv6 hardware fib aggregate-address** and **default ipv6 hardware fib aggregate-address** commands remove the restriction from the hardware routing table for the specified routes by removing the corresponding **ipv6 hardware fib aggregate-address** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ipv6 hardware fib aggregate-address ipv6_prefix summary-only software-forward
```

```
no ipv6 hardware fib aggregate-address ipv6_prefix
```

```
default ipv6 hardware fib aggregate-address ipv6_prefix
```

#### Parameters

*ipv6\_prefix* IPv6 prefix that is restricted from the hardware routing table (CIDR notation).

#### Example

These commands configure a hardware routing restriction for an IPv6 prefix, then displays that restriction.

```
switch(config)#ipv6 hardware fib aggregate-address fd77:4890:5313:ffed::/64
summary-only software-forward
switch(config)#show ipv6 hardware fib aggregate-address
Codes: S - Software Forwarded
S fd77:4890:5313:ffed::/64

switch(config)#
```

---

### 12.2.4.10 ipv6 hardware fib ecmp resilience

The `ip hardware fib ecmp resilience` command configures a fixed number of next hop entries in the hardware ECMP table for the specified IPv6 address prefix. In addition to specifying the maximum number of next hop addresses that the table can contain for the prefix, the command introduces a redundancy factor that allows duplication of each next hop address. The fixed table space for the address is the maximum number of next hops multiplied by the redundancy factor.

The default method of adding or removing next hop entries when required by the active hashing algorithm leads to inefficient management of the ECMP table, which can result in the rerouting of packets to different next hops that breaks TCP packet flows. Implementing fixed table entries for a specified IP address allows data flows that are hashed to a valid next hop number to remain intact. Additionally, traffic is evenly distributed over a new set of next hops.

The `no ip hardware fib ecmp resilience` and `default ip hardware fib ecmp resilience` commands restore the default hardware ECMP table management by removing the `ip hardware fib ecmp resilience` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ipv6 hardware fib ecmp resilience net_prfx capacity nhop_max redundancy duplicates  
no ipv6 hardware fib ecmp resilience net_addr  
default ipv6 hardware fib ecmp resilience net_addr
```

#### Parameters

- *net\_prfx* IPv6 address prefix managed by command.
- *nhop\_max* Specifies maximum number of nexthop entries for specified IP address prefix. Value range varies by platform:
  - Helix: <2 to 64>
  - Trident: <2 to 32>
  - Trident II: <2 to 64>
- *duplicates* Specifies the redundancy factor. Value ranges from 1 to 128.

#### Example

This command configures a hardware ECMP table space of 15 entries for the IPv6 address `2001:db8:0::/64`. A maximum of five nexthop addresses can be specified for the address. When the table contains five nexthop addresses, each appears in the table three times. When the table contains fewer than five nexthop addresses, each is duplicated until the 15 table entries are filled.

```
switch(config)#ipv6 hardware fib ecmp resilience 2001:db8:0::/64 capacity  
5 redundancy 3
```

### 12.2.4.11 ipv6 hardware fib nexthop-index

The **ipv6 hardware fib nexthop-index** command deterministically selects the next hop used for ECMP routes. By default, routes that are created statically through the CLI or dynamically through routing protocols are initially stored in software routing tables, then entered in the hardware routing table by the routing agent. This command specifies the method of creating an index-offset number that points to the next hop from the list of the route's ECMP next hops.

The index-offset is calculated by adding the next hop index to a prefix offset.

- **Next hop index:** specified in the command.
- **Prefix offset:** the least significant bits of the route's prefix.

The command specifies the number of bits that comprise the prefix offset. The prefix offset is set to the prefix when the command specifies a prefix size larger than the prefix. If the command specifies a prefix size of zero, the prefix-offset is also zero and the index-offset is set to the next hop index.

When the index-offset is greater than the number of next hops in the table, the position of the next hop is the remainder of the division of the index-offset by the number of next hop entries.

The **no ipv6 hardware fib nexthop-index** and **default ipv6 hardware fib nexthop-index** commands remove the specified nexthop used for ECMP routes by removing the **ipv6 hardware fib nexthop-index** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ipv6 hardware fib nexthop nxthop_index [PREFIX]
```

```
no ipv6 hardware fib nexthop
```

```
default ipv6 hardware fib nexthop
```

#### Parameters

- *nxthop\_index* specifies the next hop index. Value ranges from 0 to 32.
- PREFIX Number of bits of the route's prefix to use as the prefix-offset. Value ranges from 0 to 64.
  - *<no parameter>* The prefix offset is set to zero.
  - prefix-bits **<0 to 64>** Specifies the number bits to use as the prefix-offset.

#### Example

This command specifies the next hop from the list of ECMP next hops for the route.

```
switch(config)#ipv6 hardware fib nexthop-index 5 prefix-bits 10
switch>show ip
IP Routing : Enabled
IP Multicast Routing : Disabled
VRRP: Configured on 0 interfaces

IPv6 Unicast Routing : Enabled
IPv6 ECMP Route support : False
IPv6 ECMP Route nexthop index: 5
IPv6 ECMP Route num prefix bits for nexthop index: 10
switch>
```

---

### 12.2.4.12 ipv6 nd managed-config-flag

The `ipv6 nd managed-config-flag` command causes the `managed address configuration` flag to be set in IPv6 RA packets transmitted from the configuration mode interface.

The `no ipv6 nd managed-config-flag` and `default ipv6 nd managed-config-flag` commands restore the default setting where the `managed address configuration` flag is not set in IPv6 RA packets transmitted by the interface by removing the corresponding `ipv6 nd managed-config-flag` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ipv6 nd managed-config-flag
```

```
no ipv6 nd managed-config-flag
```

```
default ipv6 nd managed-config-flag
```

#### Example

These commands cause the managed address configuration flag to be set in IPv6 RA packets sent from *VLAN interface 200*.

```
switch(config)#interface vlan 200  
switch(config-if-Vl200)#ipv6 nd managed-config-flag  
switch(config-if-Vl200)#
```

### 12.2.4.13 ipv6 nd ns-interval

The **ipv6 nd ns-interval** command configures the interval between IPv6 neighbor solicitation (NS) transmissions from the configuration mode interface.

The **no ipv6 nd ns-interval** and **default ipv6 nd ns-interval** commands return the IPv6 NS transmission interval for the configuration mode interface to the default value of 1000 milliseconds by removing the corresponding **ipv6 nd ns-interval** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ipv6 nd ns-interval period no ipv6 nd ns-interval
```

```
default ipv6 nd ns-interval
```

#### Parameters

*period* interval in milliseconds between successive IPv6 neighbor solicitation transmissions. Values range from 1000 to 4294967295. The default period is 1000 milliseconds.

#### Example

This command configures a neighbor solicitation transmission interval of 30 seconds on *VLAN interface 200*.

```
switch(config)#interface vlan 200  
switch(config-if-Vl200)#ipv6 nd ns-interval 30000  
switch(config-if-Vl200)#
```

---

#### 12.2.4.14 ipv6 nd other-config-flag

The **ipv6 nd other-config-flag** command configures the configuration mode interface to send IPv6 RAs with the **other stateful configuration** flag set.

The **no ipv6 nd other-config-flag** and **default ipv6 nd other-config-flag** commands restore the default setting by removing the corresponding **ipv6 nd other-config-flag** command from **running-config**.

##### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
ipv6 nd other-config-flag
no ipv6 nd other-config-flag
default ipv6 nd other-config-flag
```

##### Example

These commands configure the switch to set the other stateful configuration flag in advertisements sent from *VLAN interface 200*.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd other-config-flag
switch(config-if-Vl200)#
```

### 12.2.4.15 ipv6 nd prefix

The `ipv6 nd prefix` command configures neighbor discovery Router Advertisements (RAs) prefix inclusion for RAs sent from the configuration mode interface.

By default, all prefixes configured as [IPv6 addresses](#) are advertised in the interface's RAs. The `ipv6 nd prefix` command with the `no-advertise` option prevents advertising of the specified prefix without affecting the advertising of other prefixes specified as IPv6 addresses. When an interface configuration includes at least one `ipv6 nd prefix` command that enables prefix advertising, RAs advertise only prefixes specified through `ipv6 nd prefix` commands.

Commands enabling prefix advertising also specify the advertised valid and preferred lifetime periods. Default periods are 2,592,000 (valid) and 604,800 (preferred) seconds.

The `no ipv6 nd prefix` and `default ipv6 nd prefix` commands remove the corresponding `ipv6 nd prefix` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ipv6 nd prefix ipv6_prefix LIFETIME [FLAGS]
```

```
ipv6 nd prefix ipv6_prefix no-advertise
```

```
no ipv6 nd prefix ipv6_prefix
```

```
default ipv6 nd prefix ipv6_prefix
```

#### Parameters

- *ipv6\_prefix* IPv6 prefix (CIDR notation).
- no-advertise Prevents advertising of the specified prefix.
- LIFETIME Period that the specified IPv6 prefix is advertised (seconds). Options include
  - valid preferred Two values that set the *valid* and *preferred* lifetime periods.
  - valid One value that sets the *valid* lifetime. The *preferred* lifetime is set to the default value.
  - <no parameter> The *valid* and *preferred* lifetime periods are set to their default values.

Options for valid: <0 to 4294967295 > and infinite. Default value is 2592000 Options for preferred: <0 to 4294967295 > and infinite. Default value is 604800 The maximum value (4294967295) and infinite are equivalent settings.

- FLAGS on-link and autonomous address-configuration flag values in RAs.
  - <no parameter> both flags are set.
  - no-autoconfig autonomous address-configuration flag is reset.
  - no-onlink on-link flag is reset.
  - no-autoconfig no-onlink both flags are reset.
  - no-onlink no-autoconfig both flags are reset.

#### Example

---

These commands enable neighbor discovery advertising for IPv6 address *3012:D678::/64*, on *VLAN interface 200*, specifying a valid lifetime of 1,296,000 seconds and the default preferred lifetime.

```
switch(config)#interface vlan 200  
switch(config-if-Vl200)#ipv6 nd prefix 3012:D678::/64 1296000
```

### 12.2.4.16 ipv6 nd ra disabled

The **ipv6 nd ra disabled** command suppress IPv6 Router Advertisement (RA) transmissions on the configuration mode interface. By default, only unsolicited RAs that are transmitted periodically are suppressed. The **all** option configures the switch to suppress all RAs, including those responding to a router solicitation.

The **no ipv6 nd ra disabled** and **default ipv6 nd ra disabled** commands restore the transmission of RAs on the configuration mode interface by deleting the corresponding **ipv6 nd ra disabled** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ipv6 nd ra disabled [SCOPE]
no ipv6 nd ra disabled
default ipv6 nd ra disabled
```

#### Parameters

- **SCOPE** specifies the RAs that are suppressed.
  - *<no parameter>* Periodic unsolicited RAs are suppressed.
  - **all** All RAs are suppressed.

#### Example

This command suppresses all RAs on *VLAN interface 200*.

```
switch(config)#interface vlan 200
switch(config-vl200)#ipv6 nd ra disabled all
switch(config-vl200)#
```

---

### 12.2.4.17 ipv6 nd ra dns-server

The `ipv6 nd ra dns-server` command configures the IPv6 address of a preferred Recursive DNS Server (RDNSS) for the command mode interface to include in its neighbor-discovery Router Advertisements (RAs). Including RDNSS information in RAs provides DNS server configuration for connected IPv6 hosts without requiring DHCPv6.

Multiple servers can be configured on the interface by using the command repeatedly. A lifetime value for the RDNSS can optionally be specified with this command, and overrides any default value configured for the interface using the `ipv6 nd ra dns-servers lifetime` command.

The `no ipv6 nd ra dns-server` and `default ipv6 nd ra dns-server` commands remove the corresponding `ipv6 nd ra dns-server` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ipv6 nd ra dns-server ipv6_addr SERVER_LIFE
```

```
no ipv6 nd ra dns-server ipv6_addr
```

```
default ipv6 nd ra dns-server ipv6_addr
```

#### Parameters

- *ipv6\_addr* RDNSS address to be included in RAs from the command mode interface.
- SERVER\_LIFE maximum lifetime value for the specified RDNSS entry. This value overrides any default lifetime value. Value should be between the RA interval configured on the interface and two times that interval. Options include:
  - *<no parameter>* lifetime period is the default lifetime period configured on the interface. If no lifetime period is configured on the interface, the default value is 1.5 times the maximum RA interval set by the `ipv6 nd ra interval` command.
  - lifetime 0 the configured RDNSS is not to be used.
  - lifetime **< 1 to 4294967295 >** specifies the lifetime period for this RDNSS in seconds.

#### Example

This command configures the RDNSS at `2001:0db8:0:1::1` as a preferred RDNSS for *VLAN interface 200* to include in its neighbor-discovery route advertisements, and sets its lifetime value to `300` seconds.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra dns-server 2001:0db8:0:1::1 lifetime
300
switch(config-if-Vl200)#
```

### 12.2.4.18 ipv6 nd ra dns-servers lifetime

The `ipv6 nd ra dns-servers lifetime` command sets the default value that the configuration mode interface uses for the lifetime of any Recursive DNS Server (RDNSS) configured on the interface. A lifetime value set for an individual RDNSS overrides this value. The lifetime value is the maximum amount of time after a route advertisement packet is sent that the RDNSS referenced in the packet may be used for name resolution.

The `no ipv6 nd ra dns-servers lifetime` and `default ipv6 nd ra dns-servers lifetime` commands remove the default lifetime value from the interface by removing the corresponding `ipv6 nd ra dns-servers lifetime` command from *running-config*. When there is no default RDNSS lifetime value configured on the interface, an RDNSS without a custom lifetime value will default to 1.5 times the RA interval configured on the interface. A lifetime of zero seconds means that the RDNSS must not be used for name resolution.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ipv6 nd ra dns-servers lifetime period
no ipv6 nd ra dns-servers lifetime
default ipv6 nd ra dns-servers lifetime
```

#### Parameters

- *period* the RDNSS lifetime value for the configuration mode interface. Options include:
  - **<0>** any RDNSS configured on the command mode interface without a custom lifetime value must not be used.
  - **< 1 to 4294967295 >** maximum RDNSS lifetime value for the configuration mode interface. This value is overridden by any lifetime value set with the `ipv6 nd ra dns-server` command. Should be between the router advertisement interval configured on the interface and two times that interval.

#### Example

- This command sets the default RDNSS maximum lifetime value for *VLAN 200* to 350 seconds.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra dns-servers lifetime 350
switch(config-if-Vl200)#
```

---

### 12.2.4.19 ipv6 nd ra dns-suffix

The **ipv6 nd ra dns-suffix** command creates a DNS Search List (DNSSL) for the command mode interface to include in its neighbor-discovery Router Advertisements as defined in RFC 6106 . The DNSSL contains the domain names of DNS suffixes for IPv6 hosts to append to short, unqualified domain names for DNS queries.

Multiple DNS domain names can be added to the DNSSL by using the command repeatedly. A lifetime value for the DNSSL can optionally be specified with this command, and overrides any default value configured for the interface using the **ipv6 nd ra dns-suffixes lifetime** command.

The **no ipv6 nd ra dns-suffix** and **default ipv6 nd ra dns-suffix** commands remove the corresponding **ipv6 nd ra dns-suffix** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ipv6 nd ra dns-suffix domain SUFFIX_LIFE
no ipv6 nd ra dns-suffix ipv6_addr
default ipv6 nd ra dns-suffix ipv6_addr
```

#### Parameters

- *domain* domain suffix for IPv6 hosts to append to short, unqualified domain names for DNS queries. Suffix must contain only alphanumeric characters, "." and "-" and must begin and end with an alphanumeric character.
- SUFFIX\_LIFE maximum lifetime value for the specified domain suffix. This value overrides any default lifetime value. Value should be between the RA interval configured on the interface and two times that interval. Options include:
  - *<no parameter>* lifetime period is the default lifetime period configured on the interface. If no lifetime period is configured on the interface, the default value is 1.5 times the maximum RA interval set by the `ipv6 nd ra interval` command.
  - `lifetime 0` the configured domain suffix is not to be used.
  - `lifetime < 1 to 4294967295 >` specifies the lifetime period for this domain suffix in seconds.

#### Example

These commands create a DNSSL for *VLAN interface 200* to include in its neighbor-discovery route advertisements, and set its lifetime value to *300* seconds.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra dns-suffix test.com lifetime 300
switch(config-if-Vl200)#
```

### 12.2.4.20 ipv6 nd ra dns-suffixes lifetime

The `ipv6 nd ra dns-suffixes lifetime` command sets the default value that the configuration mode interface uses for the lifetime of any DNS Search List (DNSSL) configured on the interface. A lifetime value set for an individual DNSSL overrides this value. The lifetime value is the maximum amount of time after a route advertisement packet is sent that the DNSSL included in the packet may be used for name resolution.

The `no ipv6 nd ra dns-suffixes lifetime` and `default ipv6 nd ra dns-suffixes lifetime` commands remove the default lifetime value from the interface by removing the corresponding `ipv6 nd ra dns-suffixes lifetime` command from *running-config*. When there is no default DNSSL lifetime value configured on the interface, a DNSSL without a custom lifetime value will default to 1.5 times the RA interval configured on the interface. A lifetime of zero seconds means that the DNSSL must not be used for name resolution.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ipv6 nd ra dns-suffixes lifetime period
no ipv6 nd ra dns-suffixes lifetime
default ipv6 nd ra dns-suffixes lifetime
```

#### Parameters

- *period* the DNSSL lifetime value for the configuration mode interface. Options include:
  - `<0>` any DNSSL configured on the command mode interface without a custom lifetime value must not be used.
  - `< 1 to 4294967295 >` maximum DNSSL lifetime value for the configuration mode interface. This value is overridden by any lifetime value set with the `ipv6 nd ra dns-suffix` command. Should be between the RA interval configured on the interface and two times that interval.

#### Example

This command sets the default DNSSL maximum lifetime value for *VLAN 200* to 350 seconds.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra dns-suffixes lifetime 350
switch(config-if-Vl200)#
```

---

#### 12.2.4.21 ipv6 nd ra hop-limit

The `ipv6 nd ra hop-limit` command sets a suggested hop-limit value to be included in Router Advertisement (RA) packets. The hop-limit value is to be used by attached hosts in outgoing packets.

The `no ipv6 nd ra hop-limit` and `default ipv6 nd ra hop-limit` commands remove the corresponding `ipv6 nd ra hop-limit` command from *running-config*.

##### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
ipv6 nd ra hop-limit quantity
```

```
no ipv6 nd ra hop-limit lifetime
```

```
default ipv6 nd ra hop-limit lifetime
```

##### Parameters

- *quantity* the hop-limit value to be included in RA packets sent by the configuration mode interface. Options include:
  - `<0>` indicates that outgoing packets from attached hosts are to be immediately discarded.
  - `<1 to 255>` number of hops. The default value is 64.

##### Example

These commands include a hop-limit value of `100` in RA packets sent by `VLAN 200`.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra hop-limit
switch(config-if-Vl200)#
```

#### 12.2.4.22 ipv6 nd ra interval

The `ipv6 nd ra interval` command configures the interval between IPv6 Router Advertisement transmissions from the configuration mode interface.

The `no ipv6 nd ra interval` and `default ipv6 nd ra interval` commands return the IPv6 RA transmission interval for the configuration mode interface to the default value of 200 seconds by removing the corresponding `ipv6 nd ra interval` command from *running-config*.

##### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
ipv6 nd ra interval [SCALE] ra_period [minimum_period]
```

```
no ipv6 nd ra interval
default ipv6 nd ra interval
```

### Parameters

- **SCALE** timescale in which command parameter values are expressed.
  - *<no parameter>* seconds
  - msec milliseconds
- *ra\_period* maximum interval between successive IPv6 RA transmissions. The default period is 200 seconds.
  - **< 4 - 1800 >** valid range when scale is set to default value (seconds).
  - **< 500 - 1800000 >** valid range when scale is set to msec.
- *minimum\_period* minimum interval between successive IPv6 RA transmissions. Must be smaller than *ra\_period*. By default, a minimum period is not defined.
  - *<no parameter>* Command does not specify a minimum period.
  - **< 3 - 1799 >** valid range when scale is set to default value (seconds).
  - **< 375 - 1799999 >** valid range when scale is set to msec.

### Example

These commands configure a RA transmission interval of 60 seconds on VLAN interface 200, then displays the interface status.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra interval 60
switch(config-if-Vl200)#show active
interface Vlan200
    ipv6 nd ra interval 60
switch(config-if-Vl200)#
```

---

### 12.2.4.23 ipv6 nd ra lifetime

The **ipv6 nd ra lifetime** command specifies the value that the switch places in the **router lifetime** field of IPv6 Router Advertisements sent from the configuration mode interface.

If the value is set to 0, IPv6 peers connected to the specified interface will remove the switch from their lists of default routers. Values greater than 0 indicate the time in seconds that peers should keep the router on their default router lists without receiving further RAs from the switch. Unless the value is 0, the router lifetime value should be equal to or greater than the interval between unsolicited RAs sent on the interface.

The **no ipv6 nd ra lifetime** and **default ipv6 nd ra lifetime** commands return the IPv6 RA lifetime data entry filed for the configuration mode interface to the default value of 1800 seconds by removing the corresponding **ipv6 nd ra lifetime** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ipv6 nd ra lifetime ra_lifetime
```

```
no ipv6 nd ra lifetime
```

```
default ipv6 nd ra lifetime
```

#### Parameters

- *ra\_lifetime* router lifetime period (seconds). Default value is 1800. Options include
  - <0> Router should not be considered as a default router
  - <1 - 65535 > Lifetime period advertised in RAs. Should be greater than or equal to the interval between IPv6 RA transmissions from the configuration mode interface as set by the **ipv6 nd ra interval** command.

#### Example

This command configures the switch to enter 2700 in the router lifetime field of RAs transmitted from VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd ra lifetime 2700
switch(config-if-Vl200)#show active
interface Vlan20
    ipv6 nd ra lifetime 2700
switch(config-if-Vl200)#
```

#### 12.2.4.24 ipv6 nd ra mtu suppress

The **ipv6 nd ra mtu suppress** command suppresses the Router Advertisement (RA) MTU option on the configuration mode interface. The MTU option causes an identical MTU value to be advertised by all nodes on a link. By default, the RA MTU option is not suppressed.

The **no ipv6 nd ra mtu suppress** and **default ipv6 nd ra mtu suppress** commands restores the MTU option setting to enabled by for the configuration mode interface by removing the corresponding **ipv6 nd ra mtu suppress** command from *running-config*.

##### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
ipv6 nd ra mtu suppress
```

```
no ipv6 nd ra mtu suppress
```

```
default ipv6 nd ra mtu suppress
```

##### Example

This command suppresses the MTU option on *VLAN interface 200*.

```
switch(config)#interface vlan 200  
switch(config-vl200)#ipv6 nd ra mtu suppress  
switch(config-vl200)#
```

---

#### 12.2.4.25 ipv6 nd reachable-time

The **ipv6 nd reachable-time** command specifies the time period that the switch includes in the reachable time field of RAs sent from the configuration mode interface. The reachable time defines the period that a remote IPv6 node is considered reachable after a reachability confirmation event.

RAs that advertise zero seconds indicate that the router does not specify a reachable time. The default advertisement value is 0 seconds. The switch reachability default period is 30 seconds.

The **no ipv6 nd reachable-time** and **default ipv6 nd reachable-time** commands restore the entry of the default value (0) in RAs sent from the configuration mode interface by deleting the corresponding **ipv6 nd reachable-time** command from **running-config**.

##### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
ipv6 nd reachable-time period  
no ipv6 nd reachable-time  
default ipv6 nd reachable-time
```

##### Parameters

*period* Reachable time value (milliseconds). Value ranges from <0 to 4294967295>. Default is 0.

##### Example

These commands configure the entry of 25000 (25 seconds) in the reachable time field of RAs sent from VLAN 200.

```
switch(config)#interface vlan 200  
switch(config-if-Vl200)#ipv6 nd reachable-time 25000  
interface Vlan200  
    ipv6 address fd7a:4321::1/64  
    ipv6 nd reachable-time 25000  
switch(config-if-Vl200)#
```

### 12.2.4.26 ipv6 nd router-preference

The **ipv6 nd router-preference** command specifies the value that the switch enters in the Default Router Preference (DRP) field of Router Advertisements (RAs) that it sends from the configuration mode interface. The default field entry value is **medium**.

The **no ipv6 nd router-preference** and **default ipv6 nd router-preference** commands restore the switch to enter the default DRP field value of **medium** in RAs sent from the configuration mode interface by deleting the corresponding **ipv6 nd router-preference** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ipv6 nd router-preference RANK
no ipv6 nd router-preference
default ipv6 nd router-preference
```

#### Parameters

- **RANK** Router preference value. Options include:
  - high
  - low
  - medium

#### Example

This command configures the switch as a medium preference router on RAs sent from *VLAN 200*.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 nd router-preference medium
switch(config-if-Vl200)#
```

---

### 12.2.4.27 ipv6 neighbor cache persistent

The `ipv6 neighbor cache persistent` command restores the IPv6 neighbor cache after reboot.

The `no ipv6 neighbor cache persistent` and `default ipv6 neighbor cache persistent` commands remove the ARP cache persistent configuration from the *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ipv6 neighbor cache persistent
no ipv6 neighbor cache persistent
default ipv6 neighbor cache persistent
```

#### Example

This command restores the ipv6 neighbor cache after reboot.

```
switch(config)#ipv6 neighbor cache persistent
switch(config)#
```

### 12.2.4.28 ipv6 neighbor

The **ipv6 neighbor** command creates an IPv6 neighbor discovery cache static entry. The command converts pre-existing dynamic cache entries for the specified address to static entries.

The **no ipv6 neighbor** and **default ipv6 neighbor** commands remove the specified static entry from the IPV6 neighbor discovery cache and delete the corresponding **ipv6 neighbor** command from *running-config*. These commands do not affect any dynamic entries in the cache.

#### Command Mode

Global Configuration

#### Command Syntax

```
ipv6 neighbor ipv6_addr PORT mac_addr
```

```
no ipv6 neighbor ipv6_address PORT
```

```
default ipv6 neighbor ipv6_addr PORT
```

#### Parameters

- *ipv6\_addr* Neighbor's IPv6 address.
- PORT Interface through which the neighbor is accessed. Options include:
  - ethernet *e\_num* Ethernet interface specified by *e\_num*.
  - loopback *l\_num* Loopback interface specified by *l\_num*.
  - management *m\_num* Management interface specified by *m\_num*.
  - port-channel *p\_num* Port-channel interface specified by *p\_num*.
  - vlan *v\_num* VLAN interface specified by *v\_num*.
  - vxlan *vx\_num* VXLAN interface specified by *vx\_num*.
- *mac\_addr* Neighbor's data-link (hardware) address. (48-bit dotted hex notation – H.H.H).

#### Example

This command will add a static entry to the neighbor discovery cache for the neighbor located at `3100:4219::3EF2` with hardware address `0100.4EA1.B100` and accessible through `VLAN 200`.

```
switch(config)#ipv6 neighbor 3100:4219::3EF2 vlan 200 0100.4EA1.B100
switch(config)#
```

---

### 12.2.4.29 ipv6 route

The `ipv6 route` command creates an IPv6 static route. The destination is a IPv6 prefix; the source is an IPv6 address or a routable interface port. When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of 200 is overridden by OSPF intra-area routes, which have a default distance of 110.

The command provides these methods of designating the nexthop location:

- **null0:** Traffic to the specified destination is dropped.
- **IPv6 gateway:** Switch identifies egress interface by recursively resolving the next-hop.
- **Egress interface:** Switch assumes destination subnet is directly connected to interface; when routing to any subnet address, the switch sends an ARP request to find the MAC address for the first packet.
- **Combination Egress interface and IPv6 gateway:** Switch does not assume subnet is directly connected to interface; the only ARP traffic is for the nexthop address for the first packet on the subnet. Combination routes are not recursively resolved.

Multiple routes that are configured to the same destination with the same administrative distance comprise an Equal Cost Multi-Path (ECMP) route. The switch attempts to spread outbound traffic across all ECMP route paths equally. All ECMP paths are assigned the same tag value; commands that change the tag value of any ECMP path change the tag value of all paths in the ECMP.

The `no ipv6 route` and `default ipv6 route` commands delete static routes by removing the corresponding `ipv6 route` statements from *running-config*. Commands not including a source delete all statements to the destination. Only statements with parameters that match specified command arguments are deleted. Parameters that are not in the command line are not evaluated.

#### Command Mode

Global Configuration

#### Command Syntax

```
ipv6 route dest_prefix NEXTHOP [DISTANCE][TAG_OPT][RT_NAME]
```

```
no ipv6 route dest_prefix [nexthop_addr][DISTANCE]
```

```
default ipv6 route dest_prefix [nexthop_addr][DISTANCE]
```

#### Parameters

- *dest\_prefix* Destination IPv6 prefix (CIDR notation).
- NEXTHOP Access method of next hop device. Options include:
  - null0 Null0 interface – route is dropped.
  - *nexthop\_addr* IPv6 address of nexthop device.
  - ethernet *e\_num* Ethernet interface specified by *e\_num*.
  - loopback *l\_num* Loopback interface specified by *l\_num*.
  - management *m\_num* Management interface specified by *m\_num*.
  - port-channel *p\_num* Port-channel interface specified by *p\_num*.
  - vlan *v\_num* VLAN interface specified by *v\_num*.
  - vxlan *vx\_num* VXLAN interface specified by *vx\_num*.
  - ethernet *e\_num nexthop\_addr* Combination route (Ethernet interface and gateway).
  - loopback *l\_num nexthop\_addr* Combination route (loopback interface and gateway).
  - management *m\_num nexthop\_addr* Combination route (management interface and gateway).
  - port-channel *p\_num nexthop\_addr* Combination route (port channel interface and gateway).

- `vlan v_num nexthop_addr` Combination route (VLAN interface and gateway).
- `vxlan vx_num nexthop_addr` Combination route (VXLAN interface and gateway)
- DISTANCE administrative distance assigned to route. Options include:
  - `<no parameter>` route assigned default administrative distance of one.
  - `<1 to 255>` The administrative distance assigned to route.
- TAG\_OPT static route tag. Options include:
  - `<no parameter>` assigns default static route tag of 0.
  - `tag <0 to 4294967295>` Static route tag value.
- RT\_NAME Associates descriptive text to the route. Options include:
  - `<no parameter>` No text is associated with the route.
  - `name descriptive_text` The specified text is assigned to the route.

### Example

This command creates an IPv6 static route.

```
switch(config)#ipv6 route 10:23:31:00:01:32:93/24 vlan 300
```

---

### 12.2.4.30 ipv6 unicast-routing

The **ipv6 unicast-routing** command enables the forwarding of IPv6 unicast packets. When routing is enabled, the switch attempts to deliver inbound packets to destination addresses by forwarding them to interfaces or next hop addresses specified by the IPv6 routing table.

The **no ipv6 unicast-routing** and default **ip ipv6 unicast-routing** commands disable IPv6 unicast routing by removing the **ipv6 unicast-routing** command from **running-config**. Dynamic routes added by routing protocols are removed from the routing table. Static routes are preserved by default; the **delete-static-routes** option removes static entries from the routing table.

IPv6 unicast routing is disabled by default.

#### Command Mode

Global Configuration

#### Command Syntax

```
ipv6 unicast-routing
```

```
no ipv6 unicast-routing [DELETE_ROUTES]
```

```
default ipv6 unicast-routing [DELETE_ROUTES]
```

#### Parameters

- **DELETE\_ROUTES** Resolves routing table static entries when routing is disabled.
  - *<no parameter>* Routing table retains static entries.
  - **delete-static-routes** Static entries are removed from the routing table.

#### Example

This command enables IPv6 unicast-routing.

```
switch(config)#ipv6 unicast-routing  
switch(config)#
```

### 12.2.4.31 ipv6 verify

The **ipv6 verify** command configures Unicast Reverse Path Forwarding (uRPF) for inbound IPv6 packets on the configuration mode interface. uRPF verifies the accessibility of source IP addresses in packets that the switch forwards.

uRPF defines two operational modes: strict mode and loose mode.

- Strict mode: uRPF also verifies that a packet is received on the interface that its routing table entry specifies for its return packet.
- Loose mode: uRPF validation does not consider the inbound packet's ingress interface.

The **no ipv6 verify** and **default ipv6 verify** commands disable uRPF on the configuration mode interface by deleting the corresponding **ipv6 verify** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Management Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ipv6 verify unicast source reachable-via RPF_MODE
no ipv6 verify unicast
default ipv6 verify unicast
```

#### Parameters

- RPF\_MODE Specifies the uRPF mode. Options include:
  - any Loose mode.
  - rx Strict mode
  - rx allow-default Strict mode. All inbound packets are forwarded if a default route is defined.

#### Guidelines

The first IPv6 uRPF implementation briefly disables IPv6 unicast routing. Subsequent **ip verify** commands on any interface do not disable IPv6 routing.

#### Example

This command enables uRPF strict mode on VLAN interface 100. When a default route is configured on the interface, all inbound packets are checked as valid.

```
switch(config)#interface vlan 100
switch(config-if-Vl100)#ipv6 verify unicast source reachable-via rx
allow-default
switch(config-if-Vl100)#show active
  interface Vlan100
    ipv6 verify unicast source reachable-via rx allow-default
switch(config-if-Vl100)#
```

---

### 12.2.4.32 ipv6 dhcp snooping

The **ipv6 dhcp snooping** command enables DHCP snooping globally on the switch.

The **no ipv6 dhcp snooping** and **default ipv6 dhcp snooping** commands disable global DHCP snooping by removing the ipv6 dhcp snooping command from running-config.

#### Command Mode

Global Configuration

#### Command Syntax

```
ipv6 dhcp snooping [remote-id option | vlan [$ | vlan-range]]
```

```
no ipv6 dhcp snooping [remote-id option | vlan [$ | vlan-range]]
```

```
default ipv6 dhcp snooping [remote-id option | vlan [$ | vlan-range]]
```

#### Parameters

- remote-id option configures the remote ID option.
- vlan enables IPv6 DHCP snooping for a specific VLAN. Numbers range from 1 to 4094.
- \$ end of range.
- vlan-range VLANs based on the snooping enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

#### Platform Compatibility

- DCS-7010
- DCS-7050
- DCS-7060
- DCS-7250
- DCS-7260
- DCS-7300

#### Examples

- The following configuration enables IPv6 DHCP snooping feature at the global level.

```
switch(config)#ipv6 dhcp snooping  
switch(config)#ipv6 dhcp snooping remote-id option  
switch(config)#ipv6 dhcp snooping vlan <vlan|vlan-range>
```

- The following command display IPv6 DHCP snooping state.

```
switch(config)#ipv6 dhcp snooping  
switch(config)# show ipv6 dhcp snooping  
DHCPv6 Snooping is enabled  
DHCPv6 Snooping is operational  
DHCPv6 Snooping is configured on following VLANs:  
  2789-2790  
DHCPv6 Snooping is operational on following VLANs:  
  2789  
Insertion of Option-37 is enabled
```

### 12.2.4.33 pim ipv6 sparse-mode

The **pim ipv6 sparse-mode** command enables PIM Sparse Mode (PIM-SM) and IGMP (router mode) on the configuration mode interface.

**Note:** PIM and multicast border router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The **no pim ipv6 sparse-mode** and **default pim ipv6 sparse-mode** commands restore the default PIM and IGMP (router mode) settings of **disabled** on the configuration mode interface by removing the **pim ipv6 sparse-mode** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel

Configuration Interface-VLAN Configuration

#### Command Syntax

```
pim ipv6 sparse-mode
no pim ipv6
no pim ipv6 sparse-mode
default pim ipv6
default pim ipv6 sparse-mode
```

#### Example

This command enables PIM ipv6 sparse mode on *VLAN 4* interface.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv6 sparse-mode
switch(config-if-Vl4)#
```

---

### 12.2.4.34 show ipv6 dhcp relay counters

The **show ipv6 dhcp relay counters** command displays the number of DHCP packets received, forwarded, or dropped on the switch and on all interfaces enabled as DHCP relay agents.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 dhcp relay counters
```

#### Example

This command displays the IP DHCP relay counter table.

```
switch>show ipv6 dhcp relay counters
```

Interface	Dhcp Packets			Last Cleared
	Rcvd	Fwdd	Drop	
All Req	376	376	0	4 days, 19:55:12 ago
All Resp	277	277	0	
Ethernet4	207	148	0	4 days, 19:54:24 ago

```
switch>
```

### 12.2.4.35 show ipv6 dhcp snooping counters

The **show ipv6 dhcp snooping counters** command displays counters that track the quantity of DHCP request and reply packets that the switch receives. Data is either presented for each VLAN or aggregated for all VLANs with counters for packets dropped.

#### Command Mode

EXEC

#### Command Syntax

show ipv6 dhcp snooping counters [COUNTER\_TYPE] **Parameters**

- COUNTER\_TYPE The type of counter that the command displays.
- <no parameter> command displays counters for each VLAN.
- debug command displays aggregate counters and drop cause counters.

#### Examples

- This command displays the number of DHCP packets sent and received on each VLAN.

```
switch#show ipv6 dhcp snooping counters
```

Vlan	Dhcpv6 Request Pkts			Dhcpv6 Reply Pkts			Last Cleared
	Rcvd	Fwdd	Drop	Rcvd	Fwdd	Drop	
2789	1	1	0	1	1	0	0:03:09 ago

- This command displays the number of DHCP packets sent on the switch.

```
switch#show ipv6 dhcp snooping counters debug
```

Counter	Snooping to Relay	Relay to Snooping
Received	1	1
Forwarded	1	1
Dropped - Invalid VlanId	0	0
Dropped - Parse error	0	0
Dropped - Invalid Dhcp Optype	0	0
Dropped - Invalid Remote-ID Option	0	0
Dropped - Snooping disabled	0	0

Last Cleared: 0:04:29 ago

---

### 12.2.4.36 show ipv6 dhcp snooping hardware

The **show ipv6 dhcp snooping hardware** command displays internal hardware DHCP snooping status on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 dhcp snooping hardware
```

#### Example

This command displays DHCP snooping hardware status.

```
switch#show ipv6 dhcp snooping hardware
DHCPv6 Snooping is enabled
DHCPv6 Snooping is enabled on following VLANs:
 2789
  Vlans enabled per Slice
    Slice: Linecard0-0
    2789
    Slice: Linecard0-1
    2789
    Slice: Linecard0-2
    2789
    Slice: Linecard0-3
    2789
```

### 12.2.4.37 show ipv6 dhcp snooping

The **show ipv6 dhcp snooping** command displays information about the DHCP snooping configuration.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 dhcp snooping
```

#### Related Commands

- [ipv6 dhcp snooping](#)
- [ipv6 dhcp relay always-on](#)
- [ipv6 dhcp relay destination](#)
- [ipv6 dhcp relay option link-layer address](#)
- [show ipv6 dhcp relay counters](#)
- [show ipv6 dhcp snooping counters](#)
- [show ipv6 dhcp snooping hardware](#)
- [clear ipv6 dhcp snooping counters](#)

#### Example

This command displays the switch's DHCP snooping configuration.

```
switch#show ipv6 dhcp snooping  
DHCPv6 Snooping is enabled  
DHCPv6 Snooping is operational  
DHCPv6 Snooping is configured on following VLANs:  
 2789-2790  
DHCPv6 Snooping is operational on following VLANs:  
 2789  
Insertion of Option-37 is enabled
```

---

### 12.2.4.38 show ipv6 hardware fib aggregate-address

The **show ipv6 hardware fib aggregate-address** command displays the IPv6 prefixes that are restricted from entry into the hardware routing table. The **ipv6 hardware fib aggregate-address** command configures IPv6 prefix restrictions.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 address fib aggregate-address [ADDRESS][RESTRICTION]
```

#### Parameters

- **ROUTE\_FILTER** filters by IPv6 address. Options include:
  - *<no parameter>* Displays all routes.
  - *ipv6\_addr* Command displays only specified address.
  - *ipv6\_prefix* Command displays addresses filtered by specified prefix (CIDR notation).
- **RESTRICTION** filters by route restriction.
  - *<no parameter>* displays routes restricted from the hardware routing table.
  - *software-forward* displays routes restricted from the hardware routing table.

#### Example

This command displays the routes that are restricted from the hardware routing table.

```
switch>show ipv6 hardware fib aggregate-address
Codes: S - Software Forwarded
S   fd77:4890:5313:aaed::/64
S   fd77:4890:5313:ffed::/64

switch>
```

### 12.2.4.39 show ipv6 interface

The **ipv6 interface** command displays the status of specified routed interfaces that are configured for IPv6.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 interface [INTERFACE_NAME][INFO_LEVEL]
```

#### Parameters

- **INTERFACE\_NAME** interfaces for which command displays status.
  - *<no parameter>* all routed interfaces.
  - **ethernet e\_num** Ethernet interface specified by *e\_num*.
  - **loopback l\_num** Loopback interface specified by *l\_num*.
  - **management m\_num** Management interface specified by *m\_num*.
  - **port-channel p\_num** Port-Channel Interface specified by *p\_num*.
  - **vlan v\_num** VLAN interface specified by *v\_num*.
  - **vxlan vx\_num** VXLAN interface specified by *vx\_num*.
- **INFO\_LEVEL** amount of information that is displayed. Options include:
  - *<no parameter>* command displays data block for each specified interface.
  - **brief** command displays table that summarizes IPv6 interface data.

#### Example

This command displays the status of *VLAN 903*.

```
switch>show ipv6 interface vlan 903
Vlan903 is up, line protocol is up (connected)
IPv6 is enabled, link-local is fe80::21c:73ff:fe01:21e/64
Global unicast address(es):
  fd7a:629f:52a4:fe10::3, subnet is fd7a:629f:52a4:fe10::/64
Joined group address(es):
  ff02::1
  ff02::1:ff01:21e
  ff02::1:ff00:3
  ff01::2
switch>
```

#### 12.2.4.40 show ipv6 nd ra internal state

The `ipv6 nd ra internal state` command displays the state of the IPv6 Router Advertisement (RA) daemon for the specified routable interface.

##### Command Mode

EXEC

##### Command Syntax

```
show ipv6 nd ra internal state [INTERFACE_NAME]
```

##### Parameters

- `INTERFACE_NAME` interfaces for which command displays status.
  - `<no parameter>` all routed interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.

##### Example

This command displays the IPv6 RA daemon for *VLAN interface 1243*.

```
switch>show ipv6 nd ra internal state vlan 1243
INTERFACE: Vlan3908
                ifindex : 0x00000021
                  mtu : 9212

raNotSentIntfNotReady : 0
                numRaSent : 219
                numRsRcvd : 0
                numRsSuppressed : 0
                numRsRspSent : 0
numRsDroppedInvalidHopLimit : 0
numPktDroppedUnexpectedType : 0
                initialized : 1
switch>
```

### 12.2.4.41 show ipv6 neighbors

The **show ipv6 neighbors** command displays the IPv6 neighbor discovery cache. The command provides filters to restrict the list to a specified IPv6 address or routable interface.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 neighbors [PORT][SOURCE][INFO_LEVEL]
```

#### Parameters

- **PORT** Filters by interface through which neighbor is accessed. Options include:
  - *<no parameter>* all routed interfaces.
  - *ethernet e\_num* Ethernet interface specified by *e\_num*.
  - *loopback l\_num* Loopback interface specified by *l\_num*.
  - *management m\_num* Management interface specified by *m\_num*.
  - *port-channel p\_num* Port-channel interface specified by *p\_num*.
  - *vlan v\_num* VLAN interface specified by *v\_num*.
  - *vxlan vx\_num* VXLAN interface specified by *vx\_num*.
- **SOURCE** Filters by neighbor IPv6 address. Options include:
  - *<no parameter>* all IPv6 neighbors.
  - *ipv6\_addr* IPv6 address of individual neighbor.
- **INFO\_LEVEL** amount of information that is displayed. Options include:
  - *<no parameter>* command displays the discovery cache for the specified interfaces.
  - *summary* command displays summary information only.

#### Example

This command displays the IPv6 neighbor discovery cache for IPv6 address *fe80::21c:73ff:fe01:5fe1*.

```
switch>show ipv6 neighbors fe80::21c:73ff:fe01:5fe1
IPv6 Address      Age  Hardware Addr      State Interface
fe80::21c:73ff:fe01:5fe1  0  001c.d147.8214  REACH Et12
fe80::21c:73ff:fe01:5fe1  0  001c.d147.8214  REACH Po999
fe80::21c:73ff:fe01:5fe1  0  001c.d147.8214  REACH V1102
fe80::21c:73ff:fe01:5fe1  0  001c.d147.8214  REACH V1103
fe80::21c:73ff:fe01:5fe1  0  001c.d147.8214  REACH V1205
fe80::21c:73ff:fe01:5fe1  0  001c.d147.8214  REACH V1207
fe80::21c:73ff:fe01:5fe1  0  001c.d147.8214  REACH V13901
fe80::21c:73ff:fe01:5fe1  0  001c.d147.8214  REACH V13902
fe80::21c:73ff:fe01:5fe1  0  001c.d147.8214  REACH V13903
fe80::21c:73ff:fe01:5fe1  0  001c.d147.8214  REACH V13904
fe80::21c:73ff:fe01:5fe1  0  001c.d147.8214  REACH V13905
fe80::21c:73ff:fe01:5fe1  0  001c.d147.8214  REACH V13996
```

---

#### 12.2.4.42 show ipv6 route age

The `show ipv6 route age` command displays the IPv6 route age to the specified IPv6 address or prefix.

##### Command Mode

EXEC

##### Command Syntax

```
show ipv6 route ADDRESS age
```

##### Parameters

- `ADDRESS` filters routes by IPv6 address or prefix.
  - `ipv6_address` routing table entries matching specified address (A:B:C:D:E:F:G:H).
  - `ipv6_prefix` routing table entries matching specified IPv6 prefix (A:B:C:D:E:F:G:H/PL).

##### Example

This command displays the route age for the specified prefix.

```
switch>show ipv6 route 2001::3:0/11 age
IPv6 Routing Table - 74 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP,
A -
Aggregate

C 2001::3:0/11 age 00:02:34
switch>
```

### 12.2.4.43 show ipv6 route host

The **show ipv6 route host** command displays all host routes in the IPv6 host forwarding table. Host routes are those whose destination prefix is the entire address (prefix = /128). Each displayed host route is labeled with its purpose:

- **F** static routes from the FIB.
  - **R** routes defined because the IP address is an interface address.
  - **A** routes to any neighboring host for which the switch has an ARP entry.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 route host
```

#### Example

This command displays all IPv6 host routes in the host forwarding table.

```
switch>show ipv6 route host
R - receive F - FIB, A - attached

F  ::1 to cpu
A  fee7:48a2:0c11:1900:400::1 on Vlan102
R  fee7:48a2:0c11:1900:400::2 to cpu
F  fee7:48a2:0c11:1a00::b via fe80::21c:73ff:fe0b:a80e on Vlan3902
R  fee7:48a2:0c11:1a00::17 to cpu
F  fee7:48a2:0c11:1a00::20 via fe80::21c:73ff:fe0b:33e on Vlan3913
F  fee7:48a2:0c11:1a00::22 via fe80::21c:73ff:fe01:5fe1 on Vlan3908
                               via fe80::21c:73ff:fe01:5fe1 on Vlan3902

switch>
```

#### 12.2.4.44 show ipv6 route interface

The **show ipv6 route interface** command displays routing table entries on a specified routed port.

##### Command Mode

EXEC

##### Command Syntax

```
show ipv6 route [ADDRESS] interface PORT_NAME [INFO_LEVEL]
```

##### Parameters

ADDRESS, when present, is always listed first. All other parameters can be placed in any order.

- ADDRESS filters routes by IPv6 address or prefix.
  - *<no parameter>* all routing table entries.
  - *ipv6\_address* routing table entries matching specified IPv6 address.
  - *ipv6\_prefix* routing table entries matching specified IPv6 prefix (CIDR notation).
- PORT\_NAME interfaces for which command displays status.
  - *ethernet e\_num* Ethernet interface specified by *e\_num*.
  - *loopback l\_num* Loopback interface specified by *l\_num*.
  - *management m\_num* Management interface specified by *m\_num*.
  - *port-channel p\_num* Port-Channel Interface specified by *p\_num*.
  - *vlan v\_num* VLAN interface specified by *v\_num*.
  - *vxlan vx\_num* VXLAN interface specified by *vx\_num*.
- INFO\_LEVEL Filters entries by next hop connection.
  - *<no parameter>* filters routes whose next hops are directly connected.
  - *detail* displays all routes.

##### Example

This command displays the IPv6 routes in *VLAN interface 661*.

```
switch>show ipv6 route interface ethernet 8
IPv6 Routing Table - 77 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP,
A -
Aggregate

O   fd7a:629f:63af:1232::/64 [150/11]
    via fe80::823c:73ff:fe00:3640, Ethernet8
O   fd7a:629f:63af:4118::/64 [150/11]
    via fe80::823c:73ff:fe00:3640, Ethernet8
O   fd7a:629f:63af:4119::/64 [150/11]
    via fe80::823c:73ff:fe00:3640, Ethernet8
O   fd7a:629f:63af:411a::/64 [150/11]
    via fe80::823c:73ff:fe00:3640, Ethernet8
O   fd7a:629f:63af:fe78::/64 [150/11]
    via fe80::823c:73ff:fe00:3640, Ethernet8
C   fd7a:629f:63af:fe88::/64 [0/1]
    via ::, Ethernet12
O   fd7a:629f:63af:fe8c::/64 [10/20]
    via fe80::21c:73ff:fe00:3640, Ethernet8
C   fe80:0:40::/64 [0/1]
    via ::, Ethernet8
```

### 12.2.4.45 show ipv6 route match tag

The **show ipv6 route match tag** command displays the route tag assigned to the specified IPv6 address or prefix. Route tags are added to static routes for use by route maps.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 route ADDRESS match tag
```

#### Parameters

- **ADDRESS** filters routes by IPv6 address or prefix.
  - *ipv6\_address* routing table entries matching specified address (A:B:C:D:E:F:G:H)
  - *ipv6\_prefix* routing table entries matching specified IPv6 prefix (A:B:C:D:E:F:G:H/PL).

#### Example

This command displays the route tag for the specified prefix.

```
switch>show ipv6 route 2001:0DB8::/64 match tag
IPv6 Routing Table - 74 entries
Codes: C - connected, S - static, K - kernel, O3 - OSPFv3, B - BGP, R -
RIP, A B
- BGP Aggregate, I L1 - IS-IS level 1, I L2 - IS-IS level 2, DH - DHCP,
NG -
NextHop Group Static Route, M - Martian, DP - Dynamic Policy Route, L -
VRF Leaked

C    2001:0DB8::/64 tag 0

switch>
```

---

#### 12.2.4.46 show ipv6 route summary

The `show ipv6 route summary` command displays the information about the IPv6 routing table.

##### Command Mode

EXEC

##### Command Syntax

```
show ipv6 route summary
```

##### Example

This command displays the route source and the corresponding number of routes in the IPv6 routing table.

```
switch>show ipv6 route summary
Route Source      Number Of Routes
-----
connected         2
static            0
ospf              5
bgp               7
isis              0
internal          1
attached          0
aggregate         2

Total Routes      17
switch>
```

### 12.2.4.47 show ipv6 route

The **show ipv6 route** command displays IPv6 routing table entries that are in the Forwarding Information Base (FIB), including static routes, routes to directly connected networks, and dynamically learned routes. Multiple equal cost paths to the same prefix are displayed contiguously as a block, with the destination prefix displayed only on the first line.

The **show running-config** command displays all configured routes.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 route [ADDRESS][ROUTE_TYPE][INFO_LEVEL]
```

#### Parameters

ADDRESS, when present, is always listed first. All other parameters can be placed in any order.

- ADDRESS filters routes by IPv6 address or prefix.
  - *<no parameter>* all routing table entries.
  - *ipv6\_address* routing table entries matching specified IPv6 address.
  - *ipv6\_prefix* routing table entries matching specified IPv6 prefix (CIDR notation).
- ROUTE\_TYPE filters routes by specified protocol or origin.
  - *<no parameter>* all routing table entries.
  - *aggregate* entries for BGP aggregate routes.
  - *bgp* entries added through BGP protocol.
  - *connected* entries for routes to networks directly connected to the switch.
  - *kernel* entries appearing in Linux kernel but not added by EOS software.
  - *isis* entries added through IS-IS protocol.
  - *ospf* entries added through OSPF protocol.
  - *static* entries added through CLI commands.
- INFO\_LEVEL Filters entries by next hop connection.
  - *<no parameter>* filters routes whose next hops are directly connected.
  - *detail* displays all routes.

#### Example

This command displays a route table entry for a specific IPv6 route.

```
switch>show ipv6 route fd7a:3418:52a4:fe18::/64
IPv6 Routing Table - 77 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP,
A -
Aggregate

O   fd7a:3418:52a4:fe18::/64 [10/20]
    via fe80::21c:73ff:fe00:1319, Vlan3601
    via fe80::21c:73ff:fe00:1319, Vlan3602
    via fe80::21c:73ff:fe00:1319, Vlan3608
    via fe80::21c:73ff:fe0f:6a80, Vlan3610
    via fe80::21c:73ff:fe00:1319, Vlan3611

switch>
```

---

### 12.2.4.48 show platform fap mroute ipv6

The `show platform fap mroute ipv6` command enables PIM Sparse Mode (PIM-SM) and IGMP (router mode) on the configuration mode interface.

#### Command Mode

EXEC

#### Command Syntax

```
show platform
```

#### Example

This command enables PIM sparse mode on VLAN 4 interface.

```
switch#show platform fap mroute ipv6
Jericho0 Multicast Routes:
-----
Location  GroupId Group          Source      IIF      McId      OIF
FLP/TT    FLP/TT  TT              FLP        FLP      FLP      FLP
-----
4096/2048 1/1      ff33::1:0:0:23/128 101:1::2/128  Vlan1357 21504    Vlan1044 (Et7/1)
Vlan1123 (Et9/1)
Vlan1223 (Et2/1)
Vlan1232 (Et3/1)
Vlan1337 (Et4/1)
Vlan1200 (Et8/1)
Vlan1226 (Et5/1)
Vlan1307 (Et6/1)
```

### 12.2.4.49 show rib route ipv6

The **show rib route ipv6** command displays a list of IPv6 Routing Information Base (RIB) routes.

#### Command Mode

EXEC

#### Command Syntax

```
show rib route ipv6 [vrf vrf_name] [PREFIX][ROUTE TYPE]
```

#### Parameters

- **vrf vrf\_name** displays RIB routes from the specified VRF.
- **PREFIX** displays routes filtered by the specified IPv6 information. Options include:
  - *ipv6\_address* displays RIB routes filtered by the specified IPv6 address.
  - *ipv6\_subnet\_mask* displays RIB routes filtered by the specified IPv6 address and subnet mask.
  - *ipv6\_prefix* displays RIB routes filtered by the specified IPv6 prefix.
- **ROUTE TYPE** displays routes filtered by the specified route type. Options include:
  - **bgp** displays RIB routes filtered by BGP.
  - **connected** displays RIB routes filtered by connected routes.
  - **dynamicPolicy** displays RIB routes filtered by dynamic policy routes.
  - **host** displays RIB routes filtered by host routes.
  - **isis** displays RIB routes filtered by ISIS routes.
  - **ospf** displays RIB routes filtered by OSPF routes.
  - **ospf3** displays RIB routes filtered by OSPF3 routes.
  - **reserved** displays RIB routes filtered by reserved routes.
  - **route-input** displays RIB routes filtered by route-input routes.
  - **static** displays RIB routes filtered by static routes.

#### Examples

- This command displays IPv6 RIB BGP routes.

```
switch#show rib route ipv6 bgp
VRF name: default, VRF ID: 0xfe, Protocol: bgp
Codes: C - Connected, S - Static, P - Route Input
       B - BGP, O - Ospf, O3 - Ospf3, I - Isis
       > - Best Route, * - Unresolved Nexthop
       L - Part of a recursive route resolution loop
B      2001:10:1::/64 [200/42]
       via 2001:10:1::100 [0/1]
       via Ethernet1, directly connected
>B     2001:10:100::/64 [200/200]
       via 2001:10:1::100 [0/1]
       via Ethernet1, directly connected
>B     2001:10:100:1::/64 [200/0]
       via 2001:10:1::100 [0/1]
       via Ethernet1, directly connected
>B     2001:10:100:2::/64 [200/42]
       via 2001:10:1::100 [0/1]
       via Ethernet1, directly connected
switch#
```

- This command displays IPv6 RIB connected routes.

```
switch#show rib route ipv6 connected
VRF name: default, VRF ID: 0xfe, Protocol: connected
Codes: C - Connected, S - Static, P - Route Input
```

```

B - BGP, O - Ospf, O3 - Ospf3, I - Isis
> - Best Route, * - Unresolved Nexthop
L - Part of a recursive route resolution loop
>C 2001:10:1::/64 [0/1]
    via 2001:10:1::102, Ethernet1
>C 2001:10:2::/64 [0/1]
    via 2001:10:2::102, Ethernet2
>C 2001:10:3::/64 [0/1]
    via 2001:10:3::102, Ethernet3
switch#

```

## 12.3 ACLs and Route Maps

The switch uses rule-based lists to control packet access to ports and to select routes for redistribution to routing domains defined by dynamic routing protocols. This section describes the construction of access control lists (ACLs), prefix lists, and route maps.

This section includes the following topics:

- [ACL, Service ACL, Route Map, Prefix List, and RACL Divergence Introduction](#)
- [Access Control Lists](#)
- [Service ACLs](#)
- [RACL Sharing on SVIs](#)
- [Route Maps](#)
- [Prefix Lists](#)
- [ACL, Route Map, and Prefix List Commands](#)

### 12.3.1 ACL, Service ACL, Route Map, Prefix List, and RACL Divergence Introduction

Access control lists (ACLs), Service ACLs, route maps, and prefix lists are all processed in order, beginning with the first rule and proceeding until a match is encountered.

An access control list (ACL) is a list of rules that control the inbound flow of packets into Ethernet interfaces, subinterfaces, and port channel interfaces or the switch control plane. The switch supports the implementation of a wide variety of filtering criteria including IP and MAC addresses, TCP/UDP ports with include/exclude options without compromising its performance or feature set. Filtering syntax is industry standard.

A Service ACL is an ACL applied by a control-plane process to control connections to, or packets processed by, the agent process.

A route map is a list of rules that control the redistribution of IP routes into a protocol domain on the basis of such criteria as route metrics, access control lists, next hop addresses, and route tags. Route maps can also alter parameters of routes as they are redistributed.

A prefix list is a list of rules that defines route redistribution access for a specified IP address space. Route maps often use prefix lists to filter routes.

The RACL divergence optimizes the usage of hardware resources occupied on each forwarding ASIC by installing ACLs only on the hardware components corresponding to the member interfaces belonging to the SVIs on which ACL is applied. Hence, saving the hardware resources used and enables RACLs to scale-up to a larger configuration. The show commands are used to display the interface mapping, TCAM entries, and TCAM utilization information.

### 12.3.2 Access Control Lists

These sections describe access control lists:

- [ACL Description](#)

- [ACL Configuration](#)
- [Applying ACLs](#)

### 12.3.2.1 ACL Description

This section describes ACL composition and function. The switch supports the following ACL types:

- IPv4
- IPv6
- Standard IPv4
- Standard IPv6
- MAC

#### 12.3.2.1.1 ACL Structure

An ACL is an ordered list of rules that defines access restrictions for the entities (the control plane, or an interface) to which it is applied. ACLs are also used by route maps to select routes for redistribution into specified routing domains.

ACL rules specify the data to which packet contents are compared when filtering data.

- The interface forwards packets that match all commands in a permit rule.
- The interface drops packets that match all commands in a deny rule.
- The interface drops packets that do not match at least one rule.

Upon its arrival at an interface, a packet's fields are compared to the first rule of the ACL applied to the interface. Packets that match the rule are forwarded (permit rule) or dropped (deny rule). Packets that do not match the rule are compared to the next rule in the list. This process continues until the packet either matches a rule or the rule list is exhausted. The interface drops packets not matching a rule.

The sequence number designates the rule's placement in the ACL.

#### 12.3.2.1.2 ACL Rules

ACL rules consist of a command list that is compared to inbound packet fields. When all of a rule's criteria match a packet's contents, the interface performs the action specified by the rule.

The set of available commands depend on the ACL type and the specified protocol within the rule. The following is a list of commands available for supported ACL types

##### IPv4 ACL Rule Parameters

All rules in IPv4 ACLs include the following criteria:

- **Protocol:** The packet's IP protocol. Valid rule inputs include:
  - Protocol name for a limited set of common protocols.
  - Assigned protocol number for all IP protocols.
- **Source Address:** The packet's source IPv4 address. Valid rule inputs include:
  - a subnet address (CIDR or address-mask). Discontiguous masks are supported.
  - a host IP address (dotted decimal notation).
  - *any* to denote that the rule matches all source addresses.
- **Destination Address:** The packet's destination IP address. Valid rule inputs include:
  - a subnet address (CIDR or address-mask). Discontiguous masks are supported.
  - a host IP address (dotted decimal notation).
  - *any* to denote that the rule matches all destination addresses.

All rules in IPv4 ACLs *may* include the following criteria:

- **Fragment:** Rules filter on the fragment bit.
- **Time-to-live:** Compares the TTL (time-to-live) value in the packet to a specified value. Valid in ACLs applied to the control plane. Validity in ACLs applied to the data plane varies by switch platform. Comparison options include:
  - Equal: Packets match if packet value equals statement value.
  - Greater than: Packets match if packet value is greater than statement value.
  - Less than: Packets match if packet value is less than statement value.
  - Not equal: Packets match if packet value does not equal statement value.

The availability of the following optional criteria depends on the specified protocol:

- **Source Ports / Destination Ports:** A rule filters on ports when the specified protocol supports IP address-port combinations. Rules provide one of these port filtering values:
  - **any** denotes that the rule matches all ports.
  - A list of ports that matches the packet port. Maximum list size is 10 ports.
  - Negative port list. The rule matches any port not in the list. Maximum list size is 10 ports.
  - Integer (lower bound): The rule matches any port with a number larger than the integer.
  - Integer (upper bound): The rule matches any port with a number smaller than the integer.
  - Range integers: The rule matches any port whose number is between the integers.
- **Flag bits:** Rules filter TCP packets on flag bits.
- **Message type:** Rules filter ICMP type or code.
- **Tracked:** Matches packets in existing ICMP, UDP, or TCP connections. Valid in ACLs applied to the control plane. Validity in ACLs applied to the data plane varies by switch platform.

### IPv6 ACL Rule Parameters

**Note:** When calculating the size of ACLs, be aware that Arista switches install four rules in every IPv6 ACL so that ICMPv6 neighbor discovery packets bypass the default drop rule.

All rules in IPv6 ACLs include the following criteria:

- **Protocol:** All rules filter on the packet's IP protocol field. Rule input options include:
  - Protocol name for a limited set of common protocols.
  - Assigned protocol number for all IP protocols.
- **Source Address:** The packet's source IPv6 address. Valid rule inputs include:
  - an IPv6 prefix (CIDR). Discontiguous masks are supported.
  - a host IP address (dotted decimal notation).
  - **any** to denote that the rule matches all addresses.
- **Destination Address:** The packet's destination IP address. Valid rule inputs include:
  - a subnet address (CIDR or address-mask). Discontiguous masks are supported.
  - a host IP address (dotted decimal notation).
  - **any** to denote that the rule matches all addresses.

All rules in IPv6 ACLs **may** include the following criteria:

- **Fragment:** Rules filter on the fragment bit.
- **HOP** Compares the packet's hop-limit value to a specified value. Comparison options include:
  - Equal: Packets match if packet value equals statement value.

The availability of the following optional criteria depends on the specified protocol:

- **Source Ports / Destination Ports:** A rule filters on ports when the specified protocol supports IP address-port combinations. Rules provide one of these port filtering values:
  - **any** denotes that the rule matches all ports.

- A list of ports that matches the packet port. Maximum list size is 10 ports.
- Negative port list. The rule matches any port not in the list. Maximum list size is 10 ports.
- Integer (lower bound): The rule matches any port with a number larger than the integer.
- Integer (upper bound): The rule matches any port with a number smaller than the integer.
- Range integers: The rule matches any port whose number is between the integers.
- **Flag bits:** Rules filter TCP packets on flag bits.
- **Message type:** Rules filter ICMP type or code.
- **Tracked:** Matches packets in existing ICMP, UDP, or TCP connections. Valid in ACLs applied to the control plane. Validity in ACLs applied to the data plane varies by switch platform.

### Standard IPv4 and IPv6 ACL Rule Parameters

**Note:** When calculating the size of ACLs, be aware that Arista switches install four rules in every IPv6 ACL so that ICMPv6 neighbor discovery packets bypass the default drop rule.

Standard ACLs filter only on the source address.

### MAC ACL Rule Parameters

MAC ACLs filter traffic on a packet's layer 2 header. Criteria that MAC ACLs use to filter packets include:

- **Source Address and Mask:** The packet's source MAC address. Valid rule inputs include:
  - MAC address range (address-mask in 3x4 dotted hexadecimal notation).
  - **any** to denote that the rule matches all source addresses.
- **Destination Address and Mask:** The packet's destination MAC address. Valid rule inputs include:
  - MAC address range (address-mask in 3x4 dotted hexadecimal notation).
  - **any** to denote that the rule matches all destination addresses.
- **Protocol:** The packet's protocol as specified by its EtherType field contents. Valid inputs include:
  - Protocol name for a limited set of common protocols.
  - Assigned protocol number for all protocols.

#### 12.3.2.1.3 Creating and Modifying Lists

The switch provides configuration modes for creating and modifying ACLs. The command that enters an ACL configuration mode specifies the name of the list that the mode modifies. The switch saves the list to the running configuration when the configuration mode is exited.

- ACLs are created and modified in ACL configuration mode.
- Standard ACLs are created and modified in Standard-ACL-configuration mode.
- MAC ACLs are created and modified in MAC-ACL-configuration mode.

Lists that are created in one mode cannot be modified in any other mode.

A sequence number designates the rule's placement in a list. New rules are inserted into a list according to their sequence numbers. A rule's sequence number can be referenced when deleting it from a list.

[ACL Configuration](#) describes procedures for configuring ACLs.

#### 12.3.2.1.4 Implementing Access Control Lists

An access control list (ACL) is implemented by assigning the list to an Ethernet interface or subinterface, to a port channel interface, or to the control plane. The switch assigns a default ACL to the control plane unless the configuration contains a valid control-plane ACL assignment statement.

---

Ethernet and port channel interfaces are not assigned an ACL by default. Standard ACLs are applied to interfaces in the same manner as other ACLs.

IPv4 and MAC ACLs are separately applied for inbound and outbound packets. An interface or subinterface can be assigned multiple ACLs, with a limit of one ACL per packet direction per ACL type. Egress ACLs are supported on a subset of all available switches. The control-plane does not support egress ACLs.

[Applying ACLs](#) describes procedures for applying ACLs to interfaces or the control plane.

#### 12.3.2.1.5 ACL Rule Tracking

ACL rule tracking determines the impact of ACL rules on the traffic accessing interfaces upon which they are applied. ACLs provide two tracking mechanisms:

- ACL logging: A syslog entry is logged when a packet matches specified ACL rules.
- ACL counters: ACL counters increment when a packet matches a rule in specified ACLs.

##### ACL Logging

ACL rules provide a **log** option that produces a log message when a packet matches the rule. ACL logging creates a syslog entry when a packet matches an ACL rule where logging is enabled. Packets that match a logging-enabled ACL rule are copied to the CPU by the hardware. These packets trigger the creation of a syslog entry. The information provided in the entry depends on the ACL type or the protocol specified by the ACL. Hardware rate limiting is applied to packets written to the CPU, avoiding potential DoS attacks. The rate of logging is also software limited to avoid the creation of syslog lists that are too large for practical use by human operators.

[ACL Rule Tracking Configuration](#) describes procedures for configuring and enabling ACL logging.

##### ACL Counters

An ACL counter is assigned to each ACL rule. The activity of the ACL counters for rules within a list depend on the list's counter state. When the list is in counting state, the ACL counter of a rule increments when the rule matches a packet. When the list is in non-counting state, the counter does not increment. A list's counter state applies to all rules in the ACL. The initial state for new ACLs is non-counting.

When an ACL changes from counting state to non-counting state, or when the ACL is no longer applied to any interfaces that increment counters, counters for all rules in the list maintain their values and do not reset. When the ACL returns to counting mode or is applied to an interface that increments counters, the counter operation resumes from its most recent value.

Counters never decrement and are reset only through CLI commands.

[ACL Rule Tracking Configuration](#) describes procedures for configuring and enabling ACL counters.

#### 12.3.2.1.6 AlgoMatch

AlgoMatch enables more flexible and scalable solutions for access control, telemetry, and enforcement networking whether the requirements are an on-premises or hybrid cloud model. By combining power-efficient and low-cost general purpose memory technology with advanced software algorithms, AlgoMatch provides greater scale, performance, and efficiency compared to common standard implementations with merchant silicon systems and TCAM.

In a typical TCAM solution, as additional lookup capacity is added, the power increases in-line with the scale. AlgoMatch utilizes power-efficient searching, only checking locations needed, and as a result lowers power draw by as much as half compared to TCAMs.

AlgoMatch utilizes a flexible and efficient packet matching algorithm with variable lookup sizes, rather than a fixed size lookup with TCAM. This enables full flow matching against source and destination

criteria, or parts of the mask, and allows for multiple actions to be performed on a single packet or flow, with user defined filters for packet classification and custom actions in a single pass. A policy with multiple actions is not typically possible with a TCAM solution without using recirculation of chained lookups. However, with AlgoMatch, multiple actions can be applied in a single pass (For example, access control, telemetry, and counters) without losing either features or performance.

### AlgoMatch Benefits

- Improved power efficiency: 50 percentage lower.
- Efficient Layer 4 rules: allows enhanced security policy.
- Counters: provide better visibility and flow filtering.

**Note:** AlgoMatch configuration and show commands are no different from security ACLs. For more information on ACL commands refer [ACL, Route Map, and Prefix List Commands](#).

### 12.3.2.2 ACL Configuration

Access control lists are created and modified in an ACL-configuration mode. A list can be edited only in the mode where it was created. The switch provides five configuration modes for creating and modifying access control lists:

- **ACL configuration mode** for IPv4 access control lists.
- **IPv6-ACL configuration mode** for IPv6 access control lists.
- **Std-ACL configuration mode** for Standard IPv4 access control lists.
- **Std-IPv6-ACL configuration mode** for Standard IPv6 access control lists.
- **MAC-ACL configuration mode** for MAC access control lists.

These sections describe the creation and modification of ACLs:

- [Managing ACLs](#)
- [Modifying an ACL](#)
- [ACL Rule Tracking Configuration](#)
- [Displaying ACLs](#)
- [Configuring Per-Port Per-VLAN QoS](#)
- [Displaying Per-Port Per-VLAN QoS](#)
- [On DCS-7010, DCS-7050X, DCS7250X, DCS-7300X series switches](#)
- [On DCS-7280\(E/R\), DCS7500\(E/R\) series switches](#)
- [Configuring Mirror Access Control Lists](#)

#### 12.3.2.2.1 Managing ACLs

##### Creating and Opening a List

To create an ACL, enter one of the following commands, followed by the name of the list:

- [ip access-list](#) for IPv4 ACLs.
- [ipv6 access-list](#) for IPv6 ACLs.
- [ip access-list standard](#) for standard IPv4 ACLs.
- [ipv6 access-list standard](#) for standard IPv6 ACLs.
- [mac access-list](#) for MAC ACLs.

The switch enters the appropriate ACL configuration mode for the list. If the command is followed by the name of an existing ACL, subsequent commands edit that list (see [Modifying an ACL](#) for additional information).

---

## Examples

- This command places the switch in ACL configuration mode to create an ACL named test1.

```
switch(config)#ip access-list test1
switch(config-acl-test1)#
```

- This command places the switch in Standard-ACL-configuration mode to create a Standard ACL named stest1.

```
switch(config)#ip access-list standard stest1
switch(config-std-acl-stest1)#
```

- This command places the switch in MAC-ACL configuration mode to create an MAC ACL named mtest1.

```
switch(config)#mac access-list mtest1
switch(config-mac-acl-mtest1)#
```

## Saving List Modifications

ACL configuration modes are group-change modes. Changes made in a group-change mode are saved by exiting the mode.

**Note:** After exiting ACL mode, the running-config file must be saved to the startup configuration file to preserve an ACL after a system restart.

## Example

- The second example in [Adding a Rule](#) results in this edited ACL:

```
switch(config-acl-test1)#show
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip 10.30.10.0/24 host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
```

Because the changes were not yet saved, the ACL remains empty, as shown by [show ip access-lists](#).

```
switch(config-acl-test1)#show ip access-lists test1
switch(config-acl-test1)#
```

To save all current changes to the ACL and exit ACL configuration mode, type **exit**.

```
switch(config-acl-test1)#exit
switch(config)#show ip access-lists test1
IP Access List test1
  10 permit ip 10.10.10.0/24 any
  20 permit ip 10.30.10.0/24 host 10.20.10.1
  30 deny ip host 10.10.10.1 host 10.20.10.1
  40 permit ip any any
```

## Discarding List Changes

The **abort** command exits ACL configuration mode without saving pending changes.

## Example

- Example 2 in [Adding a Rule](#) results in this edited ACL:

```
switch(config-acl-test1)#show
IP Access List test1
 10 permit ip 10.10.10.0/24 any
 20 permit ip 10.30.10.0/24 host 10.20.10.1
 30 deny ip host 10.10.10.1 host 10.20.10.1
 40 permit ip any any
```

To discard the changes, enter **abort**. If the ACL existed before entering ACL-configuration mode, **abort** restores the version that existed before entering ACL-configuration mode. Otherwise, [show ip access-lists](#) shows the ACL was not created.

```
switch(config-acl-test1)#abort
switch(config)#
```

### 12.3.2.2.2 Modifying an ACL

An existing ACL, including those currently applied to interfaces, can be modified by entering the appropriate configuration mode for the ACL as described in [Creating and Opening a List](#). By default, while an ACL is being modified all traffic is blocked on any interface to which the ACL has been applied.

#### Permit All Traffic During ACL Update

Because blocking ports during ACL modifications can result in packet loss and can interfere with features such as routing and dynamic NAT, 7050X, 7060X, 7150, 7250X, 7280, 7280R, 7300X, 7320X, and 7500 series switches can be configured instead to permit all traffic on Ethernet and VLAN interfaces while ACLs applied to those interfaces are being modified. This is done with the [hardware access-list update default-result permit](#) command.

These commands add deny rules to the appropriate ACL:

- [deny \(IPv4 ACL\)](#) adds a deny rule to an IPv4 ACL.
- [deny \(IPv6 ACL\)](#) adds a deny rule to an IPv6 ACL.
- [deny \(Standard IPv4 ACL\)](#) adds a deny rule to an IPv4 standard ACL.
- [deny \(Standard IPv6 ACL\)](#) adds a deny rule to an IPv6 standard ACL.
- [deny \(MAC ACL\)](#) adds a deny rule to a MAC ACL.

These commands add permit rules to the appropriate ACL:

- [permit \(IPv4 ACL\)](#) adds a permit rule to an IPv4 ACL.
- [permit \(IPv6 ACL\)](#) adds a permit rule to an IPv6 ACL.
- [permit \(Standard IPv4 ACL\)](#) adds a permit rule to an IPv4 standard ACL.
- [permit \(Standard IPv6 ACL\)](#) adds a permit rule to an IPv6 standard ACL.
- [permit \(MAC ACL\)](#) adds a permit rule to a MAC ACL.

#### Adding a Rule

To append a rule to the end of a list, enter the rule without a sequence number while in ACL configuration mode for the list. The new rule's sequence number is derived by adding 10 to the last rule's sequence number.

---

## Examples

- This command configures the switch to permit all traffic during ACL modifications on interfaces to which the ACL has been applied. The rules in modified ACLs are applied after exiting ACL configuration mode, and after the ACL rules have been populated in hardware.

```
switch(config)#hardware access-list update default-result permit
```

- These commands enter the first three rules into a new ACL.

```
switch(config-acl-test1)#permit ip 10.10.10.0/24 any  
switch(config-acl-test1)#permit ip any host 10.20.10.1  
switch(config-acl-test1)#deny ip host 10.10.10.1 host 10.20.10.1
```

To view the edited list, type **show**.

```
switch(config-acl-test1)#show  
IP Access List test1  
    10 permit ip 10.10.10.0/24 any  
    20 permit ip any host 10.20.10.1  
    30 deny ip host 10.10.10.1 host 10.20.10.1
```

- This command appends a rule to the ACL. The new rule's sequence number is 40.

```
switch(config-acl-test1)#permit ip any any  
switch(config-acl-test1)#show  
IP Access List test1  
    10 permit ip 10.10.10.0/24 any  
    20 permit ip any host 10.20.10.1  
    30 deny ip host 10.10.10.1 host 10.20.10.1  
    40 permit ip any any
```

## Inserting a Rule

To insert a rule into a ACL, enter the rule with a sequence number between the existing rules' numbers.

## Example

This command inserts a rule between the first two rules by assigning it the sequence number 15.

```
Switch(config-acl-test1)#15 permit ip 10.30.10.0/24 host 10.20.10.1  
Switch(config-acl-test1)#show  
IP Access List test1  
    10 permit ip 10.10.10.0/24 any  
    15 permit ip 10.30.10.0/24 host 10.20.10.1  
    20 permit ip any host 10.20.10.1  
    30 deny ip host 10.10.10.1 host 10.20.10.1  
    40 permit ip any any
```

## Deleting a Rule

To remove a rule from the current ACL, perform one of these commands:

- Enter **no**, followed by the sequence number of the rule to be deleted.
- Enter **no**, followed by the rule to be deleted.
- Enter **default**, followed by the rule to be deleted.

## Examples

- These equivalent commands remove rule 20 from the list.

```
switch(config-acl-test1)#no 20
switch(config-acl-test1)#no permit ip any host 10.20.10.1
switch(config-acl-test1)#default permit ip any host 10.20.10.1
```

- This ACL results from entering one of the preceding commands.

```
switch(config-acl-test1)#show
ip access list test1
    10 permit ip 10.10.10.0/24 any
    15 permit ip 10.30.10.0/24 host 10.20.10.1
    30 deny ip host 10.10.10.1 host 10.20.10.1
    40 permit ip any any
```

## Resequencing Rule Numbers

Sequence numbers determine the order of the rules in an access control list. After a list editing session where existing rules are deleted and new rules are inserted between existing rules, the sequence number distribution may not be uniform. Resequencing rule numbers changes the sequence number of rules to provide a constant difference between adjacent rules. The [resequence \(ACLs\)](#) command adjusts the sequence numbers of ACL rules.

### Example

The **resequence** command renumbers rules in the test1 ACL. The sequence number of the first rule is 100; subsequent rules numbers are incremented by 20.

```
switch(config-acl-test1)#show
IP Access List test1
    10 permit ip 10.10.10.0/24 any
    25 permit ip any host 10.20.10.1
    30 deny ip host 10.10.10.1 host 10.20.10.1
    50 permit ip any any
    90 remark end of list
switch(config-acl-test1)#resequence 100 20
switch(config-acl-test1)#show
IP Access List test1
    100 permit ip 10.10.10.0/24 any
    120 permit ip any host 10.20.10.1
    140 deny ip host 10.10.10.1 host 10.20.10.1
    160 permit ip any any
    180 remark end of list
```

### 12.3.2.2.3 ACL Rule Tracking Configuration

ACL rules provide a **log** option that produces a syslog message about the packets matching packet. ACL logging creates a syslog entry when a packet matches an ACL rule with logging enabled.

This feature is currently available on Arad switches and on 7100 series switches. On 7100 series switches, matches are logged only on ingress, not on egress.

### Example

- This command creates an ACL rule with logging enabled.

```
switch(config-acl-test1)#15 permit ip 10.30.10.0/24 host 10.20.10.1 log
switch(config-acl-test1)#
```

---

The format of the generated syslog message depends on the ACL type and the specified protocol:

- Messages generated by a TCP or UDP packet matching an IP ACL use this format:

**IPACCESS: list** *acl intf filter protocol src-ip(src\_port) -> dst-ip(dst\_port)*

- Messages generated by ICMP packets matching an IP ACL use this format:

**IPACCESS: list** *acl intf filter icmp src-ip(src-port) -> dst-ip(dst-port) type= n code= m*

- Messages generated by all other IP packets matching an IP ACL use this format:

**IPACCESS: list** *acl intf filter protocol src-ip -> dst-ip*

- Messages generated by packets matching a MAC ACL use this format:

**MACACCESS: list** *acl intf filter vlan ether src\_mac -> dst\_mac*

- Messages generated by a TCP or UDP packet matching a MAC ACL use this format:

**MACACCESS: list** *acl intf filter vlan ether ip-prt src-mac src-ip : src-prt -> dst-mac dst-ip : dst-prt*

- Messages generated by any other IP packet matching a MAC ACL use this format:

**MACACCESS: list** *acl intf filter vlan ether src\_mac src\_ip -> dst\_mac dst\_ip*

Variables in the syslog messages display the following values:

- *acl* Name of ACL.
- *intf* Name of interface that received the packet.
- *filter* Action triggered by ACL (**denied** or **permitted**).
- *protocol* IP protocol specified by packet.
- *vlan* Number of VLAN receiving packet.
- *ether* EtherType protocol specified by packet.
- *src-ip* and *dst-ip* source and destination IP addresses.
- *src-prt* and *dst-prt* source and destination ports.
- *src-mac* and *dst-mac* source and destination MAC addresses.

ACLs provide a command that configures its counter state (counting or non-counting). The counter state applies to all rules in the ACL. The initial state for new ACLs is non-counting.

The [counters per-entry \(ACL configuration modes\)](#) command places the ACL in counting mode.

- This command places the configuration mode ACL in counting mode.

```
switch(config-acl-test1)#counters per-entry
switch(config-acl-test1)#exit
switch(config-acl-test1)#show ip access-list test1
IP Access List test1
    counters per-entry
    10 permit ip 10.10.10.0/24 any
    20 permit ip any host 10.20.10.1
    30 deny ip host 10.10.10.1 host 10.20.10.1
    40 permit ip any any
    50 remark end of list
```

The [clear ip access-lists counters](#) and [clear ipv6 access-lists counters](#) commands set the IP access list counters to zero for the specified IP access list.

- This command clears the ACL counter for the test1 ACL.

```
switch(config)#clear ip access-lists counters test1
switch(config)#
```

### 12.3.2.2.4 Displaying ACLs

ACLs can be displayed by a **show running-config** command. The **show ip access-lists** also displays ACL rosters and contents, as specified by command parameters.

When editing an ACL, the **show (ACL configuration modes)** command displays the current or pending list, as specified by command parameters.

#### Displaying a List of ACLs

To display the roster of ACLs on the switch, enter **show ip access-lists** with the **summary** option.

#### Example

- This command lists the available access control lists.

```
switch(config)#show ip access-list summary
IPV4 ACL default-control-plane-acl
    Total rules configured: 12
    Configured on: control-plane
    Active on      : control-plane

IPV4 ACL list2
    Total rules configured: 3

IPV4 ACL test1
    Total rules configured: 6

IPV4 ACL test_1
    Total rules configured: 1

IPV4 ACL test_3
    Total rules configured: 0
switch(config)#
```

#### Displaying Contents of an ACL

These commands display ACL contents.

- show ip access-lists**
- show ipv6 access-lists**
- show mac access-lists**

Each command can display the contents of one ACL or of all ACLs of the type specified by the command:

- To display the contents of one ACL, enter **show ip access-lists** followed by the name of the ACL.
- To display the contents of all ACLs on the switch, enter the command without any options.

ACLs that are in counting mode display the number of inbound packets each rule in the list matched and the elapsed time since the last match.

#### Examples

- This command displays the rules in the default-control-plane-acl ACL.

```
switch#show ip access-lists default-control-plane-acl
IP Access List default-control-plane-acl [readonly]
    counters per-entry
    10 permit icmp any any
    20 permit ip any any tracked [match 1725, 0:00:00 ago]
    30 permit ospf any any
```

```

ago] 40 permit tcp any any eq ssh telnet www snmp bgp https
      50 permit udp any any eq bootps bootpc snmp [match 993, 0:00:29
      60 permit tcp any any eq mlag ttl eq 255
      70 permit udp any any eq mlag ttl eq 255
      80 permit vrrp any any
      90 permit ahp any any
      100 permit pim any any
      110 permit igmp any any [match 1316, 0:00:23 ago]
      120 permit tcp any any range 5900 5910

```

- This command displays the rules in all ACLs on the switch.

```

switch#show ip access-lists
IP Access List default-control-plane-acl [readonly]
  counters per-entry
  10 permit icmp any any
  20 permit ip any any tracked [match 1371, 0:00:00 ago]
  30 permit ospf any any
  40 permit tcp any any eq ssh telnet www snmp bgp https
  50 permit udp any any eq bootps bootpc snmp
  60 permit tcp any any eq mlag ttl eq 255
  70 permit udp any any eq mlag ttl eq 255
  80 permit vrrp any any
  90 permit ahp any any
  100 permit pim any any
  110 permit igmp any any [match 1316, 0:00:23 ago]
  120 permit tcp any any range 5900 5910

IP Access List list2
  10 permit ip 10.10.10.0/24 any
  20 permit ip 10.30.10.0/24 host 10.20.10.1
  30 permit ip any host 10.20.10.1
  40 deny ip host 10.10.10.1 host 10.20.10.1
  50 permit ip any any

IP Access List test1
Switch(config)#

```

## Displaying ACL Modifications

While editing an ACL in ACL-configuration mode, the [show \(ACL configuration modes\)](#) command provides options for displaying ACL contents.

- To display the list, as modified in ACL configuration mode, enter **show** or **show pending**.
- To display the list, as stored in *running-config*, enter **show active**.
- To display differences between the pending list and the stored list, enter **show diff**.

## Examples

The examples in this section assume these ACL commands were previously entered.

These commands are stored in the configuration:

```

10 permit ip 10.10.10.0/24 any
20 permit ip any host 10.21.10.1
30 deny ip host 10.10.10.1 host 10.20.10.1
40 permit ip any any
50 remark end of list

```

The current edit session removed this command. This change is not yet stored to running-config:

```
20 permit ip any host 10.21.10.1
```

The current edit session added these commands ACL. They are not yet stored to running-config:

```
20 permit ip 10.10.0.0/16 any
25 permit tcp 10.10.20.0/24 any
45 deny pim 239.24.124.0/24 10.5.8.4/30
```

This command displays the pending ACL, as modified in ACL configuration mode.

```
switch(config-acl-test_1)#show pending
IP Access List test_1
 10 permit ip 10.10.10.0/24 any
 20 permit ip 10.10.0.0/16 any
 25 permit tcp 10.10.20.0/24 any
 30 deny ip host 10.10.10.1 host 10.20.10.1
 40 permit ip any any
 45 deny pim 239.24.124.0/24 10.5.8.4/30
 50 remark end of list
```

This command displays the ACL, as stored in the configuration.

```
switch(config-acl-test_1)#show active
IP Access List test_1
 10 permit ip 10.10.10.0/24 any
 20 permit ip any host 10.21.10.1
 30 deny ip host 10.10.10.1 host 10.20.10.1
 40 permit ip any any
 50 remark end of list
```

This command displays the difference between the saved and modified ACLs.

- Rules added to the pending list are denoted with a plus sign (+).
- Rules removed from the saved list are denoted with a minus sign (-).

```
switch(config-acl-test_1)#show diff
---
+++
@@ -1,7 +1,9 @@
 IP Access List test_1

```

### 12.3.2.2.5 Configuring Per-Port Per-VLAN QoS

To configure per-port per-VLAN QoS, first, configure the ACL policing for QoS, and then apply the policy-map on a single Ethernet or port-channel interfaces on a per-port per-VLAN basis. The per port per VLAN QoS allows a class-map to match traffic for a single VLAN or for a range of VLANs separated by commas. Per-port per-VLAN works with QoS-based class-maps only.

#### Platform Compatibility

- DCS-7010T

- DCS-7050X
- DCS-7250X
- DCS-7250X
- DCS-7280E, DCS-7280R
- DCS-7280E, DCS-7280R
- DCS-7300X
- DCS-7320X
- DCS-7500E, DCS-7500R

To configure per-port per-VLAN QoS on DCS-7280(E/R) and DCS-7500(E/R), change the TCAM profile to QoS as shown below.

1. Change the TCAM profile to QoS.

```
switch#config
switch(config)#
switch(config)#hardware tcam profile qos
```

2. Create an ACL and then match the traffic packets based on the VLAN value and the VLAN mask configured in the ACL.

```
switch(config)#ip access-list acl1
switch(config-acl-acl1)#permit vlan 100 0xfff ip any any
switch(config-acl-acl1)#exit
```

3. Similarly, create a class-map and then match the traffic packets based on the range of VLAN values configured in the class-map.

```
switch(config)#class-map match-any class1
switch(config-cmap-qos-class1)#match vlan 20-40, 1000-1250, 2000
switch(config-cmap-qos-class1)#exit
```

### 12.3.2.2.6 Displaying Per-Port Per-VLAN QoS

The following show commands display the status, traffic hit counts, tcam profile information, and policy-maps configured on an interface.

The **show policy-map** command displays the policy-map information of the configured policy-map.

#### Example

```
switch#show policy-map policy1
Service-policy policy1
Class-map: class1 (match-any)
Match: ip access-group name acl1
Police cir 512000 bps bc 96000 bytes
Class-map: class-default (match-any)
```

The **show policy-map interface** command displays the policy-map configured on an interface.

#### Example

```
switch#show policy-map interface ethernet 1
Service-policy input: p1
Hardware programming status: Successful
Class-map: c2001 (match-any)
Match: vlan 2001 0xfff
set dscp 4
Class-map: c2002 (match-any)
Match: vlan 2002 0xfff
set dscp 8
```

```
Class-map: c2003 (match-any)
Match: vlan 2003 0xffff
set dscp 12
```

### 12.3.2.2.7 On DCS-7010, DCS-7050X, DCS7250X, DCS-7300X series switches

The **show policy-map policy-name counters** command displays the policy-map traffic match count for the policy-map configured.

#### Example

```
switch#show policy-map policy1 counters
Service-policy input: policy1
Hardware programming status: Successful
Class-map: class1 (match-any)
  Match: vlan 20-40,1000-1250
    police rate 100 mbps burst-size 100 kbytes
      Interface: Ethernet16/1
        Conformed 28621 packets, 7098008 bytes ----- packet match count

Class-map: class-default (match-any)
  Matched Packets: 19 ----- packet match count
```

The **show platform trident tcam** command displays the TCAM entries configured for each TCAM group including policy-maps and corresponding hits.

#### Examples

- ```
switch#show platform trident tcam
=== TCAM summary for switch Linecard0/0 ===
TCAM group 9 uses 42 entries and can use up to 1238 more.
  Mlag control traffic uses 4 entries.
  CVX traffic uses 6 entries.
  L3 Control Priority uses 23 entries.
  IGMP Snooping Flooding uses 8 entries.
  L4 MicroBfd traffic uses 1 entries.
TCAM group 13 uses 99 entries and can use up to 1181 more.
  Dot1x MAB traffic uses 1 entries.
  ACL Management uses 10 entries.
  Vxlan Traffic uses 24 entries.
  L2 Control Priority uses 11 entries.
  Storm Control Management uses 2 entries.
  ARP Inspection uses 2 entries.
  L3 Routing uses 49 entries.
TCAM group 14 uses 12 entries and can use up to 2548 more.
  Policy QOS uses 12 entries.
TCAM group 16 uses 59 entries and can use up to 1221 more.
  PDP Reserved uses 1 entries.
  PDP uses 58 entries.
TCAM group 67 uses 12 entries and can use up to 500 more.
  PDP Class Reservation uses 12 entries.
```
- ```
switch#show platform trident tcam detail
=== TCAM detail for switch Linecard0/0 ===
TCAM group 9 uses 42 entries and can use up to 1238 more.
  Mlag control traffic uses 4 entries.
    589826          0 hits - MLAG - SrcPort UDP Entry
    589827          0 hits - MLAG - DstPort UDP Entry
    589828          0 hits - MLAG - SrcPort TCP Entry
    589829          0 hits - MLAG - DstPort TCP Entry
  CVX traffic reserves 6 entries (0 used).
  L3 Control Priority uses 23 entries.

```

### 12.3.2.2.8 On DCS-7280(E/R), DCS7500(E/R) series switches

The **show platform fap [fapName] acl tcam hw** command displays the TCAM entries configured for each TCAM bank including policy-maps and corresponding traffic match.

#### Example

```

switch#show platform fap Arad1 acl tcam hw
=====
Arad1 Bank 0 Type: dbPdpIp, dbPdpIp6, dbPdpMpls, dbPdpNonIp, dbPdpTunnel

### 12.3.2.2.9 Configuring Mirror Access Control Lists

Access Control Lists (ACLs) are configured to permit or deny traffic between source and destination ports on Strata-based platforms. Mirror ACLs are used in mirroring traffic by matching VLAN ID of the configured ACLs. Mirror ACLs are applied for IPv4, IPv6, and MAC ACLs.

 **Note:** Mirror ACLs work in receiving direction only.

#### Platform Compatibility

Mirror ACLs are supported on the following platforms:

- 7050X
- 7050X2
- 7050X3
- 7060X

- 7060X2
- 7060X3
- 7260X
- 7260X3

### Examples

- These commands configure ACL to permit VLAN traffic between any source and destination host.

```
switch(config)#ip access-list acl1
switch(config-acl-acl1)#permit vlan 1234 0x0 ip any any
```

- These commands configure monitor session sess1 with Ethernet 1 as source port and Ethernet 2 as destination port for an ingress ip acl\_1.

```
switch(config)#monitor session sess1 source ethernet 1 rx ip access-
group acl1
switch(config)#monitor session sess1 destination ethernet 2
```

### 12.3.2.3 Applying ACLs

Access control lists become active when they are assigned to an interface or subinterface or to the control plane. This section describes the process of adding and removing ACL interface assignments.

#### Applying an ACL to an Interface

The switch must be in interface configuration mode to assign an ACL to an interface or subinterface.

- The [ip access-group](#) command applies the specified IP or standard IP ACL to the configuration mode interface or subinterface.
- The [mac access-group](#) command applies the specified MAC ACL to the configuration mode interface.

IPv4, IPv6, and MAC ACLs are separately applied for inbound and outbound packets. An interface or subinterface can be assigned with multiple ACLs, with a limit of one ACL per packet direction per ACL type. Egress ACLs are supported on a subset of all available switches. IPv6 egress ACLs have limited availability, and IPv6 egress ACLs applied to routed interfaces or subinterfaces across the same chip on the DCS-7500E and the DCS-7280E series can be shared. In addition to that, the DSCP value can match on IPv6 egress ACLs. This result in a more efficient utilization of system resources, and is particularly useful for environments with few, potentially large, IPv6 egress ACLs applied across multiple routed interfaces.

### Examples

- These commands assign *test1* ACL to Ethernet interface 3, then verify the assignment.

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#ip access-group test1 in
switch(config-if-Et3)#show running-config interfaces ethernet 3
interface Ethernet3
    ip access-group test1 in
switch(config-if-Et3)#
```

- This command enables shared ACLs.

```
switch(config)#hardware access-list resource sharing vlan ipv6 out
switch(config)#
```

- This command disables shared ACLs.

```
switch(config)#no hardware access-list resource sharing vlan ipv6 out
switch(config)#
```

- These commands apply an IPv4 ACL named “test\_ACL” to ingress traffic on Ethernet subinterface 5.1.

```
switch(config)#interface ethernet 5.1
switch(config-if-Et5.1)#ipv4 access-group test_ACL in
switch(config-if-Et5.1)#
```

### Removing an ACL from an Interface

The **no ip access-group** command removes an IP ACL assignment statement from **running-config** for the configuration mode interface. After an ACL is removed, the interface is not associated with an IP ACL.

The **no mac ip access-group** command removes a MAC ACL assignment statement from **running-config** for the configuration mode interface. After a MAC ACL is removed, the interface is not associated with an MAC ACL.

To remove an ACL from the control plane, enter the **no ip access-group** command in control plane configuration mode. Removing the control plane ACL command from **running-config** reinstates **default-control-plane-acl** as the control plane ACL.

### Examples

- These commands remove the assigned IPv4 ACL from *Ethernet interface 3*.

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#no ip access-group test in
switch(config-if-Et3)#
```

- These commands place the switch in control plane configuration mode and remove the ACL assignment from **running-config**, restoring **default-control-plane-acl** as the Control Plane ACL.

```
switch(config)#control-plane
switch(config-cp)#no ip access-group test_cp in
switch(config-cp)#
```

## 12.3.3 Service ACLs

These sections describe Service ACLs:

- [Service ACL Description](#)
- [Configuring Service ACLs and Displaying Status and Counters](#)

### 12.3.3.1 Service ACL Description

Service ACL enforcement is a feature added to a control plane service (the SSH server, the SNMP server, routing protocols, etc) that allows the switch administrator to restrict the processing of packets and connections by the control plane processes that implement that service. The control plane program run by the control plane process checks already received packets and connections against a user configurable access control list (ACL), a Service ACL. The Service ACL contains permit and deny rules matching any of the source address, destination address, and TCP or UDP ports of received packets or connections. After receiving a packet or connection, the control plane process evaluates the packet or connection against the rules of the Service ACL configured for the control plane process, and

if the received packet or connection matches a deny rule the control plane process drops or closes it without further processing.

Control Plane Process Enforced Access Control enables the system administrator to restrict which systems on the network can access the services provided by the switch. Each service has its own access control list, giving the system administrator fine grained control over access to the switch's control plane services. The CLI for this uses the familiar pattern of access control lists assigned for a specific purpose, in this case for each control plane service.

### 12.3.3.2 Configuring Service ACLs and Displaying Status and Counters

#### 12.3.3.2.1 SSH Server

To apply the SSH server Service ACLs for IPv4 and IPv6 traffic, use the [ip access-group \(Service ACLs\)](#) and [ipv6 access-group \(Service ACLs\)](#) commands in mgt-ssh configuration mode as shown below.

```
(config)# management ssh
(config-mgmt-ssh)# ip access-group <acl_name> [vrf <vrf_name>] in
(config-mgmt-ssh)# ipv6 access-group <acl_name> [vrf <vrf_name>] in
```

In EOS 4.19.0, all VRFs are required to use the same SSH server Service ACL. The Service ACL assigned without the **vrf** keyword is applied to all VRFs where the SSH server is enabled.

To display the status and counters of the SSH server Service ACLs, use the following commands.

```
(switch)>show management ssh ip access-list
(switch)>show management ssh ipv6 access-list
```

#### 12.3.3.2.2 SNMP Server

To apply the SNMP server Service ACLs to restrict which hosts can access SNMP services on the switch, use the [snmp-server community](#) command as shown below.

```
(config)# snmp-server community <community-name> [view <viewname>] [ro |
rw]
<acl_name>
(config)# snmp-server community <community-name> [view <viewname>] [ro |
rw] ipv6
<ipv6_acl_name>
```

#### 12.3.3.2.3 EAPI

To apply Service ACLs to the EOS application programming interface (EAPI) server, use the [ip access-group \(Service ACLs\)](#) and [ipv6 access-group \(Service ACLs\)](#) commands as shown below.

```
(config)#management api http-commands
(config-mgmt-api-http-cmds)#vrf <vrf_name>
(config-mgmt-api-http-cmds-vrf-<vrf>)#ip access-group <acl_name>
(config-mgmt-api-http-cmds-vrf-<vrf>)#ipv6 access-group <ipv6_acl_name>
```

To display the status and counters of the EAPI server Service ACLs, use the following commands.

```
(switch)> show management api http-commands ip access-list
(switch)> show management api http-commands ipv6 access-list
```

#### 12.3.3.2.4 BGP

To apply Service ACLs for controlling connections to the BGP routing protocol agent, use the [ip access-group \(Service ACLs\)](#) and [ipv6 access-group \(Service ACLs\)](#) commands as shown below.

```
(config)# router bgp <asn>
(config-router-bgp)# ip access-group <acl_name>
(config-router-bgp)# ipv6 access-group <ipv6_acl_name>
(config-router-bgp)# vrf <vrf_name>
(config-router-bgp-vrf-<vrf>)# ip access-group <acl_name>
(config-router-bgp-vrf-<vrf>)# ipv6 access-group <ipv6_acl_name>
```

To display the status and counters of the BGP routing protocol Service ACLs, use the following commands.

```
(switch)> show bgp ipv4 access-list
(switch)> show bgp ipv6 access-list
```

#### 12.3.3.2.5 OSPF

To apply Service ACLs for controlling packets processed by the OSPF routing protocol agent, use the [ip access-group \(Service ACLs\)](#) and [ipv6 access-group \(Service ACLs\)](#) commands as shown below.

```
(config)# router ospf <id>
(config-router-ospf)# ip access-group <acl_name>
(config-router-ospf)# ipv6 access-group <ipv6_acl_name>
```

When using VRFs, each per-VRF OSPF instance must be assigned its Service ACL explicitly.

To display the status and counters of the OSPF routing protocol Service ACLs, use the following commands.

```
(switch)> show ospf ipv4 access-list
(switch)> show ospf ipv6 access-list
```

#### 12.3.3.2.6 PIM

To apply Service ACLs for controlling packets processed by the PIM routing protocol agent, use the [access-group](#) command as shown below.

```
(config)#router pim
(config-router-pim)#ipv4
(config-router-pim-ipv4)#access-group <acl_name>
(config-router-pim-ipv4)#vrf <vrf_name>
(config-router-pim-vrf-<vrf>)#ipv4
(config-router-pim-vrf-<vrf>-ipv4)#access-group <acl_name>
```

To display the status and counters of the PIM routing protocol Service ACLs, use the following commands.

```
(switch)> show ip pim access-list
```

#### 12.3.3.2.7 IGMP

To apply Service ACLs for controlling packets processed by the IGMP management protocol agent, use the [ip igmp access-group](#) command as shown below.

```
(config)# router igmp
```

```
(config-router-igmp)# ip igmp access-group <acl_name>
(config-router-igmp)# vrf <vrf_name>
(config-router-igmp-vrf-<vrf>)# ip igmp access-group <acl_name>
```

To display the status and counters of the IGMP management protocol Service ACLs, use the following commands.

```
(switch)> show ip igmp access-list
```

#### 12.3.3.2.8 DHCP Relay

To apply Service ACLs for controlling packets processed by the DHCP relay agent, use the **ip dhcp relay access-group** and **ipv6 dhcp relay access-group** commands as shown below.

```
(config)# ip dhcp relay access-group <acl_name> [vrf <vrf_name>]
(config)# ipv6 dhcp relay access-group <acl_name> [vrf <vrf_name>]
```

To display the status and counters of the DHCP relay agent Service ACLs, use the following commands.

```
(switch)> show ip dhcp relay access-list
(switch)> show ipv6 dhcp relay access-list
```

#### 12.3.3.2.9 LDP

To apply Service ACLs for controlling packets and connections processed by the LDP MPLS label distribution protocol, use the **ip access-group (Service ACLs)** command as shown below.

```
(config)# mpls ldp
(config-mpls-ldp)# ip access-group <acl_name>
```

To display the status and counters of the LDP Service ACLs, use the following command.

```
(switch)> show mpls ldp access-list
```

#### 12.3.3.2.10 LANZ

To apply Service ACLs for controlling connections accepted by the LANZ agent, use the **ip access-group (Service ACLs)** and **ipv6 access-group (Service ACLs)** commands as shown below.

```
(config)# queue-monitor streaming
(config-qm-streaming)# ip access-group <acl_name>
(config-qm-streaming)# ipv6 access-group <ipv6_acl_name>
```

To display the status and counters of the LDP Service ACLs, use the following command.

```
(switch)> show queue-monitor streaming access-lists
```

#### 12.3.3.2.11 MPLS Ping and Traceroute

To apply Service ACLs for controlling connections accepted by the MPLS Ping agent, use the **ip access-group (Service ACLs)** and **ipv6 access-group (Service ACLs)** commands as shown below.

```
(config)# mpls ping
```

```
(config-mpls-ping)# ip access-group <acl_name> [vrf <vrf_name>]
(config-mpls-ping)# ipv6 access-group <ipv6_acl_name> [vrf <vrf_name>]
```

### 12.3.3.2.12 Telnet Server

To apply Service ACLs to the Telnet server, use the `ip access-group (Service ACLs)` and `ipv6 access-group (Service ACLs)` commands as shown below.

```
(config)# management telnet
(config-mgmt-telnet)# ip access-group <acl_name> [vrf <vrf_name>] in
(config-mgmt-telnet)# ipv6 access-group <ipv6_acl_name> [vrf <vrf_name>]
in
```

In EOS 4.19.0, all VRFs are required to use the same Telnet server Service ACL. The Service ACL assigned without the `vrf` keyword is applied to all VRFs where the Telnet server is enabled.

To display the status and counters of the LDP Service ACLs, use the following commands.

```
(switch)>show management telnet ip access-list
(switch)>show management telnet ipv6 access-list
```

## 12.3.4 RACL Sharing on SVIs

### 12.3.4.1 IPv4 Ingress Sharing

The IPv4 ingress sharing optimizes the utilization of hardware resources by sharing the hardware resources between different VLAN interfaces when they have same ACL attached.

Larger deployments are benefited with this function, where IPv4 ingress sharing is applied on multiple SVIs with member interfaces on same forwarding ASIC. For example, a trunk port carrying multiple VLANs and an ingress sharing is applied on all VLANs, it occupies lesser hardware resources irrespective of number of VLANs. By default, IPv4 ingress sharing is disabled on the switches.

To enable IPv4 Ingress Sharing use `no hardware access-list resource sharing vlan in` command. Note, enabling or disabling the IPv4 ingress sharing requires the restart of software agents on the switches which is a disruptive process and will impact the traffic forwarding. The `no` form of the command disables the IPv4 ingress sharing on the switch. To display the IPv4 ingress sharing information use `show platform trident` command on the switch.

### 12.3.4.2 IPv4 Egress Sharing

The IPv4 Egress Sharing optimizes the utilization of hardware resources by sharing TCAM entries for a group of SVIs on which IPv4 ACLs shared. The TCAM entries are shared for all the SVIs per chip, hence, saving a lot of hardware resources and enabling ACLs to scale to a larger configurations.

Larger deployments are benefited, where IPv4 Egress Sharing is applied on multiple SVIs with member interfaces on same forwarding ASIC. For example, a trunk port carrying multiple VLANs, and when Egress Sharing is applied on all VLANs it occupies lesser hardware resources irrespective of number of VLANs. By default, IPv4 Egress Sharing is enabled on the switches. However, both IPv4 Egress Sharing and uRPF cannot be enabled at the same time. Disabling IPv4 RACL sharing will allow uRPF configuration and make sure RACL configuration, non-shared mode, is configured at the same time.

To enable unicast Reverse Path Forwarding (uRPF) on the switch, the IPv4 Egress Sharing must be disabled using the `no hardware access-list resource sharing vlan ipv4 out` command.

To enable IPv4 Egress Sharing if previously disabled from the default configuration, use `hardware access-list resource sharing vlan ipv4 out` command. Note, enabling or disabling the

IPv4 Egress Sharing requires the restart of software agents on the switches which is a disruptive process and will impact the traffic forwarding.

The following **show** commands can be used to verify the IPv4 Egress Sharing information on the switch.

- **show ip access-lists**
- **show vlan**
- **show platform arad acl tcam**
- **show ip route**
- **show platform arad ip route**

### 12.3.4.3 Configuring IPv4 Egress Sharing

Use **hardware access-list resource sharing vlan ipv4 out** command to enable the IPv4 Egress Sharing on the switch. By default, IPv4 Egress Sharing is enabled on the switch. The **no** form of the command disables the IPv4 Egress Sharing on the switch and user is allowed to configure the uRPF on the switch.

### 12.3.4.4 Displaying IPv4 Egress Sharing Information

#### Examples

- The **show ip access-lists** command displays the list of all the configured IPv4 ACLs.

```
switch#show ip access-lists summary
IPV4 ACL default-control-plane-acl [readonly]
Total rules configured: 17
Configured on Ingress: control-plane(default VRF)
Active on Ingress: control-plane(default VRF)

IPV4 ACL ipAclLimitTest
Total rules configured: 0
Configured on Egress: V12148,2700
Active on Egress: V12148,2700
```

- The **show vlan** command displays the list of all the member interfaces under each SVI.

```
switch#show vlan
VLAN  Name                Status    Ports
-----
1     default              active    Cpu, Et1, Et26
2148  VLAN2148             active    Cpu, Et1, Et26
2700  VLAN2700             active    Cpu, Et18
```

- The **show platform arad acl tcam** command displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC and the percentage of TCAM utilization per forwarding ASIC.

```
switch#show platform arad acl tcam detail
ip access-list ipAclLimitTest (Shared RACL, 0 rules, 1 entries,
direction out,
state success, Acl Label 2)
Fap: Arad0, Shared: true, Interfaces: V12148, V12700
Bank Offset Entries
0         0         1
Fap: Arad1, Shared: true, Interfaces: V12148
Bank Offset Entries
0         0         1

Switch#show platform arad acl tcam summary
```

The total number of TCAM lines per bank is 1024.

Arad0:

```
=====
Bank    Used          Used %          Used By
  0      1              0      IP Egress PACLs/RACLs
Total Number of TCAM lines used is: 1
=====
```

Arad1:

```
=====
Bank    Used          Used %          Used By
  0      1              0      IP Egress PACLs/RACLs
Total Number of TCAM lines used is: 1
=====
```

- The **show ip route** command displays the unicast ip routes installed in the system.

```
switch#show ip route
VRF name: default
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I - ISIS, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route

Gateway of last resort is not set
C 10.1.0.0/16 is directly connected, Vlan2659
C 10.2.0.0/16 is directly connected, Vlan2148

## 12.3.5 Route Maps

A route map is an ordered set of rules that control the redistribution of IP routes into a protocol domain on the basis of such criteria as route metrics, access control lists, next hop addresses, and route tags. Route maps can also alter parameters of routes as they are redistributed.

These sections describe the route map implementation:

- [Route Map Description](#) describes route maps.
- [Route Map Configuration](#) describes the route map configuration process.
- [Using Route Maps](#) describes the usage of route maps.

### 12.3.5.1 Route Map Description

Route maps are composed of route map statements, each of which consists of a list of match and set commands.

#### Route Map Statements

Route map statements are categorized by the resolution of routes that the statement filters.

- Permit statements facilitate the redistribution of matched routes.
- Deny statements prevent the redistribution of matched routes.

Route map statement elements include name, sequence number, filter type, match commands, set commands, and continue commands.

- **name** identifies the route map to which the statement belongs.
- **sequence number** designates the statement's placement within the route map.
- **filter type** specifies the route resolution. Valid types are permit and deny.
- **match commands** specify criteria that select routes that the statement is evaluating for redistribution.
- **set commands** modify route parameters for redistributed routes.
- **continue commands** prolong the route map evaluation of routes that match a statement.

Statements filter routes for redistribution. Routes that statements pass are redistributed (permit statements) or rejected (deny statements). Routes that statements fail are filtered by the next statement in the route map.

- When a statement does not contain a **match** command, the statement passes all routes.
- When a statement contains a single **match** command that lists a single object, the statement passes routes whose parameters match the object.
- When a statement contains a single **match** command that lists multiple objects, the statements passes routes whose parameters match at least one object.
- When a statement contains multiple **match** commands, the statement passes routes whose parameters match all match commands.

**Set** commands modify parameters for redistributed routes. **Set** commands are valid in permit statements.

---

## Example

The following route map statement is named `MAP_1` with sequence number 10. The statement matches all routes from BGP Autonomous System 10 and redistributes them with a local preference set to 100. Routes that do not match the statement are evaluated against the next statement in the route map.

```
switch#route-map MAP_1 permit 10
  match as 10
  set local-preference 100
```

## Route Maps with Multiple Statements

A route map consists of statements with the same name and different sequence numbers. Statements filter routes in ascending order of their sequence numbers. When a statement passes a route, the redistribution action is performed as specified by the filter type and all subsequent statements are ignored. When the statement fails the route, the statement with the smallest sequence number that is larger than the current one filters the route.

All route maps have an implied final statement that contains a single deny statement with no match command. This denies redistribution to routes that are not passed by any statement.

## Example

The following route map is named `MAP_1` with two permit statements. Routes that do not match either statement are denied redistribution into the target protocol domain.

```
switch#route-map MAP_1 permit 10
  match as 10
  set local-preference 100
!
switch#route-map MAP_1 permit 20
  match metric-type type-1
  match as 100
```

[Route Map Configuration](#) describes route map configuration procedures.

## Route Maps with Multiple Statements and Continue Commands

Route map statements that contain a [continue \(route map\)](#) command support additional route map evaluation of routes whose parameters meet the statement's match commands. Routes that match a statement containing a `continue` command are evaluated against the statement specified by the `continue` command.

When a route matches multiple route map statements, the filter action (deny or permit) is determined by the last statement that the route matches. The `set` commands in all statements matching the route are applied to the route after the route map evaluation is complete. Multiple `set` commands are applied in the same order by which the route was evaluated against the statements containing them.

## Example

The following route map is named `MAP_1` with a permit statement and a deny statement. The permit statement contains a `continue` command. Routes that match statement 10 are evaluated against statement 20.

```
route-map MAP_2 permit 10
  match as 10
  continue 20
  set local-preference 100
!
```

```
route-map MAP 2 deny 20
  match metric-type type-1
  match as 100
```

The route is redistributed if it passes statement 10 and is rejected by statement 20. The route is denied redistribution in all other instances. The `continue` command guarantees the evaluation of all routes against both statements.

### 12.3.5.2 Route Map Configuration

Route maps are created and modified in route map configuration mode. These sections describe the configuration mode and its commands.

- [Route Map Creation and Editing](#)
- [Modifying Route Map Components](#)

#### 12.3.5.2.1 Route Map Creation and Editing

##### Creating a Route Map Statement

To create a route map, enter `route-map` followed by the map name and filter type (**deny** or **permit**). The default sequence number is assigned to the statement if the command does not include a number.

##### Example

This command places the switch in route map configuration mode to create a route map statement named `map1` with a sequence number of 50.

```
switch(config)#route-map map1 permit 50
switch(config-route-map-map1)#
```

##### Editing a Route Map Statement

To edit an existing route map statement, enter `route-map` with the map's name and statement's number. The switch enters route map configuration mode for the statement. Subsequent `match (route-map)` and `set (route-map)` commands add the corresponding commands to the statement.

The `show` command displays contents of the existing route map.

##### Example

This command places the switch in route map configuration mode to edit an existing route map statement. The `show` command displays contents of all statements in the route map.

```
switch(config)#route-map MAP2
switch(config-route-map-MAP2)#show
  Match clauses:
    match as 10
    match tag 333
  Set clauses:
    set local-preference 100
switch(config-route-map-MAP2)#
```

##### Saving Route Map Modifications

Route map configuration mode is a group-change mode. Changes are saved by exiting the mode, either with an explicit `exit` command or by switching directly to another configuration mode. This includes switching to the configuration mode for a different route map.

## Example

The first command creates the *map1* statement with sequence number of 10. The second command is not yet saved to the route map, as displayed by the **show** command.

```
• switch(config)#route-map map1 permit
  switch(config-route-map-map1)#match as 100
  switch(config-route-map-map1)#show
  switch(config-route-map-map1)#
```

The **exit** command saves the **match** command.

```
switch(config-route-map-map1)#exit
switch(config)#show route-map map1
route-map map1 permit 10
  Match clauses:
    match as 100
  Set clauses:
switch(config)#
```

## Discarding Route Map Modifications

The **abort** command discards all pending changes and exits route map configuration mode.

## Example

The **abort** command discards the pending **match** command and restores the original route map.

```
switch(config)#route-map map1 permit
switch(config-route-map-map1)#match as 100
switch(config-route-map-map1)#abort
switch(config)#show route-map map1
switch(config)#
```

### 12.3.5.2.2 Modifying Route Map Components

These commands add rules to the configuration mode route map:

- **match (route-map)** adds a match rule to a route map.
- **set (route-map)** adds a set rule to a route map.

## Inserting a Statement

To insert a new statement into an existing route map, create a new statement with a sequence number that differs from any existing statement in the map.

## Example

This command adds statement 50 to the *Map1* route map, then displays the new route map.

```
switch(config)#route-map Map1 permit 50
switch(config-route-map-Map1)#match as 150
switch(config-route-map-Map1)#exit
switch(config)#show route-map Map1
route-map Map1 deny 10
  Match clauses:
    match as 10
    match tag 333
  Set clauses:
    set local-preference 100
```

```

route-map Map1 permit 50
  Match clauses:
    match as 150
  Set clauses:
switch(config) #

```

### Deleting Route Map Components

To remove a component from a route map, perform one of the following:

- To remove a command from a statement, enter **no**, followed by the command to be removed.
- To remove a statement, enter **no**, followed by the route map with the filter type and the sequence number of the statement to be removed.
- To remove a route map, enter **no** followed by the route map without a sequence number.

### 12.3.5.3 Using Route Maps

Protocol redistribution commands include a route map parameter that determines the routes to be redistributed into the specified protocol domain.

#### Example

This command uses *Map1* route map to select OSPFv2 routes for redistribution into BGP AS1.

```

switch(config)#router bgp 1
switch(config-router-bgp)#redistribute ospf route-map Map1
switch(config-router-bgp)#exit
switch(config)#

```

### 12.3.6 Prefix Lists

A prefix list is an ordered set of rules that defines route redistribution access for a specified IP address space. A prefix list rule consists of a filter action (deny or permit), an address space identifier (IPv4 subnet address or IPv6 prefix), and a sequence number.

Prefix lists are referenced by route map match commands when filtering routes for redistribution.

- [Prefix List Configuration](#) describes the prefix list configuration process.
- [Using Prefix Lists](#) describes the use of prefix lists.

#### 12.3.6.1 Prefix List Configuration

A prefix list is an ordered set of rules that defines route redistribution access for a specified IP address space. A prefix list rule consists of a filter action (deny or permit), a network address (IPv4 subnet or IPv6 prefix), and a sequence number. A rule may also include an alternate mask size.

The switch supports IPv4 and IPv6 prefix lists. The switch is placed in a Prefix-list configuration mode to create and edit IPv4 or IPv6 prefix lists.

##### 12.3.6.1.1 IPv4 Prefix Lists

IPv4 prefix lists are created or modified by adding an IPv4 prefix list rule in the Prefix-list configuration mode. Each rule includes the name of a prefix list, in addition to the sequence number, network address, and filter action. A list consists of all rules that have the same prefix list name.

The [ip prefix-list](#) command creates a prefix list or adds a rule to an existing list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains.

---

## Creating an IPv4 Prefix List

To create an IPv4 prefix list, enter the `ip prefix-list` command, followed by the name of the list. The switch enters IPv4 prefix-list configuration mode for the list. If the command is followed by the name of an existing ACL, subsequent commands edit that list.

### Examples

- This command places the switch in IPv4 prefix list configuration mode to create an IPv4 prefix list named `route-one`.

```
switch(config)#ip prefix-list route-one
switch(config-ip-pfx)#
```

- These commands create four different rules for the prefix-list named `route-one`.

```
switch(config)#ip prefix-list route-one
switch(config-ip-pfx)#seq 10 deny 10.1.1.0/24
switch(config-ip-pfx)#seq 20 deny 10.1.0.0/16
switch(config-ip-pfx)#seq 30 permit 12.15.4.9/32
switch(config-ip-pfx)#seq 40 deny 1.1.1.0/24
```

To view the list, save the rules by exiting the Prefix-list command mode, then re-enter the configuration mode and type `show active`.

```
switch(config-ip-pfx)#exit
switch(config)#ip prefix-list route-one
switch(config-ip-pfx)#show active
ip prefix-list route-one
  seq 10 deny 10.1.1.0/24
  seq 20 deny 10.1.0.0/16
  seq 30 permit 12.15.4.9/32
  seq 40 deny 1.1.1.0/24
switch(config-ip-pfx)#ip prefix-list route-one
```

IPv4 prefix lists are referenced in `match (route-map)` command.

## 12.3.6.1.2 IPv6 Prefix Lists

### Creating an IPv6 Prefix List

The switch provides IPv6 prefix-list configuration mode for creating and modifying IPv6 prefix lists. A list can be edited only in the mode where it was created.

To create an IP ACL, enter the `ipv6 prefix-list` command, followed by the name of the list. The switch enters IPv6 prefix-list configuration mode for the list. If the command is followed by the name of an existing ACL, subsequent commands edit that list.

### Example

This command places the switch in IPv6 prefix list configuration mode to create an IPv6 prefix list named `map1`.

```
switch(config)#ipv6 prefix-list map1
switch(config-ipv6-pfx)#
```

## Adding a Rule

To append a rule to the end of a list, enter the rule without a sequence number while in Prefix-List configuration mode for the list. The new rule's sequence number is derived by adding 10 to the last rule's sequence number.

### Example

These commands enter the first two rules into a new prefix list.

```
switch(config-ipv6-pfx)#permit 3:4e96:8ca1:33cf::/64
switch(config-ipv6-pfx)#permit 3:11b1:8fe4:1aac::/64
```

To view the list, save the rules by exiting the prefix-list command mode, then re-enter the configuration mode and type **show active**.

```
switch(config-ipv6-pfx)#exit
switch(config)#ipv6 prefix-list map1
switch(config-ipv6-pfx)#show active
ipv6 prefix-list map1
  seq 10 permit 3:4e96:8ca1:33cf::/64
  seq 20 permit 3:11b1:8fe4:1aac::/64
switch(config-ipv6-pfx)#
```

This command appends a rule to the end of the prefix list. The new rule's sequence number is 30.

```
switch(config-ipv6-pfx)#permit 3:1bca:1141:ab34::/64
switch(config-ipv6-pfx)#exit
switch(config)#ipv6 prefix-list map1
switch(config-ipv6-pfx)#show active
ipv6 prefix-list map1
  seq 10 permit 3:4e96:8ca1:33cf::/64
  seq 20 permit 3:11b1:8fe4:1aac::/64
  seq 30 permit 3:1bca:1141:ab34::/64
switch(config-ipv6-pfx)#
```

## Inserting a Rule

To insert a rule into a prefix list, use the **seq (IPv6 Prefix Lists)** command to enter a rule with a sequence number that is between numbers of two existing rules.

### Example

This command inserts a rule between the first two rules by assigning it the sequence number 15.

```
switch(config-ipv6-pfx)#seq 15 deny 3:4400::/64
switch(config-ipv6-pfx)#exit
switch(config)#show ipv6 prefix-list map1
ipv6 prefix-list map1
  seq 10 permit 3:4e96:8ca1:33cf::/64
  seq 15 deny 3:4400::/64
  seq 20 permit 3:11b1:8fe4:1aac::/64
  seq 30 permit 3:1bca:3ff2:634a::/64
switch(config)#
```

## Deleting a Rule

To remove a rule from the configuration mode prefix list, enter **no seq** (see **seq (IPv6 Prefix Lists)**), followed by the sequence number of the rule to be removed.

---

### Example

These commands remove rule 20 from the prefix list, then displays the resultant prefix list.

```
switch(config-ipv6-pfx) #no seq 20
switch(config-ipv6-pfx) #exit
switch(config) #show ipv6 prefix-list map1
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 30 permit 3:1bca:3ff2:634a::/64
switch(config) #
```

### 12.3.6.2 Using Prefix Lists

Route map match commands include an option that matches a specified prefix list.

#### Example

The *MAP\_1* route map uses a match command that references the *PL\_1* prefix list.

```
switch(config) #route-map MAP_1 permit
switch(config-route-map-MAP_1) #match ip address prefix-list PL_1
switch(config-route-map-MAP_1) #set community 500
switch(config-route-map-MAP_1) #exit
```

## 12.3.7 ACL, Route Map, and Prefix List Commands

This section describes CLI commands that this chapter references.

### ACL Creation and Access Commands

- [hardware access-list resource sharing vlan in](#)
- [hardware access-list resource sharing vlan ipv4 out](#)
- [ip access-list](#)
- [ip access-list standard](#)
- [ipv6 access-list](#)
- [ipv6 access-list standard](#)
- [mac access-list](#)
- [system profile](#)

### ACL Implementation Commands

- [ip access-group](#)
- [ipv6 access-group](#)
- [mac access-group](#)

### Service ACL Implementation Commands

- [ip access-group \(Service ACLs\)](#)
- [ipv6 access-group \(Service ACLs\)](#)

### ACL Edit Commands

- [counters per-entry \(ACL configuration modes\)](#)
- [hardware access-list update default-result permit](#)
- [no <sequence number> \(ACLs\)](#)
- [resequence \(ACLs\)](#)
- [show \(ACL configuration modes\)](#)

### ACL Rule Commands

- [deny \(IPv4 ACL\)](#)
- [deny \(IPv6 ACL\)](#)
- [deny \(MAC ACL\)](#)
- [deny \(Standard IPv4 ACL\)](#)
- [deny \(Standard IPv6 ACL\)](#)
- [permit \(IPv4 ACL\)](#)
- [permit \(IPv6 ACL\)](#)
- [permit \(MAC ACL\)](#)
- [permit \(Standard IPv4 ACL\)](#)
- [permit \(Standard IPv6 ACL\)](#)
- [remark](#)

### ACL List Counter Commands

- [clear ip access-lists counters](#)
- [clear ipv6 access-lists counters](#)
- [hardware counter feature acl out](#)

---

### **ACL Display Commands**

- [show ip access-lists](#)
- [show ipv6 access-lists](#)
- [show mac access-lists](#)

### **Prefix List Creation and Access Commands**

- [ip prefix-list](#)
- [ipv6 prefix-list](#)

### **Prefix List Edit Commands**

- [deny \(IPv6 Prefix List\)](#)
- [permit \(IPv6 Prefix List\)](#)
- [seq \(IPv6 Prefix Lists\)](#)

### **Prefix List Display Commands**

- [show ip prefix-list](#)
- [show ipv6 prefix-list](#)
- [show platform trident tcam](#)
- [show platform fap acl](#)
- [show platform fap acl tcam](#)
- [show platform arad acl tcam](#)
- [show platform arad acl tcam summary](#)
- [show platform arad mapping](#)
- [show hardware tcam profile](#)
- [show platform fap acl tcam hw](#)

### **Route Map Creation and Access Command**

- [route-map](#)

### **Route Map Edit Commands**

- [continue \(route map\)](#)
- [description \(route map\)](#)
- [match \(route-map\)](#)
- [set \(route-map\)](#)
- [set as-path prepend](#)
- [set as-path match](#)
- [set community \(route-map\)](#)
- [set extcommunity \(route-map\)](#)

### **Route Map Display Commands**

- [show route-map](#)

### 12.3.7.1 clear ip access-lists counters

The **clear ip access-lists counters** command sets ACL counters to zero for the specified IPv4 access control list (ACL). The **session** parameter limits ACL counter clearing to the current CLI session.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ip access-lists counters [ACL_NAME][SCOPE]
```

#### Parameters

- **ACL\_NAME** Name of ACL. Options include:
  - *<no parameter>* all ACLs.
  - *access\_list* name of ACL.
- **SCOPE** Session affected by command. Options include:
  - *<no parameter>* command affects counters on all CLI sessions.
  - *session* affects only current CLI session.

#### Example

This command resets all IPv4 ACL counters.

```
switch(config) #clear ip access-lists counters  
switch(config) #
```

---

### 12.3.7.2 clear ipv6 access-lists counters

The **clear ipv6 access-lists counters** command sets ACL counters to zero for the specified IPv6 access control list (ACL). The **session** parameter limits ACL counter clearing to the current CLI session.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ipv6 access-lists counters [ACL_NAME][SCOPE]
```

#### Parameters

- ACL\_NAME name of ACL. Options include:
  - *<no parameter>* all IPv6 ACLs.
  - *access\_list* name of IPv6 ACL.
- SCOPE Session affected by command. Options include:
  - *<no parameter>* command affects counters on all CLI sessions.
  - *session* affects only current CLI session.

#### Example

This command resets all IPv6 ACL counters.

```
switch(config) #clear ipv6 access-lists counters
switch(config) #
```

### 12.3.7.3 continue (route map)

The **continue** command creates a route map statement entry that enables additional route map evaluation of routes whose parameters meet the statement's matching criteria.

A statement typically contains a [match \(route-map\)](#) and a [set \(route-map\)](#) command. The evaluation of routes whose settings are the same as **match** command parameters normally ends and the statement's **set** commands are applied to the route. Routes that match a statement containing a **continue** command are evaluated against the statement specified by the continue command.

When a route matches multiple route map commands, the filter action (deny or permit) is determined by the last statement that the route matches. The **set** commands in all statements matching the route are applied to the route after the route map evaluation is complete. Multiple set commands are applied in the same order by which the route was evaluated against the statement containing them.

The **no continue** and **default continue** commands remove the corresponding **continue** command from the configuration mode route map statement by deleting the corresponding command from **running-config**.

#### Command Mode

Route-Map Configuration

#### Command Syntax

```
continue NEXT_SEQ
no continue NEXT_SEQ
default continue NEXT_SEQ
```

#### Parameters

- **NEXT\_SEQ** Specifies next statement for evaluating matching routes. Options include:
  - *<no parameter>* Next statement in the route map, as determined by sequence number.
  - *seq\_number* Specifies the number of the next statement. Values range from 1 to 16777215.

#### Restrictions

A **continue** command cannot specify a sequence number smaller than the sequence number of its route map statement.

#### Related Command

[route-map](#) command enters route map configuration mode.

#### Example

This command creates route map map1, statement 40 with a match command, a set command, and a continue command. Routes that match the statement are subsequently evaluated against statement 100. The **set local-preference** command is applied to matching routes regardless of subsequent matching operations.

```
switch(config)#route-map map1 deny 40
switch(config-route-map-map1)#match as 15
switch(config-route-map-map1)#continue 100
switch(config-route-map-map1)#set local-preference 50
switch(config-route-map-map1)#
```

---

### 12.3.7.4 counters per-entry (ACL configuration modes)

The **counters per-entry** command places the ACL in counting mode. An ACL in counting mode displays the number of instances each rule in the list matches an inbound packet and the elapsed time since the last match. The show access list commands display the statistics next to each rule in the ACL.

On the FM6000 platform, this command has no effect when used in an ACL that is part of a PBR class map.

The **no counters per-entry** and **default counters per-entry** commands place the ACL in non-counting mode.

#### Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

#### Command Syntax

```
counters per-entry
```

```
no counters per-entry
```

```
default counters per-entry
```

#### Examples

- This command places the test1 ACL in counting mode.

```
switch(config)#ip access-list test1
switch(config-acl-test1)#counters per-entry
switch(config-acl-test1)#
```

- This command displays the ACL, with counter information, for an ACL in counting mode.

```
switch#show ip access-lists
IP Access List default-control-plane-acl [readonly]
  counters per-entry
  10 permit icmp any any
  20 permit ip any any tracked [match 12041, 0:00:00 ago]
  30 permit ospf any any
  40 permit tcp any any eq ssh telnet www snmp bgp https [match 11,
1:41:07 ago]
  50 permit udp any any eq bootps bootpc snmp rip [match 78, 0:00:27
ago]
  60 permit tcp any any eq mlag ttl eq 255
  70 permit udp any any eq mlag ttl eq 255
  80 permit vrrp any any
  90 permit ahp any any
  100 permit pim any any
  110 permit igmp any any [match 14, 0:23:27 ago]
  120 permit tcp any any range 5900 5910
  130 permit tcp any any range 50000 50100
  140 permit udp any any range 51000 51100
```

### 12.3.7.5 deny (IPv4 ACL)

The **deny** command adds a deny rule to the configuration mode IPv4 access control list (ACL). Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

#### Command Mode

ACL Configuration

#### Command Syntax

```
[SEQ_NUM] deny PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT]
[FLAGS][MESSAGE][fragments][tracked][DSCP_FILTER][TTL_FILTER][log]
```

```
no deny PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT][FLAGS]
[MESSAGE][fragments][tracked][DSCP_FILTER][TTL_FILTER][log]
```

```
default deny PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT]
[FLAGS][MESSAGE][fragments][tracked][DSCP_FILTER][TTL_FILTER][log]
```

**Note:** Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a deny rule.

#### Parameters

- SEQ\_NUM Sequence number assigned to the rule. Options include:
  - *<no parameter>* Number is derived by adding 10 to the number of the ACL's last rule.
  - *<14294967295>* Number assigned to entry.
- PROTOCOL protocol field filter. Values include:
  - *ahp* Authentication Header Protocol (51).
  - *icmp* Internet Control Message Protocol (1).
  - *igmp* Internet Group Management Protocol (2).
  - *ip* Internet Protocol v4 (4).
  - *ospf* Open Shortest Path First (89).
  - *pim* Protocol Independent Multicast (103).
  - *tcp* Transmission Control Protocol (6).
  - *udp* User datagram protocol (17).
  - *vrrp* Virtual Router Redundancy Protocol (112).
  - *protocol\_num* Integer corresponding to an IP protocol. Values range from 0 to 255.
- SOURCE\_ADDR and DEST\_ADDR Source and destination address filters. Options include:
  - *network\_addr* Subnet address (CIDR or address-mask).
  - *any* Packets from all addresses are filtered.
  - *host ip\_addr* IP address (dotted decimal notation).

Subnet addresses support discontinuous masks.
- SOURCE\_PORT and DEST\_PORT Source and destination port filters. Options include:
  - *any* All ports
  - *eq port-1 port-2 ... port-n* A list of ports. Maximum list size is 10 ports.
  - *neq port-1 port-2 ... port-n* The set of all ports not listed. Maximum list size is 10 ports.
  - *gt port* The set of ports with larger numbers than the listed port.
  - *lt port* The set of ports with smaller numbers than the listed port.

- `range port_1 port_2` The set of ports whose numbers are between the range.
- `fragments` Filters packets with FO bit set (indicates a non-initial fragment packet).
- `FLAGS` Flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- `MESSAGE` Message type filters (ICMP packets). Use CLI syntax assistance (?) to display options.
- `tracked` Rule filters packets in existing ICMP, UDP, or TCP connections.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.
- `DSCP_FILTER` Rule filters packet by its DSCP value. Values include:
  - `<no parameter>` Rule does not use DSCP to filter packets.
  - `dscp dscp_value` Packets match if DSCP field in packet is equal to `dscp_value`.
- `TTL_FILTER` Rule filters packet by its TTL (time-to-live) value. Values include:
  - `ttl eq ttl_value` Packets match if `ttl` in packet is equal to `ttl_value`.
  - `ttl gt ttl_value` Packets match if `ttl` in packet is greater than `ttl_value`.
  - `ttl lt ttl_value` Packets match if `ttl` in packet is less than `ttl_value`.
  - `ttl neq ttl_value` Packets match if `ttl` in packet is not equal to `ttl_value`.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.
- `log` Triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.

### Examples

- This command appends a **deny** statement at the end of the ACL. The **deny** statement drops OSPF packets from `10.10.1.1/24` to any host.

```
switch(config)#ip access-list text1
switch(config-acl-text1)#deny ospf 10.1.1.0/24 any
switch(config-acl-text1)#
```

- This command inserts a **deny** statement with the sequence number 65. The **deny** statement drops all PIM packets.

```
switch(config-acl-text1)#65 deny pim any any
switch(config-acl-text1)#
```

### 12.3.7.6 deny (IPv6 ACL)

The **deny** command adds a deny rule to the configuration mode IPv6 access control list (ACL). Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

#### Command Mode

IPv6-ACL Configuration

#### Command Syntax

```
[SEQ_NUM] deny PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT][FLAG] [MSG][hop]
[tracked][DSCP_FILTER] [log]
```

```
no deny PROT SRC_ADDR [SOURCE_PT] DEST_ADDR [DEST_PT][FLAG][MSG][hop][tracked]
[DSCP_FILTER][log]
```

```
default deny PROT SRC_ADDR [SOURCE_PT] DEST_ADDR [DEST_PT][FLAG][MSG] [hop]
[tracked][DSCP_FILTER][log]
```

**Note:** Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a deny rule.

#### Parameters

- SEQ\_NUM Sequence number assigned to the rule. Options include:
  - *<no parameter>* Number is derived by adding 10 to the number of the ACL's last rule.
  - *<1 - 4294967295>* Number assigned to entry.
- PROT Protocol field filter. Values include:
  - icmpv6 Internet Control Message Protocol for version 6 (58).
  - ipv6 Internet Protocol IPv6 (41).
  - ospf Open Shortest Path First (89).
  - tcp Transmission Control Protocol (6).
  - udp User Datagram Protocol (17).
  - *protocol\_num* Integer corresponding to an IP protocol. Values range from 0 to 255.
- SRC\_ADDR and DEST\_ADDR Source and destination address filters. Options include:
  - *ipv6\_prefix* IPv6 address with prefix length (CIDR notation).
  - any Packets from all addresses are filtered.
  - host *ipv6\_addr* IPv6 host address.
- SRC\_PT and DEST\_PT Source and destination port filters. Options include:
  - any All ports.
  - eq *port-1 port-2 ... port-n* A list of ports. Maximum list size is 10 ports.
  - neq *port-1 port-2 ... port-n* The set of all ports not listed. Maximum list size is 10 ports.
  - gt *port* The set of ports with larger numbers than the listed port.
  - lt *port* The set of ports with smaller numbers than the listed port.
  - range *port\_1 port\_2* The set of ports whose numbers are between the range.
- HOP Filters by packet's hop-limit value. Options include:
  - *<no parameter>* Rule does not use hop limit to filter packets.
  - hop-limit eq *hop\_value* Packets match if hop-limit value in packet equals *hop\_value*.
  - hop-limit gt *hop\_value* Packets match if hop-limit in packet is greater than *hop\_value*.

- 
- hop-limit lt *hop\_value* Packets match if hop-limit in packet is less than *hop\_value*.
  - hop-limit neq *hop\_value* Packets match if hop-limit in packet is not equal to *hop\_value*.
  - FLAG Flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
  - MSG Message type filters (ICMPv6 packets). Use CLI syntax assistance (?) to display options.
  - tracked Rule filters packets in existing ICMP, UDP, or TCP connections.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.
  - DSCP\_FILTER Rule filters packet by its DSCP value. Values include:
    - <no parameter> Rule does not use DSCP to filter packets.
    - dscp *dscp\_value* Packets match if DSCP field in packet is equal to *dscp\_value*.
  - log Triggers an informational log message to the console about the matching packet.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.

### Example

This command appends a **deny** statement at the end of the ACL. The **deny** statement drops IPv6 packets from *3710:249a:c643:ef11::/64* to any host.

```
switch(config)#ipv6 access-list text1
switch(config-acl-text1)#deny ipv6 3710:249a:c643:ef11::/64 any
switch(config-acl-text1)#
```

### 12.3.7.7 deny (IPv6 Prefix List)

The **deny** command adds a rule to the configuration mode IPv6 prefix list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains. Routes are denied access when they match the prefix that a **deny** statement specifies.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode prefix list. The **no seq (IPv6 Prefix Lists)** command also removes the specified rule from the prefix list.

#### Command Mode

IPv6-pfx Configuration

#### Command Syntax

```
[SEQUENCE] deny ipv6_prefix [MASK]
```

#### Parameters

- SEQUENCE Sequence number assigned to the rule. Options include:
  - *<no parameter>* Number is derived by adding 10 to the number of the list's last rule.
  - seq *seq\_num* Number is specified by *seq\_num*. Value ranges from 0 to 65535.
- *ipv6\_prefix* IPv6 prefix upon which command filters routes (CIDR notation).
- MASK Range of the prefix to be matched.
  - *<no parameter>* Exact match with the subnet mask is required.
  - eq *mask\_e* Prefix length is equal to *mask\_e*.
  - ge *mask\_g* Range is from *mask\_g* to 128.
  - le *mask\_l* Range is from *subnet* mask length to *mask\_l*.
  - ge *mask\_l* le *mask\_g* Range is from *mask\_g* to *mask\_l*.

*mask\_e*, *mask\_land*, and *mask\_g* range from 1 to 128.

When le and ge are specified, *subnet* mask > *mask\_g*>*mask\_l*

#### Example

This command appends a **deny** statement at the end of the text1 prefix list. The **deny** statement denies redistribution of routes with the specified prefix.

```
switch(config)#ipv6 prefix-list route-five
switch(config-ipv6-pfx)#deny 3100::/64
switch(config-ipv6-pfx)#
```

---

### 12.3.7.8 deny (MAC ACL)

The **deny** command adds a deny rule to the configuration mode MAC access control list (ACL). Packets filtered by a deny rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

#### Command Mode

MAC-ACL Configuration

#### Command Syntax

```
[SEQ_NUM] deny SOURCE_ADDR DEST_ADDR [PROTOCOL][log]
```

```
no deny SOURCE_ADDR DEST_ADDR [PROTOCOL][log]
```

```
default deny SOURCE_ADDR DEST_ADDR [PROTOCOL][log]
```

#### Parameters

- SEQ\_NUM Sequence number assigned to the rule. Options include:
  - *<no parameter>* Number is derived by adding 10 to the number of the ACL's last rule.
  - *<1 - 4294967295>* Number assigned to entry.
- SOURCE\_ADDR and DEST\_ADDR Source and destination address filters. Options include:
  - *mac\_address mac\_mask* MAC address and mask.
  - any Packets from all addresses are filtered.
    - *mac\_address* specifies a MAC address in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh).
    - *mac\_mask* specifies a MAC address mask in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh).
  - 0 bits require an exact match to filter.
  - 1 bits filter on any value.
- PROTOCOL Protocol field filter. Values include:
  - aarp Appletalk Address Resolution Protocol (0x80f3).
  - appletalk Appletalk (0x809b).
  - arp Address Resolution Protocol (0x806).
  - ip Internet Protocol Version 4 (0x800).
  - ipx Internet Packet Exchange (0x8137).
  - lldp LLDP (0x88cc).
  - novell Novell (0x8138).
  - rarp Reverse Address Resolution Protocol (0x8035).
  - *protocol\_num* Integer corresponding to a MAC protocol. Values range from 0 to 65535
- log Triggers an informational log message to the console about the matching packet.

#### Examples

- This command appends a permit statement at the end of the ACL. The deny statement drops all aarp packets from 10.1000.0000 through 10.1000.FFFF to any host.

```
switch(config)#mac access-list text1  
switch(config-mac-acl-text1)#deny 10.1000.0000 0.0.FFFF any aarp
```

- This command inserts a permit statement with the sequence number 25. The deny statement drops all packets through the interface.

```
switch(config-mac-acl-text1)#25 deny any any
```

---

### 12.3.7.9 deny (Standard IPv4 ACL)

The **deny** command adds a deny rule to the configuration mode standard IPv4 access control list (ACL). Standard ACL rules filter on the source field.

Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

#### Command Mode

Std-ACL Configuration

#### Command Syntax

```
[SEQ_NUM] deny SOURCE_ADDR [log]
```

```
no deny SOURCE_ADDR [log]
```

```
default deny SOURCE_ADDR [log]
```

#### Parameters

- SEQ\_NUM Sequence number assigned to the rule. Options include:
  - *<no parameter>* Number is derived by adding 10 to the number of the ACL's last rule.
  - *<1 - 4294967295>* Number assigned to entry.
- SOURCE\_ADDR Source address filter. Options include:
  - *network\_addr* Subnet address (CIDR or address-mask).
  - *any* Packets from all addresses are filtered.
  - *host ip\_addr* IP address (dotted decimal notation).  
Subnet addresses support discontinuous masks.
- log Triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.

#### Example

This command appends a **deny** statement at the end of the ACL. The **deny** statement drops packets from *10.10.1.1/24*.

```
switch(config)#ip access-list standard text1
switch(config-std-acl-text1)#deny 10.1.1.1/24
switch(config-std-acl-text1)#
```

### 12.3.7.10 deny (Standard IPv6 ACL)

The **deny** command adds a deny rule to the configuration mode standard IPv6 access control list (ACL). Standard ACL rules filter on the source field.

Packets filtered by a **deny** rule are dropped by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no deny** and **default deny** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

#### Command Mode

Std-IPv6-ACL Configuration

#### Command Syntax

```
[SEQ_NUM] deny SOURCE_ADDR
```

```
no deny SOURCE_ADDR
```

```
default deny SOURCE_ADDR
```

#### Parameters

- SEQ\_NUM Sequence number assigned to the rule. Options include:
  - *<no parameter>* Number is derived by adding 10 to the number of the ACL's last rule.
  - *<1 - 4294967295>* Number assigned to entry.
- SOURCE\_ADDR Source address filter. Options include:
  - *ipv6\_prefix* IPv6 address with prefix length (CIDR notation).
  - *any* Packets from all addresses are filtered.
  - *host ipv6\_addr* IPv6 host address.

#### Example

This command appends a **deny** statement at the end of the ACL. The **deny** statement drops packets from *2103::/64*.

```
switch(config)#ipv6 access-list standard text1
switch(config-std-acl-ipv6-text1)#deny 2103::/64
switch(config-std-acl-ipv6-text1)#
```

---

### 12.3.7.11 description (route map)

The **description** command adds a text string to the configuration mode route map. The string has no functional impact on the route map.

The **no description** and **default description** commands remove the text string from the configuration mode route map by deleting the corresponding **description** command from **running-config**.

#### Command Mode

Route-Map Configuration

#### Command Syntax

```
description label_text
```

```
no description
```

```
default description
```

#### Parameters

*label\_text* Character string assigned to the route map configuration.

#### Related Command

[route-map](#).

#### Example

These commands add description text to the *XYZ-1* route map.

```
switch(config)#route-map XYZ-1
switch(config-route-map-XYZ-1)#description This is the first map.
switch(config-route-map-XYZ-1)#exit
switch(config)#show route-map XYZ-1
route-map XYZ-1 permit 10
  Description:
    description This is the first map.
  Match clauses:
  Set clauses:
switch(config)#
```

### 12.3.7.12 hardware access-list resource sharing vlan in

The **hardware access-list resource sharing vlan in** command enables the IPv4 Ingress Sharing of hardware resources on the switch same ACL is applied on different VLANs.

The **no hardware access-list resource sharing vlan in** command disables the IPv4 Ingress Sharing of hardware resources on the switch.

#### Command Mode

Global Configuration

#### Command Syntax

```
hardware access-list resource sharing vlan in
```

```
no hardware access-list resource sharing vlan in
```

#### Guidelines

- This command is compatible only with the DCS-7010 and DCS-7050x series switches.
- Enabling IPv4 Ingress Sharing requires the restart of software agents on the platform. This is a disruptive process and impacts traffic forwarding.

Use the **show platform trident** command to verify the Ingress IPv4 Sharing information.

---

### 12.3.7.13 hardware access-list resource sharing vlan ipv4 out

The **hardware access-list resource sharing vlan ipv4 out** command enables the IPv4 Egress RACL TCAM sharing on the switch.

The **no hardware access-list resource sharing vlan ipv4 out** command disables the IPv4 Egress RACL TCAM sharing on the switch. By default, the IPv4 Egress RACL sharing is enabled on the switch.

#### Command Mode

Global Configuration

#### Command Syntax

```
hardware access-list resource sharing vlan ipv4 out
no hardware access-list resource sharing vlan ipv4 out
```

#### Guidelines

- This command is compatible only with the DCS-7280E and DCS-7500E series switches.
- Disabling IPv4 RACL sharing requires the restart of software agents on the platform. This is a disruptive process and impacts traffic forwarding.
- Enabling IPv4 RACL sharing, if previously disabled from the default configuration, requires the restart of software agents on the platform. This is a disruptive process and impacts traffic forwarding. Enabling IPv4 RACL sharing if uRPF is configured will disable uRPF.
- Use **show running-config all | include sharing** command to verify whether or not sharing for egress IPv4 RACLs is enabled.

#### Example

This command verifies whether IPv4 RACL sharing is enabled or disabled.

```
switch#show running-config all | include sharing
hardware access-list resource sharing vlan ipv4 out
----->It returns the following output if IPv4 RACL
sharing is enabled.
```

### 12.3.7.14 hardware access-list update default-result permit

The **hardware access-list update default-result permit** command configures the switch to permit all traffic on Ethernet and VLAN interfaces with ACLs applied to them while those ACLs are being modified. Traffic is permitted when the ACL is available for modification using one of the **ip access-list** commands, and ends when the ACL configuration mode is exited and rules are populated in hardware. This command is disabled by default.

The **no hardware access-list update default-result permit** and **default hardware access-list update default-result permit** commands restore the switch to its default state (blocking traffic during ACL modifications) by removing the corresponding **hardware access-list update default-result permit** command from the *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
hardware access-list update default-result permit
no hardware access-list update default-result permit
default hardware access-list update default-result permit
```

#### Restrictions

This command is available on the Arista 7050X, 7060X, 7150, 7250X, 7280, 7280R, 7300X, 7320X, and 7500 series switches.

This command does not support egress ACLs.

While this command is enabled, static NAT, and ACL-based mirroring are affected during ACL updates.

#### Example

This command configures a 7150 series switch to permit all traffic on Ethernet and VLAN interfaces with ACLs applied to them while those ACLs are being modified.

```
switch(config)#hardware access-list update default-result permit
switch(config)#
```

---

### 12.3.7.15 hardware counter feature acl out

The **hardware counter feature acl out** command enables egress ACL hardware counters for IPv4 or IPv6, which count the number of packets hitting rules associated with egress ACLs applied to various interfaces on a switch.

The **no hardware counter feature acl out** and **default hardware counter feature acl out** commands disable or return the egress ACL hardware counters to the default state.

#### Command Mode

Global Configuration

#### Command Syntax

```
hardware counter feature acl out [OPTIONS]
```

```
no hardware counter feature acl out [OPTIONS]
```

```
default hardware counter feature acl out [OPTIONS]
```

#### Parameters

- *OPTIONS* ACL hardware counter options include:
  - ipv4 Address family IPv4.
  - ipv6 Address family IPv6.

#### Examples

- This command enables IPv4 egress ACL hardware counters.

```
switch(config)#hardware counter feature acl out ipv4  
switch(config)#
```

- This command disables IPv4 egress ACL hardware counters.

```
switch(config)#no hardware counter feature acl out ipv4  
switch(config)#
```

### 12.3.7.16 ip access-group (Service ACLs)

The `ip access-group (Service ACLs)` command configures a Service ACL to be applied by a control-plane service. The service is specified by the command mode in which the Service ACL is applied.

The `no ip access-group (Service ACLs)` and `default ip access-group (Service ACLs)` commands remove the corresponding `ip access-group (Service ACLs)` command from *running-config*.

#### Command Mode

Mgmt-SSH Configuration

Mgmt-API Configuration

Router-BGP Configuration

Router-OSPF Configuration

Router-IGMP Configuration

MPLS-LDP Configuration

Queue-Monitor-Streaming Configuration

MPLS-Ping Configuration

Mgmt-Telnet Configuration

#### Command Syntax

```
ip access-group acl_name [vrfvrf_name][in]  
no ip access-group acl_name [vrfvrf_name][in]  
default ip access-group acl_name [vrfvrf_name][in]
```

#### Parameters

Parameters vary by process.

- *acl\_name* Name of the Service ACL assigned to control-plane service.
- *vrf vrf\_name* Specifies the VRF in which the Service ACL is to be applied.
- *in* Specifies inbound connections or packets only (keyword required for SSH and Telnet services).

#### Example

These commands apply the Service ACL *bgpacl* to the BGP routing protocol in VRF *purple*.

```
(config)# router bgp 5  
(config-router-bgp)# vrf purple  
(config-router-bgp-vrf-purple)# ip access-group bgpacl
```

For additional configuration examples, see [Configuring Service ACLs and Displaying Status and Counters](#).

---

### 12.3.7.17 ip access-group

The `ip access-group` command applies an IPv4 or standard IPv4 access control list (ACL) to the configuration mode interface or subinterface.

The `no ip access-group` and `default ip access-group` commands remove the corresponding `ip access-group` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip access-group list_name DIRECTION
```

```
no ip access-group list_name DIRECTION
```

```
default ip access-group list_name DIRECTION
```

#### Parameters

- *list\_name* Name of ACL assigned to interface.
- DIRECTION Transmission direction of packets, relative to interface. Valid options include:
  - in Inbound packets.
  - out Outbound packets.

#### Restrictions

Filtering of outbound packets by ACLs is not supported on Petra platform switches.

Filtering of outbound packets by ACLs on FM6000 switches is supported on physical interfaces only (Ethernet and port channels).

ACLs on sub-interfaces are supported on DCS-7280E, DCS-7500E, DCS-7280R, and DCS-7500R.

#### Example

These commands apply the IPv4 ACL named *test2* to *Ethernet interface 3*.

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#ip access-group test2 in
switch(config-if-Et3)#
```

### 12.3.7.18 ip access-list standard

The **ip access-list standard** command places the switch in std-ACL configuration mode, which is a group change mode that modifies a standard IPv4 access control list. The command specifies the name of the standard IPv4 ACL that subsequent commands modify, and creates an ACL if it references a nonexistent list. All group change mode edit session changes are pending until the session ends.

The **exit** command saves pending ACL changes to **running-config**, then returns the switch to global configuration mode. Pending changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no ip access-list standard** and **default ip access-list standard** commands delete the specified ACL.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip access-list standard list_name
no ip access-list standard list_name
default ip access-list standard list_name
```

#### Parameters

- **list\_name** Name of standard ACL. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

#### Commands Available in std-ACL configuration mode:

- [deny \(Standard IPv4 ACL\)](#)
- [no <sequence number> \(ACLs\)](#)
- [permit \(Standard IPv4 ACL\)](#)
- [remark](#)
- [resequence \(ACLs\)](#)
- [show \(ACL configuration modes\)](#)

#### Related Commands

- [ip access-list](#) Enters ACL configuration mode for editing IPv4 ACLs.
- [show ip access-lists](#) Displays IPv4 and standard IPv4 ACLs.

#### Examples

- This command places the switch in std-ACL configuration mode to modify the **filter2** IPv4 ACL.

```
switch(config)#ip access-list standard filter2
switch(config-std-acl-filter2)#
```

- This command saves changes to **filter2** ACL, then returns the switch to global configuration mode.

```
switch(config-std-acl-filter2)#exit
switch(config)#
```

- This command discards changes to **filter2**, then returns the switch to global configuration mode.

```
switch(config-std-acl-filter2)#abort
switch(config)#
```

---

### 12.3.7.19 ip access-list

The **ip access-list** command places the switch in ACL configuration mode, which is a group change mode that modifies an IPv4 access control list. The command specifies the name of the IPv4 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The **exit** command saves pending ACL changes to **running-config**, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no ip access-list** and **default ip access-list** commands delete the specified IPv4 ACL.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip access-list list_name
no ip access-list list_name
default ip access-list list_name
```

#### Parameters

- *list\_name* Name of ACL. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

#### Commands Available in ACL configuration mode:

- [deny \(IPv4 ACL\)](#)
- [no <sequence number> \(ACLs\)](#)
- [permit \(IPv4 ACL\)](#)
- [remark](#)
- [resequence \(ACLs\)](#)
- [show \(ACL configuration modes\)](#)

#### Related Commands:

- [ip access-list standard](#) Enters **std-acl configuration mode** for editing standard IP ACLs.
- [show ip access-lists](#) Displays IP and standard ACLs.

#### Examples

- This command places the switch in ACL configuration mode to modify the **filter1** IPv4 ACL.

```
switch(config)#ip access-list filter1
switch(config-acl-filter1)#
```

- This command saves changes to **filter1** ACL, then returns the switch to global configuration mode.

```
switch(config-acl-filter1)#exit
switch(config)#
```

- This command discards changes to **filter1**, then returns the switch to global configuration mode.

```
switch(config-acl-filter1)#abort
switch(config)#
```

### 12.3.7.20 ip prefix-list

The **ip prefix-list** command creates a prefix list or adds an entry to an existing list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains.

A prefix list comprises all prefix list entries with the same label. The sequence numbers of the rules in a prefix list specify the order that the rules are applied to a route that the match command is evaluating.

The **no ip prefix-list** and **default ip prefix-list** commands delete the specified prefix list entry by removing the corresponding **ip prefix-list** statement from *running-config*. If the **no** or **default ip prefix-list** command does not list a sequence number, the command deletes all entries of the prefix list.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip prefix-list list_name [SEQUENCE] FILTER_TYPE network_addr [MASK]
```

```
no ip prefix-list list_name [SEQUENCE]
```

```
default ip prefix-list list_name [SEQUENCE]
```

#### Parameters

- *list\_name* The label that identifies the prefix list.
- SEQUENCE Sequence number of the prefix list entry. Options include
  - *<no parameter>* Entry's number is ten plus highest sequence number in current list.
  - seq *seq\_num* Number assigned to entry. Value ranges from 0 to 65535.
- FILTER\_TYPE Specifies route access when it matches IP prefix list. Options include:
  - permit Routes are permitted access when they match the specified subnet.
  - deny Routes are denied access when they match the specified subnet.
- *network\_addr* Subnet upon which command filters routes. Format is CIDR or address-mask.
- MASK Range of the prefix to be matched.
  - *<no parameter>* Exact match with the subnet mask is required.
  - eq *mask\_e* Prefix length is equal to *mask\_e*.
  - ge *mask\_g* Range is from *mask\_g* to 32.
  - le *mask\_l* Range is from *subnet* mask length to *mask\_l*.
  - ge *mask\_l* le *mask\_g* Range is from *mask\_g* to *mask\_l*.

*mask\_e*, *mask\_l*, and *mask\_g* range from 1 to 32. When le and ge are specified, *subnet* mask > *mask\_g*>*mask\_l*.

#### Example .

- This command places the switch in IPv4 prefix list configuration mode to create an IPv4 prefix list named *route-one*.

```
switch(config)#ip prefix-list route-one
switch(config-ip-pfx)#
```

- These commands create four different rules for the prefix-list named *route-one*.

```
switch(config)#ip prefix-list route-one
switch(config-ip-pfx)#seq 10 deny 10.1.1.0/24
switch(config-ip-pfx)#seq 20 deny 10.1.0.0/16
switch(config-ip-pfx)#seq 30 permit 12.15.4.9/32
switch(config-ip-pfx)#seq 40 deny 1.1.1.0/24
```

---

### 12.3.7.21 ipv6 access-group (Service ACLs)

The `ipv6 access-group (Service ACLs)` command configures an IPv6 or standard IPv6 Service ACL to be applied by a control-plane service. The service is specified by the command mode in which the Service ACL is applied.

The `no ipv6 access-group (Service ACLs)` and `default ipv6 access-group (Service ACLs)` commands remove the corresponding `ipv6 access-group (Service ACLs)` command from *running-config*.

#### Command Mode

Mgmt-SSH Configuration

Mgmt-API Configuration

Router-BGP Configuration

Router-OSPF Configuration

MPLS-LDP Configuration

Queue-Monitor-Streaming Configuration

MPLS-Ping Configuration

Mgmt-Telnet Configuration

#### Command Syntax

```
ipv6 access-group ipv6_acl_name [vrf vrf_name][in]
```

```
no ipv6 access-group [ipv6_acl_name][vrf vrf_name][in]
```

```
default ipv6 access-group ipv6_acl_name [vrf vrf_name][in]
```

#### Parameters

Parameters vary by process.

- *ipv6\_acl\_name* Name of the IPv6 Service ACL assigned to control-plane service.
- *vrf vrf\_name* Specifies the VRF in which the Service ACL is to be applied.
- *in* Specifies inbound connections or packets only (keyword required for SSH and Telnet services).

#### Example

These commands apply the IPv6 Service ACL *bgpacl* to the BGP routing protocol in VRF *purple*.

```
(config)#router bgp 5
(config-router-bgp)#vrf purple
(config-router-bgp-vrf-purple)#ipv6 access-group bgpacl
```

For additional configuration examples, see [Configuring Service ACLs and Displaying Status and Counters](#).

### 12.3.7.22 ipv6 access-group

The **ipv6 access-group** command applies an IPv6 or standard IPv6 access control list (ACL) to the configuration mode interface.

The **no ipv6 access-group** and **default ipv6 access-group** commands remove the corresponding **ipv6 access-group** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ipv6 access-group list_name DIRECTION
```

```
no ipv6 access-group list_name DIRECTION
```

```
default ipv6 access-group list_name DIRECTION
```

#### Parameters

- *list\_name* Name of ACL assigned to interface.
- DIRECTION Transmission direction of packets, relative to interface. Valid options include:
  - in Inbound packets.
  - out Outbound packets.

#### Examples

These commands assign the IPv6 ACL named *test2* to the *Ethernet 3 interface*.

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#ipv6 access-group test2 in
switch(config-if-Et3)#
```

---

### 12.3.7.23 ipv6 access-list standard

The **ipv6 access-list standard** command places the switch in std-IPv6-ACL-configuration mode, which is a group change mode that modifies a standard IPv6 access control list. The command specifies the name of the standard IPv6 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All group change mode edit session changes are pending until the session ends.

The **exit** command saves pending ACL changes to **running-config**, then returns the switch to global configuration mode. Pending changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no ipv6 access-list standard** and **default ipv6 access-list standard** commands delete the specified ACL.

#### Command Mode

Global Configuration

#### Command Syntax

```
ipv6 access-list standard list_name
no ipv6 access-list standard list_name
default ipv6 access-list standard list_name
```

#### Parameters

*list\_name* Name of ACL. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

#### Commands Available in std-IPv6-ACL configuration mode:

- [deny \(Standard IPv6 ACL\)](#)
- [no <sequence number> \(ACLs\)](#)
- [permit \(Standard IPv6 ACL\)](#)
- [remark](#)
- [resequence \(ACLs\)](#)
- [show \(ACL configuration modes\)](#)

#### Related Commands

- [ipv6 access-list](#) Enters IPv6-ACL configuration mode for editing IPv6 ACLs.
- [show ipv6 access-lists](#) Displays IPv6 and standard IPv6 ACLs.

#### Examples

- This command places the switch in Std-IPv6 ACL configuration mode to modify the *filter2* ACL.

```
switch(config)#ipv6 access-list standard filter2
switch(config-std-ipv6-acl-filter2)#
```

- This command saves changes to *filter2* ACL, then returns the switch to global configuration mode.

```
switch(config-std-ipv6-acl-filter2)#exit
switch(config)#
```

- This command discards changes to *filter2*, then returns the switch to global configuration mode.

```
switch(config-std-ipv6-acl-filter2)#abort
switch(config)#
```

### 12.3.7.24 ipv6 access-list

The **ipv6 access-list** command places the switch in IPv6-ACL configuration mode, which is a group change mode that modifies an IPv6 access control list. The command specifies the name of the IPv6 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The **exit** command saves pending ACL changes to **running-config**, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no ipv6 access-list** and **default ipv6 access-list** commands delete the specified IPv6 ACL.

#### Command Mode

Global Configuration

#### Command Syntax

```
ipv6 access-list list_name
no ipv6 access-list list_name
default ipv6 access-list list_name
```

#### Parameters

*list\_name* Name of ACL. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

#### Commands Available in IPv6-ACL configuration mode:

- [deny \(IPv6 ACL\)](#)
- [no <sequence number> \(ACLs\)](#)
- [permit \(IPv6 ACL\)](#)
- [remark](#)
- [resequence \(ACLs\)](#)
- [show \(ACL configuration modes\)](#)

#### Related Commands

- [ipv6 access-list standard](#) Enters std-ipv6-acl configuration mode for editing standard IPv6 ACLs.
- [show ipv6 access-lists](#) Displays IPv6 and standard IPv6 ACLs.

#### Examples

- This command places the switch in IPv6-ACL configuration mode to modify the *filter1* IPv6 ACL.

```
switch(config)#ipv6 access-list filter1
switch(config-ipv6-acl-filter1)#
```

- This command saves changes to *filter1* ACL, then returns the switch to global configuration mode.

```
switch(config-ipv6-acl-filter1)#exit
switch(config)#
```

- This command discards changes to *filter1*, then returns the switch to global configuration mode.

```
switch(config-ipv6-acl-filter1)#abort
switch(config)#
```

---

### 12.3.7.25 ipv6 prefix-list

The **ip prefix-list** command places the switch in IPv6 prefix-list configuration mode, which is a group change mode that modifies an IPv6 prefix list. The command specifies the name of the IPv6 prefix list that subsequent commands modify and creates a prefix list if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The **exit** command saves pending prefix list changes to **running-config**, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no ipv6 prefix-list** and **default ipv6 prefix-list** commands delete the specified IPv6 prefix list.

#### Command Mode

Global Configuration

#### Command Syntax

```
ipv6 prefix-list list_name
no ipv6 prefix-list list_name
default ipv6 prefix-list list_name
```

#### Parameters

- *list\_name* Name of prefix list. Must begin with an alphabetic character. Cannot contain spaces or quotation marks.

#### Commands Available in IPv6-pfx configuration mode:

- [deny \(IPv6 Prefix List\)](#).
- [permit \(IPv6 Prefix List\)](#).
- [seq \(IPv6 Prefix Lists\)](#).

#### Examples

- This command places the switch in IPv6 prefix-list configuration mode to modify the *route-five* prefix list.

```
switch(config)#ipv6 prefix-list route-five
switch(config-ipv6-pfx)#
```

- This command saves changes to the prefix list, then returns the switch to global configuration mode.

```
switch(config-ipv6-pfx)#exit
switch(config)#
```

- This command saves changes to the prefix list, then places the switch in interface-Ethernet mode.

```
switch(config-ipv6-pfx)#interface ethernet 3
switch(config-if-Et3)#
```

- This command discards changes to the prefix list, then returns the switch to global configuration mode.

```
switch(config-ipv6-pfx)#abort
switch(config)#
```

### 12.3.7.26 mac access-group

The **mac access-group** command applies a MAC access control list (MAC ACL) to the configuration mode interface.

The **no mac access-group** and **default mac access-group** commands remove the specified **mac access-group** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

*list\_name* DIRECTION

*list\_name* DIRECTION

*list\_name* DIRECTION

#### Parameters

- *list\_name* Name of MAC ACL.
- DIRECTION Transmission direction of packets, relative to interface. Valid options include:
  - in Inbound packets.
  - out Outbound packets.

#### Restrictions

Filtering of outbound packets by MAC ACLs is supported only on Helix, Trident, and Trident II platform switches.

#### Example

These commands assign the MAC ACL named *mtest2* to *interface Ethernet 3* to filter inbound packets.

```
switch(config)#interface ethernet 3
switch(config-if-Et3)#mac access-group mtest2 in
switch(config-if-Et3)#
```

---

### 12.3.7.27 mac access-list

The **mac access-list** command places the switch in MAC-ACL configuration mode, which is a group change mode that modifies a MAC access control list. The command specifies the name of the MAC ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending until the end of the session.

The **exit** command saves pending ACL changes to **running-config**, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **abort** command discards pending ACL changes, returning the switch to global configuration mode.

The **no mac access-list** and **default mac access-list** commands delete the specified list.

#### Command Mode

Global Configuration

#### Command Syntax

```
mac access-list list_name
```

```
no mac access-list list_name
```

```
default mac access-list list_name
```

#### Parameters

*list\_name* Name of MAC ACL. Names must begin with an alphabetic character and cannot contain a space or quotation mark.

#### Commands Available in MAC-ACL configuration mode:

- [deny \(MAC ACL\)](#)
- [no <sequence number> \(ACLs\)](#)
- [permit \(MAC ACL\)](#)
- [remark](#)
- [resequence \(ACLs\)](#)
- [show \(ACL configuration modes\)](#)

#### Examples

- This command places the switch in MAC-ACL configuration mode to modify the *mfilter1* MAC ACL.

```
switch(config)#mac access-list mfilter1  
switch(config-mac-acl-mfilter1)#
```

- This command saves changes to *mfilter1* ACL, then returns the switch to global configuration mode.

```
switch(config-mac-acl-mfilter1)#exit  
switch(config)#
```

- This command saves changes to *mfilter1* ACL, then places the switch in interface-Ethernet mode.

```
switch(config-mac-acl-mfilter1)#interface ethernet 3  
switch(config-if-Et3)#
```

- This command discards changes to *mfilter1*, then returns the switch to global configuration mode.

```
switch(config-mac-acl-mfilter1)#abort  
switch(config)#
```

### 12.3.7.28 match (route-map)

The **match** command creates a route map statement entry that specifies one route filtering command. When a statement contains multiple match commands, the permit or deny filter applies to a route only if its properties are equal to corresponding parameters in each **match** command. When a route properties do not equal the command parameters, the route is evaluated against the next statement in the route map, as determined by sequence number. If all statements fail to permit or deny the route, the route is denied.

The **no match** and **default match** commands remove the **match** command from the configuration mode route map statement by deleting the corresponding command from **running-config**.

**Note:** The route map configuration supports only standard ACL.

#### Command Mode

Route-Map Configuration

#### Command Syntax

`match` CONDITION

`no match` CONDITION

`default match` CONDITION

#### Parameters

- **CONDITION** Specifies criteria for evaluating a route. Options include:
  - `as <1 to 4294967295>` BGP Autonomous System number.
  - `as-path path_name` BGP Autonomous System path access list.
  - `community NAME` BGP community. Options for NAME include:
    - `listname` BGP community.
    - `listname exact-match` BGP community; list must match set that is present.
  - **extcommunity listname** BGP extended community. Options for NAME include:
    - `listname` BGP community.
    - `listname exact-match` BGP community; list must match set that is present.
  - `interface INTF_NAME` Specifies an interface. Options for INTF\_NAME include:
    - `ethernet e_num` Ethernet interface.
    - `loopback l_num` Loopback interface.
    - `port-channel p_num` Port channel interface.
    - `vlan v_num` VLAN interface.
  - `ip address LIST` IPv4 address filtered by an ACL or prefix list. LIST options include:
    - `access-list acl_name` IPv4 address filtered by access control list (ACL).
    - `prefix-list plv4_name` IPv4 address filtered by IP prefix list.
  - `ip next-hop prefix-list plv4_name` IPv4 next-hop filtered by IP prefix list.
  - `ip resolved-next-hop prefix-list plv4_name` IPv4 resolved nexthop filtered by IP prefix list.
  - `ipv6 address prefix-list plv6_name` IPv6 address filtered by IPv6 prefix list.
  - `ipv6 next-hop prefix-list plv6_name` IPv6 next-hop filtered by IPv6 prefix list.
  - `ipv6 resolved-next-hop prefix-list plv6_name` IPv6 resolved nexthop filtered by IPv6 prefix list.
  - `local-preference <1 to 4294967295>` BGP local preference metric.
  - `metric <1 to 4294967295>` Route metric.
  - `metric-type OSPF_TYPE` OSPF metric type. Options include:
    - `type-1` OSPF type 1 metric.
    - `type-2` OSPF type 2 metric.

- 
- source-protocol *protocol\_type* Routing protocol of route's source. Options include:
    - bgp
    - connected
    - ospf
    - rip
    - static
  - tag <1 to 4294967295> Route tag.

#### Related Command

[route-map](#).

#### Example

This command creates a route map match rule that filters routes from BGP AS 15.

```
switch(config)#route-map map1
switch(config-route-map-map1)#match as 15
switch(config-route-map-map1)#
```

### 12.3.7.29 no <sequence number> (ACLs)

The **no <sequence number>** command removes the rule with the specified sequence number from the ACL. The **default <sequence number>** command also removes the specified rule.

#### Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

#### Command Syntax

no *line\_num*

default *line\_num*

#### Parameters

*line\_num* Sequence number of rule to be deleted. Values range from 1 - 4294967295.

#### Example

This command removes statement 30 from the list.

```
switch(config-acl-test1)#show IP Access List test1
 10 permit ip 10.10.10.0/24 any
 20 permit ip any host 10.20.10.1
 30 deny ip host 10.10.10.1 host 10.20.10.1
 40 permit ip any any
 50 remark end of list
switch(config-acl-test1)#no 30
switch(config-acl-test1)#show IP Access List test1
 10 permit ip 10.10.10.0/24 any
 20 permit ip any host 10.20.10.1
 40 permit ip any any
 50 remark end of list
```

---

### 12.3.7.30 permit (IPv4 ACL)

The **permit** command adds a permit rule to the configuration mode IPv4 access control list (ACL). Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes a specified rule from the ACL.

#### Command Mode

ACL Configuration

#### Command Syntax

```
[SEQ_NUM] permit PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT]
[FLAGS][MESSAGE][fragments][tracked][DSCP_FILTER][TTL_FILTER][log]
```

```
no permit PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT][FLAGS
[MESSAGE] [fragments] [tracked][DSCP_FILTER][TTL_FILTER][log]
```

```
default permit PROTOCOL SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT]
[FLAGS][MESSAGE][fragments][tracked][DSCP_FILTER][TTL_FILTER][log]
```

Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a permit rule.

#### Parameters

- SEQ\_NUM Sequence number assigned to the rule. Options include:
  - *<no parameter>* Number is derived by adding 10 to the number of the ACL's last rule.
  - *<1 - 4294967295>* Number assigned to entry.
- PROTOCOL Protocol field filter. Values include:
  - *ahp* Authentication Header Protocol (51).
  - *gre* Generic Routing Encapsulation.
  - *gtp* GPRS Tunneling Protocol.
  - *icmp* Internet Control Message Protocol (1).
  - *igmp* Internet Group Management Protocol (2).
  - *ip* Any Internet Protocol v4 (4).
  - *ospf* Open Shortest Path First (89).
  - *pim* Protocol Independent Multicast (103).
  - *tcp* Transmission Control Protocol (6).
  - *udp* User datagram protocol (17).
  - *vlan* Enter VLAN number. Value ranges from 1 to 4094.
  - *vrp* Virtual Router Redundancy Protocol (112).
  - *protocol\_num* Integer corresponding to an IP protocol. Values range from 0 to 255.
- SOURCE\_ADDR and DEST\_ADDR Source and destination address filters. Options include:
  - *network\_addr* subnet address (CIDR or address-mask).
  - *any* Packets from all addresses are filtered.
  - *host ip\_addr* IP address (dotted decimal notation).

Source and destination subnet addresses support discontinuous masks.
- SOURCE\_PORT and DEST\_PORT Source and destination port filters. Options include:
  - *any* All ports.
  - *eq port-1 port-2 ... port-n* A list of ports. Maximum list size is 10 ports.
  - *neq port-1 port-2 ... port-n* The set of all ports not listed. Maximum list size is 10 ports.

- `gt port` The set of ports with larger numbers than the listed port.
- `lt port` The set of ports with smaller numbers than the listed port.
- `range port_1 port_2` The set of ports whose numbers are between the range.
- `fragments` Filters packets with FO bit set (indicates a non-initial fragment packet).
- `FLAGS` Flags bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- `MESSAGE` Message type filters (ICMP packets). Use CLI syntax assistance (?) to display options.
- `tracked` Rule filters packets in existing ICMP, UDP, or TCP connections.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.
- `DSCP_FILTER` Rule filters packet by its DSCP value. Values include:
  - `<no parameter>` Rule does not use DSCP to filter packets.
  - `dscp dscp_value` Packets match if DSCP field in packet is equal to `dscp_value`.
- `TTL_FILTER` Rule filters packet by its TTL (time-to-live) value. Values include:
  - `ttl eq ttl_value` Packets match if `ttl` in packet is equal to `ttl_value`.
  - `ttl gt ttl_value` Packets match if `ttl` in packet is greater than `ttl_value`.
  - `ttl lt ttl_value` Packets match if `ttl` in packet is less than `ttl_value`.
  - `ttl neq ttl_value` Packets match if `ttl` in packet is not equal to `ttl_value`.
    - Valid in ACLs applied to the control plane.
    - Validity in ACLs applied to data plane varies by switch platform.
- `log` Triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.

### Examples

- This command appends a `permit` statement at the end of the ACL. The `permit` statement passes all OSPF packets from `10.10.1.1/24` to any host.

```
switch(config)#ip access-list text1
switch(config-acl-text1)#permit ospf 10.1.1.0/24 any
switch(config-acl-text1)#
```

- This command inserts a `permit` statement with the sequence number 25. The `permit` statement passes all PIM packets through the interface.

```
switch(config-acl-text1)#25 permit pim any any
switch(config-acl-text1)#
```

- These commands configure ACL to permit VLAN traffic between any source and destination host.

```
switch(config)#ip access-list acl1
switch(config-acl-acl1)#permit vlan 1234 0x0 ip any any
```

### 12.3.7.31 permit (IPv6 ACL)

The **permit** command adds a permit rule to the configuration mode IPv6 access control list (ACL). Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes a specified rule from the ACL.

#### Command Mode

IPv6-ACL Configuration

#### Command Syntax

```
[SEQ_NUM] permit PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT][FLAG] [MSG] [HOP]
[tracked] [DSCP_FILTER] [log]
```

```
no permit PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT][FLAG][MSG] [HOP][tracked]
[DSCP_FILTER][log]
```

```
default permit PROT SRC_ADDR [SRC_PT] DEST_ADDR [DEST_PT][FLAG][MSG] [HOP]
[tracked][DSCP_FILTER][log]
```

**Note:** Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a permit rule.

#### Parameters

- SEQ\_NUM Sequence number assigned to the rule. Options include:
  - *<no parameter>* Number is derived by adding 10 to the number of the ACL's last rule.
  - *<1 - 4294967295>* Number assigned to entry.
- PROT Protocol field filter. Values include:
  - icmpv6 Internet Control Message Protocol for v6 (58).
  - ipv6 Internet Protocol IPv6 (41).
  - ospf Open Shortest Path First (89).
  - tcp Transmission Control Protocol (6).
  - udp User Datagram Protocol (17).
  - vlan Enter VLAN number. Value ranges from 1 to 4094.
  - *protocol\_num* Integer corresponding to an IP protocol. Values range from 0 to 255.
- SRC\_ADDR and DEST\_ADDR Source and destination address filters. Options include:
  - *ipv6\_prefix* IPv6 address with prefix length (CIDR notation).
  - any Packets from all addresses are filtered.
  - host *ipv6\_addr* IPv6 host address.
- SRC\_PT and DEST\_PT Source and destination port filters. Options include:
  - any All ports.
  - eq *port-1 port-2 ... port-n* A list of ports. Maximum list size is 10 ports.
  - neq *port-1 port-2 ... port-n* The set of all ports not listed. Maximum list size is 10 ports.
  - gt *port* The set of ports with larger numbers than the listed port.
  - lt *port* The set of ports with smaller numbers than the listed port.
  - range *port\_1 port\_2* The set of ports whose numbers are between the range.
- HOP Filters by packet's hop-limit value. Options include:
  - *<no parameter>* Rule does not use hop limit to filter packets.
  - hop-limit eq *hop\_value* Packets match if **hop-limit** value in packet equals *hop\_value*.

- **hop-limit gt** *hop\_value* Packets match if **hop-limit** in packet is greater than *hop\_value*.
- **hop-limit lt** *hop\_value* Packets match if **hop-limit** in packet is less than *hop\_value*.
- **hop-limit neq** *hop\_value* Packets match if **hop-limit** in packet is not equal to *hop\_value*.
- **FLAG** Flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- **MSG** Message type filters (ICMPv6 packets). Use CLI syntax assistance (?) to display options.
- **tracked** Rule filters packets in existing ICMP, UDP, or TCP connections.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.
- **DSCP\_FILTER** Rule filters packet by its DSCP value. Values include:
  - *<no parameter>* Rule does not use DSCP to filter packets.
  - **dscp** *dscp\_value* Packets match if DSCP field in packet is equal to *dscp\_value*.
- **log** Triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.

### Examples

- This command appends a **permit** statement at the end of the ACL. The **permit** statement passes all IPv6 packets with the source address *3710:249a:c643:ef11::/64* and with any destination address.

```
switch(config)#ipv6 access-list text1
switch(config-acl-text1)#permit ipv6 3710:249a:c643:ef11::/64 any
switch(config-acl-text1)#
```

- These commands configure ACL to permit VLAN traffic between any source and destination host.

```
switch(config)#ip access-list acl1
switch(config-acl-acl1)#permit ipv6 vlan 1234 0x0 ip any any
```

---

### 12.3.7.32 permit (IPv6 Prefix List)

The **permit** command adds a rule to the configuration mode IPv6 prefix list. Route map match commands use prefix lists to filter routes for redistribution into OSPF, RIP, or BGP domains. Routes are redistributed into the specified domain when they match the prefix that a **permit** statement specifies.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode prefix list. The **no seq (IPv6 Prefix Lists)** command also removes the specified rule from the prefix list.

#### Command Mode

IPv6-pfx Configuration

#### Command Syntax

```
[SEQUENCE] permit ipv6_prefix [MASK]
```

#### Parameters

- SEQUENCE Sequence number assigned to the rule. Options include:
  - *<no parameter>* Number is derived by adding 10 to the number of the list's last rule.
  - *seq seq\_num* Number is specified by *seq\_num*. Value ranges from 0 to 65535.
- *ipv6\_prefix* IPv6 prefix upon which command filters routes (CIDR notation).
- MASK Range of the prefix to be matched.
  - *<no parameter>* Exact match with the subnet mask is required.
  - *eq mask\_e* Prefix length is equal to *mask\_e*.
  - *ge mask\_g* Range is from *mask\_g* to 128.
  - *le mask\_l* Range is from *subnet* mask length to *mask\_l*.
  - *ge mask\_l le mask\_g* Range is from *mask\_g* to *mask\_l*.

*mask\_e, mask\_l and mask\_g range from 1 to 128.*

When *le* and *ge* are specified, the prefix list size *< mask\_g>mask\_l*

#### Example

- This command appends a **permit** statement at the end of the *text1* prefix list. The **permit** statement allows redistribution of routes with the specified prefix.

```
switch(config)#ipv6 prefix-list route-five
switch(config-ipv6-pfx)#permit 3100::/64
switch(config-ipv6-pfx)#
```

### 12.3.7.33 permit (MAC ACL)

The **permit** command adds a permit rule to the configuration mode MAC access control list packets through the interface to which the list is applied. Rule filters include protocol, source, and destination.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

#### Command Mode

MAC-ACL Configuration

#### Command Syntax

```
[SEQ_NUM] permit SOURCE_ADDR DEST_ADDR [PROTOCOL][log]
```

```
no permit SOURCE_ADDR DEST_ADDR [PROTOCOL][log]
```

```
default permit SOURCE_ADDR DEST_ADDR [PROTOCOL][log]
```

#### Parameters

- SEQ\_NUM Sequence number assigned to the rule. Options include:
  - *<no parameter>* Number is derived by adding 10 to the number of the ACL's last rule.
  - *<1 - 4294967295>* Number assigned to entry.
- SOURCE\_ADDR and DEST\_ADDR Source and destination address filters. Options include:
  - *mac\_address mac\_mask* MAC address and mask.
  - any Packets from all addresses are filtered.
  - *mac\_address* Specifies a MAC address in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh).
  - *mac\_mask* Specifies a MAC address mask in 3x4 dotted hexadecimal notation (hhhh.hhhh.hhhh).
  - *0* bits require an exact match to filter.
  - *1* bits filter on any value.
- PROTOCOL Protocol field filter. Values include:
  - *aarp* Appletalk Address Resolution Protocol (0x80f3).
  - *appletalk* Appletalk (0x809b).
  - *arp* Address Resolution Protocol (0x806).
  - *ip* Internet Protocol Version 4 (0x800).
  - *ipx* Internet Packet Exchange (0x8137).
  - *lldp* LLDP (0x88cc).
  - *novell* Novell (0x8138).
  - *rarp* Reverse Address Resolution Protocol (0x8035).
  - *protocol\_num* Integer corresponding to a MAC protocol. Values range from 0 to 65535
- *log* Triggers an informational log message to the console about the matching packet.

#### Examples

- This command appends a **permit** statement at the end of the ACL. The **permit** statement passes all aarp packets from *10.1000.0000* through *10.1000.FFFF* to any host.

```
switch(config)#mac access-list text1
switch(config-mac-acl-text1)#permit 10.1000.0000 0.0.FFFF any aarp
switch(config-mac-acl-text1)#
```

- 
- This command inserts a **permit** statement with the sequence number 25. The **permit** statement passes all packets through the interface.

```
switch(config-mac-acl-text1)#25 permit any any  
switch(config-mac-acl-text1)#
```

### 12.3.7.34 permit (Standard IPv4 ACL)

The **permit** command adds a permit rule to the configuration mode standard IPv4 access control list (ACL). Standard ACL rules filter on the source field.

Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

#### Command Mode

Std-ACL Configuration

#### Command Syntax

```
[SEQ_NUM] permit SOURCE_ADDR [log]
```

```
no permit SOURCE_ADDR [log]
```

```
default permit SOURCE_ADDR [log]
```

#### Parameters

- SEQ\_NUM Sequence number assigned to the rule. Options include:
  - *<no parameter>* Number is derived by adding 10 to the number of the ACL's last rule.
  - *<1 - 4294967295>* Number assigned to entry.
- SOURCE\_ADDR Source address filter. Options include:
  - *network\_addr* Subnet address (CIDR or address-mask).
  - any Packets from all addresses are filtered.
  - *host ip\_addr* IP address (dotted decimal notation).

Subnet addresses support discontinuous masks.
- log Triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.

#### Example

This command appends a **permit** statement at the end of the ACL. The **permit** statement passes all packets with a source address of *10.10.1.1/24*.

```
switch(config)#ip access-list standard text1
switch(config-std-acl-text1)#permit 10.1.1.1/24
switch(config-std-acl-text1)#
```

---

### 12.3.7.35 permit (Standard IPv6 ACL)

The **permit** command adds a permit rule to the configuration mode standard IPv6 access control list. Standard ACL rules filter on the source field.

Packets filtered by a permit rule are accepted by interfaces to which the ACL is applied. Sequence numbers determine rule placement in the ACL. Sequence numbers for commands without numbers are derived by adding 10 to the number of the ACL's last rule.

The **no permit** and **default permit** commands remove the specified rule from the configuration mode ACL. The **no <sequence number> (ACLs)** command also removes the specified rule from the ACL.

#### Command Mode

Std-IPv6-ACL Configuration

#### Command Syntax

```
[SEQ_NUM] permit SOURCE_ADDR
```

```
no permit SOURCE_ADDR
```

```
default permit SOURCE_ADDR
```

#### Parameters

- SEQ\_NUM Sequence number assigned to the rule. Options include:
  - *<no parameter>* Number is derived by adding 10 to the number of the ACL's last rule.
  - *<1 - 4294967295>* Number assigned to entry.
- SOURCE\_ADDR Source address filter. Options include:
  - *ipv6\_prefix* IPv6 address with prefix length (CIDR notation).
  - any Packets from all addresses are filtered.
  - *host ipv6\_addr* IPv6 host address.

#### Example

This command appends a **permit** statement at the end of the ACL. The **permit** statement drops packets with a source address of *2103::/64*.

```
switch(config)#ipv6 access-list standard text1
switch(config-std-acl-ipv6-text1)#permit 2103::/64
switch(config-std-acl-ipv6-text1)#
```

### 12.3.7.36 remark

The **remark** command adds a non-executable comment statement into the pending ACL. Remarks entered without a sequence number are appended to the end of the list. Remarks entered with a sequence number are inserted into the list as specified by the sequence number.

The **default remark** command removes the comment statement from the ACL.

The **no remark** command removes the comment statement from the ACL. The command can specify the remark by content or by sequence number.

#### Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

#### Command Syntax

```
remark text
```

```
line_num remark [text]
```

```
no remark text
```

```
default remark text
```

#### Parameters

- *text* The comment text.
- *line\_num* Sequence number assigned to the remark statement. Value ranges from 1 - 4294967295.

#### Example

This command appends a comment to the list.

```
switch(config-acl-test1)#remark end of list
switch(config-acl-test1)#show
IP Access List test1
 10 permit ip 10.10.10.0/24 any
 20 permit ip any host 10.20.10.1
 30 deny ip host 10.10.10.1 host 10.20.10.1
 40 permit ip any any
 50 remark end of list
```

---

### 12.3.7.37 resequence (ACLs)

The **resequence** command assigns sequence numbers to rules in the configuration mode ACL. Command parameters specify the number of the first rule and the numeric interval between consecutive rules.

Maximum rule sequence number is 4294967295.

#### Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

#### Command Syntax

```
resequence [start_num [inc_num]]
```

#### Parameters

- *start\_num* Sequence number assigned to the first rule. Default is 10.
- *inc\_num* Numeric interval between consecutive rules. Default is 10.

#### Example

The **resequence** command rennumbers the list, starting the first command at number 100 and incrementing subsequent lines by 20.

- ```
switch(config-acl-test1)#show
IP Access List test1
 10 permit ip 10.10.10.0/24 any
 20 permit ip any host 10.20.10.1
 30 deny ip host 10.10.10.1 host 10.20.10.1
 40 permit ip any any
 50 remark end of list
switch(config-acl-test1)#resequence 100 20
switch(config-acl-test1)#show
IP Access List test1
 100 permit ip 10.10.10.0/24 any
 120 permit ip any host 10.20.10.1
 140 deny ip host 10.10.10.1 host 10.20.10.1
 160 permit ip any any
 180 remark end of list
```

### 12.3.7.38 route-map

The **route-map** command places the switch in route map configuration mode, which is a group change mode that modifies a route map statement. The command specifies the name and number of the route map statement that subsequent commands modify and creates a route map statement if it references a nonexistent statement. All changes in a group change mode edit session are pending until the end of the session.

Route maps define commands for redistributing routes between routing protocols. A route map statement is identified by a name, filter type (permit or deny), and sequence number. Statements with the same name are components of a single route map; the sequence number determines the order in which the statements are compared to a route.

The **exit** command saves pending route map statement changes to **running-config**, then returns the switch to global configuration mode. ACL changes are also saved by entering a different configuration mode.

The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no route-map** and **default route-map** commands delete the specified route map statement from **running-config**.

**Note:** The route map configuration supports only standard ACL.

#### Command Mode

Global Configuration

#### Command Syntax

```
route-map map_name [FILTER_TYPE] [sequence_number]
no route-map map_name [FILTER_TYPE] [sequence_number]
default route-map map_name [FILTER_TYPE][sequence_number]
```

#### Parameters

- *map\_name* Label assigned to route map. Protocols reference this label to access the route map.
- *FILTER\_TYPE* Disposition of routes matching commands specified by route map statement.
  - permit Routes are redistributed when they match route map statement.
  - deny Routes are not redistributed when they match route map statement.
  - *<No parameter>* Ssigns **permit** as the *FILTER\_TYPE*.

When a route does not match the route map criteria, the next statement within the route map is evaluated to determine the redistribution action for the route.

- *sequence\_number* The route map position relative to other statements with the same name.
  - *<no parameter>* Sequence number of 10 (default) is assigned to the route map.
  - *<1-16777215>* Specifies sequence number assigned to route map.

#### Commands Available in route map configuration mode:

- [continue \(route map\)](#)
- [match \(route-map\)](#)
- [set \(route-map\)](#)

#### Examples

- This command creates the route map named *map1* and places the switch in route map configuration mode. The route map is configured as a permit map.

```
switch(config)#route-map map1 permit 20
switch(config-route-map-map1)#
```

- 
- This command saves changes to *map1* route map, then returns the switch to global configuration mode.

```
switch(config-route-map-map1) #exit  
switch(config) #
```

- This command saves changes to *map1* route map, then places the switch in interface-Ethernet mode.

```
switch(config-route-map-map1) #interface ethernet 3  
switch(config-if-Et3) #
```

- This command discards changes to *map1* route map, then returns the switch to global configuration mode.

```
switch(config-route-map-map1) #abort  
switch(config) #
```

### 12.3.7.39 seq (IPv6 Prefix Lists)

The **no seq** command removes the rule with the specified sequence number from the ACL. The **default seq** command also removes the specified rule.

The **seq** keyword is a command option used at the beginning of [deny \(IPv6 Prefix List\)](#) and [permit \(IPv6 Prefix List\)](#) commands that places a new rule between two existing rules.

#### Command Mode

IPv6-pfx Configuration

#### Command Syntax

```
no seq line_num
```

```
default seq line_num
```

#### Parameters

- *line\_num* Sequence number of rule to be deleted. Valid rule numbers range from 0 to 65535.

#### Example

These commands remove rule 20 from the *map1* prefix list, then displays the resultant list.

```
switch(config)#ipv6 prefix-list map1
switch(config-ipv6-pfx)#no seq 20
switch(config-ipv6-pfx)#exit
switch(config)#show ipv6 prefix-list map1
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 30 permit 3:1bca:3ff2:634a::/64
seq 40 permit 3:1bca:1141:ab34::/64
switch(config)#
```

### 12.3.7.40 set (route-map)

The **set** command specifies modifications to routes that are selected for redistribution by the configuration mode route map.

The **no set** and **default set** commands remove the specified **set** command from the configuration mode route map statement by deleting the corresponding **set** command from **running-config**.

#### Command Mode

Route-Map Configuration

#### Command Syntax

```
set CONDITION
```

```
no set CONDITION
```

```
default set CONDITION
```

#### Parameters

- **CONDITION** Specifies the route modification parameter and value. Options include:
  - **as-path prepend** BGP AS number that is prepended to as-path. For details, see the [set as-path prepend](#) command.
    - `<1 - 4294967295>` BGP AS number to prepend.
    - **auto** Use peer AS number for inbound and local AS for outbound to prepend.
  - **distance** `<1 - 255>` Protocol independent administrative distance.
  - **ip next-hop** `ipv4_address` Next hop IPv4 address.
  - **ip next-hop peer-address** Use BGP peering address as next hop IPv4 address.
  - **ipv6 next-hop** `ipv6_address` Next hop IPv6 address.
  - **ipv6 next-hop peer-address** Use BGP peering address as next hop IPv6 address.
  - **local-preference** `<1 - 4294967295>` BGP local preference metric.
  - **metric** `<1 - 4294967295>` Route metric.
  - **metric +** `<1 - 4294967295>` Add specified value to current route metric.
  - **metric -** `<1 - 4294967295>` Subtract specified value to current route metric.
  - **metric-type** OSPF\_TYPE OSPF metric type. Options include:
    - **type-1** OSPF type 1 metric.
    - **type-2** OSPF type 2 metric.
  - **origin** O\_TYPE BGP origin attribute. Options for O\_TYPE include:
    - **egp** Exterior BGP route.
    - **igp** Interior BGP route.
    - **incomplete** BGP route of unknown origin.
  - **tag** `<1 - 4294967295>` Route tag.
  - **weight** `<1 - 65535>` BGP weight parameter.

#### Related Commands

- [route-map](#) enters route-map configuration mode.
- [set \(route-map\)](#) specifies community modifications for the redistributed routes.
- [set community \(route-map\)](#) specifies extended community modifications for the redistributed routes.

#### Example

This command creates a route map entry that sets the local preference metric to 100 on redistributed routes.

```
switch(config)#route-map map1
```

```
switch(config-route-map-map1)#set local-preference 100  
switch(config-route-map-map1)#
```

### 12.3.7.41 set as-path match

The **set as-path match** command configures the AS\_PATH attribute for prefixes that are either received from a BGP neighbor or advertised to a BGP neighbor in the route map configuration mode.

The **no set as-path match** command removes the AS path specified for the BGP prefix.

#### Command Mode

Route-Map Configuration

#### Command Syntax

```
set as-path match all replacement [[none | auto] as_path]
```

```
no set as-path match all replacement [[none | auto] as_path]
```

#### Parameters

- **none** Replaces the AS-Path of the matching routes with a null or an empty AS-Path.
- **auto** If the specific route map is applied as an inbound policy to a corresponding BGP neighbor statement, then replace the AS\_PATH of the prefixes received from this neighbor with the neighbor's AS number. If this route map is applied as an outbound policy to a corresponding neighbor statement, then replace the AS\_PATH of the prefixes advertised to this neighbor with the locally configured AS number.
- **as\_path** Replaces the AS-Path of the matching routes with an arbitrary AS-Path.

#### Examples

- This command replaces the AS-Path with the none option.

```
switch#show ip bgp neighbors 80.80.1.2 advertised-routes
BGP routing table information for VRF default
Router identifier 202.202.1.1, local AS number 200

* > 202.202.1.0/24 80.80.1.1 - - - 200 i

```

The AS-Path of matching prefixes are replaced with an empty or a null AS-Path. AS 302 is removed from prefix *103.103.1.0/24* as shown in the above output.

- This command replaces the AS-Path with the auto option.

```

switch(config)#route-map foo permit 10
switch(config-route-map-foo)#set as-path match all replacement auto
switch(config-route-map-foo)#end
switch#show ip bgp neighbors 80.80.1.2 advertised-routes

* > 202.202.1.0/24 80.80.1.1 - - - 200 200 500 600 i

```

The AS-Path of matching prefixes are replaced with the locally configured AS 200 and 500 600.

### 12.3.7.42 set as-path prepend

The **set as-path prepend** command adds a **set** statement to a route map to prepend one or more autonomous system (AS) numbers to the AS\_PATH attribute of a BGP route.

The **no set as-path prepend** and **default set as-path prepend** commands remove the specified set statements from the route map and update all corresponding routes.

#### Command Mode

Route-Map Configuration

#### Command Syntax

```
set as-path prepend {{auto | as_number... [auto | as_number]} | last-as count}
```

```
no set as-path prepend {{auto | as_number... [auto | as_number]} | last-as count}
```

```
default set as-path prepend {{auto | as_number... [auto | as_number]} | last-as count}
```

#### Parameters

- **auto** Prepends the peer AS number for peer inbound route maps and the local AS number for peer outbound route maps.
- **as\_number** Prepends the specified AS number. Can be entered in plain notation (values range from 1-4294967295) or in asdot notation as described in RFC 5396. In asdot notation, AS numbers from 1-65535 are entered in plain notation, and AS numbers from 65536 to 4294967295 are entered as two values separated by a dot. The first value is high-order and represents a multiple of 65536; the second value is low-order and represents a decimal integer. For example, AS number 65552 can be entered as either 65552 or 1.16 (i.e., 1\*65536+16). However they are entered, AS numbers are stored internally in plain decimal notation and will appear that way in **show** outputs.
- **last-as count** Prepends the last AS number in the AS path *count* times. Values range from 1 to 15. This is mutually exclusive with the use of the **auto** keyword or the entry of one or more specified AS numbers, and is not supported in multi-agent mode.

#### Examples

- These commands create a route-map entry that prepends AS number 64496 and prepends either the peer or local AS number twice.

```
switch(config)#route-map map1
switch(config-route-map-map1)#set as-path prepend 64496 auto auto
switch(config-route-map-map1)#exit
switch(config)#show route-map map1
route-map map1 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set as-path prepend 64496 auto auto
switch(config)#
```

- The commands create a route-map entry that prepends AS numbers 64496, 64498, and 65552.

```
switch(config)#route-map map2
switch(config-route-map-map2)#set as-path prepend 64496 64498 1.16
switch(config-route-map-map2)#exit
switch(config)#show route-map map2
route-map map2 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set as-path prepend 64496 64498 65552
```

---

```
switch(config)#
```

- These commands create a route map entry that prepends the last AS number 12 times.

```
switch(config)#route-map map3
switch(config-route-map-map3)#set as-path prepend last-as 12
switch(config-route-map-map3)#exit
switch(config)#show route-map map3
route-map map3 permit 10
  Description:
  Match clauses:
  SubRouteMap:
  Set clauses:
    set as-path prepend last-as 12
switch(config)#
```

### 12.3.7.43 set community (route-map)

The **set community** command specifies community attribute modifications to routes that are selected for redistribution by the configuration mode route map. The **set community none** command removes community attributes from the route.

The **no set community** and **default set community** commands remove the specified community from the configuration mode route map statement by deleting the corresponding statement from the *running config*.

#### Command Mode

Route-Map Configuration

#### Command Syntax

```
set community [GSHUT | aa:nn | community-list | internet | local-as | no-advertise | no-export | none | number]
```

```
no set community [GSHUT | aa:nn | additive | community-list | delete | internet | local-as | no-advertise | no-export | none | number]
```

```
default set community [GSHUT | aa:nn | additive | community-list | delete | internet | local-as | no-advertise | no-export | none | number]
```

#### Parameters

- **GSHUT** Configures a graceful shutdown in BGP.
- **aa:nn** Configures the community AS and network number, separated by colon. Value ranges from 0:0 to 65535:65535.
- **community-list** A label for community list.
- **internet** Advertises route to the Internet community.
- **local-as** Advertises route only to local peers.
- **no-advertise** Does not advertise route to any peer.
- **no-export** Advertises route only within BGP AS boundary.
- **none** Does not provide any community attributes.
- **number** Configures the community number. Value ranges from 1 to 4294967040.
- **additive** Adds specified attributes to the current community.
- **delete** Removes specified attributes from the current community.

#### Related Commands

- [ip community-list](#)
- [route-map](#)
- [set \(route-map\)](#)
- [set community \(route-map\)](#)

#### Guideline

EOS does not support disabling the process of graceful shutdown community.

#### Example

This command advertises routes only to local peers.

```
switch(config-route-map-map1)#show active
route-map map1 permit 10
  match community instances <= 50
  set community 0:456 0:2345
switch(config-route-map-map1)#set community local-as
switch(config-route-map-map1)#ip community-list 345 permit 23
switch(config)#route-map map1
switch(config-route-map-map1)#show active
```

---

```
route-map map1 permit 10
  match community instances <= 50
  set community 0:456 0:2345 local-as
switch(config-route-map-map1)#
```

### 12.3.7.44 set extcommunity (route-map)

The **set extcommunity** command specifies extended community attribute modifications to routes that are selected for redistribution by the configuration mode route map. The **set extcommunity none** command removes extended community attributes from the route.

The **no set extcommunity** and **default set extcommunity** commands remove the specified **set extcommunity** command from the configuration mode route map statement by deleting the corresponding statement from *running-config*.

#### Command Mode

Route-Map Configuration

#### Command Syntax

```
set extcommunity COND_X [COND_2][COND_N][MOD_TYPE]
set extcommunity none
no set extcommunity COND_X[COND_2][COND_N][MOD_TYPE]
no set extcommunity none
default set extcommunity COND_X [COND_2][COND_N][MOD_TYPE]
default set extcommunity none
```

#### Parameters

- **COND\_X** Specifies extended community route map modification. Command may contain multiple attributes. Options include:
  - **rt ASN:nn** Route target attribute (AS:network number).
  - **rt IP-address:nn** Route target attribute (IP address: network number).
  - **soo ASN:nn** Site of origin attribute (AS:network number).
  - **soo IP-address:nn** Site of origin attribute (IP address: network number).
- **MOD\_TYPE** Specifies route map modification method. Options include:
  - **<no parameter>** Command replaces existing route map with specified parameters.
  - **additive** Command adds specified parameters to existing route map.
  - **delete** Command removes specified parameters from existing route map.

#### Related Commands

- [route-map](#) enters route map configuration mode.
- [set \(route-map\)](#) specifies attribute modifications for the redistributed routes
- [set \(route-map\)](#) specifies community modifications for the redistributed routes.

#### Example

This command creates a route map entry in *map1* that sets the route target extended community attribute.

```
switch(config)#route-map map1
switch(config-route-map-map1)#set extcommunity rt 10.13.2.4:100
switch(config-route-map-map1)#
```

---

### 12.3.7.45 show (ACL configuration modes)

The **show** command displays the contents of an access control list (ACL).

- **show** or **show pending** displays the list as modified in ACL configuration mode.
- **show active** displays the list as stored in running-config.
- **show comment** displays the comment stored with the list.
- **show diff** displays the modified and stored lists, with flags denoting the modified rules.

Exiting the ACL configuration mode stores all pending ACL changes to **running-config**.

#### Command Mode

ACL Configuration

IPv6-ACL Configuration

Std-ACL Configuration

Std-IPv6-ACL Configuration

MAC-ACL Configuration

#### Command Syntax

```
show
```

```
show active
```

```
show comment
```

```
show diff
```

```
show pending
```

#### Examples

The examples in this section assume these ACL commands are entered as specified.

These commands are stored in none:

```
10 permit ip 10.10.10.0/24 any
20 permit ip any host 10.21.10.1
30 deny ip host 10.10.10.1 host 10.20.10.1
40 permit ip any any
50 remark end of list
```

The current edit session removed this command. This change is not yet stored to none:

```
20 permit ip any host 10.21.10.1
```

The current edit session added these commands ACL. They are not yet stored to none:

```
20 permit ip 10.10.0.0/16 any
25 permit tcp 10.10.20.0/24 any
45 deny pim 239.24.124.0/24 10.5.8.4/30
```

- This command displays the ACL, as stored in the configuration.

```
switch(config-acl-test_1)#show active
IP Access List test_1
 10 permit ip 10.10.10.0/24 any
 20 permit ip any host 10.21.10.1
 30 deny ip host 10.10.10.1 host 10.20.10.1
 40 permit ip any any
 50 remark end of list
```

- This command displays the pending ACL, as modified in ACL configuration mode.

```
switch(config-acl-test_1)#show pending
IP Access List test_1
 10 permit ip 10.10.10.0/24 any
 20 permit ip 10.10.0.0/16 any
 25 permit tcp 10.10.20.0/24 any
 30 deny ip host 10.10.10.1 host 10.20.10.1
 40 permit ip any any
 45 deny pim 239.24.124.0/24 10.5.8.4/30
 50 remark end of list
```

- This command displays the difference between the saved and modified ACLs.
  - Rules added to the pending list are denoted with a plus sign (+).
  - Rules removed from the saved list are denoted with a minus sign (-)

```
switch(config-acl-test_1)#show diff

### 12.3.7.46 show hardware tcam profile

The **show hardware tcam profile** command displays the hardware specific information for the current operational TCAM profile in the running configuration.

This command is applicable to DCS-7280(E/R) and DCS-7500(E/R) series switches only.

#### Command Mode

EXEC

#### Command Syntax

```
show hardware tcam profile
```

#### Parameters

- *tcam* Specifies the TCAM information.
- *profile* Specifies the TCAM profile information.

#### Example

This command displays the current operational TCAM profile details.

```
switch#show hardware tcam profile
Configuration      Status
FixedSystem       default          default
```

### 12.3.7.47 show ip access-lists

The **show ip access-list** command displays the contents of IPv4 and standard IPv4 access control lists (ACLs) on the switch. Use the **summary** option to display only the name of the lists and the number of lines in each list.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show ip access-list [LIST][SCOPE]
```

#### Parameters

- LIST Name of lists to be displayed. Selection options include:
  - *<no parameter>* All IPv4 ACLs are displayed.
  - *list\_name* Specified IPv4 ACL is displayed.
- SCOPE Information displayed. Selection options include:
  - *<no parameter>* All rules in the specified lists are displayed.
  - *summary* The number of rules in the specified lists are displayed.

#### Examples

- This command displays all rules in *test1* IPv4 ACL.

```
switch#show ip access-list list2
IP Access List list2
    10 permit ip 10.10.10.0/24 any
    20 permit ip any host 10.20.10.1
    30 deny ip host 10.10.10.1 host 10.20.10.1
switch#
```

- This command displays the name of, and number of rules in, each list on the switch.

```
switch#show ip access-list summary
IPV4 ACL default-control-plane-acl
    Total rules configured: 12
    Configured on: control-plane
    Active on      : control-plane

IPV4 ACL list2
    Total rules configured: 3

IPV4 ACL test1
    Total rules configured: 6

Standard IPV4 ACL test_1
    Total rules configured: 1

IPV4 ACL test_3
    Total rules configured: 0

switch#
```

- This command displays the summary and lists all the configured IPv4 ACLs.

```
switch #show ip access-lists summary
IPV4 ACL default-control-plane-acl [readonly]
    Total rules configured: 17
    Configured on Ingress: control-plane(default VRF)
    Active on Ingress: control-plane(default VRF)
```

---

```
IPV4 ACL ipAclLimitTest
Total rules configured: 0
Configured on Egress: V12148,2700
Active on Egress: V12148,2700
```

### 12.3.7.48 show ip prefix-list

The **show ip prefix-list** command displays all rules for the specified IPv4 prefix list. The command displays all IPv4 prefix list rules if a prefix list name is not specified.

#### Command Mode

EXEC

#### Command Syntax

```
show ip prefix-list [DISPLAY_ITEMS]
```

#### Parameters

- **DISPLAY\_ITEMS** Specifies the name of prefix lists for which rules are displayed. Options include:
  - *<no parameter>* All IPv4 prefix list rules are displayed.
  - *list\_name* Specifies the IPv4 prefix list for which rules are displayed.

#### Example

This command displays all rules in the route-one IPv4 prefix list:

```
switch(config-ip-pfx)#show ip prefix-list  
ip prefix-list route-one  
  seq 10 deny 10.1.1.0/24  
  seq 20 deny 10.1.0.0/16  
  seq 30 permit 12.15.4.9/32  
  seq 40 deny 1.1.1.0/24  
switch(config-ip-pfx)#
```

---

### 12.3.7.49 show ipv6 access-lists

The **show ipv6 access-list** command displays the contents of all IPv6 access control lists (ACLs) on the switch. Use the summary option to display only the name of the lists and the number of lines in each list.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show ipv6 access-list [LIST][SCOPE]
```

#### Parameters

- LIST Name of lists to be displayed. Selection options include:
  - *<no parameter>* All IPv6 ACLs are displayed.
  - *list\_name* Specified IPv6 ACL is displayed.
- SCOPE Information displayed. Selection options include:
  - *<no parameter>* All rules in the specified lists are displayed.
  - *summary* The number of rules in the specified lists are displayed.

#### Examples

- This command displays all rules in test1 IPv6 ACL.

```
switch#show ipv6 access-list list2
IP Access List list2
    10 permit ipv6 3891:3c58:6300::/64 any
    20 permit ipv6 any host 2fe1:b468:024a::
    30 deny ipv6 host 3411:91c1:: host 4210:cc23:d2de:::
switch#
```

- This command displays the name of, and number of rules in, each list on the switch.

```
switch#show ipv6 access-list summary
IPV6 ACL list2
    Total rules configured: 3

IPV6 ACL test1
    Total rules configured: 6

IPV6 ACL test_1
    Total rules configured: 1

Standard IPV6 ACL test_3
    Total rules configured: 0
switch#
```

### 12.3.7.50 show ipv6 prefix-list

The **show ipv6 prefix-list** command displays all rules for the specified IPv6 prefix list. The command displays all IPv6 prefix lists if a prefix list name is not specified.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 prefix-list [DISPLAY_ITEMS]
```

#### Parameters

- **DISPLAY\_ITEMS** Specifies the name of prefix lists for which rules are displayed. Options include:
  - *<no parameter>* All IPv6 prefix lists are displayed.
  - *list\_name* Specifies the IPv6 prefix list for which rules are displayed.

#### Examples

- This command displays all rules in the map1 IPv6 prefix list:

```
switch>show ipv6 prefix-list map1
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 20 permit 3:11b1:8fe4:1aac::/64
seq 30 permit 3:1bca:3ff2:634a::/64
seq 40 permit 3:1bca:1141:ab34::/64
switch>
```

- This command displays all prefix lists:

```
switch>show ipv6 prefix-list
ipv6 prefix-list map1
seq 10 permit 3:4e96:8ca1:33cf::/64
seq 15 deny 3:4400::/64
seq 20 permit 3:11b1:8fe4:1aac::/64
seq 30 permit 3:1bca:3ff2:634a::/64
seq 40 permit 3:1bca:1141:ab34::/64
ipv6 prefix-list FREDD
ipv6 prefix-list route-five
ipv6 prefix-list map2
seq 10 deny 10:1:1:1::/64 ge 72 le 80
seq 20 deny 10:1::/32
switch>
```

---

### 12.3.7.51 show mac access-lists

The **show mac access-list** command displays the contents of all MAC access control lists (ACLs) on the switch. Use the summary to display only the name of the lists and the number of lines in each list.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show mac access-lists [LIST][SCOPE]
```

#### Parameters

- LIST Name of lists to be displayed. Selection options include:
  - *<no parameter>* Command displays all ACLs.
  - *list\_name* Command displays ACL specified by parameter.
- SCOPE Information displayed. Selection options include:
  - *<no parameter>* Command displays all rules in specified lists.
  - *summary* Command displays the number of rules in specified lists.

#### Examples

- This command displays all rules in *mtest2* MAC ACL.

```
switch#show mac access-list mlist2
IP Access List mlist2
    10 permit 1024.4510.F125 0.0.0 any aarp
    20 permit any 4100.4500.0000 0.FF.FFFF novell
    30 deny any any
switch#
```

- This command displays the number of rules in each MAC ACL on the switch.

```
switch#show mac access-list summary
MAC ACL mlist1
    Total rules configured: 6

MAC ACL mlist2
    Total rules configured: 3

MAC ACL mlist3
    Total rules configured: 1

MAC ACL mlist4
    Total rules configured: 0
switch#
```

### 12.3.7.52 show platform arad acl tcam summary

The `show platform arad tcam summary` command displays the percentage of TCAM utilization per forwarding ASIC.

#### Command Mode

EXEC

#### Command Syntax

`show platform arad acl tcam summary`

#### Parameter

*summary* Displays the ACL TCAM summary.

#### Example

This command displays the percentage of TCAM utilization per forwarding ASIC.

```
switch#show platform arad acl tcam summary
The total number of TCAM lines per bank is 1024.

=====
Arad3/0:
=====
  Bank      Used      Used %      Used By
   1         4         0          IP RACLs
Total Number of TCAM lines used is: 4

=====
Arad3/4:
=====
  Bank      Used      Used %      Used By
   1         2         0          IP RACLs
Total Number of TCAM lines used is: 2
```

### 12.3.7.53 show platform arad acl tcam

The **show platform arad acl tcam** command displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC.

This command is applicable only on DCS-7500E, DCS-7280E series switches.

#### Command Mode

EXEC

#### Command Syntax

```
show platform arad acl tcam [scope]
```

#### Parameters

- *scope* Specifies the information displayed. Options include:
  - *detail* Displays the ACL TCAM details.
  - *diff* Displays the difference between hardware and shadow.
  - *hw* Displays the ACL entries from hardware.
  - *shadow* Displays the ACL entries from shadow.
  - *summary* Displays the ACL TCAM summary.

#### Examples

- This command displays the number of TCAM entries used by Arad0 ASIC. In this example, ACL is applied on 2 VLANs (Vl2148 and Vl2700) but number of TCAM entries occupied is only 1.

```
switch# show platform arad acl tcam detail
ip access-list ipAclLimitTest (Shared RACL, 0 rules, 1 entries,
direction out,
state success, Acl Label 2)
Fap: Arad0, Shared: true, Interfaces: Vl2148, Vl2700
Bank Offset Entries
0          0          1
Fap: Arad1, Shared: true, Interfaces: Vl2148
Bank Offset Entries
0          0          1
```

- This command displays the percentage of TCAM utilization per forwarding ASIC.

```
switch# show platform arad acl tcam summary
The total number of TCAM lines per bank is 1024.
=====
Arad0:
=====
Bank   Used           Used %           Used By
0      1              0              IP Egress PACLs/RACLs
Total Number of TCAM lines used is: 1
=====
Arad1:
=====
Bank   Used           Used %           Used By
0      1              0              IP Egress PACLs/RACLs
Total Number of TCAM lines used is: 1
```

### 12.3.7.54 show platform arad mapping

The **show platform arad mapping** command displays the mapping between the interfaces and the forwarding ASICs.

#### Command Mode

EXEC

#### Command Syntax

```
show platform arad chip_name mapping
```

#### Parameter

*chip\_name* Specifies the Arad chip name.

**Example** This command displays the mapping between the interfaces and the forwarding ASICs on arad3/0 chip.

```
switch#show platform arad arad3/0 mapping
Arad3/0  Port                SysPhyPort    Voq    ( Fap,FapPort)    Xlge    Serdes
-----
          Ethernet3/1/1          34    288          (0 , 2)          n/a          (20)
          .....
```

### 12.3.7.55 show platform fap acl tcam hw

The **show platform fap acl tcam hw** command displays the TCAM entries configured for each TCAM bank including policy-maps and corresponding traffic match.

This command is applicable only on DCS-7280(E/R), DCS-7500(E/R) series switches.

#### Command Mode

EXEC

#### Command Syntax

```
show platform fap fap_name acl tcam hw
```

#### Parameters

- *fap\_name* Specifies the switch chip-set name.
- *acl* Specifies the Arad ACL information.
- *tcam* Specifies the Arad TCAM information.
- *hw* Specifies the ACL entries for hardware.

#### Example

This command displays the TCAM entries configured for each TCAM bank including policy maps and corresponding traffic matches.

```
switch#show platform fap Arad1 acl tcam hw
=====

### 12.3.7.56 show platform fap acl tcam

The **show platform fap tcam** command displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC of Sand platform devices.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show platform fap acl tcam [detail | diff | hw | shadow | summary]
```

#### Parameter

- detail Displays the number of TCAM entries (hardware resources) occupied by the ACL on each forwarding ASIC.
- diff Displays the difference between hardware and shadow.
- hw Displays ACL entries from hardware.
- shadow Displays ACL entries from shadow.
- summary Displays the percentage of TCAM utilization per forwarding ASIC.

#### Example

This command displays the number of TCAM entries and other ACL TCAM detail.

```
switch#show platform fap acl tcam detail
ip access-list ipAcl0000 (RACL, 1 rules, 2 entries, direction in, state
success)
Shared: false
Interface: Vlan0002
-----
Fap: Arad3/0
Bank Offset Entries
1      0      2
Interface: Vlan0003
-----
Fap: Arad3/0
Bank Offset Entries
1      2      2
Fap: Arad3/4
Bank Offset Entries
1      0      2
```

---

### 12.3.7.57 show platform fap acl

The **show platform fap acl** command displays the ACL information of Sand platform devices.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show platform fap acl [ipkgv | l4ops | mirroring | opkgv | pmf | tcam | udf | vsicfg]
```

#### Parameters

- ipkgv Displays the ACL Ingress Interface Specification (IPKGV) information.
- l4ops Displays the ACL Layer 4 Options (L4OPS) information.
- mirroring Displays the mirroring ACL information.
- opkgv Displays the ACL Egress Interface Specification (OPKGV) information.
- pmf Displays the Pmf.
- tcam Displays the ACL TCAM information.
- udf Displays the ACL UDF information.
- vsicfg Displays the ACL Virtual Switch Instance (VSI) CONFIG information.

#### Guidelines

This command is supported on DCS-7280SE and DCS-7500E series platforms only.

#### Example

This command displays the brief information of all installed mirroring ACLs.

```
switch(config)#show platform fap acl mirroring

=====
Aggregate ACLs
=====

(list2:0->2) type=2; version=0
- list2 [ prio 0 ] => session 2

(list1:10->1,list3:20->3) type=0; version=13
- list3 [ prio 20 ] => session 3
- list1 [ prio 10 ] => session 1

=====
Interface-ACL Mapping
=====

Ethernet1 => (list1:10->1,list3:20->3) [ ipv4 ]
Ethernet33 => (list2:0->2) [ mac ]
```

### 12.3.7.58 show platform trident tcam

The **show platform trident tcam** command displays the TCAM entries configured for each TCAM group including policy maps and corresponding hits.

#### Command Mode

EXEC

#### Command Syntax

```
show platform trident tcam [acl | cpu-bound | detail | entry | mirror | pbr | pipe | qos | shared | summary]
```

#### Parameters

- *<no parameters>* Displays TCAM entries for each TCAM group.
- **acl** Displays the trident ACL information.
- **cpu-bound** Displays the trident cpu-bound information.
- **detail** Lists all TCAM entries.
- **entry** Displays the TCAM entry information.
- **mirror** Displays the trident Mirroring ACL information.
- **pbr** Displays the trident PBR ACL information.
- **pipe** Allows to specify a pipe for filtering.
- **qos** Displays the trident QOS information.
- **shared** Displays the ACL Sharing information.
- **summary** Displays the TCAM allocation information.

#### Guidelines

This command is applicable only on DCS-7010, DCS-7050/DCS-7050X, DCS7250X, DCS-7300X series switches.

#### Examples

- This command displays the trident mirroring ACL information.

```
switch(config)#show platform trident tcam mirror
=== Mirroring ACLs on switch Linecard0/0 ===

Session: mir-sess2

INGRESS ACL mirAcl2* uses 2 entries
Assigned to ports: Ethernet32/1
```

- This command displays detailed information for the TCAM group.

```
switch#show platform trident tcam detail
=== TCAM detail for switch Linecard0/0 ===
TCAM group 9 uses 42 entries and can use up to 1238 more.
Mlag control traffic uses 4 entries.
 589826          0 hits - MLAG - SrcPort UDP Entry
 589827          0 hits - MLAG - DstPort UDP Entry
 589828          0 hits - MLAG - SrcPort TCP Entry
 589829          0 hits - MLAG - DstPort TCP Entry
CVX traffic reserves 6 entries (0 used).
L3 Control Priority uses 23 entries.
 589836          0 hits - URM - SelfIp UDP Entry
 589837          0 hits - URM - SelfIp TCP Entry
589848          0 hits - OSPF - unicast
 589849          71196 hits - OSPFv2 - Multicast
 589850          0 hits - OSPFv3 - Multicast
 589851          0 hits - OSPF Auth ESP - Multicast
 589852          0 hits - OSPF Auth ESP - Unicast
 589853          0 hits - IP packets with GRE type and ISIS protocol
 589854          0 hits - RouterL3 Vlan Priority 6,7 Elevator
 589855          0 hits - RouterL3 DSCP 48-63 Elevator
```

---

```
589856          0 hits - RouterL3 Priority Elevator
589857          0 hits - NextHopToCpu, Glean
589858          0 hits - L3MC Cpu OIF
IGMP Snooping Flooding reserves 8 entries (6 used).
589864          0 hits - IGMP Snooping Restricted Flooding L3 from local
mlag peer
589865          0 hits - IGMP Snooping Restricted Flooding L3
L4 MicroBfd traffic reserves 1 entries (0 used).
TCAM group 13 uses 99 entries and can use up to 1181 more.
Dot1x MAB traffic uses 1 entries.
851968          0 hits - Dot1xMab Rule

<-----OUTPUT OMITTED FROM EXAMPLE----->

ck338.22:14:38(config-pmap-qos-policy1)#
```

### 12.3.7.59 show route-map

The **show route-map** command displays the contents of configured route maps.

#### Command Mode

EXEC

#### Command Syntax

```
show route-map [map_name]
```

#### Parameters

- *<no parameter>* Displays the content of all configured route maps
- *map\_name* Displays the content of the specified route map

#### Example

- This command displays the *map1* route map.

```
switch(config)#show route-map map1  
route-map map1 permit 10  
  Description:  
  Match clauses:  
  SubRouteMap:  
  Set clauses:  
    set as-path prepend last-as 12  
    set as-path prepend auto auto
```

- This command displays the **map** route map.

```
switch>show route-map map  
route-map map permit 5  
  Match clauses:  
    match as 456  
  Set clauses:  
route-map map permit 10  
  Match clauses:  
match ip next-hop 2.3.4.5  
  match as-path path_2  
  Set clauses:  
    set local-preference 100
```

### 12.3.7.60 system profile

The **system profile** command creates a new Ternary Content-Addressable Memory (TCAM) profile in the running configuration.

The **default system profile** and **no system profile** commands delete non-default TCAM profiles from the running configuration.

#### Command Mode

Hardware TCAM

#### Command Syntax

```
system profile [profile_name | default | mirroring-acl | pbr-match-nexthop-group | qos | tap-aggregation-default | tap-aggregation-extended | tc-counters]
```

```
default system profile
```

```
no system profile
```

#### Parameters

- *profile\_name* Creates a profile with the specified name.
- default Creates a default profile.
- mirroring-acl Creates a mirroring-ACL profile.
- pbr-match-nexthop-group Creates a pbr-match-nexthop-group profile.
- qos Creates a Quality of Service (QoS) profile.
- tap-aggregation-default Creates a tap-aggregation-default profile.
- tap-aggregation-extended Creates a tap-aggregation-extended profile.
- tc-counters Creates a tc-counters profile.

#### Guideline

These commands are compatible with the DCS-7280SE and DCS-7500E series switches only.

#### Examples

- These commands create a mirroring-ACL profile.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#system profile mirroring-acl
switch(config-hw-tcam)#show hardware tcam profile
Configuration      Status
FixedSystem        mirroring-acl     mirroring-acl
switch(config-hw-tcam)#
```

- These commands delete non-default TCAM profiles.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#show hardware tcam profile
Configuration      Status
Linecard9          mirroring-acl     mirroring-acl
Linecard8          mirroring-acl     mirroring-acl
Linecard3          mirroring-acl     mirroring-acl
Linecard4          mirroring-acl     mirroring-acl
Linecard6          mirroring-acl     mirroring-acl
switch(config-hw-tcam)#default system profile
switch(config-hw-tcam)#show hardware tcam profile
Configuration      Status
Linecard9          default           default
Linecard8          default           default
Linecard3          default           default
Linecard4          default           default
Linecard6          default           default
```

```
switch(config-hw-tcam) #
```

- These commands delete TCAM profiles.

```
switch(config-hw-tcam) #show hardware tcam profile
Configuration      Status
Linecard9          tc-counters       tc-counters
Linecard8          tc-counters       tc-counters
Linecard3          tc-counters       tc-counters
Linecard4          tc-counters       tc-counters
Linecard6          tc-counters       tc-counters
switch(config-hw-tcam) #no system profile
switch(config-hw-tcam) #show hardware tcam profile
Configuration      Status
Linecard9          default           default
Linecard8          default           default
Linecard3          default           default
Linecard4          default           default
Linecard6          default           default
switch(config-hw-tcam) #
```

## 12.4 VARP

Virtual-ARP (VARP) allows multiple switches to simultaneously route packets from a common IP address in an active-active router configuration. Each switch is configured with the same set of virtual IP addresses on corresponding VLAN interfaces and a common virtual MAC address. In MLAG configurations, VARP is preferred over VRRP because VARP does not require traffic to traverse the peer-link to the master router as VRRP would.

A maximum of 500 virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address.

VARP functions by having each switch respond to ARP and GARP requests for the configured router IP address with the virtual MAC address. The virtual MAC address is only for inbound packets and never used in the source field of outbound packets.

When ip routing is enabled, packets to the virtual MAC address are routed to the next hop destination.

**Figure 16: VARP Configuration**

The following sections are included in this chapter:

- [VRRP and VARP Conceptual Overview](#)
- [VRRP and VARP Implementation Procedures](#)
- [VRRP and VARP Implementation Examples](#)

## 12.4.1 VRRP and VARP Conceptual Overview

This section review the following topics:

- [VRRPv2](#)
- [VRRPv3](#)
- [VARP](#)

### 12.4.1.1 VRRPv2

A virtual router, also known as a virtual router group, is defined by a virtual router identifier (VRID) and a virtual IP address. A virtual routers mapping of VRID and IP address must be consistent among all switches implementing the virtual router group. A virtual routers scope is restricted to a single LAN.

A LAN may contain multiple virtual routers for distributing traffic. Each virtual router on a LAN is assigned a unique VRID. A switch may be configured with virtual routers among multiple LANs.

VRRP uses priority ratings to assign Master or Backup roles for each VRRP router configured for a virtual router group. The Master router sends periodic VRRP Advertisement messages along the LAN and forwards packets received by the virtual router to their destination. Backup routers are inactive but are available to assume Master router duties when the current Master fails.

A VRRP can be configured to allow VRRP routers with higher priority to take over Master router duties. Alternatively, the group can be configured to prevent a router from preemptively assuming the Master role. A VRRP router is always assigned the Master of any virtual router configured with the address owned by the VRRP router, regardless of the preemption prevention setting.

### 12.4.1.2 VRRPv3

RFC 5798 defines version 3 of the Virtual Router Redundancy Protocol (VRRP) for both IPv4 and IPv6. It is based on version 2 of VRRP, as defined in RFC 3768.

### 12.4.1.3 VARP

Virtual-ARP (VARP) allows multiple switches to simultaneously route packets from a common IP address in an active-active router configuration. Each switch is configured with the same set of virtual IP addresses on corresponding VLAN interfaces and a common virtual MAC address. In MLAG configurations, VARP is preferred over VRRP because VARP does not require traffic to traverse the peer-link to the master router as VRRP would.

A maximum of 500 virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address.

VARP functions by having each switch respond to ARP and GARP requests for the configured router IP address with the virtual MAC address. The virtual MAC address is only for inbound packets and never used in the source field of outbound packets.

When ip routing is enabled, packets to the virtual MAC address are routed to the next hop destination.

**Figure 17: VRRP Configuration**

The following sections are included in this chapter:

- [VRRP and VARP Conceptual Overview](#)
- [VRRP and VARP Implementation Procedures](#)
- [VRRP and VARP Implementation Examples](#)
- [VRRP and VARP Configuration Commands](#)

## 12.4.2 VRRP and VARP Implementation Procedures

This section contains the following configuration instructions:

- [VRRP Configuration for IPv4](#)
- [VRRP Configuration for IPv6](#)
- [VARP Configuration](#)

### 12.4.2.1 VRRP Configuration for IPv4

To implement a virtual router, it must be configured and enabled. A virtual router is typically configured before it is enabled; this ensures that the VRRP router operates as required before its priority settings immediately make it the master virtual router. Because assigning a primary address to a virtual router enables it, address assignment is normally performed after all other configuration tasks.

The `no vrrp` command removes all VRRP commands for the specified virtual router from *running-config*.

#### 12.4.2.1.1 Virtual Router Configuration

Most configuration tasks are optional because all mandatory parameters have a default value. The following virtual router parameters are configurable:

- VRRP version (default = version 2)
- Router priority (default = 100)
- Preemption option (default is enabled)
- Advertisement timer (default = one second)
- Description (optional parameter)
- Peer authentication (optional parameter)
- Secondary IP addresses (optional parameter)

#### VRRP Version

The `vrrp ipv4 version` command sets the version of VRRP for the corresponding IPv4 virtual router. IPv6 version is not configurable as it only supports version 3. The version selected in a VRRP

---

group can either be same for all group members or independent of each other. By default, Arista switches use VRRP version 2, which supports only IPv4 environments. VRRP version 3 supports both IPv4 and IPv6 environments.

### Example

- This command causes VLAN 20 to use VRRP version 3.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 1 ipv4 version 3
switch(config-if-vl20)#
```

### Master and Backup Router

The VRRP routers within a virtual router group determine the Master router through priority settings. Priority values range from 254 (highest priority) to 1 (lowest priority). Priority is either set by a CLI command or is assigned the default value of 100. A switch specifies priority settings for each of its virtual routers. Once set, VRRP priority level can also be changed by a tracked object. The `vrrp tracked-object` command configures the VRRP client process to track an object created by the `track` command and react if its status changes to **down**.

Preemption mode determines when a VRRP router with a higher priority rating becomes the Master router. If preemption is enabled, the VRRP router with the highest priority immediately becomes the Master router. If preemption is disabled, a VRRP router with a higher priority value does not become the Master router unless the current Master becomes unavailable; this is applicable when a new VRRP router becomes available on the LAN or VRRP routers priority value changes for the virtual router.

The `vrrp priority-level` command configures the switchs priority setting for the specified virtual router.

### Example

- This command sets the priority value of 250 for the virtual router with VRID 15 on VLAN 20.

```
switch(config-if-vl20)#vrrp 15 priority-level 250
switch(config-if-vl20)#
```

The `vrrp preempt` command controls the preempt mode setting of the specified virtual router. By default, preempt mode is enabled.

### Examples

- This command disables preempt mode for the virtual router 15 on VLAN 20.

```
switch(config-if-vl20)#no vrrp 15 preempt
switch(config-if-vl20)#
```

- This command enables preempt mode for the virtual router 30 on VLAN 20.

```
switch(config-if-vl20)#vrrp 30 preempt
switch(config-if-vl20)#
```

The `vrrp preempt delay` command configures a period between an event that elevates a switch to master VRRP router status and the switchs assumption of master VRRP router role. Command options configure delays during normal operation and after a switch reboot.

### Advertisement Interval

The Master router sends periodic VRRP Advertisement messages to other VRRP routers. The `vrrp advertisement interval` command specifies the interval between successive advertisement message transmissions.

The advertisement interval also defines the timeout that determines when the switch assumes the Master router role. This timeout interval is three times the advertisement interval.

### Example

- This command sets the advertisement interval of 10 seconds for virtual router 35 on VLAN 100.

```
switch(config-if-vl100)#vrrp 35 advertisement interval 10
switch(config-if-vl100)#
```

### Description

The `vrrp session description` command associates a text string to the specified virtual router. The maximum string length is 80 characters. The string has no functional impact on the virtual router.

### Example

- This command associates the text string *Laboratory Router* to virtual router 15 on VLAN 20.

```
switch(config-if-vl20)#vrrp 15 session description Laboratory Router
switch(config-if-vl20)#
```

### Peer Authentication

VRRP peer authentication validates VRRP advertisement packets that the switch receives from other VRRP routers in a specified virtual router group. When a virtual router uses authentication, all VRRP routers in the group must use the same authentication parameters.

The `vrrp peer authentication` command configures virtual router authentication parameters for the specified virtual router.

### Example

- This command implements plain-text authentication, using 12345 as the key, for virtual router 40 on VLAN 100.

```
switch(config-if-vl100)#vrrp 40 peer authentication text 12345
switch(config-if-vl100)#
```

### Secondary Addresses

The `vrrp ipv4 secondary` command assigns a secondary IP address to a virtual router. Secondary addresses are optional; a virtual routers configuration may include more than one secondary address command. The primary and secondary address list must be identical for all switches in a virtual router group.

A primary IP address is assigned to a virtual router with the `vrrp ipv4` command ([Virtual Router Enabling and the Primary IP address](#)).

### Example

- This command assigns the IP address of 10.2.4.5 as the secondary IP address for the virtual router 15 on VLAN 20

```
switch(config-if-vl20)#vrrp 15 ipv4 10.2.4.5 secondary
switch(config-if-vl20)#
```

#### 12.4.2.1.2 Virtual Router Enabling and the Primary IP address

The `vrrp ipv4` command configures the primary IP address of the specified virtual router and enables the virtual router if the primary address is contained within the configuration mode interfaces

---

IP address subnet. A virtual routers configuration may contain only one primary IP address assignment command; subsequent **vrrp ipv4** commands reassign the virtual routers primary IP address.

### Example

- This command enables virtual router group 15 (VRID) on VLAN 20 and assigns 10.1.1.5 as the virtual routers primary address.

```
switch(config-if-vl20)#vrrp 15 ipv4 10.1.1.5
switch(config-if-vl20)#
```

#### 12.4.2.1.3 Disabling VRRP

The **vrrp disabled** command places the switch in stopped state for the specified virtual router. While in stopped state, the switch cannot act as a Master or backup router for the virtual router group. The **no vrrp disabled** command changes the switchs virtual router state to **backup** or **master** if the virtual router is properly configured.

VRRP can also be shut down when the status of a tracked object configured by the **vrrp tracked-object** command changes to **down**.

### Examples

- This command places the switch in stopped mode for virtual router 24 on VLAN 20.

```
switch(config-if-vl20)#vrrp 24 disabled
switch(config-if-vl20)#
```

- This command moves the switch out of stopped mode for virtual router 24 on VLAN 20.

```
switch(config-if-vl20)#no vrrp 24 disabled
switch(config-if-vl20)#
```

- This command configures the switch to enter stopped mode for virtual router 24 on VLAN 20 if the status of tracked object interfaceE6/48 changes to **down**.

```
switch(config-if-vl20)#vrrp 24 tracked-object interfaceE6/48 shutdown
switch(config-if-vl20)#
```

The **no vrrp** and **no vrrp ipv4** commands delete the specified virtual IP address from the interface. Additionally, the **no vrrp** command removes all residual VRRP commands for the virtual router.

### Examples

- This command removes all VRRP configuration commands for virtual router 10 on VLAN 15.

```
switch(config-if-vl15)#no vrrp 10
switch(config-if-vl15)#
```

- This command disables virtual router 25 on VLAN 20 and removes the primary IP address from its configuration.

```
switch(config-if-vl20)#no vrrp 25 ipv4 10.1.1.5
switch(config-if-vl20)#
```

#### 12.4.2.2 VRRP Configuration for IPv6

To implement a virtual router, it must be configured and enabled. A virtual router is typically configured before it is enabled; this ensures that the VRRP router operates as required before its priority settings

immediately make it the master virtual router. Because assigning a primary address to a virtual router enables it, address assignment is normally performed after all other configuration tasks.

The `no vrrp` command removes all VRRP commands for the specified virtual router from *running-config*.

#### 12.4.2.2.1 Configuring VRRP for IPv6

##### Specify the VRRP Version

The `vrrp ipv4 version` command sets the version of VRRP used on an interface. The version selected in a VRRP group must be the same for all group members. By default, Arista switches use VRRP version 2, which is not compatible with IPv6.

##### Example

- This command causes VLAN 20 to use VRRP version 3.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 1 ipv4 version 3
switch(config-if-vl20)#
```

##### Create a VRRP Group and Configure a Virtual IPv6 Address

The `vrrp ipv6` command assigns an IPv6 address to the interface being configured and creates a VRRP group.

##### Example

- These commands create VRRP group 3 and configure a virtual IPv6 address for the VRRP group on the VLAN 20 interface.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 3 ipv6 2001:db8:0:1::1
switch(config-if-vl20)#
```

##### Configure Tracking

The `vrrp tracked-object` command configures the VRRP client process to track an object created by the `track` command and react if its status changes to *down*.

##### Example

- This command causes interface VLAN 20 to disable VRRP when tracked object ETH8 changes state.

```
switch(config-if-vl20)#vrrp 1 tracked-object ETH8 shutdown
switch(config-if-vl20)#
```

##### Configure the Priority Level

The `vrrp priority-level` command configures the switch's priority setting for the specified virtual router.

##### Example

- This command sets the priority value of 250 for the virtual router with VRID 15 on VLAN 20.

```
switch(config-if-vl20)#vrrp 15 priority-level 250
switch(config-if-vl20)#
```

---

## Configure the Preemption Mode

Preemption mode determines when a VRRP router with a higher priority rating becomes the Master router. If preemption is enabled, the VRRP router with the highest priority immediately becomes the Master router. If preemption is disabled, a VRRP router with a higher priority value does not become the Master router unless the current Master becomes unavailable; this is applicable when a new VRRP router becomes available on the LAN or VRRP routers priority value changes for the virtual router.

The `vrrp preempt` command controls the preempt mode setting of the specified virtual router. By default, preempt mode is enabled.

### Example

- This command enables preempt mode for the virtual router 30 on VLAN 20.

```
switch(config-if-vl20)#vrrp 30 preempt
```

## Configure the VRRP Advertisement Interval

The `ip virtual-router mac-address advertisement-interval` command specifies the interval between advertisement packets sent by the master router to the VRRP group members.

### Example

- This command configures a MAC address advertisement interval of one minute (60 seconds).

```
switch(config)#interface vlan 20
switch(config-if-vl20)#ip virtual-router mac-address advertisement-
interval 60
switch(config-if-vl20)#
```

### 12.4.2.2 Verify VRRP IPv6 Configurations

Use the following commands to display the VRRP configurations and status.

#### Show VRRP Group

The `show vrrp` command displays information about the Virtual Router Redundancy Protocol (VRRP) groups configured on a specified interface.

#### Examples

- This command displays a table of information for VRRP groups on the switch.

```
switch#show vrrp interface vlan 3060 brief
Interface Id Ver Pri Time State VrIps
Vlan3060 1 3 100 3609 Master 2001::2
2001::3
Vlan3060 2 3 100 3609 Master 2002::2
2002::3
switch#
```

### 12.4.2.3 VARP Configuration

Implementing VARP consists of assigning virtual IP addresses to VLAN interfaces and configuring a virtual MAC address.

## Virtual IP Addresses

The `ip virtual-router address` command assigns a virtual IP address to the VLAN interface being configured. Unlike VRRP, the virtual IP address does not have to be in the same subnet as the physical interface.

A virtual IPv4 address may optionally be configured with a subnet, but doing so will modify the behavior of ARP requests sent from the router. When the router sends an ARP request for an IPv4 address in a virtual subnet, the ARP request will use the virtual IPv4 address as the source IP address and the virtual MAC address as the source MAC address inside the ARP header. For virtual IP addresses configured without the subnet option, no modifications are made to outgoing ARP requests.

### Examples

- These commands configure a Switch Virtual Interface (SVI) and a virtual IP address for VLAN 10.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip address 10.0.0.2/24
switch(config-if-Vl10)#ip virtual-router address 10.0.0.6
switch(config-if-Vl10)#ipv6 address 2001::1/64
switch(config-if-Vl10)#ipv6 virtual-router address 2001::2
switch(config-if-Vl10)#exit
switch(config)#
```

- These commands configure a Switch Virtual Interface (SVI) and a virtual IPv4 address with a subnet for VLAN 10. A static route is added to indicate that the virtual subnet is reachable through VLAN 10.

```
switch(config)#ip route 192.0.0.0/24 vlan 10
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip address 10.0.0.2/24
switch(config-if-Vl10)#ip virtual-router address 192.0.0.6/24
switch(config-if-Vl10)#exit
switch(config)#
```

## Virtual MAC Address

The `ip virtual-router mac-address` command assigns a virtual MAC address to the switch. The switch maps all virtual router IP addresses to this MAC address. The address is receive-only; the switch never sends packets with this address as the source.

When the destination MAC of a packet destined to a remote network matches the virtual MAC address, the MLAG peer forwards the traffic to the next hop destination. Each MLAG peer must have the same routes available, either through static configuration or learned through a dynamic routing protocol.

### Example

- This command configures a virtual MAC address.

```
switch(config)#ip virtual-router mac-address 001c.7300.0099
switch(config)#
```

## Show Virtual MAC Address

To display the virtual router MAC and IP addresses, enter the `show ip virtual-router` command.

### Example

- This command displays the virtual router addresses assigned on the switch.

```
switch#show ip virtual-router
IP virtual router is configured with MAC address: 24cd.5a29.cc31
```

| Interface Protocol | IP Address   | Virtual IP Address | Status |    |
|--------------------|--------------|--------------------|--------|----|
| Vlan15             | 10.1.1.3/24  | 10.1.1.15          | up     | up |
| Vlan15             | 10.1.1.3/24  | 10.1.1.16          | up     | up |
| Vlan15             | 10.1.1.3/24  | 10.1.1.17          | up     | up |
| Vlan20             | 10.12.1.6/24 | 10.1.1.51          | up     | up |
| Vlan20             | 10.12.1.6/24 | 10.1.1.53          | up     | up |
| Vlan20             | 10.12.1.6/24 | 10.1.1.55          | up     | up |
| switch#            |              |                    |        |    |

### Show IPv6 Virtual-Router

The `show ipv6 virtual-router` command displays the virtual MAC address assigned to the switch and all virtual IPv6 addresses assigned to each VLAN interface.

### Examples

- This command displays a table of information for IPv6 VRRP groups on the switch.

```
switch#show ipv6 virtual-router
IP virtual router is configured with MAC address: 001c.7300.0099
MAC address advertisement interval: 30 seconds
Interface Vlan4094
  State is up
  Protocol is up
  IPv6 address
    2001:b8:2001::1011/64
  Virtual IPv6 address
    2001:db8:ac10:fe01::
switch#
```

## 12.4.3 VRRP and VARP Implementation Examples

This section contains the following example set:

- [VRRP Examples](#)
- [VARP Example](#)

### 12.4.3.1 VRRP Examples

This section provides code that implements three VRRP configurations:

- Example 1 configures two switches in a single virtual router group. This implementation protects the LAN against the failure of one router.
- Example 2 configures two switches into two virtual routers within a single LAN. This implementation protects the LAN against the failure of one router and balances traffic between the routers.
- Example 3 configures three switches to implement virtual routers on two LANs. Each LAN contains two virtual routers. One switch is configured into four virtual routers – two on each LAN.

#### 12.4.3.1.1 VRRP Example 1: One Virtual Router on One LAN

[VRRP Example 1 Network Diagram](#) displays the Example 1 network. Two switches are configured as VRRP routers to form one virtual router.

**Figure 18: VRRP Example 1 Network Diagram**

The following code configures the first switch (Router A) as the master router and the second switch (Router B) as a backup router for virtual router 10 on VLAN 50. Router A becomes the Master virtual router by setting its priority at 200; Router B maintains the default priority of 100. The advertisement interval is three seconds on both switches. Priority preemption is enabled by default.

#### Switch code that implements Router A on the first switch

```
switch-A(config)#interface vlan 50
switch-A(config-if-vl50)#ip address 10.10.4.1/24
switch-A(config-if-vl50)#no vrrp 10
switch-A(config-if-vl50)#vrrp 10 priority 200
switch-A(config-if-vl50)#vrrp 10 advertisement interval 3
switch-A(config-if-vl50)#vrrp 10 ip 10.10.4.10
switch-A(config-if-vl50)#exit
```

#### Switch code that implements Router B on the second switch

```
switch-B(config)#interface vlan 50
switch-B(config-if-vl50)#ip address 10.10.4.2/24
switch-B(config-if-vl50)#no vrrp 10
switch-B(config-if-vl50)#vrrp 10 advertisement interval 3
switch-B(config-if-vl50)#vrrp 10 ip 10.10.4.10
switch-B(config-if-vl50)#exit
```

### 12.4.3.1.2 VRRP Example 2: Two Virtual Routers on One LAN

[VRRP Example 2 Network Diagram](#) displays Example 2. Two switches are configured as VRRP routers to form two virtual routers on one LAN. Using two virtual routers distributes the LAN traffic between the switches.

**Figure 19: VRRP Example 2 Network Diagram**

The following code configures two switches as a master and a backup router for two virtual routers on VLAN 50.

- Router A is the master for virtual router 10 and backup for virtual router 20.
- Router B is the master for virtual router 20 and backup for virtual router 10.
- VRRP advertisement interval is 3 seconds on virtual router 10 and 5 seconds on virtual router 20.
- Priority preemption is enabled by default for both virtual routers.

### Switch code that implements Router A on the first switch

```
switch-A(config)#interface vlan 50
switch-A(config-if-vl50)#ip address 10.10.4.1/24
switch-A(config-if-vl50)#no vrrp 10
switch-A(config-if-vl50)#vrrp 10 priority 200
switch-A(config-if-vl50)#vrrp 10 advertisement interval 3
switch-A(config-if-vl50)#vrrp 10 ip 10.10.4.10
switch-A(config-if-vl50)#no vrrp 20
switch-A(config-if-vl50)#vrrp 20 advertisement interval 5
switch-A(config-if-vl50)#vrrp 20 ip 10.10.4.20
switch-A(config-if-vl50)#exit
```

### Switch code that implements Router B on the second switch

```
switch-B(config)#interface vlan 50
switch-B(config-if-vl50)#ip address 10.10.4.2/24
switch-B(config-if-vl50)#no vrrp 10
switch-B(config-if-vl50)#vrrp 10 advertisement interval 3
switch-B(config-if-vl50)#vrrp 10 ip 10.10.4.10
switch-B(config-if-vl50)#no vrrp 20
switch-B(config-if-vl50)#vrrp 20 priority 200
switch-B(config-if-vl50)#vrrp 20 advertisement interval 5
switch-B(config-if-vl50)#vrrp 20 ip 10.10.4.20
switch-B(config-if-vl50)#exit
```

#### 12.4.3.1.3 VRRP Example 3: Two Virtual Routers on Two LANs

[VRRP Example 3 Network Diagram](#) displays Example 3. Three switches are configured as VRRP routers to form four virtual router groups two groups on each of two LANs.

**Figure 20: VRRP Example 3 Network Diagram**

The following code configures the three switches as follows:

- Router A is the master for virtual router 10 and backup for virtual router 20 on VLAN 100.
- Router A is the master for virtual router 30 and backup for virtual router 40 on VLAN 150.
- Router B is the master for virtual router 20 and backup for virtual router 10 on VLAN 100.
- Router C is the master for virtual router 40 and backup for virtual router 30 on VLAN 150.
- VRRP advertisement interval is set to one second on all virtual routers.

- Priority preemption is disabled on all virtual routers.

### Switch code that implements Router A on the first switch

```
switch-A(config)#interface vlan 100
switch-A(config-if-vl100)#ip address 10.10.4.1/24
switch-A(config-if-vl100)#no vrrp 10
switch-A(config-if-vl100)#vrrp 10 priority 200
switch-A(config-if-vl100)#no vrrp 10 preempt
switch-A(config-if-vl100)#vrrp 10 ip 10.10.4.10
switch-A(config-if-vl100)#vrrp 10 advertisement interval 1
switch-A(config-if-vl100)#no vrrp 20
switch-A(config-if-vl100)#no vrrp 20 preempt
switch-A(config-if-vl100)#vrrp 20 ip 10.10.4.20
switch-A(config-if-vl100)#interface vlan 150
switch-A(config-if-vl150)#ip address 40.10.5.7/24
switch-A(config-if-vl150)#no vrrp 30
switch-A(config-if-vl150)#vrrp 30 priority 200
switch-A(config-if-vl150)#no vrrp 30 preempt
switch-A(config-if-vl150)#vrrp 30 ip 40.10.5.31
switch-A(config-if-vl100)#vrrp 30 advertisement interval 1
switch-A(config-if-vl150)#no vrrp 40
switch-A(config-if-vl150)#no vrrp 40 preempt
switch-A(config-if-vl150)#vrrp 40 ip 40.10.5.32
switch-A(config-if-vl150)#exit
```

### Switch code that implements Router B on the second switch

```
switch-B(config)#interface vlan 100
switch-B(config-if-vl100)#ip address 10.10.4.2/24
switch-B(config-if-vl100)#no vrrp 10
switch-B(config-if-vl100)#no vrrp 10 preempt
switch-B(config-if-vl100)#vrrp 10 ip 10.10.4.10
switch-B(config-if-vl100)#no vrrp 20
switch-B(config-if-vl100)#vrrp 20 priority 200
switch-B(config-if-vl100)#no vrrp 20 preempt
switch-B(config-if-vl100)#vrrp 20 ip 10.10.4.20
switch-A(config-if-vl100)#vrrp 20 advertisement interval 1
switch-B(config-if-vl100)#exit
```

### Switch code that implements Router C on the third switch

```
switch-C(config)#interface vlan 150
switch-C(config-if-vl150)#ip address 40.10.5.8/24
switch-C(config-if-vl150)#no vrrp 30
switch-C(config-if-vl150)#no vrrp 30 preempt
switch-C(config-if-vl150)#vrrp 30 ip 40.10.5.31
switch-C(config-if-vl150)#no vrrp 40
switch-C(config-if-vl150)#vrrp 40 priority 200
switch-C(config-if-vl150)#no vrrp 40 preempt
switch-C(config-if-vl150)#vrrp 40 ip 40.10.5.32
switch-A(config-if-vl100)#vrrp 40 advertisement interval 1
switch-C(config-if-vl150)#exit
```

### 12.4.3.2 VARP Example

This section provides code that implements a VARP configuration. [VARP Example Network Diagram](#) displays the Example 1 network. Two switches in an MLAG domain are configured as VARP routers.

The following code configures 10.10.4.10 as the virtual IP address for VLAN 50, 10.24.4.1 as the virtual IP address for VLAN 70, and 001c.7300.0999 as the virtual MAC address on both switches.

Figure 21: VARP Example Network Diagram

#### Switch code that implements VARP on the first switch

```
switch-A(config)#ip virtual-router mac-address 001c.7300.0999
switch-A(config)#interface vlan 50
switch-A(config-if-vl50)#ip address 10.10.4.1/24
switch-A(config-if-vl50)#ip virtual-router address 10.10.4.10
switch-A(config-if-vl50)#interface vlan 70
switch-A(config-if-vl70)#ip address 10.24.4.17/24
switch-A(config-if-vl70)#ip virtual-router address 10.24.4.1
switch-A(config-if-vl70)#exit
```

#### Switch code that implements VARP on the second switch

```
switch-B(config)#ip virtual-router mac-address 001c.7300.0999
switch-B(config)#interface vlan 50
switch-B(config-if-vl50)#ip address 10.10.4.2/24
switch-B(config-if-vl50)#ip virtual-router address 10.10.4.10
switch-B(config-if-vl50)#interface vlan 70
switch-B(config-if-vl70)#ip address 10.24.4.18/24
switch-B(config-if-vl70)#ip virtual-router address 10.24.4.1
switch-B(config-if-vl70)#exit
```

## 12.4.4 VRRP and VARP Configuration Commands

This section contains descriptions of CLI commands that support VRRP and VARP.

### Global Configuration Commands

- [ip fhrp accept-mode](#)
- [ip virtual-router mac-address](#)
- [ip virtual-router mac-address advertisement-interval](#)

### Interface Configuration Commands Ethernet, Port Channel, and VLAN Interfaces

- [ip virtual-router address](#)
- [ipv6 virtual-router address](#)
- [no vrrp](#)
- [vrrp advertisement interval](#)
- [vrrp disabled](#)
- [vrrp ipv4](#)
- [vrrp ipv4 checksum pseudo-header exclude](#)
- [vrrp ipv4 secondary](#)
- [vrrp ipv4 version](#)
- [vrrp ipv6](#)
- [vrrp mac-address advertisement-interval](#)
- [vrrp peer authentication](#)
- [vrrp preempt](#)
- [vrrp preempt delay](#)
- [vrrp priority-level](#)
- [vrrp session description](#)
- [vrrp timers delay reload](#)
- [vrrp tracked-object](#)

### Privileged EXEC Commands

- [show ip virtual-router](#)
- [show ipv6 virtual-router](#)
- [show vrrp](#)

---

#### 12.4.4.1 ip fhrp accept-mode

The **ip fhrp accept-mode** command configures the switch to permit SSH access to the VRRP Master and VARP Master router. All routers within a VRRP or VARP group should be configured consistently. By default, SSH access to the VRRP and VARP Master routers is not permitted.

The **no ip fhrp accept-mode** and **default ip fhrp accept-mode** commands restores the default SSH access availability by removing the **ip fhrp accept-mode** command from **running-config**.

##### Command Mode

Global Configuration

##### Command Syntax

```
ip fhrp accept-mode
```

```
no ip fhrp accept-mode
```

```
default ip fhrp accept-mode
```

##### Example

- This command configures the switch to permit SSH access to the VRRP and VARP Master routers.

```
switch(config)#ip fhrp accept-mode
switch(config)#show running-config

!
ip fhrp accept-mode
!

switch(config)#
```

### 12.4.4.2 ip virtual-router address

The **ip virtual-router address** command assigns a virtual IPv4 address to the VLAN interface being configured. (To assign a virtual IPv6 address to a VLAN interface, use the **ipv6 virtual-router address** command.) Unlike VRRP, the virtual IP address does not have to be in the same subnet as the physical interface.

A virtual IP address may optionally be configured with a subnet, but doing so will modify the behavior of ARP requests sent from the router. When the router sends an ARP request for an IP address in a virtual subnet, the ARP request will use the virtual IP address as the source IP address and the virtual MAC address as the source MAC address inside the ARP header. For virtual IP addresses configured without the subnet option, no modifications are made to outgoing ARP requests.

A maximum of 500 virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address configured through the **ip virtual-router mac-address** command.

This command is typically used in MLAG configurations to create identical virtual routers on switches connected to the MLAG domain through an MLAG.

The **no ip virtual-router address** and **default ip virtual-router address** commands remove the specified virtual IP address from the configuration mode interface by deleting the corresponding **ip virtual-router address** command from **running-config**. If the command does not specify an address, all virtual IPv4 addresses are removed from the interface.

#### Command Mode

Interface-VLAN Configuration

#### Command Syntax

```
ip virtual-router address ipv4_addr
no ip virtual-router address [ipv4_addr]
default ip virtual-router address [ipv4_addr]
```

#### Parameters

- *ipv4\_addr* IP address of router. Dotted decimal notation.

#### Examples

- These commands configure a Switch Virtual Interface (SVI) and a virtual IP address for VLAN 10.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip address 10.0.0.2/24
switch(config-if-Vl10)#ip virtual-router address 10.0.0.6
switch(config-if-Vl10)#exit
switch(config)#
```

- These commands configure a Switch Virtual Interface (SVI) and a virtual IP address with a subnet for VLAN 10. A static route is added to indicate that the virtual subnet is reachable through VLAN 10.

```
switch(config)#ip route 192.0.0.0/24 vlan 10
switch(config)#interface vlan 10
switch(config-if-Vl10)#ip address 10.0.0.2/24
switch(config-if-Vl10)#ip virtual-router address 192.0.0.6/24
switch(config-if-Vl10)#exit
switch(config)#
```

---

### 12.4.4.3 ip virtual-router mac-address advertisement-interval

The `ip virtual-router mac-address advertisement interval` command specifies the period between the transmission of consecutive gratuitous ARP requests that contain the virtual router mac address for each virtual-router IP address configured on the switch. The default period is 30 seconds.

The `no ip virtual-router mac-address advertisement-interval` command restores the default period of 30 seconds by removing the `ip virtual-router mac-address advertisement-interval` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip virtual-router mac-address advertisement-interval period
no ip virtual-router mac-address advertisement-interval
default ip virtual-router mac-address advertisement-interval
```

#### Parameters

- *period* advertisement interval (seconds). Values range from 0 to 86400. Default is 30.

#### Examples

- This command configures a MAC address advertisement interval of one minute (60 seconds).

```
switch(config)#ip virtual-router mac-address advertisement-interval 60
switch(config)#
```

#### 12.4.4.4 ip virtual-router mac-address

The **ip virtual-router mac-address** command assigns a virtual MAC address to the switch. The switch maps all virtual router IP addresses to this MAC address. The address is receive-only; the switch never sends packets with this address as the source. The virtual router is not configured on the switch until this virtual mac-address is assigned.

This command is typically used in MLAG configurations to create identical virtual routers on switches connected to the MLAG domain through an MLAG. When the destination MAC of a packet destined to a remote network matches the virtual MAC address, the MLAG peer forwards the traffic to the next hop destination. Each MLAG peer must have the same routes available, either through static configuration or learned through a dynamic routing protocol.

The **no ip virtual-router mac-address** command removes a virtual MAC address from the interface by deleting the corresponding **ip virtual-router mac-address** command from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

```
ip virtual-router mac-address mac_addr  
no ip virtual-router mac address [mac_addr]
```

##### Parameters

- *mac\_addr* MAC IP address (dotted hex notation). Select an address that will not otherwise appear on the switch.

##### Examples

- This command configures a virtual MAC address.

```
switch(config)#ip virtual-router mac-address 001c.7300.0099  
switch(config)#
```

---

#### 12.4.4.5 ipv6 virtual-router address

The **ipv6 virtual-router address** command assigns a virtual IPv6 address to the VLAN interface being configured. (To assign a virtual IPv4 address to a VLAN interface, use the **ip virtual-router address** command.) Unlike VRRP, the virtual IP address does not have to be in the same subnet as the physical interface.

A maximum of 500 virtual IP addresses can be assigned to a VLAN interface. All virtual addresses on all VLAN interfaces resolve to the same virtual MAC address configured through the **ip virtual-router mac-address** command.

This command is typically used in MLAG configurations to create identical virtual routers on switches connected to the MLAG domain through an MLAG.

The **no ipv6 virtual-router address** and **default ipv6 virtual-router address** commands remove the specified virtual IPv6 address from the configuration mode interface by deleting the corresponding **ipv6 virtual-router address** command from **running-config**. If the command does not specify an address, all virtual IPv6 addresses are removed from the interface.

##### Command Mode

Interface-VLAN Configuration

##### Command Syntax

```
ipv6 virtual-router address net_addr
no ipv6 virtual-router address [net_addr]
default ipv6 virtual-router address [net_addr]
```

##### Parameters

- *net\_addr* network IPv6 address.

##### Examples

- These commands configure a Switch Virtual Interface (SVI) and a virtual IPv6 address for VLAN 10.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#ipv6 address 2001:0DB8:0:1::1/64
switch(config-if-Vl10)#ipv6 virtual-router address 2001:0DB8:0:1::2
switch(config-if-Vl10)#exit
switch(config)#
```

### 12.4.4.6 no vrrp

The **no vrrp** command removes all VRRP configuration commands for the specified virtual router on the configuration mode interface. The **default vrrp** command also reverts VRRP configuration parameters to default settings by removing the corresponding **vrrp** commands.

Commands removed by the **no vrrp** command include:

- [vrrp advertisement interval](#)
- [vrrp disabled](#)
- [vrrp ipv4](#)
- [vrrp ipv4 secondary](#)
- [vrrp peer authentication](#)
- [vrrp preempt](#)
- [vrrp preempt delay](#)
- [vrrp priority-level](#)
- [vrrp session description](#)

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
no vrrp group
```

```
default vrrp group
```

#### Parameters

- *group* virtual router identifier (VRID). Values range from 1 to 255.

#### Examples

- This command removes all VRRP configuration commands for virtual router group 10 on VLAN 15.

```
switch(config)#interface vlan 15  
switch(config-if-vl15)#no vrrp 10  
switch(config-if-vl15)#
```

---

### 12.4.4.7 show ip virtual-router

The **show ip virtual-router** command displays the virtual MAC address assigned to the switch and all virtual IP addresses assigned to each VLAN interface.

#### Command Mode

EXEC

#### Command Syntax

```
show ip virtual-router
```

#### Messages

- **IP virtual router is not configured** a virtual MAC address is not assigned to the switch.
- **No interface with virtual IP address** no virtual IP addresses are assigned to any VLAN interfaces.

#### Examples

- This command displays a table of information for VRRP groups on the switch.

```
switch#show ip virtual-router
IP virtual router is configured with MAC address: 24cd.5a29.cc31
Interface  IP Address      Virtual IP Address  Status
Protocol
Vlan15    10.1.1.3/24     10.1.1.15          up          up
Vlan15    10.1.1.3/24     10.1.1.16          up          up
Vlan15    10.1.1.3/24     10.1.1.17          up          up
Vlan20    10.12.1.6/24    10.1.1.51          up          up
Vlan20    10.12.1.6/24    10.1.1.53          up          up
Vlan20    10.12.1.6/24    10.1.1.55          up          up
switch#
```

- This command generates a response that indicates a virtual MAC address is not assigned to the switch.

```
switch#show ip virtual-router
IP virtual router is not configured
switch#
```

#### 12.4.4.8 show ipv6 virtual-router

The `show ipv6 virtual-router` command displays the virtual MAC address assigned to the switch and all virtual IPv6 addresses assigned to each VLAN interface.

##### Command Mode

EXEC

##### Command Syntax

```
show ipv6 virtual-router
```

##### Messages

- **IPv6 virtual router is not configured** a virtual MAC address is not assigned to the switch.
- **No interface with virtual IPv6 address** no virtual IPv6 addresses are assigned to any VLAN interfaces.

##### Examples

- This command displays a table of information for IPv6 VRRP groups on the switch.

```
switch#show ipv6 virtual-router
IP virtual router is configured with MAC address: 001c.7300.0099
MAC address advertisement interval: 30 seconds
Interface Vlan4094
  State is up
  Protocol is up
  IPv6 address
    2001:b8:2001::1011/64
  Virtual IPv6 address
    2001:db8:ac10:fe01::
switch#
```

### 12.4.4.9 show vrrp

The **show vrrp** command displays information about the Virtual Router Redundancy Protocol (VRRP) groups configured on a specified interface. Parameter options control the amount and formatting of the displayed information.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show vrrp [INFO_LEVEL] [STATES]
```

```
show vrrp INTF GROUP_NUM [INFO_LEVEL] [STATES]
```

```
show vrrp GROUP_NUM INTF_GROUP [INFO_LEVEL] [STATES]
```

#### Parameters

- INTF specifies the VRRP groups for which the command displays status. When the parameter is omitted or specifies only an interface, the group list is filtered by the STATES parameter.
  - <no parameter> specified groups on all interfaces.
  - **interface ethernet** *e\_num* specified groups on Ethernet interface.
  - **interface loopback** *l\_num* specified groups on loopback interface.
  - **interface management** *m\_num* specified groups on management interface.
  - **interface port-channel** *p\_num* specified groups on port channel interface.
  - **interface vlan** *v\_num* specified groups on VLAN interface.
  - **interface vxlan** *vx\_num* specified groups on VXLAN interface.
- GROUP\_NUM the VRRP ID number of the group for which the command displays status.
  - <no parameter> all groups on specified interface.
  - *vrid\_num* virtual router identifier (VRID). Value ranges from 1 to 255.
- INFO\_LEVEL Specifies format and amount of displayed information. Options include:
  - <no parameter> displays a block of data for each VRRP group.
  - **brief** displays a single table that lists information for all VRRP groups.
- STATES Specifies the groups, by VRRP router state, that are displayed. Options include:
  - <no parameter> displays data for groups in the master or backup states.
  - **all** displays all groups, including groups in the stopped and interface down states.

#### Examples

- This command displays a table of information for VRRP groups on the switch.

```
switch#show vrrp brief
Interface Id  Ver  Pri  Time  State  VrIps
Vlan1006  3    2   100 3609  Master 127.38.10.2
Vlan1006  4    3   100 3609  Master 127.38.10.10
Vlan1010  1    2   100 3609  Master 128.44.5.3
Vlan1014  2    2   100 3609  Master 127.16.14.2
switch>
```

- This command displays data blocks for all VRRP groups on VLAN 46, regardless of the VRRP state.

```
switch#show vrrp interface vlan 1006 all
Vlan1010 - Group 1
  VRRP Version 2
  State is Stopped
  Virtual IPv4 address is 128.44.5.3
  Virtual MAC address is 0000.5e00.0101
```

```
Mac Address Advertisement interval is 30s
VRRP Advertisement interval is 1s
Preemption is enabled
Preemption delay is 0s
Preemption reload delay is 0s
Priority is 100
Master Router is 0.0.0.0
Master Advertisement interval is 1s
Skew time is 0.609s
Master Down interval is 3.609s
switch#
```

- This command displays data for all VRRP group 2 on VLAN 1014.

```
switch#show vrrp interface vlan 1014 group 2
Vlan1006 - Group 2
  VRRP Version 2
  State is Master
  Virtual IPv4 address is 127.38.10.2
  Virtual MAC address is 0000.5e00.0103
  Mac Address Advertisement interval is 30s
  VRRP Advertisement interval is 1s
  Preemption is enabled
  Preemption delay is 0s
  Preemption reload delay is 0s
  Priority is 100
  Master Router is 127.38.10.1 (local), priority is 100
  Master Advertisement interval is 1s
  Skew time is 0.609s
  Master Down interval is 3.609s
switch#
```

---

#### 12.4.4.10 vrrp advertisement interval

The **vrrp advertisement interval** command configures the interval between successive advertisement messages that the switch sends to VRRP routers in the specified virtual router group. The switch must be the groups Master virtual router to send advertisement messages. The advertisement interval must be configured identically on all physical routers in the virtual router group.

The advertisement interval also influences the timeout interval that defines when the virtual router becomes the master virtual router. When preemption is enabled, the virtual router becomes the master when three times the advertisement interval elapses after the switch detects master router priority conditions.

The **no vrrp advertisement interval** and **default vrrp advertisement interval** commands restore the default advertisement interval of one second for the specified virtual router by removing the corresponding **vrrp advertisement interval** command from running-config. The **no vrrp** command also removes the **vrrp advertisement interval** command for the specified virtual router.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
vrrp group advertisement interval adv_time  
no vrrp group advertisement interval  
default vrrp group advertisement interval
```

##### Parameters

- *group* virtual router identifier (VRID). Values range from 1 to 255.
- *adv\_time* advertisement interval (seconds). Values range from 1 to 255. Default value is 1.

##### Example

- This command sets the advertisement interval of five seconds for the virtual router 35 on VLAN 100.

```
switch(config)#interface vlan 100  
switch(config-if-vl100)#vrrp 35 advertisement interval 5  
switch(config-if-vl100)#
```

### 12.4.4.11 vrrp disabled

The **vrrp disabled** command places the switch in stopped state for the specified virtual router. While in stopped state, the switch cannot act as a Master or backup router for the virtual router group.

The **no vrrp disabled** and **default vrrp disabled** commands remove the corresponding **vrrp disabled** command from **running-config**. This changes the switch's virtual router state to **backup** or **master** if the virtual router is properly configured.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
vrrp group disabled
```

```
no vrrp group disabled
```

```
default vrrp group disabled
```

#### Parameters

- *group* virtual router identifier (VRID). Values range from 1 to 255.

#### Example

- These commands place the switch in stopped mode for virtual router 24 on VLAN 20.

```
switch(config)#interface vlan 20  
switch(config-if-vl20)#vrrp 24 disabled  
switch(config-if-vl20)#
```

- This command moves the switch out of stopped mode for virtual router 24 on VLAN 20.

```
switch(config-if-vl20)#no vrrp 24 disabled  
switch(config-if-vl20)#
```

---

#### 12.4.4.12 vrrp ipv4 checksum pseudo-header exclude

This command excludes the pseudo-header in IPv4 VRRPv3 checksum calculation on the VRRP group on the configuration mode interface of the switch and supports IPv4 VRRPv3 interoperability.

The **no** form of the command deletes the **vrrp ipv4 checksum pseudo-header exclude** configuration from the Ethernet interface on the switch.

The **exit** command returns the switch to global configuration mode.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
vrrp group ipv4 checksum pseudo-header exclude
```

```
no vrrp group ipv4 checksum pseudo-header exclude
```

##### Parameter

- *group* virtual router identifier (VRID). Values range from 1 to 255.

##### Example

- This command excludes the pseudo-header in IPv4 VRRPv3 checksum calculation on VRRP group 1 on interface Ethernet 1.

```
switch(config-if-Et1)#vrrp 1 ipv4 checksum pseudo-header exclude
```

### 12.4.4.13 vrrp ipv4 secondary

The **vrrp ipv4 secondary** command assigns a secondary IP address to the specified virtual router. Secondary IP addresses are an optional virtual router parameter. A virtual router may contain multiple secondary address commands. The IP address list must be identical for all VRRP routers in a virtual router group.

The virtual router is assigned a primary IP address with the **vrrp ipv4** command.

The **no vrrp ipv4 secondary** and **default vrrp ipv4 secondary** commands remove the secondary IP address for the specified VRRP virtual router by deleting the corresponding **vrrp ipv4 secondary** statement from running-config. The **no vrrp** command also removes all **vrrp ipv4 secondary** commands for the specified virtual router.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
vrrp group ipv4 ipv4_addr secondary
```

```
no vrrp group ipv4 ipv4_addr secondary
```

```
default vrrp group ipv4 ipv4_addr secondary
```

#### Parameters

- *group* virtual router identifier (VRID). Values range from 1 to 255.
- *ipv4\_addr* secondary IPv4 address of the virtual router.

#### Related Commands

- [vrrp ipv4](#)

#### Example

- This command assigns the IP address of 10.2.4.5 as the secondary IP address for the virtual router with VRID of 15 on VLAN 20

```
switch(config)#interface vlan 20  
switch(config-if-vl20)#vrrp 15 ipv4 10.2.4.5 secondary  
switch(config-if-vl20)#
```

---

#### 12.4.4.14 vrrp ipv4 version

The **vrrp ipv4 version** command enables VRRP on the configuration mode interface and configures the VRRP version for the specified VRRP virtual router.

The **no vrrp ipv4 version** and **default vrrp ipv4 version** commands restore the default VRRP version to VRRPv2 by removing the corresponding **vrrp ipv4 version** statement from *running-config*.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
vrrp group ipv4 version VERSION_NUMBER
```

```
no vrrp group ipv4 version
```

```
default vrrp group ipv4 version
```

##### Parameters

- *group* virtual router identifier (VRID). Values range from 1 to 255.
- *VERSION\_NUMBER* Specifies VRRP version that the switch uses. Default value is 2 (VRRPv2)  
Options include:
  - **2** VRRP v2 supports IPv4 environment.
  - **3** VRRP v3 supports IPv4 and IPv6 environment.

##### Examples

- This command enables VRRPv3 for IPv6 on interface Ethernet 3.

```
switch#(config)#interface ethernet 3  
switch#(config-if-Et3)#vrrp 1 ipv4 version 3  
switch#
```

- This command removes VRRPv3 from interface Ethernet 3 and reverts to the default VRRPv2.

```
switch#(config)#interface ethernet 3  
switch#(config-if-Et3)#no vrrp 1 ipv4 version  
switch#(config-if-Et3)#
```

### 12.4.4.15 vrrp ipv4

The **vrrp ipv4** command configures the primary IP address for the specified VRRP virtual router. The command also activates the virtual router if the primary address is contained in the interfaces subnet. A VRRP virtual routers configuration may contain only one primary IP address assignment command; subsequent **vrrp ipv4** commands replace the existing primary address assignment.

The **vrrp ipv4 secondary** command assigns a secondary IP address to the VRRP virtual router.

The **no vrrp ipv4** and **default vrrp ipv4** commands disable the VRRP virtual router and deletes the primary IP address by removing the corresponding **vrrp ipv4** statement from **running-config**. The **no vrrp** command also removes the **vrrp ipv4** command for the specified virtual router.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
vrrp group ipv4 ipv4_address
```

```
no vrrp group ipv4 ipv4_address
```

```
default vrrp group ipv4 ipv4_address
```

#### Parameters

- *group* virtual router identifier (VRID). Values range from 1 to 255.
- *ipv4\_address* IPv4 address of the virtual router.

#### Related Commands

- [vrrp ipv4 secondary](#)

#### Example

- This command enables virtual router 15 on VLAN 20 and designates 10.1.1.5 as the virtual routers primary address.

```
switch(config)#interface vlan 20  
switch(config-if-vl20)#vrrp 15 ipv4 10.1.1.5  
switch(config-if-vl20)#
```

---

#### 12.4.4.16 vrrp ipv6

The **vrrp ipv6** command configures the IPv6 address for the specified VRRP virtual router. The command also activates the virtual router if the primary address is contained in the interfaces subnet.

The **no vrrp ipv6** and **default vrrp ipv6** commands disable the VRRP virtual router and delete the IPv6 address by removing the corresponding **vrrp ipv6** statement from **running-config**. The **no vrrp** command also removes the **vrrp ipv6** command for the specified virtual router.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
vrrp group ip ipv6_address
```

```
no vrrp group ip ipv6_address
```

```
default vrrp group ip ipv6_address
```

##### Parameters

- *group* virtual router identifier (VRID). Values range from 1 to 255.
- *ipv6\_address* IPv6 address of the virtual router.

##### Example

- This command enables address 2001:db8:0:1::1 for IPv6 VRRP on VLAN 20.

```
switch(config)#interface vlan 20  
switch(config-if-vl20)#vrrp 3 ipv6 2001:db8:0:1::1  
switch(config-if-vl20)#
```

- This command disables VRRPv3 on VLAN 20 from virtual router 3.

```
switch(config)#interface vlan 20  
switch(config-if-vl20)#no vrrp 3 ipv6 2001:db8:0:1::1  
switch(config-if-vl20)#
```

### 12.4.4.17 vrrp mac-address advertisement-interval

The `vrrp mac-address advertisement-interval` command specifies the interval between advertisement packets sent by the master router to the VRRP group members.

The `vrrp mac-address advertisement-interval 0`, `no vrrp mac-address advertisement-interval` and `default vrrp mac-address advertisement-interval` commands disable the feature by removing the `vrrp mac-address advertisement-interval` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
vrrp group mac-address advertisement-interval period
```

```
no vrrp group mac-address
```

```
default vrrp group mac-address
```

#### Parameters

- *group* virtual router identifier (VRID). Values range from 1 to 255.
- *period* interval in which the master router sends advertisement packets (seconds). Value ranges from 0 to 3600. Selecting 0 as the interval disables this feature.

#### Example

- This command specifies the interval between advertisement packets sent to the members of VRRP group 3 on VLAN 20.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#vrrp 3 mac-address advertisement-interval 60
switch(config-if-vl20)#
```

- This command disables the feature on VLAN 20.

```
switch(config)#interface vlan 20
switch(config-if-vl20)#no vrrp 3 mac-address advertisement-interval
switch(config-if-vl20)#
```

---

#### 12.4.4.18 vrrp peer authentication

The `vrrp peer authentication` command configures parameters the switch uses to authenticate virtual router packets it receives from other VRRP routers in the group.

The `no vrrp peer authentication` and `default vrrp peer authentication` commands disable VRRP peer authentication of packets from the specified virtual router by removing the corresponding `vrrp peer authentication` command from running-config. The `no vrrp` command also removes the `vrrp peer authentication` command for the specified virtual router.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
vrrp group peer authentication AUTH_PARAMETER
```

```
no vrrp group peer authentication
```

```
default vrrp group peer authentication
```

##### Parameters

- *group* virtual router identifier (VRID). Values range from 1 to 255.
- AUTH\_PARAMETER encryption level and authentication key used by router. Options include:
  - **text** *text\_key* plain-text authentication, *text\_key* is text.
  - *text\_key* plain-text authentication, *text\_key* is text.
  - **ietf-md5 key-string 0** *text\_key* IP authentication of MD5 key hash, *text\_key* is text.
  - **ietf-md5 key-string** *text\_key* IP authentication of MD5 key hash, *text\_key* is text.
  - **ietf-md5 key-string 7** *coded\_key* IP authentication of MD5 key hash, *coded\_key* is MD5 hash.

##### Guidelines

This command is applicable to VRRPv2 which supports IPv4 addresses only.

##### Examples

- This command implements plain-text authentication, using 12345 as the key, for virtual router 40 on VLAN 100.

```
switch(config)#interface vlan 100
switch(config-if-vl100)#vrrp 40 peer authentication text 12345
switch(config-if-vl100)#
```

- This command implements ietf-md5 authentication, using 12345 as the key.

```
switch(config-if-vl100)#vrrp 40 peer authentication ietf-md5 key-string
0 12345
switch(config-if-vl100)#
```

- This command implements ietf-md5 authentication, using 12345 as the key. The key is entered as the MD5 hash equivalent of the text string.

```
switch(config-if-vl100)#vrrp 40 peer authentication ietf-md5 key-string
7
EA3TUPxdddFCLYT8mb+kxw==switch(config-if-vl100)#
```

### 12.4.4.19 vrrp preempt delay

The `vrrp preempt delay` command specifies the interval between a VRRP preemption event and the point when the switch becomes the master VRRP router. A preemption event is any event that results in the switch having the highest virtual router priority setting while preemption is enabled. The `vrrp preempt` command enables preemption for a specified virtual router.

The command configures two delay periods:

- **minimum** time delays master VRRP takeover when VRRP is fully implemented.
- **reload** time delays master VRRP takeover after VRRP is initialized following a switch reload (boot). The switch bypasses the reload time to become the VRRP master immediately if it senses there are no other active switches in the virtual router group.

**Running-config** maintains separate delay statements for **minimum** and **reload** parameters. Commands may list both parameters. Commands that list one parameter do not affect the omitted parameter. Values range from 0 to 3600 seconds (one hour). The default delay is zero seconds for both parameters.

The `no vrrp preempt delay` and `default vrrp preempt delay` commands reset the specified delay to the default of zero seconds. Commands that do not list either parameter resets both periods to zero. The `no vrrp` command also removes all `vrrp preempt delay` commands for the specified virtual router.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
vrrp group preempt delay [MINIMUM_INTERVAL] [RELOAD_INTERVAL]
```

```
no vrrp group preempt delay [DELAY_TYPE]
```

```
default vrrp group preempt delay [DELAY_TYPE]
```

#### Parameters

- *group* virtual router identifier (VRID). Values range from 1 to 255.
- MINIMUM\_INTERVAL period between preempt event and takeover of master VRRP router role.
  - <no parameter> minimum delay is not altered by command.
  - **minimum** *min\_time* delay during normal operation (seconds). Values range from 0 to 3600.
- RELOAD\_INTERVAL period after reboot-VRRP initialization and takeover of master VRRP router role.
  - <no parameter> reload delay is not altered by command.
  - **reload** *reload\_time* delay after reboot (seconds). Values range from 0 to 3600.
- DELAY\_TYPE delay type that is reset to default value.
  - <no parameter> reload and minimum delays are reset to default.
  - **minimum** minimum delay is reset to default.
  - **reload** reload delay is reset to default.

(DELAY\_TYPE parameter is only used in `no vrrp preempt delay` and `default vrrp preempt delay` commands).

#### Related Commands

- `vrrp preempt`

#### Examples

- 
- This command sets the minimum preempt time of 90 seconds for virtual router 20 on VLAN 40.

```
switch(config)#interface vlan 40  
switch(config-if-vl40)#vrrp 20 preempt delay minimum 90  
switch(config-if-vl40)#
```

- This command sets the minimum and reload preempt time to zero for virtual router 20 on VLAN 40.

```
switch(config-if-vl40)#no vrrp 20 preempt delay  
switch(config-if-vl40)#
```

### 12.4.4.20 vrrp preempt

The `vrrp preempt` command controls a virtual routers preempt mode setting. When preempt mode is enabled, if the switch has a higher priority it will preempt the current master virtual router. When preempt mode is disabled, the switch can become the master virtual router only when a master virtual router is not present on the subnet, regardless of VRRP priority level settings. By default, preempt mode is enabled.

The `no vrrp preempt` and `default vrrp preempt` commands disable preempt mode for the specified virtual router; the `default vrrp preempt` command stores a corresponding `no vrrp preempt` statement in *running-config*. The `vrrp preempt` command enables preempt mode by removing the corresponding `no vrrp preempt` statement from running-config.

The `no vrrp` command also enables preempt mode by removing the `no vrrp preempt` command for the specified virtual router.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
vrrp group preempt
```

```
no vrrp group preempt
```

```
default vrrp group preempt
```

#### Parameters

- `group` virtual router identifier (VRID). Values range from 1 to 255.

#### Related Commands

- [vrrp preempt delay](#)

#### Examples

- This command disables preempt mode for virtual router 20 on VLAN 40.

```
switch(config)#interface vlan 40
switch(config-if-vl40)#no vrrp 20 preempt
switch(config-if-vl40)#
```

- This command enables preempt mode for virtual router 20 on VLAN 40.

```
switch(config-if-vl40)#vrrp 20 preempt
switch(config-if-vl40)#
```

---

#### 12.4.4.21 vrrp priority-level

The **vrrp priority-level** command configures the switch's priority setting for a VRRP virtual router. Priority values range from 1 to 254. The default value is 100.

The router with the highest VRRP priority level setting for a group becomes the master virtual router for that group. The master virtual router controls the IP address and is responsible for forwarding traffic sent. The **vrrp preempt** command controls the time when a switch can become the master virtual router.

The **no vrrp priority-level** and **default vrrp priority-level** commands restore the default priority of 100 to the virtual router on the configuration mode interface by removing the corresponding **vrrp priority-level** command from **running-config**. The **no vrrp** command also removes the **vrrp priority-level** command for the specified virtual router.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
vrrp group priority-level level
```

```
no vrrp group priority-level level
```

```
default vrrp group priority-level level
```

##### Parameters

- *group* virtual router identifier (VRID). Values range from 1 to 255.
- *level* priority setting for the specified virtual router. Values range from 1 to 254.

##### Examples

- This command sets the virtual router priority value of 250 for virtual router group 45 on VLAN 20.

```
switch(config)#interface vlan 20  
switch(config-if-vl20)#vrrp 45 priority-level 250  
switch(config-if-vl20)#
```

#### 12.4.4.22 vrrp session description

The **vrrp session description** command associates a text string to a VRRP virtual router on the configuration mode interface. The string has no functional impact on the virtual router. The maximum length of the string is 80 characters.

The **no vrrp session description** and **default vrrp session description** commands remove the text string association from the VRRP virtual router by deleting the corresponding **vrrp session description** command from *running-config*. The **no vrrp** command also removes the **vrrp session description** command for the specified virtual router.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
vrrp group session description label_text
```

```
no vrrp group session description
```

```
default vrrp group session description
```

##### Parameters

- *group* virtual router identifier (VRID). Values range from 1 to 255.
- *label\_text* text that describes the virtual router. Maximum string length is 80 characters.

##### Example

- This command associates the text string Laboratory Router to virtual router 15 on VLAN 20.

```
switch(config)#interface vlan 20  
switch(config-if-vl20)#vrrp 15 session description Laboratory Router  
switch(config-if-vl20)#
```

---

### 12.4.4.23 vrrp timers delay reload

The `vrrp timers delay reload` command delays the time for VRRP initialization after a system reboot.

The `no vrrp timers delay reload` and `default vrrp timers delay reload` commands restore the default value of 0 by deleting the `vrrp timers delay reload` statement from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
vrrp group timers delay reload [INTERVAL]
```

```
no vrrp group timers delay reload
```

```
default vrrp group timers delay reload
```

#### Parameters

- INTERVAL The number of seconds for the delay (seconds). Options include:
  - <no parameter> Default value of 0 seconds.
  - <0 to 3600> Ranges between 0 and 60 minutes.

#### Example

- These commands configure the VRRP reload delay interval to 15 minutes.

```
switch(config)#interface vlan 100  
switch(config-if-Vl100)#vrrp 2 timers delay reload 900  
switch(config-if-Vl100)#
```

- These commands removes the VRRP reload delay interval.

```
switch(config)#interface vlan 100  
switch(config-if-Vl100)#no vrrp 2 timers delay reload  
switch(config-if-Vl100)#
```

#### 12.4.4.24 vrrp tracked-object

The `vrrp tracked-object` command configures the VRRP client process on the configuration mode interface to track the specified tracked object and react when its status changes to **down**. The tracked object is created by the `track` command.

The `no vrrp tracked-object` and `default vrrp tracked-object` commands cause the VRRP client process to stop tracking the specified tracked object by removing the corresponding `vrrp tracked-object` command from *running-config*.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
vrrp group tracked-object object_name ACTION amount
```

```
no vrrp group tracked-object object_name ACTION
```

```
default vrrp group tracked-object object_name ACTION
```

##### Parameters

- *group* virtual router identifier (VRID). Values range from 1 to 255.
- *object\_name* name of tracked object.
- *amount* amount to decrement VRRP priority level. Values range from 1 to 254.
- **ACTION** The action that VRRP is to take when the tracked objects status changes to **down**. Options include:
  - **decrement** decrease VRRP priority level by *amount*.
  - **shutdown** shut down VRRP on the configuration mode interface.

If both **decrement** and **shutdown** are configured on the same interface for the same VRRP group, then VRRP will be shut down on the interface if the tracked object is down.

##### Related Commands

- [track](#)

##### Example

- This command causes Ethernet interface 5 to disable VRRP when tracked object ETH8 changes state.

```
switch(config-if-Et5)#vrrp 1 tracked-object ETH8 shutdown
switch(config-if-Et5)#
```

## 12.5 OpenFlow

This section describes Arista's OpenFlow implementation. Topics in this section include:

- [OpenFlow Introduction](#)
- [OpenFlow Description](#)
- [OpenFlow Configuration](#)
- [OpenFlow Command Descriptions](#)

## 12.5.1 OpenFlow Introduction

Arista EOS supports OpenFlow 1.0 controlled by OpenFlow controllers for filtering and redirecting traffic.

## 12.5.2 OpenFlow Description

OpenFlow is a programmable network protocol that manages and directs traffic among Ethernet switches, routers, and wireless access points over the network in support of Software-Defined Networking (SDN) applications.

OpenFlow can be used for traffic flow management in metro, WAN, and data center networks, and also security management in enterprise and campus data center applications, and other applications with the appropriate use of OpenFlow controllers.

### 12.5.2.1 OpenFlow Controller

The Arista device supports an active controller connection for which the Arista device will initiate (seek) the TCP connection to a given OpenFlow Controller address.

**Figure 22: Reactive and proactive modes**

The controller can be any standard OpenFlow controller.

Switch consists of three parts:

- A flow table, to tell the switch how to process the flow.
- A channel that connects the switch to a remote controller, allowing commands and packets to be sent between a controller and the switch.
- The OpenFlow Protocol, which provides a way for a controller to communicate with a switch.

An OpenFlow-enabled device supports an OpenFlow Client (control plane software), which communicates with an OpenFlow Controller using the OpenFlow protocol. The OpenFlow Controller runs on a server or a server cluster. OpenFlow-enabled devices support the abstraction of a flow table, which is manipulated by the OpenFlow Controller. A flow is a collection of packets where some selected header fields match particular values for those fields. The flow table is sorted by flow priority, which is defined by the controller.

### Flow table

Forwarding decisions for incoming packets are decided by a simple lookup on its flow-table entries. Packets that don't match any flow entry are dropped by default. Every flow entry in the flow-table contains:

- Header fields to match against packets: Each entry contains a specific value, or ANY, which matches any value.

| Ingress Port | Ether Source | Ether Dst | Ether Type | VLAN Id | IP Proto | Src Port | Dst Port |
|--------------|--------------|-----------|------------|---------|----------|----------|----------|
|--------------|--------------|-----------|------------|---------|----------|----------|----------|

- Counters to update for matching packet: These counters are used for statistics purposes, in order to keep track of the number of packets and bytes for each flow and the time that has elapsed since the flow initiation.
- Actions to apply to matching packets: The action specifies the way in which the packets of a flow will be processed. An action can be one of the following: 1) forward the packet to a given port or ports, after optionally rewriting some header fields, 2) drop the packet 3) forward the packet to the controller.

### Channel

The channel is the interface that connects each OpenFlow switch to a controller. Through this interface the controller exchanges messages with the switches in order to configure and manage them

## 12.5.2.2 OpenFlow Modes

### Bind modes

The switch can be configured to divide traffic entering the switch in either of two ways:

- By interface, so that only packets arriving on certain interfaces are processed by OpenFlow (interface bind mode, the default).
- By VLAN, so that only packets associated with certain VLAN IDs are processed by OpenFlow (VLAN bind mode).

Other packets are forwarded normally according to the MAC address table, filtered by ACLs, mirrored to other ports.

 **Note:** The hybrid mode of operation is experimental.

The switch can also be configured to apply a limited set of OpenFlow actions to any packets, regardless of ingress interface or VLAN, as well as forward the packets normally (monitor bind mode).

### Interface bind mode

When the switch is configured in interface bind mode, the ingress interface of a packet is processed according to entries in the OpenFlow table.

Only interfaces bound to OpenFlow are mapped to OpenFlow ports and exposed to the controller via features reply and port status messages. Output actions in flow table entries and in packet out messages can refer only to mapped ports. Use the [show openflow ports](#) command to see which interfaces the switch maps to OpenFlow ports and exposes to the controller.

- In OpenFlow configuration mode, use the [bind mode \(OpenFlow\)](#) command to select interface bind mode.
- In the OpenFlow configuration mode, use the [bind interface](#) command to bind one or more interfaces to OpenFlow.

When an interface is bound to OpenFlow, certain switch functions are disabled on the interface, including spanning tree protocol (STP). The OpenFlow controller and application must ensure that flow table entries do not allow traffic to loop in the network.

Only Ethernet and Port-Channel interfaces can be bound to OpenFlow. If an Ethernet interface is configured as a member of a LAG, attempting to bind the interface to OpenFlow has no effect. However, the Port-Channel interface of which it is a member may itself be bound to OpenFlow.

---

## VLAN bind mode

When a packet arrives at a switch interface, the switch assigns it a VLAN for internal processing, based on the switchport configuration of the ingress interface and on the packet's VLAN tag (if any). If the switch is configured in VLAN bind mode, the internal VLAN determines whether the packet is processed according to entries in the OpenFlow table and whether the packet is matched by a given entry in the OpenFlow table. After the switch has processed the packet, the switchport configuration of each potential egress interface controls whether the packet is transmitted tagged with the internal VLAN ID, transmitted untagged, or filtered.

Several configuration commands affect whether packets received on a given interface are processed by OpenFlow, and whether packets directed to an interface via an OpenFlow output action are transmitted or filtered:

Use the VLAN configuration mode command to create the VLANs to be accepted by the switch and processed by OpenFlow.

In the interface configuration mode, use switchport commands to configure the interface as either an access port or a trunk port. For an access port, set the VLAN to an OpenFlow VLAN; for a trunk port, configure which OpenFlow VLANs are allowed.

In OpenFlow configuration mode, use the [bind mode \(OpenFlow\)](#) command to select VLAN bind mode, and use the [bind vlan \(OpenFlow\)](#) command to bind one or more VLANs to OpenFlow.

### Untagged packet processing in VLAN bind mode

The OpenFlow protocol also allows a flow table entry to explicitly match untagged packets, or to strip the VLAN tag from matched packets. Since the switch actually assigns a VLAN internally to packets received without a tag, the OpenFlow function on the switch must be configured with a single "native" VLAN ID in order to make sense of such flow entries. When an OpenFlow native VLAN is configured:

- A flow table entry defined to match untagged packets actually matches packets whose internal VLAN is the OpenFlow native VLAN.
- A flow table entry with a strip VLAN tag action actually sets the packet's internal VLAN to the OpenFlow native VLAN.
- Packets sent to the controller via a packet-in message are sent untagged if they are assigned to the native VLAN, and tagged otherwise.
- Untagged packets received from the controller via a packet-out message are assigned to the native VLAN.

In contrast, when no OpenFlow native VLAN is configured:

- Flow table entries defined to match untagged packets or with a strip VLAN tag action are rejected.
- All packets sent to the controller via a packet-in message are sent tagged.
- Untagged packets received from the controller via a packet-out message are dropped.

There is no explicit command to configure the OpenFlow native VLAN. To configure a VLAN as the OpenFlow native VLAN:

- Use the VLAN configuration mode command.
- Every interface handling the OpenFlow traffic, in interface configuration mode, uses switchport commands to configure the interface as either an access port or a trunk port. For an access port, set the access VLAN to N; for a trunk port, either set the native VLAN to N or configure the interface to drop untagged frames.
- In OpenFlow configuration mode, use the [bind vlan \(OpenFlow\)](#) command to assign VLAN N to OpenFlow.

Configuring two interfaces as access ports with different OpenFlow-bound VLANs, or as trunk ports with different native OpenFlow-bound VLANs, violates these constraints and causes the OpenFlow function to behave as no OpenFlow native VLAN is configured.

Use the `show openflow` command to see whether an OpenFlow native VLAN has been configured.

### Spanning Tree Protocol in VLAN bind mode

STP can operate on OpenFlow-bound VLANs. The switch default STP configuration is one multiple spanning tree (MST) instance containing all VLANs, including OpenFlow-bound VLANs. When STP is configured on OpenFlow-bound VLANs, packets received from or sent to blocked ports are dropped, regardless of the rules defined in the OpenFlow flow table.

For some applications, you may want to disable STP on OpenFlow-bound VLANs. Before doing so, be sure that the OpenFlow controller and application is configured properly to manage multiple redundant paths through the network without allowing traffic to loop.

To ensure proper operation of STP on the switch and to support OpenFlow applications that inter-operate with STP, OpenFlow forwards inbound STP packets both to the spanning tree agent on the switch and to the OpenFlow controller as packet-in messages. This behavior overrides any flow table entries that might otherwise match STP packets, and is not configurable.

### Monitor bind mode

Unlike interface and VLAN bind modes, monitor bind mode is tailored for specific applications. The switch both forwards traffic normally and selectively mirrors packets under OpenFlow control.

When the switch is configured in monitor bind mode, all traffic entering the switch is forwarded normally, regardless of ingress interface or internal VLAN. All Ethernet and Port-Channel interfaces are mapped to OpenFlow ports and exposed to the controller (except LAG members and mirror destination ports). In this mode, the entire switch is bound to OpenFlow, and OpenFlow processing is applied to packets in addition to the normal forwarding behavior.

Currently the only actions that can be performed on packets in monitor bind mode are:

- Output normally
- Copy to mirror destination port

In monitor bind mode, the default action taken on packets that are not matched by any flow table entry is output normally. The switch rejects flow entries not conforming to these restrictions.

### Routing Between the OpenFlow and Non-OpenFlow Domain

The switch can be configured to perform standard IP routing of traffic processed by OpenFlow. From the controller's point of view, the switch appears to have a virtual port 40000 (OpenFlowRouter) in addition to the physical ports.

Packets sent out the OpenFlowRouter port can undergo standard IP routing into a different IP subnet. After routing, those packets can either exit the switch or be processed by OpenFlow again.

#### 12.5.2.2.1 Port mapping

For switches that support QSFP+ modules, a 40G interface can be configured as four 10G ports. These Ethernet interfaces are mapped to OpenFlow ports according to the formula  $\text{port} = M * 200 + N$  for EthernetM/N. For example, interface Ethernet1/1 is mapped to OpenFlow port 201; Ethernet1/2 to OpenFlow port 202, Ethernet16/1 to OpenFlow port 3201, Ethernet16/2 to OpenFlow port 3202, and so on.

When IP routing is configured, the OpenFlow Router interface is mapped to OpenFlow port 40000.

Port-Channel (LAG) interfaces are mapped to OpenFlow ports according to the formula  $\text{port} = 40000 + N$  for Port-ChannelN. For example, interface Port-Channel23 is mapped to OpenFlow port 40023.

The OpenFlow virtual ports all and flood refer to all Ethernet interfaces on the switch, but normal VLAN egress policies apply: a packet tagged with a given OpenFlow-bound VLAN (or untagged, if a native OpenFlow VLAN is configured) will egress a given interface only if the interface is configured to handle

---

traffic for that VLAN. If an interface is not configured to handle traffic for any OpenFlow-bound VLAN, then no packets sent to all or flood will egress on that interface.

#### 12.5.2.2.2 Queue mapping

All multicast transmit queues that are configured to be mapped from a QoS traffic class are mapped to OpenFlow. OpenFlow-mapped queues can be used by the enqueue action in flow table entries and are included in queue stats reply messages. By default, all the multicast queues 0 to 3 are mapped.

Use the `show qos maps` command to view the current mapping of traffic class to multicast transmit queue, and use the `qos map traffic-class to mc-tx-queue` configuration command to modify it. If no traffic class is mapped to a given multicast transmit queue, the queue will not be mapped to OpenFlow and will be unavailable for use by the enqueue action.

#### 12.5.2.2.3 Table size

The switch supports one flow table. OpenFlow packet processing is performed in hardware; software forwarding (via the switch CPU) is not supported.

The switch advertises the table size for the I2-match profile. This should be taken as an approximation, as other switch features such as ACLs can consume hardware resources shared with OpenFlow. If the controller attempts to add a flow entry but there are insufficient resources to implement it in hardware, the switch returns an error message.

#### 12.5.2.2.4 Match fields

A flow table entry can specify an exact value or wildcard for any of the following fields:

- L2 source and destination addresses
- VLAN ID (and untagged packets, if the native OpenFlow VLAN is configured)
- VLAN priority
- L2 frame type
- IPv4 source and destination addresses with subnet masking
- IPv4 TOS/DSCP field
- IPv4 protocol
- TCP/UDP source and destination port numbers

Matching the IPv4 source or destination address within an ARP message is not supported, nor is matching the ARP opcode.

#### 12.5.2.2.5 Actions

In VLAN and interface bind modes, the following flow entry actions are supported:

- Copy packet on ingress to a mirror destination port (vendor-specific extension)
- Set L2 source and destination addresses
- Set VLAN ID
- Strip VLAN tag (if the native OpenFlow VLAN is configured)
- Set VLAN priority
- Set IPv4 TOS/DSCP
- Output or enqueue to physical port (see [OpenFlow Limitations](#) for restrictions on multiple output actions)
- Output or enqueue to all or flood (see [OpenFlow Limitations](#))
- Output to controller (buffering not supported; entire packet contents are always sent)
- Drop (no action)
- Copy packet on egress to a mirror destination port (vendor-specific extension)

In monitor bind mode, only the following actions are supported:

- Copy packet on ingress to a mirror destination port (vendor-specific extension)
- Output per normal forwarding (this action is required in every flow entry)
- Copy packet on egress to a mirror destination port (vendor-specific extension)

### 12.5.2.3 OpenFlow Limitations

Consider the following when using OpenFlow:

- OpenFlow is supported on both the 7050 and 7050X series of switches.
- OpenFlow Hybrid mode is not supported.
- Output to an ingress port is silently dropped. Flow table entries with an output to ingress port action are accepted by the switch, but matching packets are not actually forwarded via the ingress port. (But for packet-out, the output to ingress port action is supported.)
- Output/enqueue actions must follow modify actions. The switch will return an error if a modify action follows an output/enqueue action.
- Each action can be performed at most once. The switch will return an error if the same action appears more than once. Output and enqueue actions may appear at most once per port.
- Support output to only one queue. The switch will return an error if multiple enqueue actions appear with different queue ids, or if both enqueue and output actions appear.
- Packet is sent at most once per port even if there are overlapping output or enqueue actions. For example, the switch will accept a rule with actions output to all ports and output to a specific port 12, but will transmit the packet on port 12 only once even though it is contained in both actions.
- Flow entry priority is always respected, even for exact-match flow entries. The switch does not force exact-match flow entries to be processed at the highest priority.
- For packet-out messages, only output actions are supported (to a physical port, or to all, flood, or ingress port). The switch will return an error if a packet-out message is received with any other action.
- The switch-to-controller connection is plain TCP. The switch does not support encrypted TLS connections to the controller.
- Matching source and destination IP and operation code in ARP packets is not supported. Flow entries with matching the ARP Ethernet type are accepted by the switch, but the source and destination IP and protocol (opcode) match field values are ignored (i.e. the fields are wildcarded).
- A flow mod message with modify or modify\_strict command does not modify the cookie value of existing flow entries. If the modify is treated as an add, however, the new entry will be assigned the specified cookie value.
- Matching all 802.3 packets without SNAP headers is not supported. The switch does not treat a dl\_type value of 0x5ff as special.
- The port\_mod message is not supported. It is not possible to modify the behavior of physical ports via the port\_mod message. In particular, the no\_flood port\_config bit cannot be used to exclude ports from the flood virtual output port set.
- Changing the list of controllers causes the current controller connection to be dropped. When the OpenFlow feature is enabled and the list of controllers is changed in any fashion (e.g. by adding or deleting a controller), the current controller connection will be dropped.
- When adding a large number of flow table entries, add higher-priority entries before lower-priority entries. Due to hardware limitations, the switch will take much longer to add a new flow entry if the table already contains many entries with lower priority.

### 12.5.3 OpenFlow Configuration

By default, the OpenFlow feature is disabled on Arista devices. You must first enable the OpenFlow feature on the device. These sections describe OpenFlow configuration tasks:

- [Configuration Procedures](#)

- [Enabling Basic OpenFlow](#)
- [Optional OpenFlow Commands](#)
- [Displaying OpenFlow Configurations](#)

### 12.5.3.1 Configuration Procedures

Use the OpenFlow configuration mode commands to configure the following basic parameters:

- [openflow](#) : places the switch in OpenFlow configuration mode.
- [controller \(OpenFlow\)](#) : set the controller IP address and port
- [bind interface \(OpenFlow\)](#) : bind interfaces to OpenFlow
- [shutdown \(Openflow\)](#) : enable or disable OpenFlow

### 12.5.3.2 Enabling Basic OpenFlow

Configure the management interface. Assign an IP address to the interface and set the default gateway IP address, allowing the OpenFlow function on the switch establish a TCP connection with the OpenFlow controller.

The following commands turn on OpenFlow pointing to a controller, ready to receive flow setup messages to be programmed in hardware for all traffic.

- The [openflow](#) command places the switch in OpenFlow configuration mode.

```
switch(config)#openflow
switch(config-OpenFlow)#
```

- The [controller \(OpenFlow\)](#) command points to the primary OpenFlow controller. Others can be configured as a standby list.

```
switch(config)#OpenFlow
switch(config-OpenFlow)#controller tcp:15.16.15.16:6633
switch(config-OpenFlow)#
```

- The [bind vlan \(OpenFlow\)](#) command dictates what VLAN or interfaces are tied to OpenFlow. Since hybrid mode is not supported, Arista recommends binding all VLANs or all interfaces to OpenFlow.

```
switch(config)#openflow
switch(config-openflow)#controller tcp:1.2.3.4:6633
switch(config-openflow)#bind mode vlan
switch(config-openflow)#bind vlan 1
```

- The [shutdown \(Openflow\)](#) command determines if the configuration takes effect or not. The following command enables OpenFlow on the switch.

```
switch(config-OpenFlow)#no shutdown
switch(config-OpenFlow)#
```

### 12.5.3.3 Optional OpenFlow Commands

#### Keepalive

The [keepalive \(OpenFlow\)](#) command allows you to set the interval for switch to controller keepalives (default of 10 seconds scales best for large scale multi-node OpenFlow switch networks). After three consecutive reply (from the controller) misses, the switch will try to connect to the second configured controller, if configured.

```
switch(config-OpenFlow)#keepalive
```

```
switch(config-OpenFlow) #
```

### Profile

The `profile (OpenFlow)` command determines the type of flows. To double flow table size (in case all flows are L2 only), setting a profile of l2-match is best suited. Default is full-match (includes L3/4 field match).

```
switch(config-OpenFlow) #profile l2-match
switch(config-OpenFlow) #
```

### Default-action

The `default-action (OpenFlow)` command tells the Arista OpenFlow agent the action that needs to be taken for packets (drop or send-to-controller) that don't match any existing flows programmed locally on the hardware.

```
switch(config-OpenFlow) #default-action drop
switch(config-OpenFlow) #
```

## 12.5.3.4 Displaying OpenFlow Configurations

Show commands display the state of OpenFlow running on the Arista switch.

- The `show openflow` command displays the configuration state of the OpenFlow feature and the flows that are actively installed in the hardware of the Arista switch.

```
switch(config)# show openflow
OpenFlow configuration: Enabled
DPID: 0x0000001c73111a92
Description: sw3-Arista
Controllers:
  configured: tcp:172.22.28.228:6633
  connected: tcp:172.22.28.228:6633
  connection count: 3
  keepalive period: 10 sec
Flow table state: Enabled
Flow table profile: full-match
Bind mode: VLAN
  VLANs: 1-2
  native VLAN: 1
IP routing state: Disabled
Shell command execution: Disabled
Total matched: 7977645 packets
```

- The `show openflow flows` command shows the default flow that is installed when OpenFlow is enabled.

```
switch(config)# show OpenFlow flows
Flow flow000000000000000000000005:
  priority: 100
  cookie: 45035996453121666 (0xa000000ab1ae82)
  match:
    ingress interface: Ethernet3
    Ethernet type: IPv4
    source IPv4 address: 10.0.0.0/255.255.255.0
  actions:
    output interfaces: Ethernet11
  matched: 0 packets, 0 bytes
Flow __default__:
```

---

```
priority: -1
cookie: 0 (0x0)
match:
actions:
  output to controller
matched: 5519922 packets, 433188045 bytes
```

## 12.5.4 OpenFlow Commands

### OpenFlow Global Configuration Mode

- [openflow](#)

### Openflow Configuration Commands

- [bind interface \(OpenFlow\)](#)
- [bind mode \(OpenFlow\)](#)
- [bind vlan \(OpenFlow\)](#)
- [controller \(OpenFlow\)](#)
- [default-action \(OpenFlow\)](#)
- [description \(OpenFlow\)](#)
- [keepalive \(OpenFlow\)](#)
- [profile \(OpenFlow\)](#)
- [routing recirculation-interface \(OpenFlow\)](#)
- [routing vlan \(OpenFlow\)](#)
- [shell-command allowed \(OpenFlow\)](#)
- [shutdown \(Openflow\)](#)

### OpenFlow Display and Clear Commands

- [clear openflow statistics](#)
- [show openflow](#)
- [show openflow flows](#)
- [show openflow ports](#)
- [show openflow profiles](#)
- [show openflow queues](#)
- [show openflow statistics](#)

---

### 12.5.4.1 bind interface (OpenFlow)

When the switch is configured in interface bind mode, the ingress interface of a packet determines whether the packet is processed according to entries in the OpenFlow table or forwarded normally by the switch.

Only interfaces bound to OpenFlow are mapped to OpenFlow ports and exposed to the controller via features reply and port status messages. Output actions in flow table entries and in packet out messages can refer only to mapped ports. Use the **show openflow ports** command to see which interfaces the switch maps to OpenFlow ports and exposes to the controller.

In the OpenFlow configuration mode, use the **bind mode interface** command to select the interface bind mode.

When an interface is bound to OpenFlow, certain switch functions are disabled on the interface, including spanning tree protocol (STP). The OpenFlow controller and application must ensure that flow table entries do not allow traffic to loop in the network.

Only Ethernet and Port-Channel interfaces can be bound to OpenFlow. If an Ethernet interface is configured as a member of a LAG, attempting to bind the interface to OpenFlow has no effect. However, the Port-Channel interface of which it is a member may itself be bound to OpenFlow.

The **no bind interface** and **default bind interface** commands revert the specified list configuration to its default by removing the corresponding **bind interface** command from *running-config*.

#### Command Mode

OpenFlow Configuration

#### Command Syntax

```
bind interface INTF
no bind interface [INTF]
default bind interface [INTF]
```

#### Parameters

- INTF Interface that are tied to OpenFlow. Options include:
  - **ethernet** *e\_range* Ethernet interfaces specified by *e\_range*.
  - **port-channel** *p\_range* port channel interfaces specified by *p\_range*.

Valid *e\_range* and *p\_range* formats include number, range, or comma-delimited list of numbers and ranges.

#### Example

- This command binds Ethernet 1 to OpenFlow.

```
switch(config)# openflow
switch(config-openflow)#bind interface ethernet 1
```

### 12.5.4.2 bind mode (OpenFlow)

The **bind mode** command controls the way packets are divided on ingress between OpenFlow processing and normal switch processing.

The switch can be configured to divide traffic entering the switch in the following ways:

- **Interface bind mode:** Packets entering the switch from certain interfaces are only processed by OpenFlow according to flow table entries; packets entering from other interfaces are forwarded normally. (interface bind mode is the default).
- **VLAN bind mode:** Only packets associated with certain VLAN IDs are processed by OpenFlow.
- **Monitor bind mode:** All packets are forwarded normally, and are also processed by OpenFlow; a restricted set of actions are applied to packets matching a flow table entry.

Other packets are forwarded normally according to the MAC address table, filtered by ACLs, mirrored to other ports.

The switch can also be configured to apply a limited set of OpenFlow actions to any packets, regardless of ingress interface or VLAN, as well as forward the packets normally (monitor bind mode).

The **no bind mode** and **default bind mode** commands revert the specified list configuration to its default by removing the corresponding **bind mode** command from *running-config*.

#### Command Mode

Open flow Configuration

#### Command Syntax

```
bind mode METHOD
```

```
no bind mode
```

```
default bind mode
```

#### Parameters

- **METHOD** bind interfaces to OpenFlow. Options include:
  - **interface** Only packets arriving on certain interfaces are processed by OpenFlow.
  - **monitor** All packets are forwarded normally, and are also processed by OpenFlow.
  - **vlan** Only packets associated with certain VLAN IDs are processed by OpenFlow.

#### Example

- In this example, packets received without VLAN tags are assigned to the default VLAN 1 upon entering the switch and are processed by OpenFlow. All VLAN-tagged packets are dropped.

```
switch#enable
switch#configure
switch(config)#interface et1-48
switch(config-if-Et1-48)#switchport mode access
switch(config-if-Et1-48)#switchport access vlan 1
switch(config-if-Et1-48)#exit
switch(config)#openflow
switch(config-openflow)#controller tcp:1.2.3.4:6633
switch(config-openflow)#bind mode vlan
switch(config-openflow)#bind vlan 1
```

---

### 12.5.4.3 bind vlan (OpenFlow)

The **bind vlan** command adds one or more VLAN IDs to the set of VLANs that are processed by OpenFlow in VLAN bind mode. The VLANs must be created separately using the VLAN configuration mode commands.

If you specify a nonexistent VLAN with the **bind vlan** command, the binding will be stored in the running configuration but will not take effect until the VLAN is created.

A range of VLANs may be passed to the **bind vlan** command to add more than one at a time.

The number of VLANs that may be bound to OpenFlow depends on available hardware resources, which are shared with other features including IP routing and ACLs. On the 7050 Series switches the maximum number is 1024.

Use the **show openflow** command to verify which VLANs are bound to OpenFlow; this command reflects the actual hardware state rather than the configuration.

The **no bind vlan** and **default bind vlan** commands removes one or more VLANs from the set of VLANs that are processed by OpenFlow in VLAN bind mode.

#### Command Mode

OpenFlow Configuration

#### Command Syntax

```
bind vlan [v_range]
```

```
no bind vlan [v_range]
```

```
default bind vlan [v_range]
```

#### Parameters

- **v\_range** VLAN list. VLAN numbers range from 1 to 4094.

#### Examples

- These command bind VLANs 1 and 2 to OpenFlow.

```
switch(config-openflow) #bind mode vlan  
switch(config-openflow) #bind vlan 1,2
```

#### 12.5.4.4 clear openflow statistics

The `clear openflow statistics` command resets the flow statistics for OpenFlow.

##### Command Mode

Privileged EXEC

##### Command Syntax

```
clear openflow statistics
```

##### Example

- This command resets the OpenFlow counters.

```
switch #clear openflow statistics  
switch#
```

---

### 12.5.4.5 controller (OpenFlow)

The **controller** command adds the address of an OpenFlow controller to which the switch should connect. The parameter must take the form `tcp:1.2.3.4:6633` where 1.2.3.4 is the IP address of the controller and 6633 is the TCP port number.

The **controller** command may be used multiple times to add multiple controllers. The switch will attempt to connect to the first controller in the list of controllers. If the connection attempt fails, or the current connection terminates, the switch will try the next controller in that list, and so on. If the switch cannot connect to the last controller in the list, it will retry with the first controller in the list.

The order in which controllers are added is the order that the switch uses to establish controller connections. This ordering can be seen in the output of the [show openflow](#) command.

The **no controller** command either removes the specified controller from the list of controllers if a controller address is given as a parameter, or removes all controllers from the list of controllers if **no** parameter is given. If there are no controllers remaining after this command is executed, the OpenFlow function is effectively disabled.

**Note:** Adding or removing a controller will cause the current controller connection to be dropped. The switch will then attempt to connect to the first controller in the list of controllers, then second controller, and so on.

The **no controller** and **default controller** commands delete the **controller** statement from *running-config*.

#### Command Mode

OpenFlow Configuration

#### Command Syntax

```
controller tcp:ip_address:tcp_port
```

```
no controller tcp:ipaddress:tcp_port
```

```
default controller tcp:ipaddress:tcp_port
```

#### Parameters

- **ip\_address** ip address used for OpenFlow. Dotted decimal location.
- **tcp\_port** name of the TCP port used for OpenFlow. Value ranges from 0 to 65535.

#### Example

- These commands enable OpenFlow and sets the controller for an OpenFlow instance.

```
switch(config)#openflow
switch(config-OpenFlow)#controller tcp:1.2.3.4:6633
```

### 12.5.4.6 default-action (OpenFlow)

The **default-action** command sets the action for the default flow table entry. This entry is automatically added by the switch. It has the lowest priority, and matches packets that are not matched by any other entry.

Use **default-action drop** to change the default entry's action to drop packets instead of sending them to the controller. (Note: In this mode, the switch deviates from the OpenFlow specification.)

The **no default-action** command restores the default entry's action to send packets to the controller.

#### Command Mode

OpenFlow Configuration

#### Command Syntax

```
default-action ACTION_TYPE
```

```
no default-action
```

```
default default-action
```

#### Parameters

- **ACTION\_TYPE** Action for the default flow table entry. Options include:
  - **controller** Sets the default entry's action to send packets to the controller.
  - **drop** Changes the default entry's action to drop packets instead of sending them to the controller.

#### Example

- This command sets the default entry's action to drop packets instead of sending them to the controller.

```
switch(config)#openflow
switch(config-OpenFlow)#default-action drop
```

---

### 12.5.4.7 description (OpenFlow)

The **description** command allows overriding the switch description string (normally the switch hostname) sent to the controller.

The **no description** and **default description** commands remove the description text for the switch hostname from *running-config*.

#### Command Mode

OpenFlow Configuration

#### Command Syntax

```
description label_text
```

```
no description
```

```
default description
```

#### Parameters

- **label\_text** character string up to 256 characters assigned to describe the switch.

#### Examples

- These commands add the description test to the switch

```
switch(config-openflow) #description test  
switch(config-openflow) #
```

### 12.5.4.8 keepalive (OpenFlow)

The **keepalive** command alters how often the switch sends an OpenFlow echo request to the currently connected controller (every 10 seconds by default). If an echo reply is not received after three successive echo requests, the switch disconnects from the controller. It then attempts to establish a new controller connection depending on the controller configuration.

The **no keepalive** command restores the default keepalive period by removing the **keepalive** command from the **running-config**.

#### Command Mode

OpenFlow Configuration

#### Command Syntax

```
keepalive keep_alive_time
```

```
no keepalive
```

```
default keepalive
```

#### Parameters

- **keep\_alive\_time** keepalive period, in seconds. Value ranges from 1 to 100000. Default value is 10 seconds.

#### Example

- This command sets the keepalive time for OpenFlow to 30 seconds.

```
switch(config)#openflow
switch(config-openflow)#keepalive 30
switch(config-openflow)#
```

---

### 12.5.4.9 openflow

The **openflow** command places the switch in OpenFlow configuration mode.

The **no openflow** and **default openflow** commands delete the openflow configuration mode statements from **running-config**.

OpenFlow configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting OpenFlow configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
openflow
```

```
no openflow
```

```
default openflow
```

#### Commands Available in OpenFlow Configuration Mode

- [bind interface \(OpenFlow\)](#)
- [bind mode \(OpenFlow\)](#)
- [bind vlan \(OpenFlow\)](#)
- [controller \(OpenFlow\)](#)
- [default-action \(OpenFlow\)](#)
- [description \(OpenFlow\)](#)
- [keepalive \(OpenFlow\)](#)
- [profile \(OpenFlow\)](#)
- [routing recirculation-interface \(OpenFlow\)](#)
- [routing vlan \(OpenFlow\)](#)
- [shell-command allowed \(OpenFlow\)](#)
- [shutdown \(Openflow\)](#)

#### Examples:

- This command places the switch in OpenFlow configuration mode:

```
switch(config)#openflow  
switch(config-openflow)#
```

- This command returns the switch to global management mode:

```
switch(config-openflow)#exit  
switch(config)#
```

### 12.5.4.10 profile (OpenFlow)

The **profile** command sets an alternate flow table profile. Use the [show openflow profiles](#) command to see the flow table profiles supported by the switch.

The **no profile** and **default profile** commands restores the default flow table profile by removing the profile command from the from **running-config**.

#### Command Mode

OpenFlow Configuration

#### Command Syntax

```
profile FIELD_TYPE
```

```
no profile
```

```
default profile
```

#### Parameters

- **FIELD\_TYPE** Profiles supported by the switch for the active bind mode. Options include:
  - **full-match** Supports matching the full set of OpenFlow match fields.
  - **l2-match** Supports matching only a subset but with a larger maximum number of flow table entries.

#### Example

- This command advertises the table size for the full-match flow table profile.

```
switch# (config-openflow) #profile full-match  
switch# (config-openflow) #
```

---

### 12.5.4.11 routing recirculation-interface (OpenFlow)

The **routing recirculation-interface** command designates a switch interface to recirculate routed OpenFlow traffic for a second pass of processing. Exactly one recirculation interface must be configured to use routing, regardless of the number of VLANs being routed.

Any Ethernet or Port-Channel interface can be used for OpenFlow routing recirculation.

When an interface is configured for OpenFlow routing recirculation:

- The switch programs the hardware into a special MAC loopback mode, so the interface cannot be used to carry normal traffic.
- The link LED turns green and the recirculation function works even if a transceiver is not present or a cable is not inserted.
- The link speed is forced to the maximum.
- Interface configuration commands such as `switchport` and `shutdown` are ineffective, although they are preserved in the running configuration and become effective again when the interface is no longer configured for OpenFlow routing recirculation.

The **routing recirculation-interface** and **default routing recirculation-interface** commands revert the configuration to its default by removing the corresponding **routing recirculation-interface** command from *running-config*.

#### Command Mode

OpenFlow Configuration

#### Command Syntax

```
bind interface INTF
no bind interface [INTF]
default bind interface [INTF]
```

#### Parameters

- **INTF** Options include:
  - **ethernet** *e\_range* Ethernet interfaces specified by *e\_range*.
  - **port-channel** *p\_range* port channel interfaces specified by *p\_range*.

Valid *e\_range* and *p\_range* formats include number, range, or comma-delimited list of numbers and ranges.

#### Example

- This command recirculates traffic routed to and from VLAN 1 via the routed transit VLAN 401.

```
switch(config-openflow) #bind mode vlan
switch(config-openflow) #bind vlan 1
switch(config-openflow) #routing recirculation-interface et48
switch(config-openflow) #routing vlan 1 routed-vlan 401
switch(config-openflow) #enable
```

### 12.5.4.12 routing vlan (OpenFlow)

The **routing vlan** command enables IP routing of traffic processed by OpenFlow for a specific VLAN.

The **no routing vlan** and **default routing vlan** command disables IP routing of traffic processed by OpenFlow for a VLAN.

#### Command Mode

OpenFlow Configuration

#### Command Syntax

```
routing vlan VLAN_ID routed-vlan vlan_transit
```

```
no routing vlan VLAN_ID
```

```
default routing vlan VLAN_ID
```

#### Parameters

- **VLAN\_ID** Options include
  - **v\_num** The full form of the command is **routing vlan 123 routed-vlan 456**, where 123 is the VLAN of the OpenFlow traffic to be routed, and 456 is a (non-OpenFlow-bound) VLAN configured for standard IP routing.
  - **untagged** To route untagged OpenFlow traffic. use the command **routing vlan untagged routed-vlan 456**.

#### Examples

- This command associates the VLAN with an untagged VLAN 22 to match during the OpenFlow pass.

```
switch(config-openflow)#routing vlan untagged routed-vlan 22
```

---

### 12.5.4.13 shell-command allowed (OpenFlow)

The **shell-command allowed** command allows the controller to run shell or CLI vendor extension commands on the switch.

When this extension is enabled, the switch will execute any CLI command sent by the controller, bypassing normal access controls, so enable it only if the controller is trusted.

The **no shell-command allowed** and **default shell-command allowed** commands disables the corresponding **shell-command allowed** from the *running-config*.

#### Command Mode

OpenFlow Configuration

#### Command Syntax

```
shell-command allowed
```

```
no shell-command allowed
```

```
default shell-command allowed
```

#### Example

- This command allows the controller to run arbitrary CLI commands on the switch.

```
switch(config)#openflow
switch(config-openflow)#shell-command allowed
switch(config-openflow)#
```

### 12.5.4.14 show openflow flows

The **show openflow flows** command displays the contents of the flow table, showing each entry with its match rules, actions, packet counters, and timeouts.

The default flow table entry is automatically created by the switch. It always has the lowest priority, and matches packets that are not matched by any other entry. The default entry's action is to send the packet to the controller.

#### Command Mode

EXEC

#### Command Syntax

```
show openflow flows
```

#### Example

- This command displays the contents of the flow table.

```
switch# show openflow flows
Flow flow0000000000000000000002:
priority: 0
cookie: 0 (0x0)
idle timeout: 60.0 sec
match:
ingress interface: Ethernet2
source Ethernet address: 00:a9:87:65:43:21
destination Ethernet address: 00:12:34:56:78:9a
untagged/native VLAN ID
VLAN PCP: 0
Ethernet type: IPv4
source IPv4 address: 10.0.1.1
destination IPv4 address: 10.0.1.2
IPv4 TOS: 0
IPv4 protocol: ICMP
source TCP/UDP port or ICMP type: 8
destination TCP/UDP port or ICMP code: 0
actions:
output interfaces: OpenFlowRouter
matched: 4 packets, 408 bytes
Flow __default__:
priority: -1
cookie: 0 (0x0)
match:
actions:
output to controller
switch#
```

---

### 12.5.4.15 show openflow ports

The **show openflow ports** command displays the mapping between OpenFlow port number and switch interface.

In interface bind mode, all OpenFlow-bound interfaces (except routed ports and LAG members) are mapped to OpenFlow ports and exposed to the controller.

In VLAN bind mode, Ethernet and Port-Channel interfaces (except routed ports and LAG members) configured to carry traffic for one or more OpenFlow-bound VLANs are mapped to OpenFlow ports and exposed to the controller.

In monitor bind mode, all Ethernet and Port-Channel interfaces (except routed ports and LAG members) are mapped to OpenFlow ports and exposed to the controller.

#### Command Mode

EXEC

#### Command Syntax

```
show openflow ports
```

#### Example

- This command displays which interfaces the switch maps to OpenFlow ports.

```
switch# show openflow ports  
Port 1: Ethernet1  
Port 15: Ethernet15  
switch#
```

### 12.5.4.16 show openflow profiles

The **show openflow profiles** command displays the flow table profiles supported by the switch for the active bind mode. For each profile, it shows:

- Which fields can be matched by a flow table entry and which can be wildcarded
- Which actions are supported for matched packets (in monitor bind mode, only normal and mirror actions are supported)
- The maximum number of entries that can be added to the flow table

The hardware resources available to OpenFlow are shared with other switch features like ACLs, so the actual maximum number of flow entries may be lower than the number shown by [show openflow profiles](#) command.

On Series 7050 switches, two profiles are available: the full-match profile supports matching the full set of OpenFlow match fields with a maximum of 750 flow table entries, while the l2-match profile supports matching only a subset but with a larger maximum number of flow table entries (1500).

#### Command Mode

EXEC

#### Command Syntax

```
show openflow profiles
```

#### Example

- This command displays the flow table profiles.

```
switch#show openflow profiles
full-match:
  Match fields:
    ingress interface
    source Ethernet address
    destination Ethernet address
    VLAN ID
    VLAN PCP
    Ethernet type
    source IPv4 address
    destination IPv4 address
    IPv4 TOS
    IPv4 protocol
    source TCP/UDP port or ICMP type
    destination TCP/UDP port or ICMP code
  Wildcard fields:
    ingress interface
    source Ethernet address
    destination Ethernet address
    VLAN ID
    VLAN PCP
    Ethernet type
    source IPv4 address
    destination IPv4 address
    IPv4 TOS
    IPv4 protocol
    source TCP/UDP port or ICMP type
    destination TCP/UDP port or ICMP code
  Actions:
    copy ingress to mirror dest interfaces
    forward normally
    copy egress to mirror dest interfaces
  Table size: 750 entries max
```

```
12-match:
  Match fields:
    ingress interface
    source Ethernet address
    destination Ethernet address
    VLAN ID
    VLAN PCP
    Ethernet type
  Wildcard fields:
    ingress interface
    source Ethernet address
    destination Ethernet address
    VLAN ID
    VLAN PCP
    Ethernet type
    source IPv4 address
    destination IPv4 address
    IPv4 TOS
    IPv4 protocol
    source TCP/UDP port or ICMP type
    destination TCP/UDP port or ICMP code
  Actions:
    copy ingress to mirror dest interfaces
    forward normally
    copy egress to mirror dest interfaces
  Table size: 1500 entries max
switch#
```

### 12.5.4.17 show openflow queues

The **show openflow queues** command displays the queues exposed to the OpenFlow controller for each switch interface, and packet and byte counters for each queue.

#### Command Mode

EXEC

#### Command Syntax

```
show openflow queues
```

#### Example

- This command displays the packet and byte counters for each queue on the active OpenFlow interfaces.

```
switch#show openflow queues
Port 1 (Ethernet1):
  Queue 0: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 1: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 2: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 3: 0 packets (0 bytes) transmitted, 0 dropped
Port 15 (Ethernet15):
  Queue 0: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 1: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 2: 0 packets (0 bytes) transmitted, 0 dropped
  Queue 3: 0 packets (0 bytes) transmitted, 0 dropped
switch#
```

### 12.5.4.18 show openflow statistics

The **show openflow statistics** command displays statistics sampled every 5 seconds over the past 5 minutes:

- Number of entries in the flow table
- Number of flow\_mod, packet\_out and packet\_in messages processed in the 5-second interval
- Number of packet\_out messages dropped in the 5-second interval (the OpenFlow agent starts dropping packet\_out messages when the transmit queue of the controller TCP connection exceeds 50% of capacity)

#### Command Mode

EXEC

#### Command Syntax

```
show openflow statistics
```

#### Example

- This command displays statistics sampled every 5 seconds.

```
switch# show openflow statistics
      table      messages processed last 5 sec      dropped
      entries    (flow_mod) (packet_out) (packet_in) last 5 sec
2013-08-16 14:48:06 4          0          0          0          0
2013-08-16 14:48:01 4          2          2          2          0
2013-08-16 14:47:56 0          0          2          2          0

2013-08-16 14:46:26 4          0          0          0          0
2013-08-16 14:46:21 4          2          2          2          0
2013-08-16 14:46:16 4          2          2          2          0
2013-08-16 14:46:11 4          0          2          2          0
2013-08-16 14:46:06 0          0          0          0          0
2013-08-16 14:46:01 0          0          0          0          0
2013-08-16 14:45:56 0          0          0          0          0
2013-08-16 14:45:51 0          0          0          0          0
2013-08-16 14:45:46 0          0          0          0          0
2013-08-16 14:45:41 0          0          0          0          0
2013-08-16 14:45:36 0          0          0          0          0
2013-08-16 14:45:31 0          0          0          0          0
2013-08-16 14:45:26 0          0          0          0          0
2013-08-16 14:45:21 4          0          0          0          0
switch#
```

### 12.5.4.19 show openflow

The **show openflow** command shows the effective OpenFlow configuration parameters.

#### Command Mode

EXEC

#### Command Syntax

```
show openflow
```

#### Example

- This command displays the actual hardware state of OpenFlow.

```
switch# show openflow
OpenFlow configuration: Enabled
DPID: 0x000000123456789a
Description: My awesome OpenFlow switch
Controllers:
configured: tcp:1.2.3.4:6633 tcp:5.6.7.8:6633
connected: tcp:1.2.3.4:6633
attempted connection count: 24
successful connection count: 1
keepalive period: 10 sec
Flow table state: Enabled
Flow table profile: full-match
Bind mode: interface
interfaces: Ethernet2, Ethernet4, Ethernet6, Ethernet8
IP routing state: Enabled
recirculation interface: Ethernet44
VLAN untagged: routed to/from VLAN 3636
Shell command execution: Disabled
Total matched: 4601 packets
switch#
```

### 12.5.4.20 shutdown (Openflow)

The **shutdown** command, in OpenFlow mode, disables OpenFlow on the switch. OpenFlow is disabled by default.

The **no shutdown** and **default shutdown** commands re-enable OpenFlow by removing the **shutdown** command from *running-config*.

#### Command Mode

Openflow Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

#### Example

- These commands enable OpenFlow on the switch.

```
switch(config)#openflow
switch(config-openflow)#no shutdown
switch(config-openflow)#
```

- This command disables OpenFlow.

```
switch(config-openflow)#shutdown
```

## 12.6 DirectFlow

This section describes Arista's DirectFlow implementation. Topics in this section include:

- [Introduction](#)
- [DirectFlow Configuration](#)
- [DirectFlow Feature Interactions](#)
- [DirectFlow Commands](#)

### 12.6.1 Introduction

Like OpenFlow, DirectFlow exposes the underlying forwarding ASICs capabilities through a programmable interface like EAPI or the standard CLI.

Unlike OpenFlow, DirectFlow works in conjunction with all other aspects of standard L2/L3 bridging or forwarding, and DirectFlow traffic is subject to the standard packet processing pipeline within the ASIC. You can think of DirectFlow as a stage in packet processing that processes traffic after ingress checks and before any egress actions.

This feature enables you to configure flows that consist of a matching criteria and actions, and to modify how traffic is processed (for example, by overriding the L2 lookup decision or rewriting a mac address or VLAN).

Features like MAC learning, STP state checks, ingress or egress VLAN membership checks on ports, ACLs, QoS and other features are all respected by DirectFlow. Traffic that doesn't match any programmed flow is processed normally while traffic that matches programmed flows is now subject to the actions specified in the flows.

DirectFlow and OpenFlow are mutually exclusive and you can run only one of the two at any given time.

### How DirectFlow is different from OpenFlow

There is no default flow matching all traffic, so traffic not matched by other rules is forwarded as normal. This means the configuration/ controller/ application doesn't consume TCAM space programming flows for normal forwarding.

DirectFlow works with other features and so the user can use ACL, rate limiting, STP etc. in their network as normal and not build all of that into the application used to inject flows.

DirectFlow flows can be configured from the CLI or using EAPI, giving users the option of using flow based forwarding without an external controller. This is especially useful where the number of flows is small and static, for example, to process a small subset of the traffic in a different manner to the normal L2/L3 pipeline.

Unlike OpenFlow which requires the switch support OUTPUT NORMAL or re-circulate a packet in order to send a packet from the OpenFlow domain to non-OpenFlow domain, there is just one domain with DirectFlow.

#### 12.6.1.1 DirectFlow Flows

Similar to OpenFlow, you can define a relative priority between flows and define idle or hard timeouts for the flow. DirectFlow also enables you to insert a flow entry that matches on specified criteria, and define actions to be taken on traffic that matches the specified matching conditions. You can define flows to match on TCP flags, IPv6 source and destination addresses, input ports, and more.

For more information, see:

- [DirectFlow Non-persistent Flows](#)
- [Supported matches](#)
- [Supported actions](#)

##### 12.6.1.1.1 DirectFlow Non-persistent Flows

DirectFlow enables you to configure flows that are not visible in the startup or running configurations and do not persist over a reboot. This feature is designed to be used for flows that are configured by a custom agent using the EOS SDK or eAPI and age out (expire) after a specified time period.

For example, if you are using a custom agent that reacts to traffic sent to the CPU (the redirect to CPU action), and you want to use a flow that will drop all matching traffic for 5 minutes, the agent can program a non-persistent flow that expires after a hard timeout of 300 seconds.

Using a non-persistent flow for this purpose ensures that other administrator actions (for example, saving the configuration) do not result in the flow being resurrected on startup or reverting to the saved configuration. It also removes the need for the agent to delete the expired flow.

 **Note:** By default, all DirectFlow flows are persistent. You must use the no [persistent](#) command to configure a non-persistent flow.

##### 12.6.1.1.2 Supported matches

DirectFlow supports all matches supported on EOS with OpenFlow 1.0.

This includes matches on VLAN, ether type, source or destination MAC address, COS, source or destination IP address, IP protocol, IP TOS, L4 source, destination ports, ICMP type, and code.

In addition, DirectFlow also allows matching on:

- TCP flags

- IPv6 source address
- IPv6 destination address
- Traffic injected from the CPU
- Input port

DirectFlow also permits re-using the same flow on multiple input ports, saving valuable TCAM space.

### 12.6.1.1.3 Supported actions

DirectFlow supports all actions supported on EOS with OpenFlow 1.0, including:

- Setting the source or destination MAC address
- VLAN
- COS
- IP TOS
- Transmit queue
- Output port list and mirroring traffic pre-modification (ingress mirror) and post-modification (egress mirror).
- Redirect to CPU

The redirect to CPU action is useful in cases in which a custom agent is running on EOS and you want to trap specific traffic (matching traffic) and send the trapped traffic to the agent.

## 12.6.2 DirectFlow Configuration

Consider the following when using DirectFlow.

- DirectFlow takes effect **ONLY** after exiting the individual flow configuration sub-mode.
- Match criteria are connected with Boolean AND operators i.e. they must **all** match for the condition to be true and action to be taken.
- CLI is automatically set to match the ethertype to IP if IP fields (such as source or destination address or L4 ports) are chosen as part of other match/ action commands.
- In a single flow, only the following fields can be matched along with IPv6 source and destination addresses:
  - VLAN priority
  - VLAN ID
  - EtherType
  - Source interface
  - Class of Service (CoS)

### 12.6.2.1 Commands Used to Enable DirectFlow, Configure and Display Flows

A number of different commands are provided for the DirectFlow feature. The different commands enable you to enter the DirectFlow configuration mode, enable DirectFlow, configure flows, and display configured flows.

**Note:** ALL match criteria specified in a flow definition must match in the packet for the actions specified to be applied to the traffic.

#### Enter the DirectFlow Configuration Mode

The `directflow` command places the switch in DirectFlow configuration mode.

```
switch(config) #directflow
switch(config-directflow) #
```

## Enable DirectFlow

The `shutdown (DirectFlow)` command determines if the configuration takes effect or not. To enable DirectFlow, enter the following command.

```
switch(config-directflow) #no shutdown
```

## Create the Flow

The `flow (DirectFlow)` command creates a new flow entry. It must be unique or it will be overwritten by an existing entry.

```
switch(config-directflow) #flow Test-1
switch(config-directflow-Test-1) #
```

## Create the DirectFlow Match Criteria

The `match (DirectFlow-flow mode)` command allows you to configure a rule or a flow which match on L2, L3, L4 fields of a packet and specify a certain action to either modify, drop or redirect the packet.

```
switch(config-directflow-Test-1) #match ethertype ip
switch(config-directflow-Test-1) #match source ip 10.10.10.10
```

## Action Set

The `action set (DirectFlow-flow mode)` command allows you to configure a packet to be routed out a layer three interface using a DirectFlow entry.

```
switch(config-directflow-Test-1) #action egress mirror ethernet 7
switch(config-directflow-Test-1) #action set destination mac 0000.aaaa.bbb
b
```

## Finalize the Flow

DirectFlow flows do not take effect until you exit the configuration sub-mode for the specified flow. Use the `exit` command to finalize the flow and put it into effect.

```
switch(config-directflow-Test-1) #exit
switch(config-directflow) #
```

## Redirect to CPU

The `action output interface cpu (DirectFlow-flow mode)` command allows you to configure flows so that traffic that matches the matching conditions specified in the flow is redirected to the CPU.

```
switch(config) #directflow
switch(config-directflow) #flow redirect-http-cpu
switch(config-directflow-redirect-http-cpu) #match ip protocol tcp
switch(config-directflow-redirect-http-cpu) #match destination port 80
switch(config-directflow-redirect-http-cpu) #action output interface cpu
```

---

## Configuring a Non-persistent Flow

DirectFlow flows are persistent by default. Use the `no persistent` command to configure non-persistent flows.

```
switch (config) #directflow
switch (config-directflow) #flow example-non-persistent
switch (config-directflow-example-non-persistent) #match input interface
    ethernet
    25
switch (config-directflow-example-non-persistent) #action drop
switch (config-directflow-example-non-persistent) #no persistent
switch (config-directflow-example-non-persistent) #timeout hard 300
```

### Display details for configured flows

The `detail` option of the `show directflow flows` command enables you to display the details of configured flows. You can use this command to verify that a non-persistent flow is deleted after the timeout period configured for the flow has elapsed.

The following example shows the use of this command to view the configuration of a non-persistent flow before the timeout period has elapsed, and a second time, after the timeout period has expired.

The initial use of the command displays the flow configuration (before the timeout expires).

```
switch (config-directflow) #show directflow flows example-non-persistent
    detail
Flow example-non-persistent: (Flow programmed)
  persistent: False
  priority: 0
  hard timeout: 300
  idle timeout: 0
  match:
    ingress interface:
      Et25
  actions:
    drop
  matched: 0 packets, 0 bytes
```

The second use of the command displays the flow details (after the timeout expires). The output shows that the flow is no longer programmed.

```
switch (config-directflow) #show directflow flows example-non-persistent
    detail
Flow example-non-persistent: (Flow not programmed)
  persistent: False
  priority: 0
  hard timeout: 300
  idle timeout: 0
  match:
    ingress interface:
      Et25
  actions:
    drop
  matched: 0 packets, 0 bytes
```

## 12.6.3 DirectFlow Feature Interactions

DirectFlow flow entries can have one of the following actions:

- A set of egress ports for sending a matched packet

- Copy to CPU
- Redirect to CPU
- Drop
- No specified action (in this case, the traffic is output normally).

The only exception is the ingress or egress mirroring action, where the DirectFlow entry causes the packet to be mirrored.

When the ingress or egress packets are mirrored, the original traffic is sent out normally.

### **Bridging Features**

- DirectFlow entries have precedence over all entries in the MAC table, including static MAC entries and static MAC drop entries. Packets that do not match DirectFlow entries are forwarded based on the MAC address table.
- VLANs: DirectFlow entries can modify the VLAN of a packet. MAC learning takes place in the original VLAN for DirectFlow entries that modify the VLAN. The modified packet will be subject to VLAN membership checks on the egress port. If a packet has no VLAN tag, DirectFlow assumes it came in on the native VLAN for the ingress interface. A VLAN override causes the packet to obey the VLAN rules on the egress port.
- Q-in-Q: Q-in-Q is supported as DirectFlow entries match only on the outer tag.
- Counters: All packets that match DirectFlow entries cause interface counters to increment as usual.

### **Spanning Tree**

DirectFlow runs alongside MSTP, RSTP, and PVST. DirectFlow entries do not match on packets that ingress an STP discarding port. DirectFlow entries that cause a packet to be forwarded out an STP discarding port will result in the packets being dropped on egress.

When STP is enabled, BPDUs will always be trapped to the CPU. When STP is disabled, BPDUs will be subject to DirectFlow entries and not be copied to the CPU by default.

### **LLDP, LAGs, and LACP**

- LLDP packets are always trapped to the CPU. DirectFlow entries can never match LLDP packets.
- LAGs are fully supported, and can be part of a match criteria and part of an output action to an interface.
- LACP packets are always trapped to CPU. DirectFlow entries can never match LACP packets.

### **sFlow**

sFlow is unaffected by DirectFlow.

### **IGMP Snooping**

IGMP control packets are trapped to the CPU when IGMP Snooping is enabled. DirectFlow entries can match IGMP Snooping control traffic and override the trap to CPU.

Link-local-multicast packets are flooded in hardware in the VLAN via a TCAM entry. DirectFlow entries can match link-local-multicast packets and change the flooding behavior. As DirectFlow entries have to specify output interfaces or drop, the action will conflict and so matching DirectFlow entries will get precedence.

When IGMP snooping is enabled, unknown IPV4 multicast packets are flooded to the multicast-router ports in the VLAN. If DirectFlow entries match unknown IPV4 multicast packets, they will override the flooding behavior.

Data packets in groups under IGMP snooping control are sent to the group members through a MAC table entry. Matching DirectFlow entries override the MAC table entries.

---

## ACLs

DirectFlow entries are lower priority than any configured Port ACLs (ingress). Packets coming in on a port that match DirectFlow entries obey any configured ACL on that port, and will only apply to packets that have a **permit** action.

DirectFlow entries are higher priority than any configured RACLs. Packets coming in on an L3 interface that match DirectFlow entries ignore any RACLs configured on that interface.

DirectFlow entries are lower priority than any configured Egress ACLs.

### 12.6.3.1 Layer Three Features and DirectFlow

DirectFlow runs alongside IP routing. If a packet is routed out a layer three interface using a DirectFlow entry, the actions associated with the entry will have to specify the new source MAC and destination MAC for the packet, as well as the physical port or LAG. If there are no output ports specified in an entry, packets that match that entry will be dropped.

#### Unicast Routing

When unicast routing is enabled, DirectFlow entries that match take precedence for all packets that would have been otherwise been routed. The three exceptions are the ingress mirror, egress mirror and copy-to-CPU actions where the packets will be routed normally in addition to the action being performed. Routed packets that do not match DirectFlow entries are forwarding based on the L3 lookup.

#### Multicast Routing

When multicast routing is enabled, DirectFlow entries that match take precedence for all packets that would have otherwise been multicast routed. The packets are not replicated based on the hardware multicast tables, but are forwarded strictly according to the actions specified by the DirectFlow entry. The entry can specify a set of output interfaces, which will result in the packet being replicated based on the DirectFlow entry.

### 12.6.3.2 Displaying DirectFlow Configurations

To [show directflow flows](#) command displays the contents of the flow table, showing each entry with its match rules, actions, and packet counters.

- This example shows the status of a default (persistent) flow.

```
switch(config-directflow)#show directflow flows
Flow Test1:
priority: 0
match:
  ingress interface: Ethernet1
    ethertype ip
  source ip address: 10.10.10.10
actions:
  output mirror: Ethernet2
matched: 0 packets, 0 bytes
switch(config-directflow)#
```

- This example shows the status of a non-persistent flow. The flow will be deleted once 5 minutes have elapsed.

```
switch(config-directflow)#show directflow flows example-non-persistent
Flow example-non-persistent:
  persistent: False
  priority: 0
  hard timeout: 300
```

```
idle timeout: 0
match:
  ingress interface:
    Et25
actions:
  drop
matched: 0 packets, 0 bytes
```

---

## 12.6.4 DirectFlow Commands

### DirectFlow Global Configuration Mode

- [directflow](#)

### DirectFlow Configuration Command

- [action drop \(DirectFlow-flow mode\)](#)
- [action mirror \(DirectFlow-flow mode\)](#)
- [action output \(DirectFlow-flow mode\)](#)
- [action output interface cpu \(DirectFlow-flow mode\)](#)
- [action set \(DirectFlow-flow mode\)](#)
- [flow \(DirectFlow\)](#)
- [match \(DirectFlow-flow mode\)](#)
- [persistent](#)
- [priority \(DirectFlow-flow mode\)](#)
- [shutdown \(DirectFlow\)](#)
- [timeout \(DirectFlow-flow mode\)](#)

### DirectFlow and Clear Commands

- [show directflow](#)
- [show directflow flows](#)

### 12.6.4.1 action drop (DirectFlow-flow mode)

The **action drop** command configures packets that match an entry to be dropped.

The **no action drop** and **default action drop** commands remove the statement from the DirectFlow **configuration mode**.

#### Command Mode

Directflow-flow Configuration

#### Command Syntax

```
action drop
```

```
no action drop
```

```
default action drop
```

#### Example

- This command sets the action for packets from Test-1 to be dropped.

```
switch(config-directflow-Test-1)#action drop  
switch#
```

---

### 12.6.4.2 action mirror (DirectFlow-flow mode)

The **action mirror** command can be used to ingress or egress mirror traffic to a mirror destination. This requires a mirror destination to be setup on the switch. If a packet comes in or goes out an interface that is part of another mirror session, then the destination for that destination as well as the DirectFlow destination will receive a copy of the packet.

The **no action mirror** and **default action mirror** commands remove the statement from DirectFlow **configuration mode**.

#### Command Mode

Directflow-flow Configuration

#### Command Syntax

```
action DIRECTION mirror INT_NAME
no action DIRECTION mirror INT_NAME
default action DIRECTION mirror INT_NAME
```

#### Parameters

- **DIRECTION** transmission direction of traffic to be mirrored.
  - **ingress** mirrors before any rewrites.
  - **egress** mirrors after rewrites.
- **INT\_NAME** Source interface for the mirroring session.
  - **ethernet** *e\_range* Ethernet interfaces specified by *e\_range*.
  - **port-channel** *p\_range* Port channel interfaces specified by *p\_range*.

#### Example

- This command configures mirror traffic to Ethernet 2.

```
switch(config-directflow)# flow Test1
switch(config-directflow-Test1)#match ethertype ip
switch(config-directflow-Test1)#match source ip 10.10.10.10
switch(config-directflow-Test1)#action egress mirror ethernet
2
switch(config-directflow-Test1)#
```

### 12.6.4.3 action output (DirectFlow-flow mode)

The **action output** command configures an Ethernet or port channel interface as the output of a specified port mirroring session.

The **no action output** and **default action output** commands remove the statement from DirectFlow **configuration mode**.

#### Command Mode

Directflow-flow Configuration

#### Command Syntax

```
action output DESTINATION
```

```
no action output DESTINATION
```

```
default action output DESTINATION
```

#### Parameters

- **DESTINATION** transmission direction of traffic to be mirrored.
  - **all** mirrors transmitted and received traffic.
  - **flood** mirrors received traffic only.
  - **interface ethernet** *e\_range* Ethernet interfaces specified by *e\_range*.
  - **interface port-channel** *p\_range* Port channel interfaces specified by *p\_range*.

#### Example

- This command configures Ethernet interface 7 as the output for the mirroring session.

```
switch(config-directflow-Test1)#action output  
interface ethernet 7  
switch(config-directflow-Test1)#
```

#### 12.6.4.4 action output interface cpu (DirectFlow-flow mode)

The **action output interface cpu** command configures the action (other commands are used to define the traffic matching conditions).

The **no action output interface cpu** and **default action output** commands remove the statement from DirectFlow configuration mode.

##### Command Mode

Directflow-flow Configuration

##### Command Syntax

```
action output DESTINATION
```

```
no action output DESTINATION
```

```
default action output DESTINATION
```

##### Parameters

- **DESTINATION** transmission direction of traffic to be mirrored.
  - **all** mirrors transmitted and received traffic.
  - **flood** mirrors received traffic only.
  - **interface cpu** Ethernet interfaces specified by *e\_range*.

##### Example

- This command configures Ethernet interface 7 as the output for the mirroring session.

```
switch(config-directflow-Test1)#action output  
  interface ethernet 7  
switch(config-directflow-Test1)#
```

- These commands configure the action to redirect traffic matching the flow to the CPU and the matching conditions for the flow.

```
switch (config)#directflow  
switch (config-directflow)#flow redirect-http-cpu  
switch (config-directflow-redirect-http-cpu)#match ip protocol  
  tcp  
switch (config-directflow-redirect-http-cpu)#match destination  
  port 80  
switch (config-directflow-redirect-http-cpu)#action output  
  interface cpu
```

### 12.6.4.5 action set (DirectFlow-flow mode)

The **action set** command allows you to configure a packet to be routed out a layer three interface using a DirectFlow entry. The actions associated with the entry will have to specify the new source MAC and destination MAC for the packet, as well as the physical port or LAG. If there are no output ports specified in an entry, packets that match that entry will be dropped.

The **no action set** and **default action set** commands remove **action set** statement from DirectFlow **configuration mode**.

#### Command Mode

Directflow-flow Configuration

#### Command Syntax

```
action set CONDITION
```

```
no action set CONDITION
```

```
default action set CONDITION
```

#### Parameters

- **CONDITION** specifies parameter and value. Options include:
  - **cos** *<0 to 7>* cost of service.
  - **destination mac** *mac\_addr* Dotted hex notation.
  - **ip tos** *<0 to 255>* Type of service.
  - **source mac** *mac\_addr* Dotted hex notation.
  - **traffic-class** *<0 to 7>* Dotted hex notation.
  - **vlan** *<0 to 4094>* Number of VLAN.

The **no action set** and **default action set** commands require only the **CONDITION** type without a specific condition value.

#### Example

- These commands change the destination MAC of the frame.

```
switch(config-directflow)#flow Test1
switch(config-directflow-Test1)#action egress mirror ethernet
7
switch(config-directflow-Test1)#action set destination mac
0000.aaaa.bbbb
```

---

### 12.6.4.6 directflow

The **directflow** command places the switch in DirectFlow configuration mode.

The **no directflow** and **default directflow** commands delete the DirectFlow configuration mode statements from running-config.

DirectFlow configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting OpenFlow configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
directflow
```

```
no directflow
```

```
default directflow
```

#### Commands Available in DirectFlow-Flow configuration mode:

- [flow \(DirectFlow\)](#)
- [shutdown \(DirectFlow\)](#)

#### Example

- This command places the switch in DirectFlow configuration mode:

```
switch(config)#directflow  
switch(config-directflow)#
```

- This command returns the switch to global management mode:

```
switch(config-directflow)#exit  
switch(config)#
```

### 12.6.4.7 flow (DirectFlow)

The **flow** command places the switch in flow configuration mode.

The **flow** command specifies the name of the flow that subsequent commands modify and creates a newflow definition if it references a nonexistent flow. All changes in a flow configuration mode edit session are pending until the session ends:

- The **exit** command saves pending changes to **running-config** and returns the switch to DirectFlow configuration mode. Changes are also saved by entering a different configuration mode.
- The **abort** command discards pending changes, returning the switch to DirectFlow configuration mode.

The **no flow** and **default flow** commands delete the specified role by removing the role and its statements from **running-config**.

#### Command Mode

DirectFlow Configuration

#### Command Syntax

```
flow flow_name
```

```
no flow flow_name
```

```
default flow flow_name
```

#### Parameters

- **flow\_name** Name of flow.

#### Commands Available in DirectFlow-Flow configuration mode:

- [action drop \(DirectFlow-flow mode\)](#)
- [action mirror \(DirectFlow-flow mode\)](#)
- [action output \(DirectFlow-flow mode\)](#)
- [action set \(DirectFlow-flow mode\)](#)
- [match \(DirectFlow-flow mode\)](#)

---

### 12.6.4.8 match (DirectFlow-flow mode)

The **match** command allows you to configure a rule or a flow which could match on L2, L3, L4 fields of a packet and specify a certain action to modify, drop or redirect the packet.

All traffic ingressing on the switch will be matched against the flows installed. In cases where none of the packets match, normal switching or routing behavior will take over. When multiple entries match a packet, precedence is given to the entry that was installed first.

The **no match** and **default match** commands remove the **match** statement from the configuration mode.

#### Command Mode

Directflow-flow Configuration

#### Command Syntax

```
match CONDITION
```

```
no match CONDITION
```

```
default match CONDITION
```

#### Parameters

- **CONDITION** specifies criteria for evaluating a route. Options include:
  - **cos** <0 to 7> cost of service.
  - **destination ip** *ipv4\_sub* destination IPv4 subnet. L3 fields valid only if ethertype is IP (0x0800).
  - **destination mac** *mac\_addr* Add to the existing community. Dotted hex notation.
  - **destination mac** *mac\_addr mask mac\_mask* Add to the sting community. Dotted hex notation.
  - **destination port** *0 to 65535* Fields accepted only if protocol is TCPI UDP
  - **ethertype** *0 to 65535* Layer 4 destination port.
  - **ethertype ARP** Layer 4 destination port.
  - **ethertype IP** Layer 4 destination port.
  - **icmp code** *0 to 255* Fields accepted only if protocol is ICMP
  - **icmp type** <0 to 255> Fields accepted only if protocol is ICMP
  - **input interface ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **input interface port-channel** *p\_num* Port channel interface specified by *p\_num*.
  - **ip protocol** *0 to 255* Type of service.
  - **ip protocol icmp** L3 fields valid only if ethertype is IP (0x0800).
  - **ip protocol tcp** L3 fields valid only if ethertype is IP (0x0800).
  - **ip protocol udp** L3 fields valid only if ethertype is IP (0x0800).
  - **ip tos** <0 to 255> L3 fields valid only if ethertype is IP (0x0800).
  - **source ip** *ipv4\_subnet* L3 fields valid only if ethertype is IP (0x0800).
  - **source mac** *mac\_addr* Add to the existing community. Dotted hex notation.
  - **source mac** *mac\_addr mask mac\_mask* Add to the sting community. Dotted hex notation.
  - **source port** *0 to 65535* Fields accepted only if protocol is TCPI UDP
  - **tcp flag ack** Layer 4 destination port.
  - **tcp flag fin** Layer 4 destination port.
  - **tcp flag psh** Layer 4 destination port.
  - **tcp flag rst** Layer 4 destination port.
  - **tcp flag syn** Layer 4 destination port.
  - **tcp flag urg** Layer 4 destination port.
  - **tcp flag urg** Layer 4 destination port
  - **vlan** < 1 to 4094 > **mask** < 1 to 4095 > Number of VLAN.

The **no match** and **default match** commands require only the **CONDITION** type without a specific condition value.

**Example**

- This command creates the rules to match on Ethertype IP and Source IP 10.10.10.10.

```
switch(config-directflow)# flow Test1
switch(config-directflow-Test1)#persistent
switch(config-directflow-Test1)#match ethertype ip
switch(config-directflow-Test1)#match source ip 10.10.10.10
```

---

### 12.6.4.9 persistent

DirectFlow flows are persistent by default. Once finalized, they appear in the running configuration, and if saved to **startup config** they will persist over a reboot. The **no** form of the **persistent** command prevents the flow from showing up in **running config**, ensuring that it will not persist over a reboot.

#### Command Mode

Directflow-flow Configuration

#### Command Syntax

```
no persistent
```

#### Example

- These commands create and enable a non-persistent DirectFlow flow.

```
switch(config)#directflow
switch(config-directflow)#flow example-non-persistent
switch(config-directflow-example-non-persistent)#match input
interface ethernet
25
switch(config-directflow-example-non-persistent)#action drop
switch(config-directflow-example-non-persistent)#no
persistent
switch(config-directflow-example-non-persistent)#timeout hard
300
switch(config-directflow-example-non-persistent)#exit
switch(config-directflow)#
```

### 12.6.4.10 priority (DirectFlow-flow mode)

The **priority** command sets the priority for the flow match rules. Each flow-table entry has an optional priority field, with a higher number indicating a higher priority. Flows with the same priority may be loaded in any order, and the order may be changed at any time. If multiple entries match a packet, precedence is given to the entry that was installed first.

Priority numbers range from 0 to 65535. The default is 0. The higher priority rules match first.

The **no priority** and **default priority** commands remove **priority** statement from the DirectFlow **configuration mode**.

#### Command Mode

Directflow-flow Configuration

#### Command Syntax

```
priority priority_value
```

```
no priority
```

```
default priority
```

#### Parameters

- **priority\_value** priority xxx. Value ranges from 0 to 65535. Default is 0.

#### Example

- These commands assign the priority of 150 to flow Test-1.

```
switch(config-directflow-Test-1) #priority 150  
switch(config-directflow-Test-1) #
```

### 12.6.4.11 show directflow flows

The **show directflow flows** command displays the contents of the flow table, showing each entry with its match rules, actions, and packet counters. Including the name of a specific flow limits the output to information about the specified flow.

#### Command Mode

EXEC

#### Command Syntax

```
show directflow flows [flow_name [counters|detail]]
```

#### Parameters

- **flow\_name** name of flow for which to display information. If no flow name is entered, command displays information for all flows.
- **counters** displays DirectFlow counters for the specified flow.
- **detail** displays detailed information for the specified flow.

#### Examples:

- This command displays the contents of the flow table.

```
switch# show directflow flows
Flow test3:
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    Ethernet type: 0x86dd
    source IPv6 address: fcaa::ffff:ffff:ffff:ffff
:ffff:ffff:ffff:ffff
  actions:
    output interfaces:
      Et32
    source: config
  matched: 0 packets, 0 bytes
Flow test2:
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    Ethernet type: IPv4
    source IPv4 address: 10.1.2.12/255.255.255.255
    IPv4 protocol: TCP
    destination TCP/UDP port or ICMP type: 8080
  actions:
    output interfaces:
      Et3/1
    source: config
  matched: 0 packets, 0 bytes
Flow test1:
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
```

```

hard timeout: 0
idle timeout: 0
match:
  ingress interface:
    Et1/1
actions:
  output interfaces:
    Et2/1
source: config
matched: 0 packets, 0 bytes
switch>

```

- This command displays information about flow test-1.

```

switch# show directflow flows test-1
Flow test1:
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    ingress interface:
      Et1/1
  actions:
    output interfaces:
      Et2/1
  source: config
  matched: 0 packets, 0 bytes
switch>

```

- This command displays detailed information for flow test-1.

```

switch# show directflow flows test-1 detail
switch>show directflow flows test1 detail
Flow test1: (Flow programmed)
  persistent: True
  priority: 0
  priorityGroupType: default
  tableType: ifp
  hard timeout: 0
  idle timeout: 0
  match:
    ingress interface:
      Et1/1
  actions:
    output interfaces:
      Et2/1
  source: config
  matched: 0 packets, 0 bytes
switch>

```

- This command displays counters for flow test-1.

```

switch# show directflow flows test-1 counters
Flow Name      Source      Matched packets  Matched bytes
-----
test1          config      0                 0
switch>

```

### 12.6.4.12 show directflow

The **show directflow** command displays summary information for DirectFlow. With the **counters** or **details** options, it displays counters or details for all flows configured on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show directflow [counters|details]
```

#### Example

- This command displays summary information for DirectFlow.

```
switch# show directflow
DirectFlow configuration: Enabled
Total matched: 0 packets
Total programmed flows: 3 flows
switch#
```

- This command displays counters for all DirectFlow flows configured on the switch.

```
switch# show directflow counters
Flow Name          Source          Matched packets
-----          -
test3              config          0
                  0
test2              config          0
                  0
test1              config          0
                  0

Total matched packets: 0
switch>
```

- This command displays details for all DirectFlow flows configured on the switch.

```
switch# show directflow detail
Flow test3: (Flow programmed)
persistent: True
priority: 0
priorityGroupType: default
tableType: ifp
hard timeout: 0
idle timeout: 0
match:
  Ethernet type: 0x86dd
  source IPv6 address: fcaa::/ffff:ffff:ffff:ffff
:ffff:ffff:ffff:ffff
actions:
  output interfaces:
    Et32
  source: config
  matched: 0 packets, 0 bytes
Flow test2: (Flow programmed)
persistent: True
priority: 0
priorityGroupType: default
tableType: ifp
```

```
hard timeout: 0
idle timeout: 0
match:
  Ethernet type: IPv4
  source IPv4 address: 10.1.2.12/255.255.255.255
  IPv4 protocol: TCP
  destination TCP/UDP port or ICMP type: 8080
actions:
  output interfaces:
    Et3/1
  source: config
  matched: 0 packets, 0 bytes
Flow test1: (Flow programmed)
persistent: True
priority: 0
priorityGroupType: default
tableType: ifp
hard timeout: 0
idle timeout: 0
match:
  ingress interface:
    Et1/1
actions:
  output interfaces:
    Et2/1
  source: config
  matched: 0 packets, 0 bytes
Flows: 3 programmed, 0 rejected
switch#
```

---

### 12.6.4.13 shutdown (DirectFlow)

The **shutdown** command, in DirectFlow mode, disables DirectFlow on the switch. DirectFlow is disabled by default.

The **no shutdown** command re-enables DirectFlow.

#### Command Mode

Directflow Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

#### Example

- These commands enable DirectFlow on the switch.

```
switch(config)#directflow  
switch(config-directflow)#no shutdown  
switch(config-directflow)#
```

- This command disables DirectFlow Flow.

```
switch(config-directflow-Test1)#shutdown
```

### 12.6.4.14 timeout (DirectFlow-flow mode)

The **timeout** command, in DirectFlow mode, configures the connection timeout period for connection sessions. The connection timeout period defines the interval between a user's most recently entered command and an automatic connection shutdown. Automatic connection timeout is disabled by setting the idle-timeout to zero, which is the default setting.

#### Command Mode

Directflow-flow Configuration

#### Command Syntax

```
no priority
no timeout hard
no timeout idle
```

#### Parameters

- **idle** session idle timeout length.
  - 0 Automatic connection timeout is disabled
  - <1-4294967295> Automatic timeout period (seconds).
- **hard** session hard timeout length.
  - 0 Automatic connection timeout is disabled.
  - <1-4294967295> Automatic timeout period (seconds).

#### Example

- These commands enable a hard timeout period of 5 seconds on the switch.

```
switch(config)#directflow
switch(config-directflow-Test1)#timeout hard 5
switch(config-directflow-Test1)#
```

- These commands enable DirectFlow on the switch.

```
switch(config)#directflow
switch(config-directflow-Test1)#no timeout hard
switch(config-directflow-Test1)#
```

## 12.7 Decap Groups

These sections describe the Decap groups:

- [Decap Groups Description](#)
- [Decap Groups Configuration](#)
- [Decap Commands](#)

### 12.7.1 Decap Groups Description

The decap group is a data structure that receives encapsulated packets and extracts the payload. The switch then processes or forwards the extracted payload as required. Although packets cannot be transmitted through decap groups, nexthop groups can be used to create a packet's reverse path. Decap groups support payload extraction of packets received from Generic Routing Encapsulation (GRE) and IP-in-IP tunnels.

Decap groups have these limitations:

- Tunnels are terminated using destination IP address; source IP address has no influence.
- Packets matching a decap group are not processed through their ingress interface and VLAN.
- During a tunnel termination, ingress ACL filter each decap group packet's inner header.
- Packet counters are not available.
- VRF is not supported.

Decap groups are defined by their tunnel type and decap IP address:

- **Tunnel type** specifies the tunnel protocol that the switch uses to extract payload.
- **Decap IP address** specifies the IP address where the switch receives decap group packets.

Decap groups support Generic Routing Encapsulation (GRE) and IP-in-IP tunnels.

## 12.7.2 Decap Groups Configuration

Decap groups are configured in decap-group configuration mode. The decap-group configuration mode is not a group change mode; the running-config is changed immediately upon entering commands. However, when exiting, the decap-group configuration mode does not affect running-config. The `exit` command returns the switch to global configuration mode.

- The static CLI entry for the incoming label is specified by the `mpls static` command.
- The tunnel type is specified by the `tunnel type (Decap Group)` command.
- The Decap IP address is specified by the `tunnel decap-ip (Decap Group)` command.
- The locally configured IP addresses are added to the Layer 3 interfaces using the `tunnel decap-interface (Decap Group)` command for a specified decap group.

Decap groups do not define a default destination address or tunnel type and is not functional until both parameters are configured. A decap group can contain multiple tunnel decap-ip statements.

### Example:

- This command defines a static CLI entry for the incoming-label.

```
switch(config)#mpls static top-label 3400 ethernet 3/3/3
10.14.4.4 pop payload-type ipv4
```

- This command creates a decap group named DC-1 and configures the group to terminate packets from GRE tunnel packets with the destination IP address of 10.14.3.2

```
switch(config)#ip decap-group DC-1
switch(config-dg-DC-1)#tunnel type gre
switch(config-dg-DC-1)#tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)#show active
ip decap-group DC-1
    tunnel type gre
    tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)#end
switch(config)#
```

## 12.7.3 Decap Commands

### Decap Configuration Commands

- `ip decap-group`
- `tunnel decap-interface (Decap Group)`
- `tunnel decap-ip (Decap Group)tunnel type (Decap Group)`

### Decap Show Command

- `show ip decap-group`

### 12.7.3.1 ip decap-group

The **ip decap-group** command places the switch in decap-group configuration mode, through which decap groups are created or modified. A decap group is a data structure that defines a method of extracting the payload from an encapsulated packet that the switch receives on a specified IP address.

Decap groups do not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

Decap-group configuration mode is not a group change mode; the running-config is changed immediately upon entering commands. Exiting the decap-group configuration mode does not affect running-config. The **exit** command returns the switch to global configuration mode.

The **no ip decap-group** and **default ip decap-group** commands delete previously configured commands in the specified **decap-group** mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip decap-group group_name
no ip decap-group group_name
default ip decap-group group_name
```

#### Parameters

- *group\_name* Decap group name.

#### Commands Available in Decap-group Configuration Mode

- [tunnel decap-ip \(Decap Group\)](#) Specifies the IP address of packets handled by the decap group.
- [tunnel type \(Decap Group\)](#) Specifies the tunnel protocol for extracting payload.
- [show ip decap-group](#)

#### Examples:

- This command creates a decap group named DC-1.

```
switch(config)#ip decap-group DC-1
switch(config-dg-DC-1)#
```

- This command exits decap-group mode for the DC-1 decap group.

```
switch(config-dg-DC-1)#exit
switch(config)#
```

- This command delete the decap group named DC-1.

```
switch(config)#no ip decap-group DC-1
switch(config)#
```

### 12.7.3.2 show ip decap-group

The `show ip decap-group` command displays the IP decap groups that are available in the switch.

#### Command Mode

Global Configuration

#### Command Syntax

`show ip decap-group [decap-group name | dynamic] Parameters`

- **decap-group name** The decap group name.
- **dynamic** Displays the dynamic entries only.

#### Related Commands

- [show ip decap-group](#)
- [tunnel decap-ip \(Decap Group\)](#)
- [tunnel type \(Decap Group\)](#)

#### Example:

This command displays the IP decap groups that are available in a switch.

```
switch(config)#show ip decap-group
NOTE: "D" column indicates dynamic entries
D	Name	Type	Info	Version	Addr Type
* | d1 | GRE | 1.2.3.4 | | |
* | d2 | IP-in-IP | Ethernet12/3 | IPv4 | primary
| gre-with-intf | GRE | | | | |
| ipip-with-decapall | IP-in-IP | all | IPv4 | all
| ipip-with-decapall | IP-in-IP | all | IPv6 | all
| ipip-with-intf | IP-in-IP | Ethernet11/3 | IPv6 | all
| ipip-with-intf | IP-in-IP | Ethernet11/3 | IPv4 | primary
* | ipip-with-ip | IP-in-IP | 1001::1 | IPv6 | |
* | ipip-with-ip | IP-in-IP | 1.1.1.1 | IPv4 | |
| p1 | GRE | 100.100.100.100 | | |
| p2 | UNKNOWN | | | |
```

### 12.7.3.3 tunnel decap-interface (Decap Group)

The **tunnel decap-interface** command adds all locally configured IP addresses to the specific Layer 3 interface per decap group.

The **no tunnel decap-interface** command and the **default tunnel decap-interface** command restores the default state by removing the locally added IP addresses from the decap group.

#### Command Mode

Decap-Group Configuration

#### Command Syntax

```
tunnel decap-interface { Ethernet | Loopback | Management | Port-Channel | Tunnel | Vlan | Vxlan | all }
```

```
no tunnel decap-interface { Ethernet | Loopback | Management | Port-Channel | Tunnel | Vlan | Vxlan | all }
```

```
default tunnel decap-interface
```

```
{ Ethernet | Loopback | Management | Port-Channel | Tunnel | Vlan | Vxlan | all }
```

#### Parameters

- **Ethernet e\_num** Ethernet interface specified by **e\_num**. The Ethernet port number ranges from **1** to **36**.
- **Loopback l\_num** Loopback interface specified by **l\_num**. The loopback interface number ranges from **0** to **1000**.
- **Management m\_num** Management interface specified by **m\_num**. The management port number ranges from **1** to **1**.
- **Port-channel p\_num** Port-channel interface specified by **p\_num**. Options include:
  - **Port-channel** interface number. The port-channel interface number ranges from **1** to **2000**.
  - **Port-channel** sub interface number. The port-channel sub interface number **<1-2000>**, **<1-4094>**.
- **tunnel t\_num** Tunnel interface specified by **t\_num**. The tunnel interface number ranges from **0** to **255**.
- **vlan v\_num** VLAN interface specified by **v\_num**. The VLAN interface number ranges from **1** to **4094**.
- **vxlan vx\_num** VXLAN interface specified by **vx\_num**. The VXLAN tunnel interface number ranges from **1** to **1**.
- **all address-family** This parameter configures all L3 interfaces as a decap interface.

#### Related Commands

- [ip decap-group](#)
- [tunnel type \(Decap Group\)](#)
- [show ip decap-group](#)

#### Example:

These commands add locally configured IP addresses to the Ethernet interface **1/1** for the **dg1** decap group.

```
switch(config)#ip decap-group dg1
switch(config-dg-dg1)#tunnel decap-interface Ethernet1/1

switch(config-dg-dg1)#show active
ip decap-group dg1
tunnel type ipip
```

```
tunnel decap-interface Ethernet1/1  
tunnel decap-interface all address-family ipv6 address all
```

---

### 12.7.3.4 tunnel decap-ip (Decap Group)

The **tunnel decap-ip** command specifies the IP address of packets that are handled by the configuration mode decap group. A decap group is a data structure that defines a method of extracting the payload from an encapsulated packet that the switch receives on a specified IP address.

Decap groups do not define a default decap-ip address. A decap group is not functional until an IP address is specified. Decap groups can contain only one tunnel decap-ip statement; subsequent commands replace any previously configured statements.

#### Command Mode

Decap-Group Configuration

#### Command Syntax

```
tunnel decap-ip ipv4_address
```

#### Parameters

- *ipv4\_addr* An IPv4 address.

#### Related Commands

- [ip decap-group](#) places the switch in decap-group configuration mode.
- [tunnel type \(Decap Group\)](#) specifies the tunnel protocol for extracting payload.
- [show ip decap-group](#)

#### Guidelines

A decap group does not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

#### Example:

These commands configure *10.14.3.2* as the decap-IP address for the *DC-1* decap group.

```
switch(config)#ip decap-group DC-1
switch(config-dg-DC-1)#tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)#show active
ip decap-group DC-1
    tunnel decap-ip 10.14.3.2
switch(config-dg-DC-1)#
```

### 12.7.3.5 tunnel type (Decap Group)

The `tunnel type` command specifies the tunnel protocol for extracting payload from encapsulated packets that arrive on the IP address specified for the configuration mode decap group. Supported tunnel protocols include GRE (General Routing Encapsulation) and IP-in-IP.

Decap groups do not define a default tunnel type. A decap group is not functional until an IP address is specified. Decap groups can contain only one tunnel decap-ip statement; subsequent commands replace any previously configured statements.

#### Command Mode

Decap-group Configuration

#### Command Syntax

```
tunnel type gre
```

#### Related Commands

- [ip decap-group](#) places the switch in decap-group configuration mode.
- [tunnel decap-ip \(Decap Group\)](#) specifies the IP address of packets handled by the decap group.
- [show ip decap-group](#)

#### Guidelines

A decap group does not specify a default IP address group or tunnel type. These parameters must be explicitly configured before a decap group can function.

#### Example:

This command configures decap group DC-1 to terminate packets from GRE tunnel packets.

```
switch(config)#ip decap-group DC-1
switch(config-dg-DC-1)#tunnel type gre
switch(config-dg-DC-1)#show active
ip decap-group DC-1
    tunnel type gre
switch(config-dg-DC-1)#
```

## 12.8 Nexthop Groups

These sections describe the Nexthop groups:

- [Nexthop Group Description](#)
- [Nexthop Group Configuration](#)
- [Nexthop Group Commands](#)

### 12.8.1 Nexthop Group Description

Each routing table entry provides the next hop address to its specified destination. A nexthop address is the address of the next device on the path to the entry's specified destination.

A nexthop group is a data structure that defines a list of nexthop addresses and a tunnel type for packets routed to the specified address. When an IP route statement specifies a nexthop group as the nexthop address, the switch configures a static route with a nexthop group member as the nexthop address and encapsulates packets forwarded to that address as required by the group's tunnel type.

---

The nexthop group size is a configurable parameter that specifies the number of entries that the group contains. Group entries that are not explicitly configured are filled with drop routes. The switch uses ECMP hashing to select the address within the nexthop group when forwarding packets. When a packet's hash selects a drop route, the packet is dropped.

Nexthop groups are supported on Trident platform switches and subject to the following restrictions:

- Each switch can support 512 IPv4 or IPv6 Tunnels
- Nexthop groups can contain 256 nexthops.
- The switch supports 1024 nexthop groups.
- Multiple routes can share a tunnel.
- Tunnels do not support IP multicast packets.

Nexthop groups support IP-in-IP tunnels. The entry IP address family within a particular nexthop group cannot be mixed, i.e. either they are all IPv4 or they are all IPv6 entries.

## 12.8.2 Nexthop Group Configuration

Nexthop groups are configured and modified in `nexthop-group` configuration mode. After a group is created, it is associated to a static route through an `ip route nexthop-group` statement.

These tasks are required to configure a nexthop group and apply it to a static route.

- [Creating and Editing Nexthop Groups](#)
- [Configuring a Group's Encapsulation Parameters](#)
- [Configuring the Group's Size](#)
- [Creating Nexthop Group Entries](#)
- [Displaying Nexthop Groups](#)
- [Applying a Nexthop Group to a Static Route](#)

### Creating and Editing Nexthop Groups

Nexthop groups are created by a `nexthop-group` command that specifies a group that isn't already configured. The switch enters `nexthop-group` configuration mode for the new group. `Nexthop-group` mode is also accessible for modifying existing groups. When in `nexthop-group` configuration mode, the `show active` command displays the group's configuration.

- This command creates a nexthop group named NH-1.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#
```

- These commands enter `nexthop-group` configuration mode for the group named NH3, then displays the previously configured group parameters.

```
switch(config)#nexthop-group NH3
switch(config-nexthop-group-NH3)#show active
nexthop-group NH3
  size 4
  ttl 10
  entry 0 tunnel-destination 10.14.21.3
  entry 1 tunnel-destination 10.14.21.5
  entry 2 tunnel-destination 10.14.22.5
  entry 3 tunnel-destination 10.14.22.6
switch(config-nexthop-group-NH3)#
```

## Configuring a Group's Encapsulation Parameters

Packets in static routes that are associated with the nexthop group are encapsulated to support the group's tunnel type. Nexthop groups support IP-in-IP tunnels. The group also defines the source IP address and TTL field contents that are included in the packet encapsulation.

- This command configures the TTL setting to 32 for nexthop group NH-1 encapsulation packets.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#ttl 32
switch(config-nexthop-group-NH-1)#show active
  nexthop-group NH-1
    size 128
    ttl 32
switch(config-nexthop-group-NH-1)#
```

The address is inserted in the encapsulation source IP fields is specified by [tunnel-source \(Nexthop Group\)](#).

- These commands create loopback interface 100, assign an IP address to the interface, then specifies that address as the tunnel source for packets designated by nexthop-group NH-1.

```
switch(config)#interface loopback 100
switch(config-if-Lo100)#ip address 10.1.1.1/32
switch(config-if-Lo100)#exit
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#tunnel-source intf loopback 100
switch(config-nexthop-group-NH-1)#show active
  nexthop-group NH-1
    size 256
    ttl 32
    tunnel-source intf Loopback100
switch(config-nexthop-group-NH-1)#
```

## Configuring IP-in-IP Encapsulation

Through IP-in-IP encapsulation, IP packets matching a static Nexthop-Group route are encapsulated within an IP-in-IP tunnel and forwarded.

- This command configures a static Nexthop-Group route and an IP-in-IP Nexthop-Group for IP-in-IP encapsulation.

```
switch(config)#ip route 124.0.0.1/32 nexthop-group abc
switch(config)#nexthop-group abc type ip-in-ip
switch(config-nexthop-group-abc)#size 512
switch(config-nexthop-group-abc)#tunnel-source 1.1.1.1
switch(config-nexthop-group-abc)#entry 0 tunnel-destination 1.1.1.2
switch(config-nexthop-group-abc)#entry 1 tunnel-destination 10.1.1.1
switch(config-nexthop-group-abc)#ttl 64
```

```
switch(config-nexthop-group-abc) #
```

### Configuring the Group's Size

The group's size specifies the number of entries in the group. A group can contain up to 256 entries, which is the default size. The group's size is specified by [size \(Nexthop Group\)](#).

- This command configures the nexthop group NH-1 to contain 128 entries.

```
switch(config) #nexthop-group NH-1
switch(config-nexthop-group-NH-1) #size 128
switch(config-nexthop-group-NH-1) #show active
nexthop-group NH-1
  size 128
  ttl 64
switch(config-nexthop-group-NH-1) #
```

### Creating Nexthop Group Entries

Each entry specifies a nexthop address that is used to forward packets. A nexthop group contains one entry statement for each nexthop address. The group's size specifies the number of entry statements the group may contain. Each entry statement is assigned an index number to distinguish it from other entries within the group; entry index numbers range from zero to the group size minus one.

Nexthop group entries are configured by [entry \(Nexthop Group\)](#).

- These commands set the nexthop group size at four entries, then create three entries. Packets that are hashed to the fourth entry are dropped.

```
switch(config) #nexthop-group NH-1
switch(config-nexthop-group-NH-1) #size 4
switch(config-nexthop-group-NH-1) #entry 0 tunnel-destination
  10.13.4.4
switch(config-nexthop-group-NH-1) #entry 1 tunnel-destination
  10.15.4.22
switch(config-nexthop-group-NH-1) #entry 2 tunnel-destination
  10.15.5.37
switch(config-nexthop-group-NH-1) #show active
nexthop-group NH-1
  size 4
  ttl 64
  entry 0 tunnel-destination 10.13.4.4
  entry 1 tunnel-destination 10.15.4.22
  entry 2 tunnel-destination 10.15.5.37
switch(config-nexthop-group-NH-1) #
```

- These commands configure a nexthop group with three IPv6 nexthop entries.

```
switch(config) #nexthop-group nhg-v6-mpls type ip
switch(config-nhg-v6-mpls) #size 3
switch(config-nhg-v6-mpls) #entry 0 nexthop 2002::6401:1
switch(config-nhg-v6-mpls) #entry 1 nexthop 2002::6404:1
switch(config-nhg-v6-mpls) #entry 2 nexthop 2002::6404:2
switch(config-nhg-v6-mpls) #
```

- These commands configure an IPv4 route to point to the nexthop group `nhg-v6-mpls`. (Both IPv4 routes and IPv6 routes can point to this nexthop group.)

```
switch#ip route 100.5.0.0/16 Nexthop-Group nhg-v6-mplsp
switch#
```

### Displaying Nexthop Groups

The `show nexthop-group` command displays a group's configured parameters.

- This command displays the properties of the nexthop group named NH-1.

```
switch>show nexthop-group NH-1
Name           Id      type      size  ttl  sourceIp
NH-1           4      ipInIp    256   64   0.0.0.0
switch>
```

### Applying a Nexthop Group to a Static Route

The `ip route nexthop-group` associates a nexthop group with a specified destination address and configures the encapsulation method for packets tunneled to that address.

This command creates a static route in the default VRF, using the nexthop group of NH-1 to determine the next hop address.

```
switch(config)#ip route 10.17.252.0/24 nexthop-group NH-1
switch(config)#
```

The `show ip route` command displays the routing table for a specified VRF. Routes that utilize a nexthop group entry are noted with a route type code of NG.

This command displays a routing table that contains a static route with its nexthop specified by a nexthop group.

```
switch>show ip route
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I - ISIS, A B - BGP Aggregate, A O - OSPF
Summary,
       NG - Nexthop Group Static Route

Gateway of last resort is not set

C      10.3.3.1/32 is directly connected, Loopback0
C      10.9.1.0/24 is directly connected, Ethernet51/3
C      10.10.10.0/24 is directly connected, Ethernet51/1

```

```
switch>
```

### 12.8.3 Nexthop Group Commands

#### Nexthop Commands

- [entry \(Nexthop Group\)](#)
- [ip route nexthop-group](#)
- [nexthop-group](#)
- [size \(Nexthop Group\)](#)
- [ttl \(Nexthop Group\)](#)
- [tunnel-source \(Nexthop Group\)](#)

#### Nexthop Show Command

- [show nexthop-group](#)

### 12.8.3.1 entry (NextHop Group)

The **entry** command defines a nexthop entry in the configuration mode nexthop group. Each nexthop entry specifies a nexthop IP address for static routes to which the nexthop group is assigned. The group size ([size \(NextHop Group\)](#)) specifies the quantity of entries a group contains. Each entry is created by an individual command. Entries within a group are distinguished by an index number.

The **no entry** and **default entry** commands delete the specified nexthop group entry, as referenced by index number, by removing the corresponding **entry** statement from **running-config**.

#### Command Mode

Nexthop-group Configuration

#### Command Syntax

```
entry index tunnel-destination ipv4_address
```

```
no entry index
```

```
default entry index
```

#### Parameters

- **index** Entry index. Values range from **0** to **group-size - 1**.
- **ipv4\_address** Nexthop IPv4 address.

**group-size** is the group's entry capacity, as specified by the [size \(NextHop Group\)](#) command.

#### Example:

- These commands sets the nexthop group size at 4 entries, then creates three nexthop entries. Packets that are hashed to the fourth entry are dropped.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#size 4
switch(config-nexthop-group-NH-1)#entry 0 tunnel-destination
10.13.4.4
switch(config-nexthop-group-NH-1)#entry 1 tunnel-destination
10.15.4.22
switch(config-nexthop-group-NH-1)#entry 2 tunnel-destination
10.15.5.37
switch(config-nexthop-group-NH-1)#show active
nexthop-group NH-1
  size 4
  ttl 64
  entry 0 tunnel-destination 10.13.4.4
  entry 1 tunnel-destination 10.15.4.22
  entry 2 tunnel-destination 10.15.5.37
switch(config-nexthop-group-NH-1)#
```

### 12.8.3.2 ip route nexthop-group

The `ip route nexthop-group` command creates a static route. The destination is a network segment. The nexthop address is one of the IP addresses that comprise the specified nexthop group. Packets forwarded as a result of this command are encapsulated as specified by the tunnel-type parameter of the specified nexthop group.

When multiple routes exist to a destination prefix, the route with the lowest administrative distance takes precedence. When a route created through this command has the same administrative distance as another static route (ECMP), the route that was created earliest has preference; *running-config* stores static routes in the order that they are created.

By default, the administrative distance assigned to static routes is 1. Assigning a higher administrative distance to a static route configures it to be overridden by dynamic routing data. For example, a static route with a distance value of 200 is overridden by OSPF intra-area routes, which have a default distance of 110.

The `no ip route nexthop-group` and `default ip route nexthop-group` commands delete the specified route by removing the corresponding `ip route nexthop-group` command from *running-config*. `ip route nexthop-group` statements for an IP address in multiple VRFs must be removed separately.

A `no ip route` or `default ip route` command without a nexthop parameter deletes all corresponding `ip route nexthop-group` statements. Deleting a user-defined VRF also deletes its static routes.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip route [VRF_INST dest_net nexthop-group nhgp_name [dist][TAG_OPTION][RT_NAME]
no ip route [VRF_INST] dest_net [nexthop-group nhgroup_name][distance]
default ip route [VRF_INST] dest_net [nexthop-group nhgroup_name][distance]
```

#### Parameters

- **VRF\_INST** Specifies the VRF instance being modified.
  - **<no parameter>** Changes are made to the default VRF.
  - **vrf vrf\_name** Changes are made to the specified VRF.
- **dest\_net** Destination IPv4 subnet (CIDR or address-mask notation).
- **nhgp\_name** Name of nexthop group.
- **dist** Administrative distance assigned to route. Options include:
  - **<no parameter>** Route assigned default administrative distance of one.
  - **<1-255>** The administrative distance assigned to route.
- **TAG\_OPTION** Static route tag. Options include:
  - **<no parameter>** Assigns default static route tag of 0.
  - **tag t\_value** Static route tag value. **t\_value** ranges from 0 to 4294967295.
- **RT\_NAME** Associates descriptive text to the route. Options include:
  - **<no parameter>** No text is associated with the route.
  - **name descriptive\_text** The specified text is assigned to the route.

#### Related Commands

- [ip route](#) creates a static route that specifies the nexthop address without using nexthop groups.

---

**Example:**

This command creates a static route in the default VRF, using the nexthop group of **NH-1** to determine the next hop address.

- ```
switch(config)#ip route 10.17.252.0/24 nexthop-group NH-1
switch(config)#
```

### 12.8.3.3 nexthop-group

The **nexthop-group** command places the switch in nexthop-group configuration mode, through which nexthop groups are created or modified. The command also specifies the tunnel protocol for extracting payload from encapsulated packets that arrive through an IP address upon which the group is applied.

A nexthop group is a data structure that defines a list of nexthop addresses and the encapsulation process for packets routed to the specified address. The command either accesses an existing nexthop group configuration or creates a new group if it specifies a non-existent group. Supported tunnel protocols include IP ECMP and IP-in-IP.

Nexthop-group configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting nexthop-group configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

The **no nexthop-group** and **default nexthop-group** commands delete previously configured commands in the specified **nexthop-group** mode. When the command does not specify a group, it removes all nexthop-groups. When the command specifies a tunnel type without naming a group, it removes all nexthop-groups of the specified type.

#### Command Mode

Global Configuration

#### Command Syntax

```
nexthop-group group_name type TUNNEL_TYPE
no nexthop-group [ group_name ] [type TUNNEL_TYPE]
default nexthop-group [ group_name] [typeTUNNEL_TYPE]
```

#### Parameters

- **group\_name** Nexthop group name.
- **TUNNEL\_TYPE** Tunnel protocol of the nexthop-group. Options include:
  - **ip** ECMP nexthop.
  - **ip-in-ip** IP in IP tunnel.
  - **gre** Encapsulates the Layer 3 protocols overs IP networks.
  - **mpls-over-gre** Tunnels MPLS over a non-MPLS network.

#### Commands Available in Nexthop-group Configuration Mode

- [entry \(Nexthop Group\)](#)
- [size \(Nexthop Group\)](#)
- [ttl \(Nexthop Group\)](#)
- [tunnel-source \(Nexthop Group\)](#)

#### Restrictions

Tunnel type availability varies by switch platform.

#### Examples:

- This command creates a nexthop group named NH-1 that specifies ECMP nexthops.

```
switch(config)#nexthop-group NH-1 type ip
switch(config-nexthop-group-NH-1)#
```

- This command exits nexthop-group mode for the NH-1 nexthop group.

```
switch(config-nexthop-group-NH-1)#exit
```

---

```
switch(config)#
```

### 12.8.3.4 show nexthop-group

The `show nexthop-group` command displays properties of the specified nexthop group.

#### Command Mode

EXEC

#### Command Syntax

```
show nhgroup_name[VRF_INST]
```

#### Parameters

- **nhgroup\_name** Name of the group displayed by command.
- **VRF\_INST** Specifies the VRF instance for which data is displayed.
  - **<no parameter>** Context-active VRF.
  - **vrf vrf\_name** Specifies the name of VRF instance. System default VRF is specified by **default**.

#### Related Commands

- [show nexthop-group](#) Places the switch in the nexthop-group configuration mode to create a new group or modify an existing group.

#### Example:

This command displays the properties of the nexthop group named NH-1.

```
switch>show nexthop-group NH-1
Name           Id      type      size  ttl  sourceIp
NH-1           4      ipInIp    256   64   0.0.0.0
switch>
```

---

### 12.8.3.5 size (Nexthop Group)

The **size** command configures the quantity of nexthop entries in the configuration mode nexthop group. Each entry specifies a nexthop IP address for static routes to which the group is assigned. Entries are configured with the [entry \(Nexthop Group\)](#) command. The default size is 256 entries.

The **no size** and **default size** commands restore the size of the configuration mode nexthop group to its default of 256 by removing the corresponding **size** command from **running-config**.

#### Command Mode

Nexthop-group Configuration

#### Command Syntax

```
size entry_size
```

```
no size entry_size
```

```
default size entry_size
```

#### Parameters

- **entry\_size** Group size (entries). Value ranges from 1 to 255. Default value is 256.

#### Example:

This command configures the nexthop group NH-1 to contain 128 entries.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#size 128
switch(config-nexthop-group-NH-1)#show active
  nexthop-group NH-1
    size 128
    ttl 64
switch(config-nexthop-group-NH-1)#
```

### 12.8.3.6 ttl (Nexthop Group)

The `ttl` command specifies the number entered into the TTL (time to live) encapsulation field of packets that are transmitted to the address designated by the configuration mode `nexthop group`. The default TTL value is 64.

The `no ttl` and `default ttl` commands restore the default TTL value written into TTL fields for the configuration mode `nexthop group` by deleting the corresponding `ttl` command from **running-config**.

#### Command Mode

Nexthop-group Configuration

#### Command Syntax

```
ttl hop_expiry
```

```
no ttl hop_expiry
```

```
default ttl hop_expiry
```

#### Parameters

- **hop\_expiry** Period that the packet remains valid (seconds or hops) Value ranges from 1 to 64.

#### Restrictions

This command is available only to Nexthop groups for tunnels of type **IP-in-IP**, **GRE**, **MPLS**, and **MPLS over GRE**.

#### Related Commands

- [nexthop-group](#) places the switch in Nexthop-group configuration mode.

#### Examples:

- This command configures the ttl setting to 32 for nexthop group NH-1 packets.

```
switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#ttl 32
switch(config-nexthop-group-NH-1)#show active
nexthop-group NH-1
    size 128
    ttl 32
switch(config-nexthop-group-NH-1)#
```

- This command restores the default ttl setting for nexthop group NH-1 packets.

```
switch(config-nexthop-group-NH-1)#no ttl
switch(config-nexthop-group-NH-1)#show active nexthop-group
NH-1
    size 128
    ttl 64
switch(config-nexthop-group-NH-1)#
```

### 12.8.3.7 tunnel-source (NextHop Group)

The **tunnel-source** command specifies the address that is entered into the source IP address encapsulation field of packets that are transmitted as designated by the configuration mode nexthop group. The command may directly specify an IP address or specify an interface from which an IP address is derived. The default source address IP address is **0.0.0.0**.

The **no tunnel-source** and **default tunnel-source** commands remove the source IP address setting from the configuration mode nexthop group by deleting the **tunnel-source** command from **running-config**.

#### Command Mode

Nexthop-group Configuration

#### Command Syntax

```
tunnel-source SOURCE
```

```
no tunnel-source SOURCE
```

```
default tunnel-source SOURCE
```

#### Parameters

- **SOURCE** IP address or derivation interface. Options include:
  - **ipv4\_addr** An IPv4 address.
  - **intf ethernet e\_num** Ethernet interface specified by **e\_num**.
  - **intf loopback l\_num** Loopback interface specified by **l\_num**.
  - **intf management m\_num** Management interface specified by **m\_num**.
  - **intf port-channel p\_num** Port-channel interface specified by **p\_num**.
  - **intf vlan v\_num** VLAN interface specified by **v\_num**.

#### Restrictions

This command is available only to Nexthop groups for tunnels of type **ip-in-ip**.

#### Related Commands

- [nexthop-group](#) Places the switch in Nexthop-group configuration mode.

#### Example:

These commands create **loopback interface 100**, assign an IP address to the interface, then specifies that address as the tunnel source for packets designated by nexthop-group **NH-1**.

```
switch(config)#interface loopback 100
switch(config-if-Lo100)#ip address 10.1.1.1/32
switch(config-if-Lo100)#exit

switch(config)#nexthop-group NH-1
switch(config-nexthop-group-NH-1)#tunnel-source intf loopback 100
switch(config-nexthop-group-NH-1)#show active nexthop-group NH-1
  size 256
  ttl 64
  tunnel-source intf Loopback100
switch(config-nexthop-group-NH-1)#show nexthop-group NH-1
Name      Id      type      size  ttl  sourceIp
NH-1      2      ipInIp    256   64   10.1.1.1
```

```
switch(config-nexthop-group-NH-1) #
```

## 12.9 Global Knob to Set MTU for all Layer 3 Interfaces

- Global Layer 3 Maximum Transfer Unit (MTU) feature provides a CLI command to set the MTU value for all Layer 3 interfaces.
- The default value for global Layer 3 MTU and for each interface Layer 3 MTU is 1500.
- Any interface which has an MTU configured is not affected by the global L3 MTU.
- When the global L3 MTU is changed, any existing interfaces which are using the default are updated to use the new MTU. Any additional interfaces which are configured in the future will also use the new default MTU.

The related sections are:

- [Platform Compatibility](#)
- [Global Knob to Set MTU for all Layer 3 Interfaces Configuration](#)
- [Show Commands](#)
- [Troubleshooting](#)
- [Limitations](#)

### 12.9.1 Platform Compatibility

Global knob to set MTU for all Layer 3 interfaces is available on all platforms.

### 12.9.2 Global Knob to Set MTU for all Layer 3 Interfaces Configuration

The global L3 `mtu` command is under *interface-defaults sub-mode*. In this example, the MTU value is set to 1600.

```
(config)#interface defaults
(config-interface-defaults)#mtu 1600
```

### 12.9.3 Show Commands

Use the `show interface` command to display the current MTU value applied on the selected interface. In the following example, interfaces *Ethernet1*, *Ethernet2*, and *Ethernet3* are selected for display.

```
(config)#interface Ethernet3
(config-if-Et3)#no switchport
(config-if-Et3)#mtu 1600
(config-if-Et3)#interface defaults
(config-interface-defaults)#mtu 1700
(config-interface-defaults)#show interfaces Ethernet1
...
  IP MTU 1700 bytes (default) , BW 10000000 kbit
...
(config-interface-defaults)#show interfaces Ethernet2
...
```

```
IP MTU 1700 bytes (default) , BW 10000000 kbit
...
(config-interface-defaults)#show interfaces Ethernet3
...
IP MTU 1600 bytes , BW 10000000 kbit
...
```

In this example,

- switch **Ethernet3** from Layer 2 to Layer 3 and explicitly set its MTU to **1600**.
- enter the **interface-defaults sub-mode**, set global L3 MTU to **1700**.
- the **show interface** command states **Ethernet1** and **Ethernet2** are using global L3 MTU value, while **Ethernet3** are using its local MTU value.
- the **(default)** in the output indicates whether or not the interface is using global L3 MTU.

#### 12.9.4 Troubleshooting

The following are troubleshooting elements for the Global knob to set MTU for all Layer 3 interfaces feature:

- For Ethernet interfaces, traces are found in the trace file for the platform agent.
- For Port-Channel interfaces, traces are found in the trace file for the **Lag** agent.
- For VLAN interfaces, traces are found in the trace file for the **Ebra** agent.

#### 12.9.5 Limitations

The following are limitations for the Global knob to set MTU for all Layer 3 interfaces feature:

- Only Ethernet, Port-Channel, and VLAN interfaces are supported.
- Other interface types, such as Management, Loopback, VXLAN, and Tunnel, are not supported.

## IP Services

---

The Internet Protocol Services (IP Services) chapter contains the following section(s):

- [CloudVision eXchange \(CVX\)](#)

### 13.1 CloudVision eXchange (CVX)

CloudVision eXchange (CVX) provides a single access point for real-time provisioning, orchestration and integration with third-party controllers. CVX aggregates and distributes operational state information across a set of EOS switches to support applications that provide network services. See the *CloudVision User Guide*, <https://www.arista.com/en/support/product-documentation>, for additional information.

Topics in this section include:

- [Upgrading CVX](#)
- [CVX Overview](#)
- [CVX Services](#)
- [Deploying CVX](#)
- [CVX Configuration](#)
- [CVX Secure out-of-band Connection](#)
- [CVX High Availability](#)
- [CVX VIP](#)
- [CVX Command Descriptions](#)

#### 13.1.1 Upgrading CVX

You can upgrade CVX from a previous version to the current version by performing a few simple tasks. You can use the following procedure to upgrade any previous version of CVX to the current version.

##### Requirements

Make sure you follow these requirements during the upgrade process.

- If you have CVP, CVX and client switches in your environment, make sure you upgrade each component in the following order:
- Upgrade CVP first
- Upgrade the CVX cluster.
- Upgrade the client switches. The reason for this is to ensure backward compatibility.
- You must upgrade the CVX cluster before you upgrade the client switches.
- If the CVX cluster is a 3 node cluster, make sure that only one node of the cluster is down at any one time during the upgrade process. (The order in which you upgrade the nodes does not matter.)

##### Pre-requisites

Before you begin the upgrade, make sure that:

- You perform a backup to ensure that you can restore data if needed.
- You download the latest version of CVX from Arista's Software Download page (<https://www.arista.com/en/support/software-download>).

---

Complete the following steps to upgrade CVX.

1. Login to the cluster to be upgraded. (You can login to any node.)
2. Upgrade the node. You must deploy a new image to perform the upgrade.
3. Wait for the node you are upgrading to rejoin the cluster. Once the node has rejoined, go to the next step. (The node automatically rejoins the cluster as a follower node.)
4. Repeat steps **1 through 3** to upgrade the two remaining nodes one node at a time. It does not matter the order in which you upgrade the remaining nodes.

## 13.1.2 CVX Overview

A CVX deployment includes CVX and a set of CVX clients to which CVX provides services. CVX is not part of the data plane, nor does it receive data-path traffic. All CVX components exist as agents that run on EOS instances.

For more information, see:

- [System Requirements](#)
- [CVX Infrastructure](#)
- [CVX Features](#)
- [CVX Clients](#)

### 13.1.2.1 System Requirements

Certain hardware and software is required to be able to use CloudVision eXchange in your CloudVision virtual appliance implementation.

The CloudVision eXchange should be installed on a single system along with CloudVision Portal.

The following table lists the minimum hardware and software required to use CloudVision eXchange.

#### Required Hardware

The hardware required to use the CloudVision eXchange are:

- CPU: 4 cores (base), 8 cores (recommended)
- RAM: 4G (base), 8G (recommended)
- Disk: 4G

#### Required Software

The software required to use the CloudVision eXchange are:

- EOS switches: Recommend 4.16.8M or later

**Note:** It is a best practice and highly recommended that the version of CVX should match the version running on the switches.

- CloudVision Portal: version 2016.1

(CloudVision Portal software is required if you want to use it in conjunction with CloudVision eXchange. If you plan to use only CloudVision eXchange, CloudVision Portal software is not required.)

**Note:** CVX supports live vMotion.

### 13.1.2.2 CVX Infrastructure

CVX provides a single integration point into network-wide services running across CVX clients. CVX is typically deployed as an EOS instance running on a VM (vEOS). The CVX infrastructure consists of a CVX instance functioning as a server and a set of CVX clients. The CVX server uses a heartbeat (KA) mechanism to maintain contact with its clients.

When de-configuring or shutting down CVX, client services should be shut down first.

### 13.1.2.3 CVX Features

CVX manages communications among the network CVX clients, and provides an integration point for services to those clients. CVX also discovers the physical network topology by aggregating topology information it receives from its client devices.

### 13.1.2.4 CVX Clients

CVX client is the agent that allows a switch to interact with a CVX server to access CVX services. Enabling the CVX client includes providing the IP address or host name of the device running CVX. The CVX client can then access services that are enabled on the CVX server.

The CVX client must be enabled to access the CVX server and the services it offers. Individual services may require additional configuration statements.

Services should be shut down or de-configured on clients before shutting down or de-configuring CVX. CVX-controlled switch features may continue to run after shutting down CVX if they are not explicitly shut down or de-configured prior to shutting down CVX.

## 13.1.3 CVX Services

CVX services are applications that run on top of the CVX infrastructure, and are accessed by CVX clients through the CVX server. All CVX services are maintained by version level; client switches negotiate the version they use when connecting to the server. This allows multiple switches that run different EOS versions to connect to the same CVX server.

The following sections briefly describe some of the services available to CVX clients through CVX:

- [OpenStack Service](#)
- [VXLAN Control Service](#)
- [Hardware Switch Controller \(HSC\) Service](#)
- [Network Topology Service](#)

### 13.1.3.1 OpenStack Service

The OpenStack service on CVX allows the networking component of an OpenStack deployment (also known as Neutron) to share state with CVX.

When deployed, this integration allows CVX to send state about the logical networks created in the OpenStack cloud to the CVX clients that configure the network.

More information on OpenStack software can be found in its online documentation at <http://docs.openstack.org/>.

### 13.1.3.2 VXLAN Control Service

The VXLAN control service allows hardware VXLAN tunnel end points (VTEPs) to share state with each other in order to establish VXLAN tunnels without the need for a multicast control plane. Configuration is required both on the client switches and in CVX.

### 13.1.3.3 Hardware Switch Controller (HSC) Service

Traffic between virtual machines which share a physical host (or between virtual machines and the rest of the network) is forwarded by virtual switches. The management and configuration of virtual switches uses the Open vSwitch Database (OVSDB) management protocol, as described in RFC 7047.

The hardware switch controller (HSC) service provides an integration point between OVSDB controllers and the VXLAN control service, allowing exchange of state information among virtual and hardware switches.

### 13.1.3.4 Network Topology Service

The network topology service gathers information from CVX clients to provide a view of the physical topology of the network. Aggregated information gathered by the network topology service is used by other CVX services, and can be viewed on the CVX server.

### 13.1.4 Deploying CVX

CloudVision Exchange (CVX) can be deployed on KVM and ESXi. The required EOS version and Aboot version vary depending on whether you are deploying CVX on KVM or ESXi.

For the detailed steps to use to deploy CVX, see:

- [Deploying CVX on Kernel-based Virtual Machine \(KVM\)](#)
- [Deploying CVX on VMware ESXi](#)

#### 13.1.4.1 Deploying CVX on Kernel-based Virtual Machine (KVM)

Complete the following steps to install CVX on Ubuntu/KVM. Once the installation is complete, you can begin the CVX configuration process.

 **Note:** Make sure you select versions of EOS and Aboot that meet the minimum requirements for CVX. The supported versions are:

- EOS (version 4.16.8M or later)
- `Aboot-veos-serial-8.0.0.iso` (located in the vEOS section of the download)

#### Pre-requisites

Before you begin the procedure, make sure that:

- Install **qemu-kvm**, **libvirt\***, and all related dependencies using yum (RHEL7/CentOS7) and apt-get (Ubuntu).
- Two bridges are configured for use by the KVM VM, and that you have the names of the bridges. (Steps are included in the procedure to add bridges, if they are not already configured.)

 **Note:** The bridges must be configured to persist (**brctl** commands do not persist across reboots). You can use Network Manager (or another application available to you) to complete this configuration.

- You have both **generateXmlForKvm.py** and **cvpTemplate.xml**. They are required to complete the procedure. You can find them in the CVP tarball for Ubuntu.

Complete the following steps to install CVX.

1. Download the Aboot and EOS files from: <https://www.arista.com/en/support/software-download/>.
2. Use **sudo su** to acquire superuser privileges, which are required to complete some of the installation steps.
3. Confirm that KVM is running on the server by entering the following command:

```
virsh -c qemu:///system listAb
```

The command output should match this example:

```
Id      Name      State
-----
$
```

4. If the output does not look correct (previous step) go to for additional assistance: <https://help.ubuntu.com/community/KVM/Installation>.
5. Use the following command to convert the **vmdk** file to **qcow2**: `qemu-img convert EOS_4_16_8M.vmdk -O qcow2 EOS.qcow2`

 **Note:** Step 6 and 7 are required if you do not already have 2 bridges defined in different subnets. If the bridges exist, go directly to step 8.

- Use **brctl** to add bridges for the KVM VM to use (br1 and br2 can be any names you choose).

```
brctl addbr br1
brctl addbr br2
```

**ifconfig** can be used to identify Ethernet ports to be bridged. Once you identify the ports, add them to the bridges.

#### Example

```
brctl addif br1 enx803f5d086eae
```

- Confirm that the bridges are up using **brctl show**.

- Enter: `ifconfig br1 up`
- And: `ifconfig br2 up`

 **Note:** The following step uses a number of input parameters (the number required vary depending on your server setup). To ensure the command executes successfully, we recommend that you type it into a scratch pad and edit as needed before typing it into the Linux Terminal.

- Use the following command to generate **cvx.xml**, which will be used to setup the CVX VM.

```
generateXmlForKvm.py
```

#### Example

```
python generateXmlForKvm.py -n cvx --device-bridge br1 --cluster-bridge
br2 -e /usr/bin/kvm -i cvpTemplate.xml -c /home/myname/Downloads/Abot-veos-serial-8.0.0.iso -x /home/myname/Downloads/EOS.qcow2 -b 8192 -p
2 -t
```

```
-n cvx: VM name.
--device-bridge br1: This is the name you gave the bridge - br1 or
anything else.
--cluster-bridge br2: Cluster bridge if clustering servers.
-i cvpTemplate.xml: Path to XML file input template.
-k: VM ID number used by virsh. If not entered, a random number is
assigned.
-b 8192: 8G of RAM.
-p 2: # of CPU cores.
-c: Path to About file.
-x: Path to qcow2 file created in step 3.
-t: This parameter indicates the file defined by -x is for CVX.
-e ~/usr/bin/kvm: Ubuntu path to KVM.
(for RHEL KVM this is: -e ~/usr/libexec/qemu-kvm)
-o: XML file used by virsh to define the KVM VM.
```

- Run the following commands:

```
virsh define cvx.xml
virsh start cvx
virsh console cvx
```

- (Optional) To configure CVX to start automatically, enter:

```
virsh autostart cvx
```

You are now ready to begin the CVX configuration (see [CVX Configuration](#)).

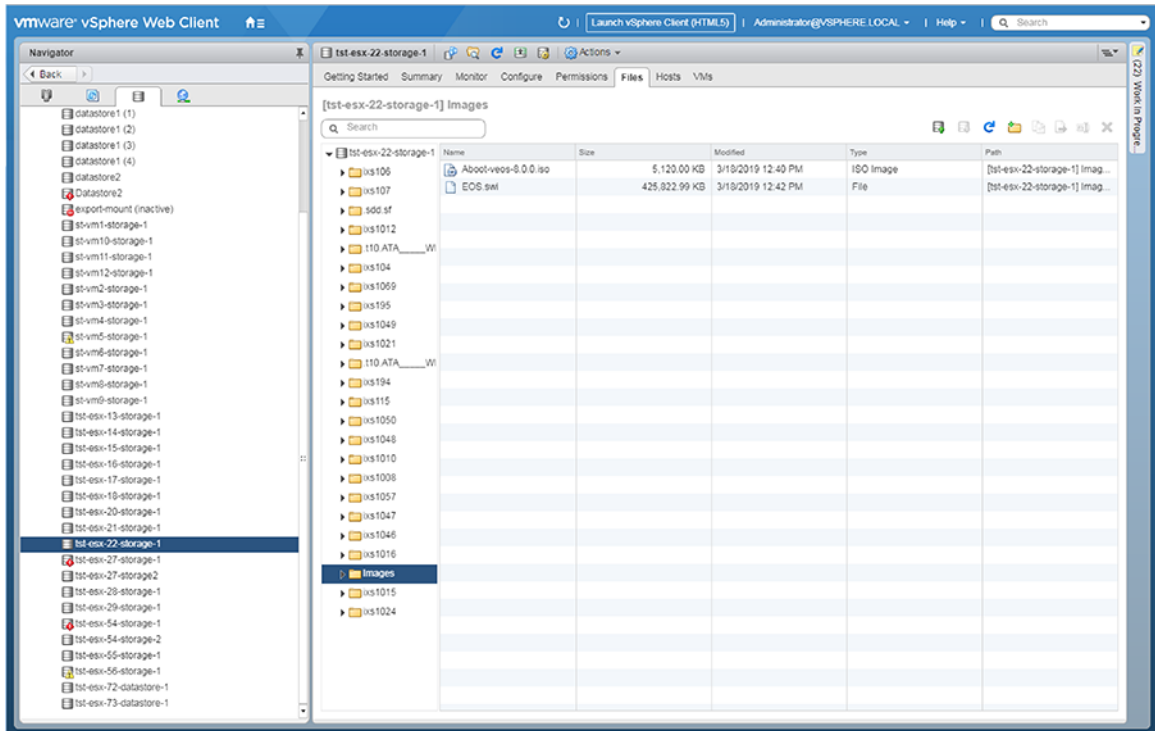

### 13.1.4.2 Deploying CVX on VMware ESXi

Complete the following steps to install CVX on ESXi. Once the installation is complete, you can begin the CVX configuration process.

**Note:** Make sure you select versions of EOS that meet the minimum requirements for CVX. The supported version is EOS (version 4.21.0 or later).

Complete the following steps to install CVX.

1. Go to: <http://www.arista.com>.
2. Select **Support > Software Download**.
3. From the software download page, expand **Active Releases > 4.21 > EOS-4.21.0F** to download **EOS-4.21.0F.vmdk**.
4. Load the files you downloaded into a filestore location within the VMware vSphere environment.

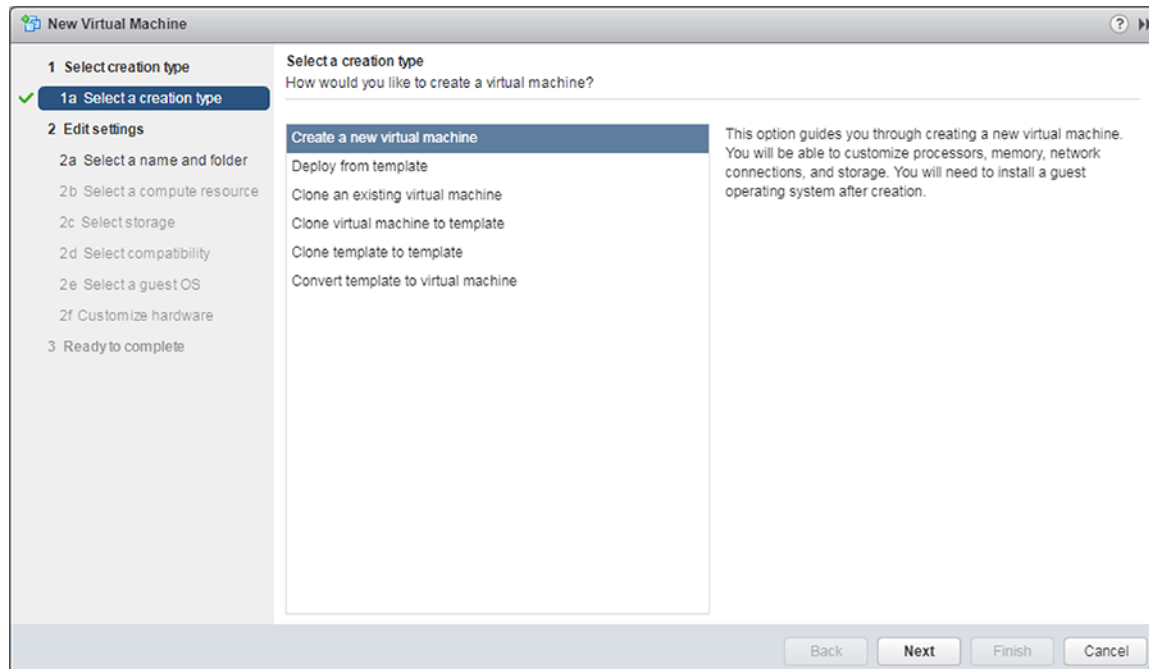

**Figure 23: Loading the files into the VMware vSphere environment**

5. Right-click the filestore location you selected, and choose **New Virtual Machine**.

**Figure 24: Selecting New Virtual Machine**

The New Virtual Machine dialog appears.

**Figure 25: New Virtual Machine dialog**

6. In the New Virtual Machine dialog, select **Create a new virtual machine**, and then click **Next**.

The dialog refreshes, showing options for the new Virtual Machine.

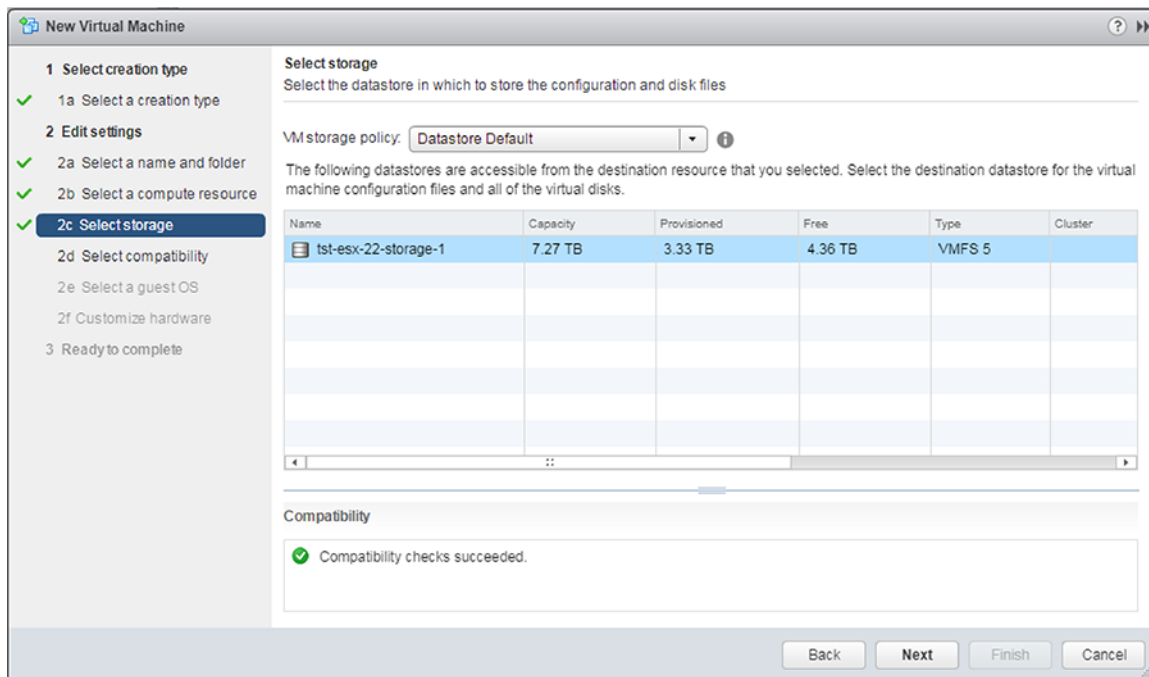

New Virtual Machine dialog (naming and selecting the location)

**Figure 26: New Virtual Machine dialog (naming and selecting the location)**

The dialog refreshes, showing options for selecting the datastore.

7. Enter a **name** for the new Virtual Machine.
8. Select a **location** for the new Virtual Machine, then click **Next**.

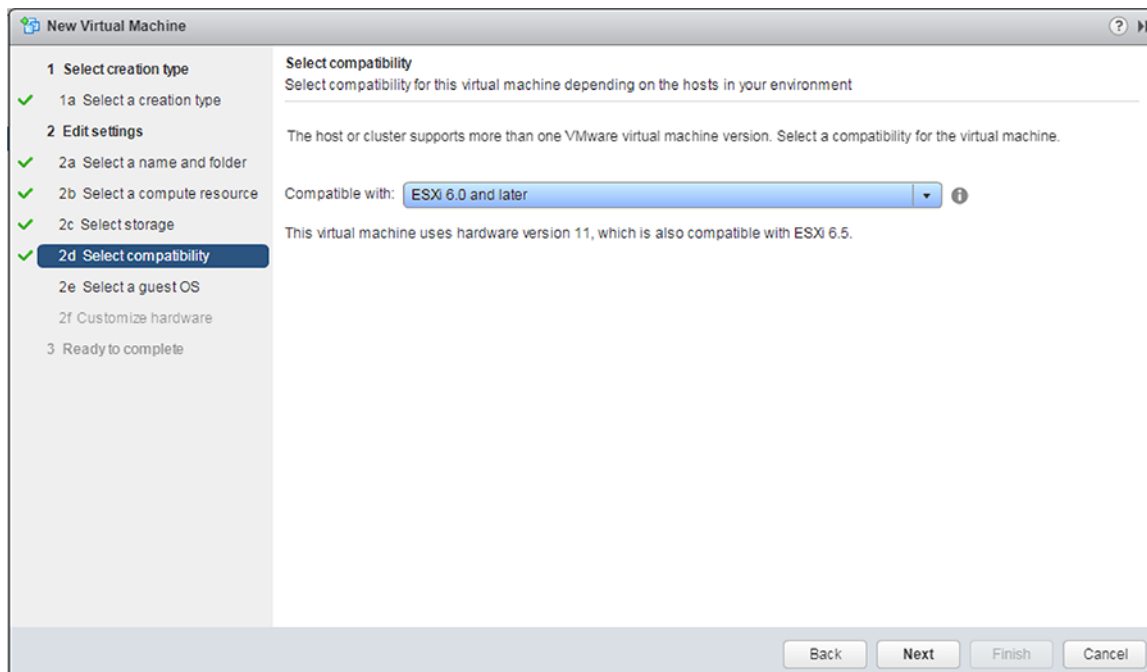

**Figure 27: New Virtual Machine dialog (selecting the datastore)**

9. Select the **datastore** for the new Virtual Machine configuration files and all of the virtual disks.
  - Click **Next**.

The dialog refreshes, showing operating system selection options.

10. Click **Next**.

The dialog refreshes, showing compatibility options.

**Figure 28: New Virtual Machine dialog (compatibility options)**

11. Using the Compatible with menu, select the **ESXi compatibility** for the new Virtual Machine.

**Note:** When adding the VMDK to ESX6, it treats this as sparse by default, whereas in ESX 5 it is thick. Converting the vEOS VMDK file from thin to thick would allow it to boot properly in ESX6: `vmkfstools -i vEOS-lab-4.18.5M.vmdk -d eagerzeroedthick vEOS-lab-4.18.5M-thick.vmdk`.

Go to <https://eos.arista.com/> and refer to the following topics for the issue and solution:

- Tip for Arista vEOS on VMware ESX 6
- Common Issues When Deploying CVX 4.18.2F on vCenter 6 or 6.5

**Note:** If the VM keeps rebooting and showing "This is not a bootable disk. Please insert a bootable floppy and press any key to try again", then go to <https://eos.arista.com/> and refer to the **Common Issues When Deploying CVX 4.18.2F on vCenter 6 or 6.5** topic.

12. Click **Next**.

The dialog refreshes, showing operating system selection options.

14. Using the Guest OS Version menu, choose **Other Linux (64-bit)**.
15. Click **Next**.

The dialog refreshes, showing options for customizing hardware.

**Figure 30: New Virtual Machine dialog (hardware configuration options)**

16. Change the default settings for the following options:

<b>CPU</b>	Set to <b>4</b> (number of CPUs)
<b>Memory</b>	Set to <b>8 GB</b>
<b>New Hard Disk</b>	Delete the current setting (leave this option empty).
<b>New Network</b>	Specify connection to Network LAN segment with connectivity to CVX client devices (the Management LAN). Choose VMXNET3 network adapter type. This connection is used for CVX client / server communications.
<b>Existing Hard Disk</b>	Specify the <b>EOS-4.21.0F.vmdk</b> you downloaded in step 3.

17. (Optional) Delete the floppy drive and SCSI controller.  
 18. Click **Next**.

You are now ready to begin the CVX configuration (see [CVX Configuration](#) ).

### 13.1.5 CVX Configuration

CVX, its clients, and its services, are independently configured. These sections describe configuration processes for each:

- [Ports Used by CVX](#)
- [CVX Server Configuration](#)
- [CVX Client Configuration](#)
- [CVX Client Services Configuration](#)

#### 13.1.5.1 Ports Used by CVX

CVX uses the following ports:

- Controller database (Controllerdb): Port 9979
- Client-server out-of-band connection: Port 50003

- CVX cluster peer out-of-band connection: Port 50004

**Note:** All of these connections are TCP.

### 13.1.5.2 CVX Server Configuration

#### Enabling CVX on the CVX Server

CVX parameters for the server infrastructure are configured in **CVX configuration** mode. CVX configuration mode is not a group-change mode; **running-config** is changed when commands are entered, and exiting the mode does not modify **running-config**. The **cvx** command places the switch in **CVX configuration** mode.

CVX is disabled by default. The **no shutdown (cvx)** command enables CVX on the switch.

#### Example

These commands enter CVX-configuration mode and enable CVX.

```
switch(config)#cvx
switch(config-cvx)#no shutdown
switch(config-cvx)#
```

#### CVX Heartbeat Configuration

CVX synchronizes with its client devices by exchanging heartbeat signals. The heartbeat transmission frequency and timeout period determine when a client's access to the server is disrupted.

The interval between heartbeat messages that the server transmits is specified by the **heartbeat-interval (cvx)** command. The CVX timeout period is specified by the **heartbeat-timeout (cvx)** command. When CVX does not receive a subsequent heartbeat message from a CVX client before the timeout expiry, the server discontinues CVX services to that client.

Best practices dictate that CVX and its client applications configure identical heartbeat interval and heartbeat timeout values.

#### Example

These commands configure a CVX heartbeat interval of 30 seconds and a server heartbeat timeout period of 90 seconds.

```
switch(config-cvx)#heartbeat-interval 30
switch(config-cvx)#heartbeat-timeout 90
switch(config-cvx)#
```

#### Disabling CVX on the CVX Server

**Note:** Before disabling or de-configuring CVX on the CVX server, CVX client services should be explicitly disabled or shut down. Failure to disable or de-configure services prior to disabling or de-configuring CVX may result in CVX features continuing to run after CVX shutdown.

When disabling the CVX service, service VXLAN configuration may be retained or erased. Be sure to disable or shut down client services prior to disabling the CVX service.

#### Examples

- These commands shut down the CVX service while retaining the CLI configuration for service VXLAN.

```
localhost(config)#cvx
localhost(config-cvx)#service vxlan
localhost(config-cvx-vxlan)#shutdown
```

- These commands shut down the CVX service and also erase service VXLAN CLI configuration.

```
localhost (config-cvx-vxlan) #
localhost (config) #cvx
localhost (config-cvx) #no service vxlan
```

### 13.1.5.3 CVX Client Configuration

This section describes the CVX client configuration and commands that enable CVX services. Most commands for the configuration of the CVX client infrastructure are accessed in Management-CVX configuration mode.

- Enabling CVX on the CVX Client

CVX client parameters are configured in **Management-CVX configuration** mode. Management-CVX configuration mode is not a group-change mode; running-config is changed when commands are entered, and exiting the mode does not modify running-config. The **management cvx** command places the switch in **Management-CVX configuration** mode.

CVX client is disabled by default. The **no shutdown (Management-CVX)** command enables CVX client on the switch.

For the CVX network topology service to create an inventory of all CVX clients, ensure that LLDP is enabled on each client switch using the **lldp run** command.

#### Example

These commands enter **Management-CVX-configuration** mode and enable the CVX client.

```
switch (config) #lldp run
switch (config) #management cvx
switch (config-mgmt-cvx) #no shutdown
switch (config-mgmt-cvx) #
```

- CVX Client Heartbeat Configuration

A CVX client synchronizes and maintains contact with CVX by exchanging heartbeat signals. The heartbeat transmission frequency and timeout period define when communication with CVX will be considered down.

The interval between heartbeat messages that the CVX client transmits is configured by the **heartbeat-interval (Management-CVX)** command.

The CVX client timeout period is specified by the **heartbeat-timeout (Management-CVX)** command. When a CVX client does not receive a subsequent heartbeat message from CVX within this timeout period, the client assumes that services provided by CVX are no longer available.

Best practices dictate that a CVX client's heartbeat interval and heartbeat timeout values are identical to those of the CVX server to which it connects.

#### Example

This command configures a CVX client heartbeat interval of 30 seconds and client timeout period of 90 seconds.

```
switch (config-mgmt-cvx) #heartbeat-interval 30
switch (config-mgmt-cvx) #heartbeat-timeout 90
switch (config-mgmt-cvx) #
```

### Connecting the CVX Client to a Server

The **server host (Management-CVX)** command identifies the location of the CVX server that the client accesses. The **source-interface (Management-CVX)** command specifies the interface

---

from which the client derives the IP address it uses as the source in CVX packets that it transmits. And the **no shutdown (Management-CVX)** command enables CVX on the client switch.

### Example

These commands configure the switch as a CVX client, connecting to a CVX server at IP address **10.1.1.14** and using IP address **10.24.24.1** as the source address for its outbound packets.

```
switch(config)#interface loopback 5
switch(config-if-Lo5)#ip address 10.24.24.1/24
switch(config-if-Lo5)#management cvx
switch(config-mgmt-cvx)#server host 10.1.1.14
switch(config-mgmt-cvx)#source-interface loopback 5
switch(config-mgmt-cvx)#no shutdown
switch(config-mgmt-cvx)#
```

## 13.1.5.4 CVX Client Services Configuration

Switches running EOS must be configured as CVX clients to access the network services running on CVX. Individual services may require additional configuration.

Refer to the following for information regarding the services available to a CVX client.

- [Configuring OpenStack Service](#)
- [Configuring VXLAN Control Service](#)
- [Configuring Hardware Switch Controller Service \(HSC\)](#)
- [Configuring Network Topology Service](#)

### 13.1.5.4.1 Configuring OpenStack Service

The OpenStack service is enabled from CVX-OpenStack configuration mode, which is accessed by the **service openstack** command. The **no shutdown (CVX-OpenStack)** command enables CVX OpenStack services on the CVX server. Additional configuration is necessary to deploy OpenStack; <http://docs.openstack.org/>.

#### Example

- These commands enable the CVX-OpenStack service.

```
switch(config-cvx)#service openstack
switch(config-cvx-openstack)#no shutdown
switch(config-cvx-openstack)#
```

### 13.1.5.4.2 Configuring VXLAN Control Service

The VXLAN control service is enabled on CVX by the **no shutdown (CVX-VXLAN)** command and on the client switches by enabling CVX and configuring the VXLAN as a controller client. When VXLAN control service is enabled, CVX functions as a VXLAN controller for its clients.

For information about configuring VXLAN on the client switch, see the VXLAN chapter of the *User Manual*.

#### Examples

- These commands enable VXLAN control service on the CVX server.

```
switch(config-cvx)#service vxlan
switch(config-cvx-vxlan)#no shutdown
switch(config-cvx-vxlan)#
```

- These commands enable VXLAN Control Service on the CVX client. (This example assumes that the VXLAN has already been configured on the client switch. For information about configuring VXLAN, see the VXLAN chapter of the *User Manual*).

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan controller-client
```

### 13.1.5.4.3 Configuring Hardware Switch Controller Service (HSC)

The hardware switch controller (HSC) service is enabled on the CVX server by the `no shutdown (CVX-HSC)` command.

#### Certificate Requirements for CVX Interoperability with VMware NSX 6.2.2 and higher

The certificate type needs to be changed from MD5 to SHA512 for use with VMware NSX 6.2.2. Complete the following steps to make the change.

1. At the EOS prompt of CVX, use the following commands.

```
switch(config)#cvx
switch(config-cvx)#service hsc
switch(config-cvx-hsc)#shut
```

2. Acquire superuser privileges and edit the default.

```
switch(config)#bash
switch(config)#sudo su
switch(config)#vi /usr/bin/ovs-pki
```

3. Find and replace **default\_md** with **sha512** (from **md5**).

```
default_md =md5
default_md =sha512
```

4. Delete all files and folders from `/persist/secure/openvswitch/`.

```
cd /persist/secure/openvswitch/
bash-4.1#sudo rm -r *
```

5. Generate the new certificate.

```
[admin@CVX ~]$ exit
logout
CVX(config-cvx-hsc)#no sh
CVX(config-cvx-hsc)#end
```

6. Verify the change using the command:

```
CVX#show nsx status
```

#### Example

These commands enable the CVX-HSC service.

```
switch(config)#cvx
switch(config-cvx)#no shutdown
switch(config-cvx)#service hsc
switch(config-cvx-hsc)#no shutdown
```

The HSC service sends flood lists to each VTEP through CVX. Some controllers (such as VMware NSX's Service Nodes) implement replication nodes for head-end replication of unknown packets. For these controllers, BUM packets should be sent to a single replication node (send-to-any

---

replication), and the flood list sent by the HSC service is a list of replication nodes. Other controllers (such as Nuage VSP) require each VTEP to perform its own head-end replication. For these, BUM packets should be sent to every known VTEP, and the flood list sent by the HSC service is the list of VTEPs.

The default behavior is to use a send-to-any replication list of VTEPs. If the required behavior is send-to-all replication of, use the all option of the `vtep` (**CVX-HSC**) command.

### Example

This command configures the CVX-HSC service to use send-to-any replication.

```
switch(config-cvx-hsc)#vtep flood list type all
switch(config-cvx-hsc)#
```

**Note:** HSC also makes use of the VXLAN control service; ensure that VXLAN control service is enabled and properly configured (see [VXLAN Control Service](#) for details).

HSC also requires a connection to an OVSDB controller. Configure the IP address or host name of the controller using the `manager` command.

### Example

This command configures the CVX-HSC service to connect to an OVSDB controller at IP address **192.168.2.5**, using the default port **6632**.

```
switch(config-cvx-hsc)#manager 192.163.2.5
switch(config-cvx-hsc)#
```

Having established a connection to the OVSDB controller, the HSC service will publish the inventory of switches managed by CVX to OVSDB. For the inventory to succeed, LLDP must be enabled on each CVX client switch with the `lldp run` command.

**Note:** LLDP is enabled by default on Arista switches.

### Example

This command enables LLDP.

```
switch(config)#lldp run
switch(config)#
```

#### 13.1.5.4.4 Configuring Network Topology Service

A network topology agent runs on each Arista switch whether or not the switch is connected to a CVX server. It requires no configuration. The network topology service on the CVX server is also enabled by default and requires no configuration.

To view the aggregated topology information, use the `show network physical-topology` command on the switch running the CVX server instance.

### Examples

- This command displays all visible hosts.

```
switch#show network physical-topology hosts
Unique Id           Hostname
-----
001c.7385.be69      cvx287.sjc.aristanetworks.com
0000.6401.0000      cvc1
0000.6402.0000      cvc2
0000.6403.0000      cvc3
0000.6404.0000      cvc4
```

```
bcf6.85bd.8050 dsj14-rack14-tor1
```

- This command displays all connections in the topology.

```
switch#show network physical-topology neighbors
cvx287.sjc.aristanetworks.com
Interface           Neighbor Intf       Neighbor Host
-----
Ethernet1           Ethernet7           cvc4
Ethernet2           Ethernet7           cvc2
Ethernet9           Ethernet7           cvc1
Ethernet10          Ethernet7           cvc3
Management1        27                  dsj14-rack14-tor1

OUTPUT OMITTED FROM EXAMPLE
 dsj14-rack14-tor1

Interface           Neighbor Intf       Neighbor Host
-----
27                  Management1         cvx287.sjc.aristanetwork
```

### 13.1.6 CVX Secure out-of-band Connection

This feature adds support for securing out-of-band connection between CVX server and CVX clients by SSL/TLS transport protocol. SSL/TLS is an application-layer protocol that provides secure transport between client and server through a combination of authentication, encryption and data integrity. SSL/TLS uses certificates and private-public key pairs to provide this security. We will use the term SSL to mean SSL/TLS.

By default, CVX server and CVX clients communicate over insecure transport (there is no authentication and encryption between CVX server and CVX clients). This poses the possibility of security risks, such as communicating with untrusted CVX server and CVX clients, or eavesdropping CVX server/client communications. This feature can be used to secure the out-of-band connection between CVX server and CVX clients.

 **Note:** The CVX client-server out-of-band connection uses port 50003. The CVX cluster peer out-of-band connection uses port 50004. These are TCP ports.

For more information, see:

- [Configuring the CVX Secure out-of-band Connection](#)
- [Show Commands](#)
- [Troubleshooting](#)

#### 13.1.6.1 Configuring the CVX Secure out-of-band Connection

This feature uses SSL certificate and key management infrastructure for managing certificates, keys and SSL profiles. For more information regarding this infrastructure see *SSL Certificate and Key Management* in the *Arista Users Guide*.

1. On CVX server, copy the server certificate and key and also the CA certificate to verify CVX clients.

```
switch(config)#!Copy the PEM encoded certificate and RSA key files for
CVX server
switch(config)#!Lets call them server.crt and server.key
switch(config)#copy <url> certificate:server.crt
switch(config)#copy <url> sslkey:server.key
switch(config)#!Copy the PEM encoded CA certificate to verify the
certificate of CVX clients.Lets call it ca.crt
switch(config)#copy <url> certificate:ca.crt
```

2. On CVX server, configure SSL profile with the certificates and key as below. Lets call the SSL profile as serverssl.

```
switch(config)#management security
switch(config-mgmt-security)#ssl profile serverssl
switch(config-mgmt-sec-ssl-profile-serverssl)#certificate server.crt
key server.key
switch(config-mgmt-sec-ssl-profile-serverssl)#!You can trust multiple
CA certificates
switch(config-mgmt-sec-ssl-profile-serverssl)#trust certificate ca.crt
```

-  **Note:** If you are using intermediate certificates to build a 'Chain of Trust' (such as **server.crt** -> **intermediate1.crt** -> **intermediate2.crt** -> **ca.crt**), then you need to configure the intermediate certificates as part of the SSL profile using the following commands:

```
switch(config-mgmt-sec-ssl-profile-serverssl)#chain certificate
intermediate1.crt
switch(config-mgmt-sec-ssl-profile-serverssl)#chain certificate
intermediate2.crt
```

3. On CVX server, configure to use the serverssl SSL profile. With this configuration, the CVX server starts listening on a secure port. The CVX server will continue to listen on the default port. i.e., the CVX server will accept connections from CVX clients over both SSL and default non-SSL transports. During a SSL negotiation, the CVX server will authenticate itself to the CVX clients by presenting server.crt and it verifies the authenticity of the CVX client by checking if the CVX client certificate is signed by the trusted certificate ca.crt.

```
switch(config)#cvx
switch(config-cvx)#ssl profile serverssl
```

4. On CVX client, copy the client certificate and key and also the CA certificate to verify CVX server.

```
switch(config)#!Copy PEM encoded certificate and RSA key files for CVX
client
switch(config)#!Lets call them client.crt and client.key
switch(config)#copy <url> certificate:client.crt
switch(config)#copy <url> sslkey:client.key
switch(config)#!Copy PEM encoded CA certificate used to verify the
switch(config)#!certificate of CVX server. Lets call it ca.crt
switch(config)#copy <url> certificate:ca.crt
```

-  **Note:** If you are using intermediate certificates to build a 'Chain of Trust' (such as **client.crt** -> **intermediate1.crt** -> **intermediate2.crt** -> **ca.crt**), then you need to configure the intermediate certificates as part of the SSL profile using the following commands:

```
switch(config-mgmt-sec-ssl-profile-clientssl)#chain certificate
intermediate1.crt
switch(config-mgmt-sec-ssl-profile-clientssl)#chain certificate
intermediate2.crt
```

5. On CVX client, configure SSL profile with the certificates and key as below. Lets call the SSL profile as clientssl.

```
switch(config)#management security
switch(config-mgmt-security)#ssl profile clientssl
switch(config-mgmt-sec-ssl-profile-clientssl)#certificate client.crt
key client.key
switch(config-mgmt-sec-ssl-profile-clientssl)#!You can trust multiple
CA certificates
switch(config-mgmt-sec-ssl-profile-clientssl)#trust certificate ca.crt
```

- On CVX client, configure to use the SSL profile `clientssl`. With this configuration, the CVX client will connect to the secure port of the CVX server over SSL transport. During SSL negotiation, the CVX client will authenticate itself to the CVX server by presenting `client.crt` and it verifies the authenticity of the CVX server by checking if the CVX server certificate is signed by the trusted certificate `ca.crt`.

```
switch(config)#management cvx
switch(config-mgmt-cvx)#ssl profile clientssl
```

### 13.1.6.2 Show Commands

For information regarding show commands of SSL certificate, key and profile, please refer to *SSL Certificate and Key Management*.

To show the SSL profile status on CVX server, use the **show cvx** command.

```
switch#show cvx

CVX Server
  Status: Enabled
  UUID: bebl9142-dfaa-11e4-b996-001c73105347
  Heartbeat interval: 20.0
  Heartbeat timeout: 60.0
  SSL profile: serverssl
  Status: Enabled
```

The Enabled SSL status means that the SSL profile is enabled for CVX server and the CVX clients can connect to CVX server over SSL transport. If there are any errors, then the status will show Disabled and the reason will be listed. In Disabled state, the CVX clients won't be able to connect to CVX server over SSL transport.

To show the SSL connection status of CVX clients on CVX server, use the **show cvx connections** command.

```
switch#show cvx connections

Switch 00:1c:73:10:53:48
  Hostname: sq302
  Status: up
  Last heartbeat sent: 0:00:04 ago
  Last heartbeat received: 0:00:10 ago
  Clock offset: -0.00201620385865
  Out-of-band connection: SSL secured
  In-band connection: Not secured (SSL not supported)
```

The out-of-band connection shows as SSL secured, which means that the CVX client has connected to CVX server over SSL transport. The in-band connection is another connection between CVX server and CVX client. The SSL is not yet supported for this connection and hence it shows as SSL not supported. There is already some level of protection for the in-band connection. The CVX server and CVX client opens up the access to in-band connection only if the out-of-band connection is successful. Since the out-of-band connection is configured to use SSL, the in-band connection access is granted only for authentic CVX client and CVX server.

To show SSL profile status and connection status on CVX client, use the **show management cvx** command.

```
switch#show management cvx

CVX Client
  Status: Enabled
  Last connected time: 2015-04-14 11:16:19
```

```
Connection status: Connected
  Out-of-band connection: SSL secured
  In-band connection: Not secured (SSL not supported)
Negotiated version: 2
Controller UUID: 0e7dee2e-e2cf-11e4-880f-001c73105347
Controller: 127.0.0.1
  Last heartbeat sent: 0:00:00 ago
  Last heartbeat received: never
  Clock offset: 0.0
SSL profile: clientssl
  Status: Enabled
```

The Enabled SSL status means that the SSL profile is enabled and the CVX client can connect to CVX server over SSL transport. If there are any errors, then the status will show as Disabled and the reason will be listed. In Disabled state, the CVX client won't be able to connect to the CVX server.

Similar to the CVX server, the out-of-band connection shows as SSL secured and the SSL is not yet supported for in-band connection.

The possible reasons for Disabled SSL status on CVX server and CVX client are:

- **SSL profile does not exist:** If the SSL profile configured under CVX server/client is not configured under management security, you will see this message. Configure the SSL profile with required certificates and key under management security.
- **Invalid SSL profile:** If the SSL profile configured under CVX server/client is in invalid state, you will see this message. Check `show management security ssl profile <name>` command to see the errors on the SSL profile and fix them.
- **Trusted certificates not configured in SSL profile:** If the SSL profile configured under CVX server/client does not have trusted certificates configured, you will see this message. Please configure trusted CA certificates in the SSL profile.
- **Certificate not configured in SSL profile:** If the SSL profile configured under CVX server/client does not have certificate key pair configured, you will see this message. Please configure certificate and key pair in the SSL profile.

**Diffie-Hellman parameters not yet ready:** When EOS is booted, a Diffie-Hellman parameters file is auto generated by the system if one does not exist. This Diffie-Hellman parameters file is used for symmetric key exchange during SSL negotiation. Only the CVX server uses this file and hence this message can be seen only on `show cvx` command output. If the file is not yet generated, you will see this message. When the file is ready, this message automatically goes away and the SSL profile will become Enabled.

### 13.1.6.3 Troubleshooting

Check `show cvx` on the CVX server and see if the SSL profile is in Enabled state. If its in Disabled state, check the reason listed and fix it.

Check `show management cvx` on CVX client and see if SSL profile is in Enabled state. If its in Disabled state, check the reason listed and fix it.

### 13.1.7 CVX High Availability

CVX provides high availability by enabling you to use multiple (redundant) CVX Controllers in the same cluster. Each Controller in the cluster has its own dedicated machine so that if a Controller fails, the failure is isolated to a single machine.

Within a cluster, one of the Controllers is a primary (leader), and the other Controllers are backup (follower) Controllers. If the primary Controller fails, one of the backup Controllers automatically assumes the role of the primary Controller.

CVX high availability does not prevent or compromise the detection of software failures or link failures that may cause Controllers to be unreachable on the network.

The configuration that is required to ensure CVX is set up for high availability involves:

- [Configuring the CVX cluster.](#)
- [Configuring the CVX clients.](#)

For more information, see:

- [CVX Clusters](#)
- [Handling of CVX Controller Failures](#)
- [CVX Support for EOS Failure Modes](#)
- [Client Interaction](#)
- [Service Agents Interaction](#)
- [Leader Election](#)
- [Configuring CVX Clusters for High Availability](#)
- [Configuring CVX Clients for High Availability](#)

### 13.1.7.1 CVX Clusters

CVX clusters are sets of CVX Controllers (usually 3 Controllers). Within a cluster, each Controller runs on its own dedicated machine, and all of the Controllers run the same version of CVX. Each Controller in the cluster functions as either the primary (leader) Controller, or a backup (follower) Controller.

One of the CVX Controllers is elected by the group of Controllers to be the primary Controller. Once a Controller is elected to be the primary, the other Controllers in the cluster are automatically assigned the role of backup Controllers. Cluster members maintain an out-of-band connection amongst themselves, which is used for the leader election protocol.

CVX Controllers in a cluster that are not the primary Controller always function as backup Controllers. Within the same cluster, only one CVX Controller can assume the role of a primary at any time.

For more information, see:

- [Required Number of Controllers to Support High Availability](#)
- [Cluster Configuration Options](#)

#### 13.1.7.1.1 Required Number of Controllers to Support High Availability

A cluster must have enough Controllers so that in the case of a failure of the primary Controller, there are enough remaining Controllers for the election process to be completed. The election process is used by clusters to select a new primary Controller in the case of failure.

 **Note:** The number of Controllers for a cluster is **3** (one primary and two backup Controllers).

#### Examples

In a cluster with only **two** Controllers (one primary and one backup), a simple majority of backup Controllers does not exist after a failure of the primary Controller. A simple majority of two backup Controllers is required for the leader election process.

Related Topics

- [Cluster Configuration Options](#)
- [Handling of CVX Controller Failures](#)
- [CVX Support for EOS Failure Modes](#)
- [Client Interaction](#)
- [Service Agents Interaction](#)
- [Leader Election](#)

#### 13.1.7.1.2 Cluster Configuration Options

---

You can configure the cluster for high availability using either of the following modes:

- Cold followers mode - Only the Controllerdb of the primary (leader) CVX Controller mounts from the client switches.
- Warm followers mode - The Controllerdb of every (all) CVX Controllers in the cluster mount from the client switches.

#### **Advantages and disadvantages of the modes**

The advantage of the warm follower mode is that if the primary CVX Controller fails, the switchover to the new primary is faster than a switchover in cold follower mode. The reason for this is that the state of the new primary does not have to be rebuilt from scratch. The disadvantage of the warm follower mode is that serialization from the switch is slower compared to cold follower mode.

#### **Related Topics**

- [Required Number of Controllers to Support High Availability](#)
- [Handling of CVX Controller Failures](#)
- [CVX Support for EOS Failure Modes](#)
- [Client Interaction](#)
- [Service Agents Interaction](#)
- [Leader Election](#)

### **13.1.7.2 Handling of CVX Controller Failures**

CVX Controllers can fail because of hardware or software faults. Because EOS agents are designed to be software fault-tolerant, an agent that fails is automatically restarted and resumes operation statefully. The most recent saved state in Sysdb for the agent is used to restore the state of the agent.

Unlike software failures, hardware failures are not handled by EOS. CVX handles hardware failures through the use of redundant backup (follower) CVX Controllers that run on their own dedicated machine. Within a cluster, any backup Controller can assume the role of the primary (leader) Controller.

**Note:** In the event of a network partition, the partition with a majority of the Controllers elects a leader from its Controllers, and the minority partition relinquishes any leadership it might have had.

#### **Related Topics**

- [CVX Clusters](#)
- [CVX Support for EOS Failure Modes](#)
- [Client Interaction](#)
- [Service Agents Interaction](#)
- [Leader Election](#)

### **13.1.7.3 CVX Support for EOS Failure Modes**

CVX supports both EOS failure modes that apply when a CVX Controller fails. The EOS failure modes are:

- Fail-stop
- Fail-recover

Because CVX supports both EOS failure modes, a failed CVX Controller can rejoin the cluster if the following failures occur:

- A crash of the agent or machine running CVX.
- The CVX controller or dedicated machine it runs on is removed (partitioned) from the cluster.

#### **Related Topics**

- [Handling of CVX Controller Failures](#)
- [CVX Clusters](#)
- [Client Interaction](#)
- [Service Agents Interaction](#)
- [Leader Election](#)

#### 13.1.7.4 Client Interaction

Client switches maintain an out-of-band connection to all members of the cluster. The connection is used to determine liveness and for communications. The connection is also used to signal a change in leadership (switchover) to the client switches. Switchovers that are changes in leadership within a cluster are executed similarly to CVX Graceful Reboot switchovers.

The ControllerClient agent on the switch is responsible for maintaining liveness with the Controllers and for exchanging metadata. The ControllerClient agent registers with all cluster members. Each Controller's ControllerStatus has an additional flag to record whether the Controller is a leader within the cluster.

If there is more than one leader, the switch automatically waits until only one Controller is designated as the leader in the cluster. Once a single Controller is designated as the leader, the switch executes a graceful switchover to the new leader Controller.

- [Handling of CVX Controller Failures](#)
- [CVX Clusters](#)
- [CVX Support for EOS Failure Modes](#)
- [Client Interaction](#)
- [Service Agents Interaction](#)
- [Leader Election](#)

#### 13.1.7.5 Service Agents Interaction

One change to Service Agents is required to support CVX high availability. Service Agents must be modified to include the leader flag (this flag identifies the leader CVX Controller in the cluster). On a leader switchover, Service Agents are deactivated on the old leader Controller and activated on the new leader Controller. The client switches will perform a graceful switchover to the new leader Controller.

- [Handling of CVX Controller Failures](#)
- [CVX Clusters](#)
- [CVX Support for EOS Failure Modes](#)
- [Client Interaction](#)
- [Leader Election](#)

#### 13.1.7.6 Leader Election

Leader election is an internal, system-run process that is essential to CVX high availability. The leader election process is used to safely elect a new leader Controller within a cluster following the failure of the current leader Controller, or a network configuration change that results in the loss of the current leader Controller in the cluster.

The leader election process is designed to ensure stability of leader Controllers within clusters. The process is based on an algorithm that provides the mechanism for the backup (follower) Controllers to elect (by consensus), the new leader Controller in the cluster.

### 13.1.7.7 Configuring CVX Clusters for High Availability

Configuring CVX clusters for high availability is a simple process that involves pointing each cluster member to the other cluster members using the peer host command. The objective of this task is to successfully register each cluster member with the other cluster members. Successful registration of the cluster members with each other ensures that the members can communicate with each other to elect a new leader member if the original leader member fails.

Once you complete the process, the cluster members will be successfully registered with each other. In addition, the cluster members will automatically elect a leader member and assign the leader to that member. The non-leader members are automatically assigned the role of follower.

#### Requirements

The requirements for setting up clusters for high availability are:

- The number of CVX Controllers in a cluster is **3**.
- An **odd number** of CVX instances (CVX Controllers) are required to form a cluster.

**Note:** If an even number of CVX Controllers are configured in a cluster, a CVX instance will automatically refuse to participate in the cluster.

- All cluster members must point to each other. This is essential for clusters to operate normally. (The steps required to complete this task are included in the following procedure.)

#### Procedure

**Note:** This procedure provides configuration examples for each step. The example cluster used throughout the procedure contains 3 cluster members (named *cvs1*, *cvs2*, and *cvs3*). The IP addresses of the cluster members are:

- *cvs1* (10.0.0.1)
- *cvs2* (10.0.0.2)
- *cvs3* (10.0.0.3).

Complete the following steps to configure clusters for high availability.

1. Using the peer host command, configure one of the cluster members to point to every other cluster member.

This example shows the configuration of cluster member ***cvs1*** to point to the other cluster members (*cvs2* and *cvs3*).

```
cvs1(config-cvx)#peer host 10.0.0.2 (connects cvs1 to cvs2)
cvs1(config-cvx)#peer host 10.0.0.3 (connects cvs1 to cvs3)
```

2. Use the `sh cvx` command to check the **Mode** and **Peer registration state** status values for cluster member *cvs1*. The status values should be:

- **Mode** = *Cluster*
- **Peer registration state** = *Connecting*

**Note:** **Mode** automatically changes from Standalone to Cluster when configuring a CVX cluster. This is because the presence of multiple CVX peers causes the Mode to change to Cluster.

**Peer registration state** remains in Connecting status after you configure the first cluster member. This is because the two peers must register with each other for the registration of the two members to be successful.

3. Using the peer host command, configure peer cluster member *cvs2* to point to every other cluster member.

This example shows the configuration of cluster member **cvx2** to point to the other cluster members (**cvx1** and **cvx3**).

```
cvx2(config-cvx)#peer host 10.0.0.1 (connects cvx2 to cvx1)
cvx2(config-cvx)#peer host 10.0.0.3 (connects cvx2 to cvx3)
```

4. Use the `sh cvx` command to check the **Peer registration state** settings for **cvx1**. This is done to verify that peers **cvx1** and **cvx2** are successfully registered with each other.

```
cvx1(config-cvx)#sh cvx
```

### Example

This example shows the output of the `sh cvx` command for **cvx1**. The **Peer registration state** setting of Registration Complete for peer **cvx2** indicates a successful registration between **cvx1** and **cvx2**.

```
cvx1(config-cvx)#sh cvx

CVX Server
  Status: Enabled
  UUID: 6c208fba-7324-11e5-8fef-1d98cdd3b27a
  Mode: Cluster
  Heartbeat interval: 20.0
  Heartbeat timeout: 60.0
  Cluster Status
    Name: default
    Role: Standby
    Leader: 10.0.0.2
    Peer timeout: 10.0
    Last leader switchover timestamp: 0:00:03 ago
    Peer Status for 10.0.0.3
      Peer registration state: Connecting
      Peer service version compatibility : Version mismatch
    Peer Status for 10.0.0.2
      Peer Id : 02-01-63-02-00-00
      Peer registration state: Registration complete
      Peer service version compatibility : Version ok
```

5. Using the `peer host` command, configure peer cluster member **cvx3** to point to every other cluster member.

This example shows the configuration of cluster member **cvx3** to point to the other cluster members (**cvx1** and **cvx2**).

```
cvx3(config-cvx)#peer host 10.0.0.1 (connects cvx3 to cvx1)
cvx3(config-cvx)#peer host 10.0.0.2 (connects cvx3 to cvx2)
```

6. Use the `sh cvx` command to check the **Peer registration state** settings for **cvx1**. This is done to verify that peers **cvx1** and **cvx3** are successfully registered with each other.

```
cvx1(config-cvx)#sh cvx
```

### Example

This example shows the output of the `sh cvx` command for **cvx1**. The **Peer registration state** setting of Registration Complete for peer **cvx3** indicates a successful registration between **cvx1** and **cvx3**.

```
cvx1(config-cvx)#sh cvx
```

```

CVX Server

Peer registration state: Registration complete
Peer service version compatibility : Version ok

```

### Next Step

You are now ready to configure the CVX clients for high availability (see [Configuring CVX Clients for High Availability](#)).

### 13.1.7.8 Configuring CVX Clients for High Availability

Configuring CVX clients for high availability is a simple process that involves pointing each CVX client to every CVX cluster member using the server host command. The objective of this task is to successfully establish connections between each CVX client and every CVX cluster member. The connections are essential to ensure that the CVX clients are aware of the current status of each cluster member.

**Note:** If a CVX client is not pointing to every cluster member, or if it is pointing to a CVX instance (Controller) that is not part of the cluster, the client may not be aware of leadership changes in the cluster, or may become confused about which cluster member is currently the leader. Either of these scenarios can result in unexpected errors.

Once you complete the process, the CVX clients will have established connections with each cluster member (the Connection status for each Controller should be Established). In addition, the clients will be aware of which CVX instance (Controller) is currently the leader in the cluster.

#### Procedure

**Note:** This procedure provides configuration examples for each step. The example CVX client used throughout the procedure is named **cvc1**. The IP addresses of the cluster members are *10.0.0.1* (*cvs1*), *10.0.0.2* (*cvs2*), and *10.0.0.3* (*cvs3*).

Complete the following steps to configure CVX clients for high availability.

1. Using the server host command, configure each of the CVX clients to point to every cluster member.

This example shows the configuration of client **cvc1** to point to all of the cluster members (the addresses of the cluster members are *10.0.0.1*, *10.0.0.2*, and *10.0.0.3*).

```

cvc1(config-mgmt-cvx)#server host 10.0.0.1 (connects cvc1 to cluster
member 10.0.0.1)
cvc1(config-mgmt-cvx)#server host 10.0.0.2 (connects cvc1 to cluster
member 10.0.0.2)

```

```
cvcl1(config-mgmt-cvx)#server host 10.0.0.3 (connects cvcl1 to cluster member 10.0.0.3)
```

2. Use the `sh man cvx` command to check the status of client **cvc1**.

The Connection status for each cluster member should be Established. In addition, the client is also aware that cluster member `10.0.0.3` is the current Master.

```
cvcl1(config-mgmt-cvx)#sh man cvx

CVX Client
Status: Enabled
Source interface: Inactive (Not configured)
Controller cluster name: default
Controller status for 10.0.0.1
  Connection status: established
  Out-of-band connection: Not secured
  In-band connection: Not secured (SSL not supported)
  Negotiated version: 2
  Controller UUID: 6c208fba-7324-11e5-8fef-1d98cdd3b27a
  Last heartbeat sent: 0:00:07 ago
  Last heartbeat received: 0:00:07 ago
Controller status for 10.0.0.3
  Master since 0:03:34 ago
  Connection status: established
  Out-of-band connection: Not secured
  In-band connection: Not secured (SSL not supported)
  Negotiated version: 2
  Controller UUID: c64954b8-7324-11e5-9f33-51f8b016cae8
  Last heartbeat sent: 0:00:14 ago
  Last heartbeat received: 0:00:14 ago
Controller status for 10.0.0.2
  Connection status: established
  Out-of-band connection: Not secured
  In-band connection: Not secured (SSL not supported)
  Negotiated version: 2
  Controller UUID: 6a0dbf2c-7324-11e5-94f3-ff17a8a1cdc8
  Last heartbeat sent: 0:00:05 ago
  Last heartbeat received: 0:00:05 ago
```

### 13.1.8 CVX VIP

CVX VIP provides the virtual IP address that actively follows the master controller of the CVX cluster.

The virtual IP address of the CVX HA Cluster is configured on a macvlan interface setup on top of a physical management interface of the master controller. The virtual IP and virtual MAC needs to be provided by the customer as part of the controller configuration. This information is available to all controllers as each cluster member has to be configured manually by the user on all controllers.

The macvlan interface created should be designated as `Management0`. `Management0` is currently used for the ManagementActive interface on modular switches. Without explicit configuration of VIP and VMAC, CVX VIP functionality will not work in the CVX HA cluster.

Customers can pick the VMAC from a pool of MAC addresses reserved for use with CVX clusters. The OUI pool, `00:1C:73:00:00:AA` - `00:1C:73:00:00:FF` has been reserved for this purpose.

The macvlan interface is setup if all of the following conditions are met:

- VMAC is configured by the user
- The controller instance is a leader
- There are more than one controller instances
- The controller is not being run on a modular system

- 
- [CVX VIP](#)
  - [Data Replication](#)
  - [SSH Host Key Tagging](#)

### 13.1.8.1 Configuring VIP

All CLI commands applicable to the management interface of the controller will be allowed on ``Management0``, with the exception of Layer 1 / phy level commands. So auto-negotiation or flow control cannot be configured on the ``Management0`` interface. Instead these commands can only be run on the physical management interfaces. This makes sense as the phy-level configuration really depends on what the interface is physically wire.

To configure VMAC/VIP

```
CVX(config)#interface management 0
CVX(config-if-Ma0)# mac-address 00:1C:72:00:00:FF
CVX(config-if-Ma0)# ip address 10.0.0.2
```

### 13.1.8.2 Data Replication

At EOS boot time, SSH host keys and Diffie-Hellman parameters are automatically generated and persistently stored on each controller. Multiple SSL profiles / keys / certificates might also be created and used by various agents on the controllers. Since these information contribute to the identity of the master, they will need to follow the master controller for all time.

In case of a controller switchover, the newly elected master controller will need to use the same SSH host keys & SSL profiles / keys / certificates to retain its identity and prevent any kind of network security alarms from being tripped. For example, if an SSH client notices that the host key has changed, it will normally flag an error warning the user of a possible man-in-the-middle type attack. Hence, this data will be replicated from the master to slaves.

### 13.1.8.3 SSH Host Key Tagging

SSH host keys are tagged with the chassis MAC address to deal with key regeneration issues when a supervisor module is moved from one chassis to another. This behavior will cause regeneration issues if we replicate the SSH host keys across the cluster resulting in the key fingerprint seen by management tools to be different.

To mitigate this, in addition to the chassis MAC address, the host keys would now be tagged with VMAC of the CVX HA cluster. If CVX VIP and VMAC are configured, SshHostKeysAgent will not regenerate keys if tagged VMAC and configured VMAC are the same, even if there is a mismatch between the chassis MAC and tagged MAC.

## 13.1.9 CVX Command Descriptions

### CVX Server Commands

- [cvx](#)
- [heartbeat-interval \(CVX\)](#)
- [heartbeat-timeout \(CVX\)](#)
- [port \(CVX\)](#)
- [show cvx](#)
- [shutdown \(CVX\)](#)

### CVX Client Commands

- [management cvx](#)
- [heartbeat-interval \(Management-CVX\)](#)
- [heartbeat-timeout \(Management-CVX\)](#)
- [server host \(Management-CVX\)](#)
- [source-interface \(Management-CVX\)](#)

---

### 13.1.9.1 cvx

CVX (CloudVision eXtension) aggregates and shares status across a network of physical switches running EOS. CVX services provide visibility and coordinate activities across a network of switches that are configured as CVX clients.

The **cvx** command enters CVX configuration mode. CVX configuration mode is not a group-change mode; **running-config** is changed immediately upon entering commands. Exiting CVX configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

The **no cvx** and **default cvx** commands restore all CVX server defaults by deleting all CVX configuration mode statements from running-config.

#### Command Mode

Global Configuration

#### Command Syntax

```
cvx
no cvx
default cvx
```

#### Commands Available in CVX Configuration Mode

- port (CVX)
- service openstack
- service vxlan
- shutdown (CVX)
- heartbeat-interval (CVX)
- heartbeat-timeout (CVX)

#### Example

- These commands enter CVX-configuration mode and display the CVX configuration.

```
switch(config)#cvx
switch(config-cvx)#show active all

cvx
 shutdown
 port 9979
 heartbeat-interval 20
 heartbeat-timeout 60
 no service vxlan
 service openstack
 shutdown
 name-resolution interval 21600
switch(config-cvx)#
```

### 13.1.9.2 heartbeat-interval (CVX)

The **heartbeat-interval** command configures the interval between heartbeat messages that the switch sends as a CVX server. Heartbeat messages are part of the keepalive mechanism between CVX and the CVX clients to which it connects.

The **no heartbeat-interval** and **default heartbeat-interval** commands restore the heartbeat interval to the default setting by removing the **heartbeat-interval** command from **running-config**.

#### Command Mode

CVX Configuration

#### Command Syntax

```
heartbeat-interval period
no heartbeat-interval
default heartbeat-interval
```

#### Parameters

- **period** Interval duration (seconds). Value ranges from 5 through 60. Default value is 20.

#### Related Commands

- **cvx**
- **heartbeat-timeout (CVX)**

#### Guidelines

Heartbeat messages flow independently in both directions between CVX and clients. When a client stops receiving heartbeat messages from the server within a specified period, the client assumes that the CVX server is no longer functioning.

Best practices dictate that CVX and its client applications configure identical heartbeat interval values.

#### Examples

- This command configures a CVX server heartbeat interval of 30 seconds:

```
switch(config)#cvx
switch(config-cvx)#heartbeat-interval 30
switch(config-cvx)#
```

---

### 13.1.9.3 heartbeat-interval (Management-CVX)

The `heartbeat-interval` command configures the interval between heartbeat messages that the switch sends as a CVX client. Heartbeat messages are part of the keepalive mechanism between the CVX client and the CVX server to which it connects.

The `no heartbeat-interval` and `default heartbeat-interval` commands revert the heartbeat interval to the default setting by removing the `heartbeat-interval` command from *running-config*.

#### Command Mode

Mgmt-CVX Configuration

#### Command Syntax

```
heartbeat-interval period
no heartbeat-interval
default heartbeat-interval
```

#### Parameters

period: Interval duration (seconds). Value ranges from 5 through 60. Default value is 20.

#### Guidelines

Heartbeat messages flow independently in both directions between CVX and clients. When the server stops receiving heartbeat messages from a client within a specified period, the server assumes that the device it is no longer functioning as a CVX client.

Best practices dictate that the CVX client's heartbeat interval value is identical to that of its CVX server.

#### Related Commands

- [management cvx](#) places the switch in **Mgmt-CVX configuration** mode.
- [heartbeat-timeout \(Management-CVX\)](#) specifies the CVX client timeout interval.

#### Example

These commands configure a CVX client heartbeat interval of 30 seconds:

```
switch(config)#management cvx
switch(config-mgmt-cvx)#heartbeat-interval 30
switch(config-mgmt-cvx)#
```

### 13.1.9.4 heartbeat-timeout (CVX)

The `heartbeat-timeout` command specifies the CVX timeout period. When a CVX server does not receive consecutive heartbeat messages from a CVX client within the heartbeat timeout period, the server discontinues providing CVX services to the client device. The default timeout period is 60 seconds.

The `no heartbeat-timeout` and `default heartbeat-timeout-timeout` commands restore the heartbeat timeout to the default setting by removing the `heartbeat-timeout` command from running-config.

#### Command Mode

CVX Configuration

#### Command Syntax

```
heartbeat-timeout period
```

```
no heartbeat-timeout
```

```
default heartbeat-timeout
```

#### Related Commands

- `cvx` places the switch in CVX configuration mode.
- `heartbeat-interval (CVX)` specifies the CVX heartbeat interval.

#### Parameters

- `period`: heartbeat timeout interval (seconds). Value ranges from 15 to 10800. Default value is 60.

#### Guidelines

Best practices dictate that CVX and its client applications configure identical heartbeat timeout values.

#### Examples

- These commands set the CVX timeout period to 90 seconds.

```
switch(config)#cvx
switch(config-cvx)#heartbeat-timeout 90
switch(config-cvx)#
```

---

### 13.1.9.5 heartbeat-timeout (Management-CVX)

The `heartbeat-timeout` command specifies the CVX client timeout period. When a CVX client does not receive consecutive heartbeat messages from a CVX server within the period specified by this command, the client assumes that its connection to CVX is disrupted. The default timeout period is 60 seconds.

The `no heartbeat-timeout` and `default heartbeat-timeout` commands restore the CVX client heartbeat timeout to the default setting by removing the `heartbeat-timeout` command from *running-config*.

#### Command Mode

Mgmt-CVX Configuration

#### Command Syntax

```
heartbeat-timeout period
no heartbeat-timeout
default heartbeat-timeout
```

#### Parameters

period: heartbeat timeout interval (seconds). Value ranges from 15 to 10800. Default value is 60

#### Guidelines

Best practices dictate that the CVX client's heartbeat timeout value is identical to that of its CVX server.

#### Related Commands

- [management cvx](#) places the switch in Mgmt-cvx configuration mode.
- [heartbeat-interval \(Management-CVX\)](#) specifies the CVX client heartbeat interval.

#### Example

These commands set the CVX client timeout period to 90 seconds.

```
switch(config)#management cvx
switch(config-mgmt-cvx)#heartbeat-timeout 90
switch(config-mgmt-cvx)#
```

### 13.1.9.6 lldp run

The `lldp run` command enables LLDP on the Arista switch.

#### Command Mode

Global Configuration

#### Command Syntax

```
lldp run
```

```
no lldp run
```

```
default lldp run
```

#### Examples

- This command enables LLDP globally on the Arista switch.

```
switch(config)# lldp run  
switch(config)#
```

- This command disables LLDP globally on the Arista switch.

```
switch(config)# no lldp run  
switch(config)#
```

---

### 13.1.9.7 management cvx

The **management cvx** command places the switch in **mgmt-CVX configuration** mode to configure CVX client parameters.

**Mgmt-CVX** configuration mode is not a group-change mode; **running-config** is changed immediately upon entering commands. Exiting mgmt-CVX configuration mode does not affect running-config. The **exit** command returns the switch to global configuration mode.

The **no management cvx** and **default management cvx** commands delete all mgmt-CVX configuration mode statements from running-config.

#### Command Mode

Global Configuration

#### Command Syntax

```
management cvx
no management cvx
default management cvx
exit
```

#### Commands Available in Mgmt-CVX Configuration Mode

- heartbeat-interval (Management-CVX)
- heartbeat-timeout (Management-CVX)
- server host (Management-CVX)
- source-interface (Management-CVX)
- shutdown (Management-CVX)

#### Examples

- This command places the switch in mgmt-CVX configuration mode:

```
switch(config)#management cvx
switch(s1)(config-mgmt-cvx)#
```

- This command returns the switch to global management mode:

```
switch(config-mgmt-cvx)#exit
switch(config)#
```

### 13.1.9.8 manager

The **manager** command configures the IP address of the OVSDB controller for the HSC service, allowing CVX to connect to the controller.

The **no manager** and **default manager** commands remove the HSC manager configuration from **running-config**.

#### Command Mode

CVX-HSC Configuration

#### Command Syntax

```
manager ip_address [port]
```

#### Parameters

**ip\_address** IP address of the HSC manager.

**port connection port.** Values range from 1 to 65535; default value is 6632.

#### Related Commands

- **service hsc** places the switch in CVX-HSC configuration mode.

#### Example

- These commands point the HSC service to a controller at IP address *192.168.2.5* using the default port *6632*.

```
switch(config)#cvx
switch(config-cvx)#service hsc
switch(config-cvx-hsc)#manager 192.163.2.5
switch(config-cvx-hsc)#
```

---

### 13.1.9.9 name-resolution force (CVX-OpenStack)

The **name-resolution force** command initiates an OpenStack controller function that communicates with the OpenStack Keystone and Nova services to update names of VMs and tenants mapped by the local OpenStack instance.

The OpenStack controller accesses the Keystone and Nova services in response to various triggering events (such as the creation of a new tenant, network or VM), and also at a regular interval configured by the **name-resolution interval (CVX-OpenStack)** command (default interval 6 hours). The **name-resolution force** command is used to force an immediate update without waiting for a triggering event.

#### Command Mode

CVX-OpenStack Configuration

#### Command Syntax

```
name-resolution force
```

#### Related Commands

- **service openstack** places the switch in CVX-OpenStack configuration mode.
- **name-resolution interval (CVX-OpenStack)** sets the interval for automatic Keystone updates.

#### Example

- These commands update the OpenStack instance immediately with data from the Keystone service.

```
switch(config)#cvx
switch(config-cvx)#service openstack
switch(config-cvx-openstack)#name-resolution force
switch(config-cvx-openstack)#
```

### 13.1.9.10 ovsdb-shutdown

The **ovsdb-shutdown** command shuts down the OVSDB server.

The **no ovsdb-shutdown** and **default ovsdb-shutdown** commands enable the OVSDB server by removing the ovsdb-shutdown command from running-config.

#### Command Mode

CVX-HSC Configuration

#### Command Syntax

```
ovsdb-shutdown
```

```
no ovsdb-shutdown
```

```
default ovsdb-shutdown
```

#### Related Commands

- **service hsc** places the switch in **CVX-HSC configuration** mode.

#### Example

- These commands shut down the OVSDB server used by the HSC service.

```
switch(config) #cvx
switch(config-cvx) #service hsc
switch(config-cvx-hsc) #ovsdb-shutdown
switch(config-cvx-hsc) #
```

---

### 13.1.9.11 port (CVX)

The **port** command specifies the TCP port number the CVX server listens on. The default port number is **9979**.

The **no port** and **default port** commands restore the default port number by removing the port statement from **running-config**.

#### Command Mode

CVX Configuration

#### Command Syntax

```
port port_number
```

```
no port
```

```
default port
```

#### Parameters

- *port\_number*: TCP port number. Value ranges from 1 to 65535.

#### Related Commands

- **cvx** places the switch in **CVX configuration** mode.

#### Example

- These commands configure **9500** as the CVX server port.

```
switch#config
switch(config)#cvx
switch(config-cvx)#port 9500
switch(config-cvx)#
```

- These commands restore the default port (9979) as the CVX server port.

```
switch(config-cvx)#no port
switch(config-cvx)#
```

### 13.1.9.12 resync-period

The **resync-period** command configures the grace period for completion of synchronization between the VXLAN control service and clients after a CVX restart. Arista recommends leaving the grace period set to its default of 300 seconds.

The **no resync-period** command disables VXLAN control service graceful restart. The **default resync-period** command resets the grace period to its default of 300 seconds.

#### Command Mode

CVX-VXLAN Configuration

#### Command Syntax

```
resync-period seconds
```

```
no resync-period
```

```
default resync-period
```

#### Parameters

- *seconds*: synchronization grace period in seconds. Values range from 30 to 4800; default is 300.

#### Examples

- These commands reset the VXLAN control service synchronization grace period to 300 seconds.

```
switch(config)#cvx
switch(config-cvx)#service vxlan
switch(config-cvx-vxlan)#default resync-period
switch(config-cvx-vxlan)#
```

---

### 13.1.9.13 server host (Management-CVX)

The **server host** command configures the IP address or host name of the CVX server to which the CVX client device connects. The configuration of this address is required for the switch to function as a CVX client. By default, no CVX host address is specified.

The **no server host** and **default server host** commands remove the CVX host address assignment by removing the server host statement from running-config.

#### Command Mode

Mgmt-CVX Configuration

#### Command Syntax

```
server host host
```

```
no server host
```

```
default server host
```

#### Parameters

- **host**: IPv4 address (in dotted decimal notation) or FQDN host name of the CVX server.

#### Related Commands

- `management cvx` places the switch in **Mgmt-CVX configuration** mode.

#### Examples

- This command specifies *10.1.1.14* as the address of the server to which the CVX client connects.

```
switch(config)#management cvx  
switch(config-mgmt-cvx)#server host 10.1.1.14  
switch(config-mgmt-cvx)#
```

### 13.1.9.14 service hsc

The **service hsc** command enters **CVX-HSC configuration** mode where the hardware switch controller (HSC) service is enabled and configured.

CVX-HSC configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting **CVX-HSC configuration** mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

#### Command Mode

CVX Configuration

#### Command Syntax

```
service hsc
```

#### Commands Available in CVX-HSC Configuration Mode

- manager
- ovssdb-shutdown
- shutdown (CVX-HSC)
- vtep (CVX-HSC)

#### Related Commands

- **cvx** places the switch in CVX configuration mode.

#### Example

- These commands enter **CVX-HSC configuration** mode.

```
switch(config) #cvx
switch(config-cvx) #service hsc
switch(config-cvx-hsc) #
```

---

### 13.1.9.15 service openstack

The service openstack command places the switch in CVX-OpenStack configuration mode.

In order to integrate Arista switches into an OpenStack managed cloud network, OpenStack needs to interact with CVX to configure and maintain VLANs on appropriate physical switch ports that connect to hosts where the VMs reside.

CVX-OpenStack configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting **CVX-OpenStack** configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

#### Command Mode

CVX Configuration

#### Command Syntax

```
service openstack
```

#### Commands Available in CVX-OpenStack Configuration Mode

- name-resolution force (CVX-OpenStack)
- name-resolution interval (CVX-OpenStack)
- shutdown (CVX-OpenStack)

#### Related Commands

- **cvx** places the switch in CVX configuration mode.

#### Example

- These commands places the switch in **CVX-OpenStack** configuration mode.

```
switch(config)#cvx
switch(config-cvx)#service openstack
switch(config-cvx-openstack)#
```

### 13.1.9.16 service vxlan

The `service vxlan` command enters **CVX-VXLAN configuration** mode where the VXLAN control service is enabled and configured.

CVX-VXLAN configuration mode is not a group change mode; *running-config* is changed immediately upon entering commands. Exiting **CVX-VXLAN configuration** mode does not affect running-config. The `exit` command returns the switch to global configuration mode.

#### Command Mode

CVX Configuration

#### Command Syntax

```
service vxlan
```

#### Commands Available in CVX-VXLAN Configuration Mode

- `resync-period`
- `shutdown (CVX-VXLAN)`
- `vtep (CVX-VXLAN)`

#### Related Commands

- `cvx` places the switch in CVX configuration mode.

#### Example

- These commands enter **CVX-VXLAN configuration** mode.

```
switch(config) #cvx
switch(config-cvx) #service vxlan
switch(config-cvx-vxlan) #
```

---

### 13.1.9.17 show cvx

The **show cvx** command displays the enable status and current configuration of CVX.

#### Command Mode

EXEC

#### Command Syntax

```
show cvx
```

#### Example

- This command displays status and configuration of CVX.

```
switch(config)#cvx
cvx
no shutdown
heartbeat-interval 30
heartbeat-timeout 90
switch(config-cvx)#dis
switch>show cvx
CVX Server
Status: Enabled
UUID: 75ce27ce-cc04-11e4-a404-233646319a2c
Heartbeat interval: 30.0
Heartbeat timeout: 90.0
switch>
```

### 13.1.9.18 show network physical-topology

The **show network physical-topology** command displays the network topology discovered through CVX.

#### Command Mode

EXEC

#### Command Syntax

```
show network physical-topology hosts|neighbors
```

#### Parameters

- *hosts* Displays all hosts visible in the topology.
- *neighbors* Displays all connections in the network topology. Table is sorted by host name, and can be optionally filtered by host.

#### Example

- This command displays all visible hosts.

```
switch#show network physical-topology hosts

Unique Id           Hostname
-----
001c.7385.be69     cvx287.sjc.aristanetworks.com
0000.6401.0000     cvc1
0000.6402.0000     cvc2
0000.6403.0000     cvc3
0000.6404.0000     cvc4
bcf6.85bd.8050     dsj14-rack14-tor1
```

- This command displays all connections in the topology.

```
switch#show network physical-topology neighbors

cvx287.sjc.aristanetworks.com

Interface           Neighbor Intf      Neighbor Host
-----
Ethernet1           Ethernet7          cvc4
Ethernet2           Ethernet7          cvc2
Ethernet9           Ethernet7          cvc1
Ethernet10          Ethernet7          cvc3
Management1        27                dsj14-rack14-tor1

OUTPUT OMITTED FROM EXAMPLE
dsj14-rack14-tor1

Interface           Neighbor Intf      Neighbor Host
-----
27                  Management1        cvx287.sjc.aristanetwork
```

---

### 13.1.9.19 shutdown (CVX)

The **shutdown** command, in **cvx** mode, disables or enables the switch as a CVX server. By default, CVX is disabled on the switch.

The **no shutdown** command enables the switch as a CVX server. The **shutdown** and **default shutdown** commands disable the switch as a CVX server by removing the **no shutdown** command from running-config.

**Note:** Be sure to de-configure or shut down all CVX client services before disabling CVX; failure to do so may result in CVX client services continuing to run after CVX has been disabled.

#### Command Mode

CVX Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

#### Related Commands

- **cvx** places the switch in CVX configuration mode.

#### Example

- These commands enable the switch as a CVX server.

```
switch#config
switch(config)#cvx
switch(config-cvx)#no shutdown
switch(config-cvx)#
```

- This command disables CVX on the switch.

```
switch(config-cvx)#shutdown
switch(config-cvx)#
```

### 13.1.9.20 shutdown (CVX-HSC)

The **shutdown** command, in **CVX-HSC configuration** mode, disables or enables the CVX hardware switch controller (HSC) service on the switch. HSC is disabled by default.

When a CVX server enables HSC, its clients (hardware VTEPs) are able to share state to establish VXLAN tunnels without the need for a multicast control plane. Configuration is also required on the client switches.

The **no shutdown** command enables the HSC service; the **shutdown** and **default shutdown** commands disable the HSC service.

#### Command Mode

CVX-VXLAN Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

#### Related Commands

- **service hsc** places the switch in CVX-HSC configuration mode.

#### Example

- These commands enable the HSC service.

```
switch(config)#cvx
switch(config-cvx)#service hsc
switch(config-cvx-hsc)#no shutdown
switch(config-cvx-hsc)#
```

- These commands disable the HSC service.

```
switch(config)#cvx
switch(config-cvx)#service hsc
switch(config-cvx-hsc)#shutdown
switch(config-cvx-hsc)#
```

---

### 13.1.9.21 shutdown (Management-CVX)

The **shutdown** command, in **mgmt-cvx** mode, disables or enables CVX client services on the switch. CVX services are disabled by default.

The **no shutdown** command enables CVX client services. The **shutdown** and **default shutdown** commands disable CVX client services by removing the corresponding no shutdown command from running-config.

#### Command Mode

Mgmt-CVX Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

#### Related Commands

- `management cvx` places the switch in **Mgmt-cvx configuration** mode.

#### Example

- These commands enable CVX client services.

```
switch(config)#management cvx  
switch(config-mgmt-cvx)#no shutdown  
switch(config-mgmt-cvx)#
```

- This command disables CVX client services.

```
switch(config-mgmt-cvx)#shutdown  
switch(config-mgmt-cvx)#
```

### 13.1.9.22 shutdown (CVX-OpenStack)

The **shutdown** command, in **cvx-openstack** configuration mode, disables or enables CVX-OpenStack on the switch. CVX-OpenStack is disabled by default.

When a CVX server enables OpenStack services, its clients are accessible to the OpenStack network controller (Neutron). Integrating Arista switches into an OpenStack-managed cloud network requires OpenStack to interact with CVX to configure and maintain VLANs on appropriate physical switch ports that connect to the hosts where the VMs reside.

The **no shutdown** command enables CVX-OpenStack. The **shutdown** and **default shutdown** commands disable CVX-OpenStack by removing the corresponding no shutdown command from running-config.

#### Command Mode

CVX-OpenStack Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

#### Related Commands

- **service openstack** places the switch in **CVX-OpenStack configuration** mode.

#### Example

- These commands enable CVX-OpenStack.

```
switch(config)#cvx
switch(config-cvx)#service openstack
switch(config-cvx-openstack)#no shutdown
switch(config-cvx-openstack)#
```

- These commands disable CVX-OpenStack.

```
switch(config-cvx-openstack)#
switch(config-cvx-openstack)#shutdown
switch(config-cvx-openstack)#
```

---

### 13.1.9.23 shutdown (CVX-VXLAN)

The **shutdown** command, in **CVX-VXLAN configuration** mode, disables or enables the CVX VXLAN control service on the switch. VXLAN control service is disabled by default.

When a CVX server enables VXLAN control service, its clients (hardware VTEPs) are able to share state to establish VXLAN tunnels without the need for a multicast control plane. Configuration is also required on the client switches.

The **no shutdown** command enables the VXLAN control service. The **shutdown** and **default shutdown** commands disable the VXLAN control service.

#### Command Mode

CVX-VXLAN Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

#### Related Commands

- **service vxlan** places the switch in CVX-VXLAN configuration mode.

#### Example

- These commands enable VXLAN control service.

```
switch(config)#cvx
switch(config-cvx)#service vxlan
switch(config-cvx-vxlan)#no shutdown
switch(config-cvx-vxlan)#
```

- These commands disable VXLAN control service

```
switch(config)#cvx
switch(config-cvx)#service vxlan
switch(config-cvx-vxlan)#shutdown
switch(config-cvx-vxlan)#
```

### 13.1.9.24 source-interface (Management-CVX)

The **source-interface** command specifies the interface from where the IPv4 address is derived for use as the source for outbound CVX packets that the switch sends as a CVX client. There is no default source interface assignment.

The **no source-interface** and **default source-interface** commands remove the source interface assignment for the CVX client by deleting the source-interface statement from **running-config**.

#### Command Mode

Mgmt-CVX Configuration

#### Command Syntax

```
source-interface INT_NAME
```

```
no source-interface
```

```
default source-interface
```

#### Parameters

**INT\_NAME**: Interface type and number. Options include:

- **ethernet** *e\_num*: Ethernet interface specified by *e\_num*.
- **loopback** *l\_num*: Loopback interface specified by *l\_num*.
- **management** *m\_num*: Management interface specified by *m\_num*.
- **port-channel** *p\_num*: Port-Channel Interface specified by *p\_num*.
- **vlan** *v\_num*: VLAN interface specified by *v\_num*.

#### Related Commands

- management cvx places the switch in **Mgmt-CVX configuration** mode.

#### Example

- These commands configure the CVX client to use the IP address *10.24.24.1* as the source address for its outbound packets.

```
switch#config
switch(config)#interface loopback 5
switch(config-if-Lo5)#ip address 10.24.24.1/24
switch(config-if-Lo5)#exit
switch(config)#management cvx
switch(config-mgmt-cvx)#source-interface loopback 5
switch(config-mgmt-cvx)#
```

---

### 13.1.9.25 vtep (CVX-HSC)

The HSC service sends flood lists to each VTEP through CVX. Some controllers (such as VMware NSX's Service Nodes) implement replication nodes for head-end replication of unknown packets. For these controllers, BUM packets should be sent to a single replication node (send-to-any replication), and the flood list sent by the HSC service is a list of replication nodes. Other controllers (such as Nuage VSP) require each VTEP to perform its own head-end replication. For these, BUM packets should be sent to every known VTEP, and the flood list sent by the HSC service is the list of VTEPs.

The default behavior is to use a send-to-any replication list of VTEPs. If the required behavior is send-to-all replication of, use the all option of the `vtep` command in **CVX-HSC configuration** mode.

#### Command Mode

CVX-HSC Configuration

#### Command Syntax

```
vtep flood list type all | any
```

```
no vtep flood list type
```

```
default vtep flood list type
```

#### Parameters

- all: send-to-all replication; flood list is the list of VTEPs.
- any: send-to-any replication; flood list is a list of replication nodes. This is the default setting.

#### Example

These commands configure the HSC to use send-to-all replication.

```
switch(config)#cvx
switch(config-cvx)#service hsc
switch(config-cvx-hsc)#vtep flood list type all
switch(config-cvx-hsc)#
```

### 13.1.9.26 vtep (CVX-VXLAN)

The OVSDB management protocol includes provisions for control-plane MAC learning, which allows MAC addresses to be distributed among VTEPs without using the data plane. Some controllers (such as VMware NSX) take advantage of this facility; others (such as Nuage VSP) do not. By default, CVX uses control-plane MAC learning.

To switch to data plane MAC learning, use the `vtep` command in CVX-VXLAN configuration mode, as shown below.

#### Command Mode

CVX-VXLAN Configuration

#### Command Syntax

```
vtep mac-learning control-plane|data-plane
```

#### Related Commands

- `service vxlan` places the switch in **CVX-VXLAN configuration** mode.

#### Example

- These commands configure CVX to use data-plane MAC address learning.

```
switch(config) #cvx
switch(config-cvx) #service vxlan
switch(config-cvx-vxlan) #vtep mac-learning data-plane
switch(config-cvx) #
```

## 13.2 CVX Client Configuration

This section describes the CVX client configuration and commands that enable CVX services. Most commands for the configuration of the CVX client infrastructure are accessed in Management-CVX configuration mode.

- Enabling CVX on the CVX Client

CVX client parameters are configured in **Management-CVX configuration** mode. Management-CVX configuration mode is not a group-change mode; running-config is changed when commands are entered, and exiting the mode does not modify running-config. The `management cvx` command places the switch in **Management-CVX configuration** mode.

CVX client is disabled by default. The `no shutdown (Management-CVX)` command enables CVX client on the switch.

For the CVX network topology service to create an inventory of all CVX clients, ensure that LLDP is enabled on each client switch using the `lldp run` command.

#### Example

These commands enter **Management-CVX-configuration** mode and enable the CVX client.

```
switch(config) #lldp run
switch(config) #management cvx
switch(config-mgmt-cvx) #no shutdown
switch(config-mgmt-cvx) #
```

- **CVX Client Heartbeat Configuration**

---

A CVX client synchronizes and maintains contact with CVX by exchanging heartbeat signals. The heartbeat transmission frequency and timeout period define when communication with CVX will be considered down.

The interval between heartbeat messages that the CVX client transmits is configured by the **heartbeat-interval (Management-CVX)** command.

The CVX client timeout period is specified by the **heartbeat-timeout (Management-CVX)** command. When a CVX client does not receive a subsequent heartbeat message from CVX within this timeout period, the client assumes that services provided by CVX are no longer available.

Best practices dictate that a CVX client's heartbeat interval and heartbeat timeout values are identical to those of the CVX server to which it connects.

### Example

This command configures a CVX client heartbeat interval of 30 seconds and client timeout period of 90 seconds.

```
switch(config-mgmt-cvx) #heartbeat-interval 30
switch(config-mgmt-cvx) #heartbeat-timeout 90
switch(config-mgmt-cvx) #
```

### Connecting the CVX Client to a Server

The **server host (Management-CVX)** command identifies the location of the CVX server that the client accesses. The **source-interface (Management-CVX)** command specifies the interface from which the client derives the IP address it uses as the source in CVX packets that it transmits. And the **no shutdown (Management-CVX)** command enables CVX on the client switch.

### Example

These commands configure the switch as a CVX client, connecting to a CVX server at IP address **10.1.1.14** and using IP address **10.24.24.1** as the source address for its outbound packets.

```
switch(config) #interface loopback 5
switch(config-if-Lo5) #ip address 10.24.24.1/24
switch(config-if-Lo5) #management cvx
switch(config-mgmt-cvx) #server host 10.1.1.14
switch(config-mgmt-cvx) #source-interface loopback 5
switch(config-mgmt-cvx) #no shutdown
switch(config-mgmt-cvx) #
```

## 13.3 CVX Server Configuration

### Enabling CVX on the CVX Server

CVX parameters for the server infrastructure are configured in **CVX configuration** mode. CVX configuration mode is not a group-change mode; **running-config** is changed when commands are entered, and exiting the mode does not modify **running-config**. The **cvx** command places the switch in **CVX configuration** mode.

CVX is disabled by default. The **no shutdown (CVX)** command enables CVX on the switch.

### Example

These commands enter CVX-configuration mode and enable CVX.

```
switch(config) #cvx
switch(config-cvx) #no shutdown
switch(config-cvx) #
```

## CVX Heartbeat Configuration

CVX synchronizes with its client devices by exchanging heartbeat signals. The heartbeat transmission frequency and timeout period determine when a client's access to the server is disrupted.

The interval between heartbeat messages that the server transmits is specified by the `heartbeat-interval (CVX)` command. The CVX timeout period is specified by the `heartbeat-timeout (CVX)` command. When CVX does not receive a subsequent heartbeat message from a CVX client before the timeout expiry, the server discontinues CVX services to that client.

Best practices dictate that CVX and its client applications configure identical heartbeat interval and heartbeat timeout values.

### Example

These commands configure a CVX heartbeat interval of 30 seconds and a server heartbeat timeout period of 90 seconds.

```
switch(config-cvx) #heartbeat-interval 30
switch(config-cvx) #heartbeat-timeout 90
switch(config-cvx) #
```

### Disabling CVX on the CVX Server

**Note:** Before disabling or de-configuring CVX on the CVX server, CVX client services should be explicitly disabled or shut down. Failure to disable or de-configure services prior to disabling or de-configuring CVX may result in CVX features continuing to run after CVX shutdown.

When disabling the CVX service, service VXLAN configuration may be retained or erased. Be sure to disable or shut down client services prior to disabling the CVX service.

### Examples

- These commands shut down the CVX service while retaining the CLI configuration for service VXLAN.

```
localhost(config) #cvx
localhost(config-cvx) #service vxlan
localhost(config-cvx-vxlan) #shutdown
```

- These commands shut down the CVX service and also erase service VXLAN CLI configuration.

```
localhost(config-cvx-vxlan) #
localhost(config) #cvx
localhost(config-cvx) #no service vxlan
```

## Routing Protocols

---

The Routing Protocols chapter contains the following sections:

- [Routing Information Protocol \(RIP\)](#)
- [Open Shortest Path First – Version 2](#)
- [Open Shortest Path First – Version 3](#)
- [IS-IS](#)
- [Border Gateway Protocol \(BGP\)](#)
- [Maintenance Mode](#)
- [Bidirectional Forwarding Detection](#)

### 14.1 Routing Information Protocol (RIP)

This chapter contains the following sections.

- [RIP Conceptual Overview](#)
- [Running RIP on the Switch](#)
- [Configuring RIP on Multiple VRFs](#)
- [RIP Commands](#)

#### 14.1.1 RIP Conceptual Overview

Routing Information Protocol (RIP) is a routing protocol typically used as an interior gateway protocol (IGP). RIP uses hop counts only to determine the shortest path to a destination. To avoid loops, RIP limits its paths to a maximum of 15 hops, making it an ineffective protocol for large networks. RIP Version 2 supports Classless Inter-Domain Routing (CIDR) and uses IP multicast at address 224.0.0.9 to share the routing table with adjacent routers.

RIP sends updates whenever there is a change in the network topology and periodic updates when there are no changes. Receiving switches update their routing table whenever the update includes topology changes. Because RIP transmits the entire routing table every 30 seconds, RIP updates can generate heavy traffic loads in large or complicated networks.

Each switch also sends a list of distance-vectors to each of its neighbors periodically. The distance-vector is the metric RIP uses to express the cost of a route, and it describes the number of hops required to reach a destination. Each hop is typically assigned a hop count value of 1, and the router adds 1 to the metric when it receives a routing update and adds the network to its routing table.

To remove dead routes from its routing table, RIP marks a route for deletion if the router does not receive an advertisement for it within the expiration interval, then removes it from the routing table after the deletion interval.

---

## 14.1.2 Running RIP on the Switch

### 14.1.2.1 Accessing RIP Configuration Mode and Enabling RIP

#### 14.1.2.1.1 RIP Configuration Mode

The `router rip` command places the switch in router-RIP configuration mode to configure Routing Information Protocol (RIP) routing.

##### Example

This command places the switch in router-RIP configuration mode.

```
switch(config)#router rip
switch(config-router-rip)#
```

Using the `router rip` command puts the switch in router-RIP configuration mode, but does not enable RIP on the switch.

#### 14.1.2.1.2 Enabling RIP

Routing Information Protocol (RIP) is disabled on the switch by default. The `no shutdown (RIP)` command in router-RIP configuration mode will enable RIP.

##### Example

This command enables RIP on the switch.

```
switch(config-router-rip)#no shutdown
switch(config-router-rip)#
```

Issuing this command enables RIP, but to send and receive RIP route updates and to route packets via RIP you must also specify interfaces on which RIP will run by using the `network (RIP)` command.

#### 14.1.2.1.3 Disabling RIP

You can disable RIP in two ways. The `shutdown (RIP)` command disables RIP on the switch but maintains all user-entered router-RIP configuration statements in the *running-config*. The `no router rip` command disables RIP and removes all user-entered router-RIP configuration statements from the *running-config*.

##### Examples

- This command disables RIP on the switch and removes all user-entered router-RIP configuration.

```
switch(config)#no router rip
switch(config)#
```

- This command disables RIP on the switch, but preserves all user-entered router-RIP configuration.

```
switch(config-router-rip)#shutdown
switch(config-router-rip)#
```

#### 14.1.2.2 Configuring RIP

Issuing the `no shutdown (RIP)` command in router-RIP configuration mode enables RIP, but to run RIP on an interface you must specify a RIP network by using the `network (RIP)` command.

You can also configure the redistribution of routes learned from other protocols, set the default metric and administrative distance for redistributed routes, configure the timing of various RIP events, and configure specific interfaces to send RIP update packets by broadcast instead of multicast.

#### 14.1.2.2.1 Specifying RIP Networks

The `network (RIP)` command identifies networks on which RIP will run and also specifies which routes RIP will accept into its routing table. You can issue the `network (RIP)` command multiple times to build up a list of RIP networks. No RIP networks are configured by default, so in order to route packets and send and receive RIP updates you must specify one or more RIP networks.

To disable RIP on a specific network, use the `no network (RIP)` command.

##### Examples

- This command enables RIP on `10.168.1.1/24`.

```
switch(config-router-rip) network 10.168.1.1/24
switch(config-router-rip) #
```

- This command disables RIP on `10.168.1.1/24`.

```
switch(config-router-rip) #no network 10.168.1.1/24
switch(config-router-rip) #
```

#### 14.1.2.2.2 Redistributing Routes Learned from Other Protocols into RIP

To enable route import from a specified protocol into RIP, use the `redistribute (RIP)` command. Additionally, you can apply a route map to the incoming routes to filter which routes are added to the RIP routing table. All connected routes are redistributed into RIP by default.

##### Example

This command redistributes all routes learned from OSPF into RIP.

```
switch(config-router-rip) #redistribute OSPF
switch(config-router-rip) #
```

#### 14.1.2.2.3 Configuring RIP Timers

When RIP is running on the switch, it sends unsolicited route updates and deletes expired routes at regular intervals. To configure the timing of those events, use the `timers (RIP)` command. The command takes three parameters: the update interval, the route expiration time, and the route deletion time.

The update interval is the amount of time in seconds that the switch waits between sending unsolicited RIP route updates to its neighbors. The route expiration time is how long the switch waits before marking an unadvertised route for deletion (the counter resets whenever an advertisement for the route is received). And the route deletion time is how long the switch waits between marking a route for deletion and removing it from the routing table. During the deletion interval, the switch continues to forward packets on the route.

##### Example

This command sets the update interval to 60 seconds, expiration time to 90 seconds, and deletion time to 150 seconds.

```
switch(config-router-rip) #timers 60 90 150
switch(config-router-rip) #
```

---

#### 14.1.2.2.4 Configuring an Interface to Transmit Broadcast RIP Updates

By default, the switch uses RIP version 2 and multicasts RIP update packets from all participating interfaces. To reconfigure a specific interface to send updates as broadcast packets, use the [rip v2 multicast disable](#) command in the configuration mode for the interface.

##### Example

The following commands configure RIP version 2 broadcasting on interface Ethernet 5.

```
switch(config)#interface ethernet5
switch(config-if-Et5)#rip v2 multicast disable
switch(config-if-Et5)#exit
switch(config)#
```

#### 14.1.2.3 Displaying RIP Information

##### 14.1.2.3.1 Displaying RIP Routes

To see a listing of the RIP routes in the switch's routing table, use the [show ip rip database](#) command. (You can also display similar information using the RIP option in the [show ip route](#) command.)

##### Examples

- This command displays all active rip routes.

```
switch>show ip rip database
10.168.11.0/24 directly connected, Et4
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et4
[2] via 10.168.15.2, 00:00:20, Et1
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et3
```

- ```
switch>show ip rip database 10.168.13.0/16
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et4
[2] via 10.168.15.2, 00:00:20, Et1
```

This command submits a query for RIP route information for a network.

##### 14.1.2.3.2 Displaying RIP Route Gateways

To see information about the switch's RIP route gateways, use the [show ip rip neighbors](#) command. The output displays the IPv4 address, the last heard time of the gateway, and characteristic flags applying to the gateway.

##### Example

This command displays information about all the gateways of RIP routes.

```
switch>show ip rip neighbors
Gateway      Last-Heard    Bad-Packets    Bad-Routes    Flags
10.2.12.33   00:00:15
                                     SRC, TRSTED,
                                     ACCPTED, RJCTED,
                                     Q_RJCTED, AUTHFAIL
```

### 14.1.3 Configuring RIP on Multiple VRFs

VRF support for Routing Information Protocol (RIP) allows instances of RIP on multiple non-default VRFs on the same router. By default, all interfaces belong to the default VRF until VRF forwarding is executed.

The `vrf instance` and `vrf (Interface mode)` commands configure a non-default VRF, enable routing in it, and configure the network command under the configuration router RIP for the prefix to which the interface belongs.

The `router rip vrf` command places the switch in router-RIP configuration mode to configure a RIP routing instance in a non-default VRF.

#### Examples

- These commands configure a non-default VRF and enable unicast routing in it.

```
switch(config)#vrf instance test
switch(config-vrf-test)#exit
switch(config)#ip routing vrf test
switch(config)#
```

- This command configures a RIP instance in a non-default VRF.

```
switch(config)#router rip vrf test
switch(config-router-rip-router-rip-vrf-test)#no shutdown
switch(config-router-rip)#exit
switch(config)#
```

- This command configures an interface as part of a non-default VRF by configuring the network command under the configuration router RIP for the prefix to which the interface belongs.

```
switch(config)#interface Ethernet 3 / 1
switch(config-if-Et3/1)#no switchport
switch(config-if-Et3/1)#ip address 1.0.0.1/24
switch(config-if-Et3/1)#vrf test
switch(config-if-Et3/1)#network 1.0.0.1
switch(config-if-Et3/1)#exit
switch(config)#
```

---

## 14.1.4 RIP Commands

### Global Configuration Commands

- `router rip`
- `router rip vrf`

### Interface Configuration Commands

- `rip v2 multicast disable`

### Router-RIP Configuration Mode

- `distance (RIP)`
- `distribute-list (RIP)`
- `metric default`
- `network (RIP)`
- `redistribute (RIP)`
- `shutdown (RIP)`
- `timers (RIP)`

### Display Commands – EXEC Mode

- `show ip rip database`
- `show ip rip neighbors`

### 14.1.4.1 distance (RIP)

The **distance** command assigns an administrative distance to routes that the switch learns through RIP. Routers use administrative distances to select a route when two protocols provide routing information to the same destination. Distance values range from 1 to 255; lower distance values correspond to higher reliability. The default RIP distance value is 120.

The **no distance** and **default distance** commands restore the administrative distance default value of 120 by removing the **distance** command from **running-config**.

#### Command Mode

Router-RIP Configuration

#### Command Syntax

```
distance distance_value
```

```
no distance
```

```
default distance
```

#### Parameters

*distance\_value* distance assigned to RIP routes. Values range from 1 to 255.

#### Example

These commands assign an administrative distance of 75 to RIP routes.

```
switch(config)# router rip  
switch(config-router-rip)# distance 75  
switch(config-router-rip)#
```

---

### 14.1.4.2 distribute-list (RIP)

The **distribute-list** command allows users to filter out routes that are received or sent out. The distribute-list command influences which routes the router installs into its routing table and advertises to its neighbors.

#### Configuration Notes:

- Only one inbound distribute-list is allowed per interface.
- Only one outbound distribute-list is allowed per interface.
- Only one globally-defined inbound distribute-list is allowed.
- Only one globally-defined outbound distribute-list is allowed.
- Not all match clauses in a route-map are supported using RIP routes filtering. These match clauses for distribute-lists are supported:
  - `match ip address access-list`
  - `match ip address prefix-list`
- The **distribute-list** command does not enforce the specified route-map to contain only supported match clauses.
- Permit or deny can be specified in both prefix/access list and route-map configurations. The following rules apply when filtering routes:
  - Routes permitted by the prefix/access lists are treated as matched.
  - Matched routes are filtered based on the permit or deny option configured for the route-map clause.
  - Unmatched routes are further evaluated by the next route-map clause.
  - If a route does not match any clause in a route-map, it is denied.
  - If the route-map given in the **distribute-list** command is not configured, then all routes are permitted.
  - When multiple inbound (or outbound) distribute-lists are configured, only the most specific one is applied.

The **no distribute-list** and **default distribute-list** commands remove the corresponding **distribute-list** command from *running-config*.

#### Command Mode

Router-RIP Configuration

#### Command Syntax

```
distribute-list DIRECTION MAP [INTF]
```

```
no distribute-list DIRECTION MAP [INTF]
```

```
default distribute-list DIRECTION MAP [INTF]
```

#### Parameters

- **DIRECTION** direction specifies if distribute-list is applied on inbound or outbound traffic. Valid options include:
  - `in` specifies inbound as the direction the distribute-list is applied.
  - `out` specifies outbound as the direction the distribute-list is applied.
- **MAP** specifies route map that assigns attribute values to the network. Options include:
  - `<no parameter>` attributes are not assigned through a route map.
  - `route-map map_name` attributes listed by specified route map are assigned to the network.
- **INTF** interface to be configured. Options include:
  - `ethernet e_num` Ethernet interface.
  - `loopback l_num` Loopback interface.

- port-channel *p\_num* Port channel interface.
- vlan *v\_num* VLAN interface.

### Examples

- The following commands demonstrate that an access-list or prefix-list can be used within a route-map for use in a distribute-list.

```
switch(config)#ip prefix-list 8to24 seq 5 permit 0.0.0.0/0 ge 8 le 24
switch(config)#route-map myRouteMap permit 10
switch(config-route-map-myRouteMap)#match ip address prefix-list 8to24
switch(config-route-map-myRouteMap)#exit
switch(config)#
switch(config)#router rip
switch(config-router-rip)#distribute-list in route-map myRouteMap
switch(config-router-rip)#
```

- These commands suppress routes advertised on a particular interface.

```
switch(config)#ip prefix-list 2 seq 10 deny 30.1.1.0/24
switch(config)#route-map myRmOut permit 10
switch(config-route-map-myRmOut)#match ip address prefix-list 2
switch(config-route-map-myRouteMap)#exit
switch(config)#router rip
switch(config-router-rip)#distribute-list out route-map myRmOut
```

---

### 14.1.4.3 metric default

The **metric default** command specifies the metric value assigned to RIP routes learned from other protocols. All routes imported into RIP receive the default metric unless a matching route-map exists for the route. The route metric of 0 is assigned to redistributed connected and static routes. The default metric values range from 0 to 16 with a default value of 1.

The **no metric default** and **default metric default** commands remove the **metric default** command from *running-config* and returns the metric value to its default value of 1.

#### Command Mode

Router-RIP Configuration

#### Command Syntax

```
metric default metric_value
```

```
no metric default
```

```
default metric default
```

#### Parameters

*metric\_value* default metric value assigned. Values range from 0 to 16; default is 1.

#### Example

This command sets the default metric value to 5.

```
switch(config)#router rip
switch(config-router-rip)#metric default 5
switch(config-router-rip)#
```

#### 14.1.4.4 network (RIP)

The **network** command specifies which network the switch runs Routing Information Protocol (RIP), and also specifies which routes will be accepted into the RIP routing table. Multiple network commands can be issued to create a network list on which RIP runs.

The switch enables RIP on all interfaces in the specified network.

The **no network** and **default network** commands disable RIP on the specified network by removing the corresponding **network** command from *running-config*.

##### Command Mode

Router-RIP Configuration

##### Command Syntax

```
network NETWORK_ADDRESS
no network NETWORK_ADDRESS
default network NETWORK_ADDRESS
```

##### Parameters

- NETWORK\_ADDRESS network IP address. Entry formats include the following:
  - *ipv4\_subnet* IPv4 subnet (CIDR notation).
  - *ipv4\_addr mask wildcard\_mask* IP address and wildcard-mask.

##### Examples

- This command enables RIP on *10.168.1.1/24*.

```
switch(config)#router rip
switch(config-router-rip)#network 10.168.1.1/24
switch(config-router-rip)#
```

- This command also enables RIP on *10.168.1.1/24*.

```
switch(config-router-rip)#network 10.168.1.1 mask 0.0.0.255
switch(config-router-rip)#
```

---

#### 14.1.4.5 redistribute (RIP)

The **redistribute** command enables the importing of routes from a specified routing domain to RIP.

- **connected** by default, RIP redistributes all connected routes that are established when IP is enabled on an interface. The route-map parameter facilitates the exclusion of connected routes from redistribution by specifying a route map that denies the excluded routes.
- **BGP, OSPF, and IP static routes** by default, routes are not redistributed. The **redistribute** command without the route-map parameter facilitates the redistribution of all routes from the specified source.

The **no redistribute** and **default redistribute** commands reset the default route redistribution setting by removing the **redistribute** statement from *running-config*.

##### Command Mode

Router-RIP Configuration

##### Command Syntax

```
redistribute connected ROUTE_MAP
redistribute ROUTE_TYPE [ROUTE_MAP]
no redistribute connected ROUTE_MAP
no redistribute ROUTE_TYPE
default redistribute connected ROUTE_MAP
default redistribute ROUTE_TYPE
```

##### Parameters

- **ROUTE\_TYPE** source from which routes are redistributed. Options include:
  - **BGP** routes from a BGP domain.
  - **OSPF** routes from an OSPF domain.
  - **OSPF match external** routes external to RIP, but imported from OSPF.
  - **OSPF match internal** OSPF routes that are internal to the AS.
  - **static** IP static routes.
- **ROUTE\_MAP** route map that determines the routes that are redistributed. Options include:
  - *<no parameter>* all routes are redistributed.
  - **route-map map\_name** only routes in the specified route map are redistributed.

##### Example

These commands redistribute OSPF routes into RIP.

```
switch(config)#router rip
switch(config-router-rip)#redistribute OSPF
switch(config-router-rip)#
```

#### 14.1.4.6 rip v2 multicast disable

The **rip v2 multicast disable** command specifies the transmission of Routing Information Protocol (RIP) Version 2 update packets from the configuration mode interface as broadcast to 255.255.255.255.

The **no rip v2 multicast disable** and **default rip v2 multicast disable** commands specify the transmission of update packets as multicast to 224.0.0.9 if the configuration mode interface is multicast capable. Updates are broadcast if the interface is not multicast capable.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
rip v2 multicast disable
no rip v2 multicast disable
default rip v2 multicast disable
```

##### Example

The following example configures version 2 broadcasting on *interface Ethernet 5*.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#rip v2 multicast disable
switch(config-if-Et5)#exit
switch(config)#
```

---

#### 14.1.4.7 router rip vrf

The **router rip** command places the switch in router-RIP configuration mode to configure an RIP routing instance in the non-default VRF.

The **no router rip vrf** and **default router rip vrf** commands disable an RIP routing instance in the non-default VRF, and remove all user-entered **router-rip** configuration statements from **running-config**. To disable RIP without removing configuration statements, use the [shutdown \(RIP\)](#) command.

The **exit** command returns the switch to global configuration mode.

##### Command Mode

Global Configuration

##### Command Syntax

```
router rip vrf [RIP_INSTANCE]
no router rip vrf [RIP_INSTANCE]
default router rip vrf [RIP_INSTANCE]
```

##### Parameters

RIP\_INSTANCE configure a RIP VRF instance in the non-default VRF.

##### Examples

- This command configures a RIP instance in the non-default VRF.

```
switch(config)#router rip vrf test
switch(config-router-rip-router-rip-vrf-test)#no shutdown
switch(config-router-rip)#exit
switch(config)#
```

- This command disables a RIP instance in the non-default VRF.

```
switch(config)#no router rip vrf test
switch(config)#
```

### 14.1.4.8 router rip

The **router rip** command places the switch in router-rip configuration mode to configure the Routing Information Protocol (RIP) routing process. Router-rip configuration mode is not a group change mode; **running-config** is changed immediately upon command entry. The **exit** command does not affect **running-config**.

The **no router rip** and **default router rip** commands disable RIP and remove all user-entered **router-rip** configuration statements from **running-config**. To disable RIP without removing configuration statements, use the **shutdown (RIP)** command.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
router rip
```

```
no router rip
```

```
default router rip
```

#### Commands Available in router-rip Configuration Mode

- [distance \(RIP\)](#)
- [network \(RIP\)](#)
- [redistribute \(RIP\)](#)
- [shutdown \(RIP\)](#)
- [timers \(RIP\)](#)

#### Example

This command places the switch in router-rip configuration mode.

```
switch(config)#router rip  
switch(config-router-rip)#
```

---

#### 14.1.4.9 show ip rip database

The **show ip rip database** command displays information about routes in the Routing Information Base. The default command displays active routes and learned routes not used in deference to higher priority routes from other protocols.

This command has the following forms:

- default (no arguments): information about all RIP routes.
- IPv4 address and mask: information about the referenced addresses.
- **active**: information about routes not superseded by routes from other protocols.

##### Command Mode

EXEC

##### Command Syntax

```
show ip rip database [FILTER]
```

##### Parameters

**FILTER** routing table entries that the command displays. Values include:

- *<no parameter>* displays all routing table entries.
- **active** displays all active routing table entries.
- *net\_addr* subnet address (CIDR or address-mask). Command displays entries in this subnet.

##### Examples

- This command displays all active rip routes.

```
switch>show ip rip database active
10.168.11.0/24 directly connected, Et4
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et4
[2] via 10.168.15.2, 00:00:20, Et1
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et3
```

- This command submits a query for RIP route information for a network.

```
switch>show ip rip database 10.168.13.0/16
10.168.13.0/24
[1] via 10.168.14.2, 00:00:25, Et4
[2] via 10.168.15.2, 00:00:20, Et1
```

- This command returns information for all RIP routes.

```
switch>show ip rip database
10.1.0.0/255.255.255.0
[1] via 10.8.31.15, 00:00:21, Et2, holddown
10.2.0.0/255.255.255.0
[1] via 10.8.31.15, 00:00:21, Et2, holddown
10.3.0.0/255.255.255.0
[1] via 10.8.31.15, 00:00:21, Et2, inactive
10.212.0.0/255.255.255.0
[1] via 10.8.31.15, 00:00:21, Et2, active
10.214.0.0/255.255.255.0
[1] via 10.8.12.17, 00:00:30, Et4, active
```

#### 14.1.4.10 show ip rip neighbors

The **show ip rip neighbors** command displays information about all RIP route gateways. The output displays the IPv4 address, the last heard time of the gateway, and characteristic flags applying to the gateway.

##### Command Mode

EXEC

##### Command Syntax

```
show ip rip neighbors
```

##### Example

The **show ip rip neighbors** command displays information about all gateways of RIP routes.

```
switch>show ip rip neighbors
Gateway      Last-Heard      Bad-Packets      Bad-Routes      Flags
10.2.12.33   00:00:15
                                     SRC, TRSTED,
                                     ACCEPTED, RJCTED,
                                     Q_RJCTED, AUTHFAIL
```

---

#### 14.1.4.11 shutdown (RIP)

The **shutdown** command disables RIP on the switch without modifying the RIP configuration. RIP is disabled by default.

The **no shutdown** command enables RIP. The **default shutdown** command disables RIP.

##### Command Mode

Router-RIP Configuration

##### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

##### Examples

- This command disables RIP on the switch.

```
switch(config)#router rip  
switch(config-router-rip)#shutdown  
switch(config-router-rip)#
```

- This command enables RIP on the switch.

```
switch(config-router-rip)#no shutdown  
switch(config-router-rip)#
```

### 14.1.4.12 timers (RIP)

The **timers** command configures the update interval, the expiration time, and the deletion time for routes received and sent through RIP. The command requires value declaration of all values.

- The update time is the interval between unsolicited route responses.
- The expiration time is initialized when a route is established and any time an update is received for the route.
- The deletion time is initialized when the expiration time elapses and the route is invalid. It is retained in the routing table until deletion time expiry.

The **no timers** and **default timers** commands return the timer values to their default values by removing the **timers** command from *running-config*.

#### Command Mode

Router-RIP Configuration

#### Command Syntax

```
timers update_time expire_time deletion_time
```

```
no timers
```

```
default timers
```

#### Parameters

- *update\_time* Default is 30 seconds
- *expire\_time* Default is 180 seconds.
- *deletion\_time* Default is 120 seconds.

Parameter values are in seconds and range from **5** to **2147483647**.

#### Example

This command sets the update (60 seconds), expiration (90 seconds), and deletion (150 seconds) times.

```
switch(config)#router rip
switch(config-router-rip)#timers 60 90 150
switch(config-router-rip)#
```

## 14.2 Open Shortest Path First – Version 2

Open Shortest Path First (OSPF) is a link-state routing protocol that operates within a single autonomous system. OSPF version 2 is defined by RFC 2328.

This section contains the following topics:

[OSPFv2 Introduction](#)

[OSPFv2 Conceptual Overview](#)

[Configuring OSPFv2](#)

[OSPFv2 Configuration Examples](#)

[OSPFv2 Commands](#)

### 14.2.1 OSPFv2 Introduction

This section contains the following topics:

- 
- [Supported Features](#)
  - [Features Not Supported](#)

#### 14.2.1.1 Features Not Supported

The following OSPFv2 functions are not supported in the current version:

- NBMA, demand circuit, and P2MP interfaces
- OSPFv2 MIB support

#### 14.2.1.2 Supported Features

Arista switches support the following OSPFv2 functions:

- A single OSPFv2 instance
- Intra- and inter-area routing
- Type 1 and 2 external routing
- Broadcast and P2P interfaces
- Stub areas
- Not so stubby areas (NSSA) (RFC 3101)
- MD5 Authentication
- Redistribution of static, IP, and BGP routes into OSPFv2 with route map filtering
- Opaque LSAs (RFC 2370)
- Graceful restart (RFC 3623)

### 14.2.2 OSPFv2 Conceptual Overview

This section contains the following topics:

- [Storing Link States](#)
- [Topology](#)
- [Link Updates](#)

#### 14.2.2.1 Storing Link States

OSPFv2 is a dynamic, link-state routing protocol, where links represent interfaces or routable paths. Dynamic routing protocols calculate the most efficient path between locations based on bandwidth and device status.

A link state advertisement (LSA) is an OSPFv2 packet that communicates a router's topology to other routers. The link state database (LSDB) stores an areas topology database and is composed of LSAs received from other routers. Routers update the LSDB by storing LSAs from other routers.

#### 14.2.2.2 Topology

An autonomous system (AS) is the IP domain within which a dynamic protocol controls the routing of traffic. In OSPFv2, an AS is composed of areas, which define the LSDB computation boundaries. All routers in an area store identical LSDBs. Routers in different areas exchange updates without storing the entire database, reducing information maintenance on large, dynamic networks.

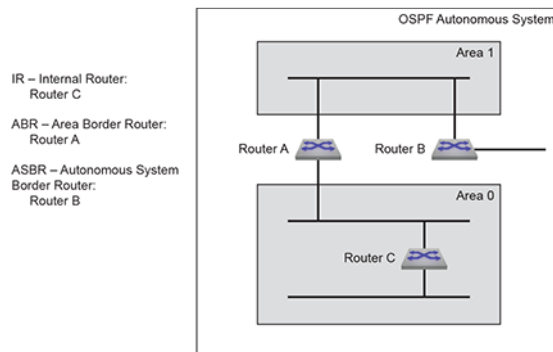

An AS shares internal routing information from its areas and external routing information from other processes to inform routers outside the AS about routes the network can access. Routers that advertise routes on other ASs commit to carry data to the IP space on the route.

OSPFv2 defines these routers:

- Internal router (IR) a router whose interfaces are contained in a single area. All IRs in an area maintain identical LSDBs.

- Area border router (ABR) a router that has interfaces in multiple areas. ABRs maintain one LSDB for each connected area.
- Autonomous system boundary router (ASBR) a gateway router connecting the OSPFv2 domain to external routes, including static routes and routes from other autonomous systems.

[OSPFv2 Router Types](#) displays the OSPFv2 router types.

**Figure 31: OSPFv2 Router Types**

OSPFv2 areas are assigned a number between 0 and 4,294,967,295 (2<sup>32</sup> - 1). Area numbers are often expressed in dotted decimal notation, similar to IP addresses.

Each AS has a backbone area, designated as area 0, that connects to all other areas. The backbone receives routing information from all areas, then distributes it to the other areas as required.

OSPFv2 area types include:

- Normal area accepts intra-area, inter-area, and external routes. The backbone is a normal area.
- Stub area does not receive router advertisements external to the AS. Stub area routing is based on a default route.
- Not-so-stubby-area (NSSA) may import external routes from an ASBR, does not receive external routes from the backbone, and does not propagate external routes to other areas.

### 14.2.2.3 Link Updates

Routers periodically send hello packets to advertise status and establish neighbors. A router's hello packet includes IP addresses of other routers from which it received a hello packet within the time specified by the router dead interval. Routers become neighbors when they detect each other in their hello packets if they:

- share a common network segment.
- are in the same area.
- have the same hello interval, dead interval, and authentication parameters.

Neighbors form adjacencies to exchange LSDB information. A neighbor group uses hello packets to elect a Designated Router (DR) and Backup Designated Router (BDR). The DR and BDR become adjacent to all other neighbors, including each other. Only adjacent neighbors share database information.

[OSPFv2 Neighbors](#) illustrates OSPFv2 neighbors.

If Routers A, B, and C have the same Hello interval, Dead interval, and authentication parameters, then

Area 1 – Router A and Router B are neighbors.

Area 0 – Router A, Router B, and Router C are neighbors.

Area 2 – Router C has no neighbors.

**Figure 32: OSPFv2 Neighbors**

The DR is the central contact for database exchanges. Switches send database information to their DR, which relays the information to the other neighbors. All routers in an area maintain identical LSDBs. Switches also send database information to their BDR, which stores this data without distributing it. If the DR fails, the BDR distributes LSDB information to its neighbors.

OSPFv2 routers distribute LSAs by sending them on all of their active interfaces. The router will generate an LSA for a network defined and active on a passive interface but will not transmit this LSA on the passive interface as no adjacencies are formed.

When a router's LSDB is changed by an LSA, it sends the changes to the DR and BDR for distribution to the other neighbors. Routing information is updated only when the topology changes.

Routers use Dijkstra's algorithm to calculate the shortest path to all known destinations, based on cumulative route cost. The cost of an interface indicates the transmission overhead and is usually inversely proportional to its bandwidth.

### 14.2.3 Configuring OSPFv2

These sections describe basic OSPFv2 configuration steps:

- [Configuring the OSPFv2 Instance](#)
- [Configuring OSPFv2 Areas](#)
- [Configuring Interfaces for OSPFv2](#)
- [Enabling OSPFv2](#)
- [Displaying OSPFv2 Status](#)

#### 14.2.3.1 Configuring the OSPFv2 Instance

##### 14.2.3.1.1 Entering OSPFv2 Configuration Mode

The `router ospf` command places the switch in router-ospf configuration mode and creates an OSPFv2 instance if one was not previously created. The switch only supports one OSPFv2 instance and all OSPFv2 configuration commands apply to this instance.

When an OSPFv2 instance is already configured, the command must specify its process ID. Any attempt to define additional instances will fail and generate errors.

The process ID is local to the router and is used to identify the running OSPFv2 process. Neighbor OSPFv2 routers can have different process ID's.

#### Example

This command places the switch in router-ospf configuration mode and, if not previously created, creates an OSPFv2 instance with a process ID of 100.

```
switch(config) #router ospf 100
switch(config-router-ospf) #
```

#### 14.2.3.1.2 Defining the Router ID

The router ID is a 32-bit number assigned to a router running OSPFv2. This number uniquely labels the router within an Autonomous System. Status commands identify the switch through the router ID.

The switch sets the router ID to the first available alternative in the following list:

1. The `router-id` command.
2. The loopback IP address, if a loopback interface is active on the switch.
3. The highest IP address on the router.

 **Note:** When configuring VXLAN on an MLAG, always manually configure the OSPFv2 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The `router-id (OSPFv2)` command configures the router ID for an OSPFv2 instance.

#### Example

This command assigns 10.1.1.1 as the OSPFv2 router ID.

```
switch(config-router-ospf) #router-id 10.1.1.1
switch(config-router-ospf) #
```

#### 14.2.3.1.3 Global OSPFv2 Parameters

These router-ospf configuration mode commands define OSPFv2 behavior.

##### LSA Overload

The `max-lsa (OSPFv2)` command specifies the maximum number of LSAs allowed in an LSDB database and configures the switch behavior when the limit is approached or exceeded. An LSA overload condition triggers these actions:

- **Warning:** the switch logs OSPF MAXLSAWARNING if the LSDB contains a specified percentage of the LSA maximum.
- **Temporary shutdown:** when the LSDB exceeds the LSA maximum, OSPFv2 is disabled and does not accept or acknowledge new LSAs. The switch re-starts OSPFv2 after a specified period (the default is five minutes).
- **Permanent shutdown:** the switch permanently disables OSPFv2 after performing a specified number of temporary shutdowns (the default is five). This state usually indicates the need to resolve a network condition that consistently generates excessive LSA packets.

OSPFv2 is re-enabled with a `router ospf` command.

The LSDB size restriction is removed by setting the LSA limit to zero.

 **Note:** if OSPFv2 has entered permanent shutdown, it can also be restarted by increasing the LSA limit to a value larger than the number of LSAs in the database. Setting the max-LSA value to zero will also restart OSPFv2, and will disable overload protection.

#### Example

- This command configures the OSPFv2 maximum LSA count to 20,000 and triggers these actions:
  - The switch logs an OSPF MAXLSAWARNING if the LSDB has 8,000 LSAs (40% of 20,000).
  - The switch temporarily disables OSPFv2 for 10 minutes if the LSDB contains 20,000 LSAs.

- The switch permanently disables OSPFv2 after four temporary OSPFv2 shutdowns.
- The shutdown counter resets if the LSDB contains less than 20,000 LSAs for 20 minutes.

```
switch(config-router-ospf) #max-lsa 20000 40 ignore-time 10 ignore-count
4 reset-time 20
switch(config-router-ospf) #
```

### Logging Adjacency Changes

The `log-adjacency-changes (OSPFv2)` command configures the switch to log OSPFv2 link-state changes and transitions of OSPFv2 neighbors into the up or down state.

#### Examples

- This command configures the switch to log transitions of OSPFv2 neighbors into the up or down state.

```
switch(config-router-ospf) #log-adjacency-changes
switch(config-router-ospf) #
```

- This command configures the switch to log all OSPFv2 link-state changes.

```
switch(config-router-ospf) #log-adjacency-changes detail
switch(config-router-ospf) #
```

### OSPF RFC Compatibility

RFC 2328 and RFC 1583 specify different methods for calculating summary route metrics. The `compatible (OSPFv2)` command allows the selective disabling of compatibility with RFC 2328.

#### Example

This command sets the OSPF compatibility list with RFC 1583.

```
switch(config) #router ospf 6
switch(config-router-ospf) #compatible rfc1583
switch(config-router-ospf) #
```

### Administrative Distance

The `distance ospf (OSPFv2)` command configures the administrative distance for intra-area, inter-area, or external OSPF routes. To configure the administrative distance for multiple route types, the command must be entered multiple times. Administrative distances compare dynamic routes configured by different protocols. The default administrative distance for all routes is 110.

**Note:** OSPF links will flap if the administrative distance value is adjusted while OSPF is running, whether it is adjusted by entering the `distance ospf` command directly through the CLI or by applying a configuration file that contains the command.

#### Example

This command configures an administrative distance of 95 for OSPFv2 intra-area routes, and will cause links to flap if issued while OSPF is running.

```
switch(config-router-ospf) #distance ospf intra-area 95
switch(config-router-ospf) #
```

## Passive Interfaces

The `passive-interface <interface> (OSPFv2)` command prevents the transmission of hello packets on the specified interface. Passive interfaces drop all adjacencies and do not form new adjacencies. Passive interfaces send LSAs but do not receive them. The router does not send or process OSPFv2 packets received on passive interfaces. The router advertises the passive interface in the router LSA.

The `no passive-interface` command re-enables OSPFv2 processing on the specified interface.

### Examples

- This command configures VLAN 2 as a passive interface.

```
switch(config-router-ospf) #passive-interface vlan 2
switch(config-router-ospf) #
```

- This command configures VLAN 2 as an active interface.

```
switch(config-router-ospf) #no passive-interface vlan 2
switch(config-router-ospf) #
```

## Redistributing Connected Routes

Redistributing connected routes causes the OSPFv2 instance to advertise all connected routes on the switch as external OSPFv2 routes. Connected routes are routes that are established when IPv4 is enabled on an interface.

### Example

The `redistribute (OSPFv2) connected` command converts connected routes to OSPFv2 external routes.

```
switch(config-router-ospf) #redistribute connected
switch(config-router-ospf) #
```

## Redistributing Static Routes

Redistributing static routes causes the OSPFv2 instance to advertise all static routes on the switch as external OSPFv2 routes. The switch does not support redistributing individual static routes.

### Examples

- The `redistribute (OSPFv2) static` command converts the static routes to OSPFv2 external routes.

```
switch(config-router-ospf) #redistribute static
switch(config-router-ospf) #
```

- The `no redistribute (OSPFv2)` command stops the advertising of the static routes as OSPFv2 external routes.

```
switch(config-router-ospf) #no redistribute static
switch(config-router-ospf) #
```

## Filtering Routes with Distribute Lists

An OSPF distribute list uses a route map or prefix list to filter specific routes from incoming OSPF LSAs; this filtering occurs after SPF calculation. The filtered routes are not installed on the switch, but are still included in LSAs sent by the switch. An OSPF router instance can have one distribute list configured.

---

If a prefix list is used, destination prefixes that do not match the prefix list will not be installed. If a route map is used, routes may be filtered based on address, next hop, or metric. OSPF external routes may also be filtered by metric type or tag.

The `distribute-list in` command specifies the filter to be used and applies it to the OSPF instance.

### Example

These commands configure a prefix-list named `dist_list1` in OSPF instance 5 to filter certain routes from incoming OSPF LSAs.

```
switch(config)#router ospf 5
switch(config-router-ospf)#distribute-list prefix-list dist_list1 in
switch(config-router-ospf)#
```

## 14.2.3.2 Configuring OSPFv2 Areas

OSPFv2 areas are configured through area commands. The switch must be in router-ospf configuration mode, as described in [Entering OSPFv2 Configuration Mode](#), to run area commands.

Areas are assigned a 32-bit number that is expressed in decimal or dotted-decimal notation. When an OSPFv2 instance configuration contains multiple areas, the switch only configures areas associated with its interfaces.

### 14.2.3.2.1 Configuring the Area Type

The `area (OSPFv2)` commands specifies the area type, refer [OSPFv2 Commands](#) section for the `area` commands. The switch supports three area types:

- Normal area: Area that accepts intra-area, inter-area, and external routes. The backbone area (area 0) is a normal area.
- Stub area: Area that does not advertise external routes. External routes are reached through a default summary route (0.0.0.0). Networks with no external routes do not require stub areas.
- NSSA (Not So Stubby Area): ASBRs advertise external LSAs directly connected to the area. External routes from other areas are not advertised and are reached through a default summary route.

The default area type is normal.

### Examples

- This command configures area 45 as a stub area.

```
switch(config-router-ospf)#area 45 stub
switch(config-router-ospf)#
```

- This command configures area 10.92.148.17 as an NSSA.

```
switch(config-router-ospf)#area 10.92.148.17 NSSA
switch(config-router-ospf)#
```

### 14.2.3.2.2 Blocking All Summary Routes from Flooding the NSSA

The `area nssa no-summary (OSPFv2)` command configures the router to not import type-3 summary LSAs into the not-so-stubby area (NSSA) and injects a default summary route (0.0.0.0/0) into the NSSA to reach the inter-area prefixes.

### Example

This command directs the device not to import type-3 summary LSAs into the NSSA area and injects a default summary route (0.0.0.0/0) into the NSSA area.

```
switch(config)#router ospf 6
switch(config-router-ospf)#area 1.1.1.1 nssa no-summary
switch(config-router-ospf)#
```

### 14.2.3.2.3 Assigning Network Segments to the Area

#### Assigning Routes to an Area

The **network area (OSPFv2)** command assigns the specified network segment to an OSPFv2 area. The network can be entered in CIDR notation or by an address and wildcard mask.

The switch zeroes the host portion of the specified network address e.g. 1.2.3.4/24 converts to 1.2.3.0/24 and 1.2.3.4/16 converts to 1.2.0.0/16

#### Example

Each of these equivalent commands assign the network segment 10.1.10.0/24 to area 0.

```
switch(config-router-ospf)#network 10.1.10.0 0.0.0.255 area 0
switch(config-router-ospf)#
switch(config-router-ospf)#network 10.1.10.0/24 area 0
switch(config-router-ospf)#
```

In each case, **running-config** stores the command in CIDR (prefix) notation.

#### Summarizing Routes

By default, ABRs create a summary LSA for each route in an area and advertise them to adjacent routers. The **area range (OSPFv2)** command aggregates routing information, allowing the ABR to advertise multiple routes with one LSA. The **area range (OSPFv2)** command can be used to suppress route advertisements.

#### Examples

- Two **network area** command assigns subnets to an area. The **area range (OSPFv2)** command summarizes the addresses, which the ABR advertises in a single LSA.

```
switch(config-router-ospf)#network 10.1.25.80 0.0.0.240 area 5
switch(config-router-ospf)#network 10.1.25.112 0.0.0.240 area 5
switch(config-router-ospf)#area 5 range 10.1.25.64 0.0.0.192
switch(config-router-ospf)#
```

- The **network area** command assigns a subnet to an area, followed by an **area range (OSPFv2)** command that suppresses the advertisement of that subnet.

```
switch(config-router-ospf)#network 10.12.31.0 0.0.0.255 area 5
switch(config-router-ospf)#area 5 range 10.12.31.0 0.0.0.255 not-
advertise
switch(config-router-ospf)#
```

### 14.2.3.2.4 Configuring Area Parameters

These router-ospf configuration mode commands define OSPFv2 behavior in a specified area.

---

## Default Summary Route Cost

The `area default-cost (OSPFv2)` command specifies the cost of the default summary route that ABRs send into a stub area or NSSA. Summary routes, also called inter-area routes, originate in areas different than their destination.

### Example

This command configures a cost of 15 for the default summary route in area 23.

```
switch(config-router-ospf) #area 23 default-cost 15
switch(config-router-ospf) #
```

## Filtering Type 3 LSAs

The `area filter (OSPFv2)` command prevents an area from receiving Type 3 (Summary) LSAs from a specified subnet. Type 3 LSAs are sent by ABRs and contain information about one of its connected areas.

### Example

This command prevents the switch from entering Type 3 LSAs originating from the 10.1.1.2/24 subnet into its area 2 LSDB.

```
switch(config-router-ospf) #area 2 filter 10.1.1.2/24
switch(config-router-ospf) #
```

### 14.2.3.3 Configuring Interfaces for OSPFv2

OSPFv2 interface configuration commands specify transmission parameters for routed ports and SVIs that handle OSPFv2 packets.

#### 14.2.3.3.1 Configuring Authentication

OSPFv2 authenticates packets through passwords configured on VLAN interfaces. Interfaces connecting to the same area can authenticate packets if they have the same key. By default, OSPFv2 does not authenticate packets.

OSPFv2 supports simple password and message digest authentication:

- Simple password authentication: A password is assigned to an area. Interfaces connected to the area can authenticate packets by enabling authentication and specifying the area password.
- Message digest authentication: Each interface is configured with a key (password) and key-id pair. When transmitting a packet, the interface generates a string, using the MD5 algorithm, based on the OSPFv2 packet, key, and key ID, then appends that string to the packet.

Message digest authentication supports uninterrupted transmissions during key changes by allowing each interface to have two keys with different key IDs. When a new key is configured on an interface, the router transmits OSPFv2 packets for both keys. Once the router detects that all neighbors are using the new key, it stops sending the old one.

Implementing authentication on an interface is a two step process:

1. Enabling authentication.
2. Configuring a key (password).

To configure simple authentication on a VLAN interface:

1. Enable simple authentication with the `ip ospf authentication` command.

```
switch(config-if-vl12) #ip ospf authentication
```

2. Configure the password with the `ip ospf authentication-key` command.

```
switch(config-if-vl12)#ip ospf authentication-key 0 code123
```

The **running-config** stores the password as an encrypted string, using a proprietary algorithm. To configure Message-Digest authentication on a VLAN interface:

1. Enable Message-Digest authentication with the `ip ospf authentication message-digest` command.

```
switch(config-if-vl12)#ip ospf authentication message-digest
```

2. Configure the key ID and password with the `ip ospf message-digest-key` command.

```
switch(config-if-vl12)#ip ospf message-digest-key 23 md5 0 code123
```

The **running-config** stores the password as an encrypted string, using a proprietary algorithm. The key ID (23) is between keywords **message-digest-key** and **md5**.

### 14.2.3.3.2 Configuring Intervals

Interval configuration commands determine OSPFv2 packet transmission characteristics for the specified VLAN interface and are entered in interface-vlan configuration mode.

#### Hello Interval

The hello interval specifies the period between consecutive hello packet transmissions from an interface. Each OSPFv2 neighbor should specify the same hello interval, which should not be longer than any neighbors dead interval.

The `ip ospf hello-interval` command configures the hello interval for the configuration mode interface. The default is 10 seconds.

#### Example

This command configures a hello interval of 30 seconds for VLAN 2.

```
switch(config-if-Vl2)#ip ospf hello-interval 30
switch(config-if-Vl2)#
```

#### Dead Interval

The dead interval specifies the period that an interface waits for an OSPFv2 packet from a neighbor before it disables the adjacency under the assumption that the neighbor is down. The dead interval should be configured identically on all OSPFv2 neighbors and be longer than the hello interval of any neighbor.

The `ip ospf dead-interval` command configures the dead interval for the configuration mode interface. The default is 40 seconds.

#### Example

This command configures a dead interval of 120 seconds for VLAN 4.

```
switch(config-if-Vl4)#ip ospf dead-interval 120
switch(config-if-Vl4)#
```

---

### Retransmit Interval

Routers that send OSPFv2 advertisements to an adjacent router expect to receive an acknowledgment from that neighbor. Routers that do not receive an acknowledgment will retransmit the advertisement. The retransmit interval specifies the period between retransmissions.

The `ip ospf retransmit-interval` command configures the LSA retransmission interval for the configuration mode interface. The default retransmit interval is 5 seconds.

#### Example

This command configures a retransmit interval of 15 seconds for VLAN 3.

```
switch(config-if-V13) #ip ospf retransmit-interval 15
switch(config-if-V13) #
```

### Transmission Delay

The transmission delay is an estimate of the time that an interface requires to transmit a link-state update packet. OSPFv2 adds this delay to the age of outbound packets to more accurately reflect the age of the LSA when received by a neighbor. The default transmission delay is one second.

The `ip ospf transmit-delay` command configures the transmission delay for the configuration mode interface.

#### Example

This command configures a transmission delay of 5 seconds for VLAN 6.

```
switch(config-if-V16) #ip ospf transmit-delay 5
switch(config-if-V16) #
```

## 14.2.3.3.3 Configuring Interface Parameters

### Interface Cost

The OSPFv2 interface cost (or metric) reflects the overhead of sending packets across the interface. The cost is typically inversely proportional to the bandwidth of the interface. The default cost is 10.

The `ip ospf cost` command configures the OSPFv2 cost for the configuration mode interface.

#### Example

This command configures a cost of 15 for VLAN 2.

```
switch(config-if-V12) #ip ospf cost 15
switch(config-if-V12) #
```

### Router Priority

Router priority determines preference during designated router (DR) and backup designated router (BDR) elections. Routers with higher priority numbers have preference over other routers. Routers with a priority of zero cannot be elected as a DR or BDR.

The `ip ospf priority` command configures router priority for the configuration mode interface. The default priority is 1.

#### Examples

- This command configures a router priority of 15 for VLAN 8.

```
switch(config-if-V18) #ip ospf priority 15
```

```
switch(config-if-Vl8) #
```

- This command restores the router priority of 1 for VLAN 7.

```
switch(config-if-Vl7) #no ip ospf priority
switch(config-if-Vl7) #
```

### 14.2.3.4 Enabling OSPFv2

#### 14.2.3.4.1 Disabling OSPFv2

The switch can disable OSPFv2 operations without disrupting the OSPFv2 configuration.

- **shutdown (OSPFv2)** disables all OSPFv2 activity.
- **ip ospf disabled** disables OSPFv2 activity on a VLAN interface.

The **no shutdown** and **no ip ospf disabled** commands resume OSPFv2 activity.

#### Examples

- This command disables OSPFv2 activity on the switch.

```
switch(config-router-ospf) #shutdown
switch(config-router-ospf) #
```

- This command resumes OSPFv2 activity on the switch.

```
switch(config-router-ospf) #no shutdown
switch(config-router-ospf) #
```

- This command disables OSPFv2 activity on VLAN 5.

```
switch(config-if-Vl5) #ip ospf disabled
switch(config-if-Vl5) #
```

#### 14.2.3.4.2 IPv4 Routing

OSPFv2 requires that IPv4 routing is enabled on the switch. When IP routing is not enabled, entering OSPFv2 configuration mode generates a message.

#### Examples

- This message is displayed if, when entering router-ospf configuration mode, IP routing is not enabled.

```
switch(config) #router ospf 100
! IP routing not enabled
switch(config-router-ospf) #
```

- This command enables IP routing on the switch.

```
switch(config) #ip routing
switch(config) #
```

#### 14.2.3.5 Displaying OSPFv2 Status

This section describes OSPFv2 **show** commands that display OSPFv2 status. General switch methods that provide OSPFv2 information include pinging routes, viewing route status (**show ip route** command), and viewing the configuration (**show running-config** command).

---

### 14.2.3.5.1 OSPFv2 Summary

The `show ip ospf` command displays general OSPFv2 configuration information and operational statistics.

#### Example

- This command displays general OSPFv2 information.

```
switch#show ip ospf
Routing Process "ospf 1" with ID 10.168.103.1
Supports opaque LSA
Maximum number of LSA allowed 12000
Threshold for warning message 75%
Ignore-time 5 minutes, reset-time 5 minutes
Ignore-count allowed 5, current 0
It is an area border router
Hold time between two consecutive SPF's 5000 msec
SPF algorithm last executed 00:00:09 ago
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msec
Number of external LSA 0. Checksum Sum 0x000000
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of LSA 27.
Number of areas in this router is 3. 3 normal 0 stub 0 nssa
Area BACKBONE(0.0.0.0)
Number of interfaces in this area is 2
It is a normal area
Area has no authentication
SPF algorithm executed 153 times
Number of LSA 8. Checksum Sum 0x03e13a
Number of opaque link LSA 0. Checksum Sum 0x000000
Area 0.0.0.2
Number of interfaces in this area is 1
It is a normal area
Area has no authentication
SPF algorithm executed 153 times
Number of LSA 11. Checksum Sum 0x054e57
Number of opaque link LSA 0. Checksum Sum 0x000000
Area 0.0.0.3
Number of interfaces in this area is 1
It is a normal area
Area has no authentication
SPF algorithm executed 5 times
Number of LSA 6. Checksum Sum 0x02a401
Number of opaque link LSA 0. Checksum Sum 0x000000
```

The output lists configuration parameters and operational statistics and status for the OSPFv2 instance, followed by a brief description of the areas located on the switch.

### 14.2.3.5.2 Viewing OSPFv2 on the Interfaces

The `show ip ospf interface` command displays OSPFv2 information for switch interfaces configured for OSPFv2. Different command options allow the display of either all interfaces or a specified interface. The command can also be configured to display complete information or a brief summary.

#### Examples

- This command displays complete OSPFv2 information for VLAN 1.

```
switch#show ip ospf interface vlan 1
Vlan1 is up, line protocol is up (connected)
```

```

Internet Address 10.168.0.1/24, Area 0.0.0.0
Process ID 1, Router ID 10.168.103.1, Network Type BROADCAST, Cost: 10
Transmit Delay is 1 sec, State BDR, Priority 1
Designated Router is 10.168.104.2
Backup Designated router is 10.168.103.1
Timer intervals configured, Hello 10, Dead 40, Retransmit 5
Neighbor Count is 1
MTU is 1500
switch#

```

The display indicates the switch is an ABR by displaying a neighbor count, the Designated Router, and Backup Designated Router.

- This command displays a summary of interface information for the switch.

```

switch#show ip ospf interface brief
InterfacePIDAreaIP AddressCostStateNbrs
Loopback010.0.0.010.168.103.1/2410DR0
Vlan110.0.0.010.168.0.1/2410BDR1
Vlan210.0.0.210.168.2.1/2410BDR1
Vlan310.0.0.310.168.3.1/2410DR0
switch#

```

Configuration information includes the Process ID (PID), area, IP address, and cost. OSPFv2 operational information includes the Designated Router status and number of neighbors.

### 14.2.3.5.3 Viewing the OSPFv2 Database

The `show ip ospf database <link state list>` command displays the LSAs in the LSDB for the specified area. If no area is listed, the command displays the contents of the database for each area on the switch. The database command provides options to display subsets of the LSDB database, a summary of database contents, and the link states that comprise the database.

#### Examples

- This command displays LSDB contents for area 2.

```

switch#show ip ospf 1 2 database

OSPF Router with ID(10.168.103.1) (Process ID 1)

switch#
```

#### 14.2.3.5.4 Viewing OSPFv2 Neighbors

The `show ip ospf neighbor` command displays information about the routers that are neighbors to the switch. Command options allow the display of summary or detailed information about the neighbors for all areas and interfaces on the switch. The command also allows the display of neighbors for individual interfaces or areas. The *adjacency-changes* option displays the interfaces adjacency changes.

##### Examples

- This command displays the switch's neighbors.

```
switch#show ip ospf neighbor
Neighbor ID Pri State Dead Time Address Interface
10.168.104.21 FULL/DR 00:00:35 10.168.0.2 Vlan1
10.168.104.28 FULL/BDR 00:00:31 10.168.2.2 Vlan2
switch#
```

- This command displays details about the neighbors to VLAN 2.

```
switch#show ip ospf neighbor vlan 2 detail
Neighbor 10.168.104.2, interface address 10.168.2.2
In the area 0.0.0.2 via interface Vlan2
Neighbor priority is 8, State is FULL, 13 state changes
Adjacency was established 00:01:25:48 ago
DR is 10.168.2.1 BDR is 10.168.2.2
Options is E
Dead timer due in 00:00:34
switch#
```

- This command displays the adjacency changes to VLAN 2.

```
switch#show ip ospf neighbor vlan 2 adjacency-changes
[08-04 08:55:32] 10.168.104.2, interface Vlan2 adjacency established
[08-04 09:58:51] 10.168.104.2, interface Vlan2 adjacency dropped:
interface went
down
[08-04 09:58:58] 10.168.104.2, interface Vlan2 adjacency established
[08-04 09:59:34] 10.168.104.2, interface Vlan2 adjacency dropped:
interface went
down
[08-04 09:59:42] 10.168.104.2, interface Vlan2 adjacency established
[08-04 10:01:40] 10.168.104.2, interface Vlan2 adjacency dropped: nbr
did not
list our router ID
[08-04 10:01:46] 10.168.104.2, interface Vlan2 adjacency established
switch#
```

The `show ip ospf neighbor state` command displays the state information for OSPF neighbors on a per-interface basis.

## Example

This command displays OSPF information for neighboring routers that are fully adjacent.

```
switch#show ip ospf neighbor state full
Neighbor ID      VRF    Pri  State          Dead Time   Address        Interface
Test1            default 1    FULL/BDR       00:00:35   10.17.254.105  Vlan3912
Test2            default 1    FULL/BDR       00:00:36   10.17.254.29   Vlan3910
Test3 default      1    FULL/DR        00:00:35   10.25.0.1      Vlan101
Test4            default 1    FULL/DROTHER   00:00:36   10.17.254.67   Vlan3908
Test5            default 1    FULL/DROTHER   00:00:36   10.17.254.68   Vlan3908
Test6            default 1    FULL/BDR       00:00:32   10.17.254.66   Vlan3908
Test7            default 1    FULL/DROTHER   00:00:34   10.17.36.4     Vlan3036
Test8            default 1    FULL/BDR       00:00:35   10.17.36.3     Vlan3036
Test9            default 1    FULL/DROTHER   00:00:31   10.17.254.13   Vlan3902
Test10           default 1    FULL/BDR       00:00:37   10.17.254.11   Vlan3902
Test11           default 1    FULL/DROTHER   00:00:33   10.17.254.163  Vlan3925
Test12           default 1    FULL/DR        00:00:37   10.17.254.161  Vlan3925
Test13           default 1    FULL/DROTHER   00:00:31   10.17.254.154  Vlan3923
Test14           default 1    FULL/BDR       00:00:39   10.17.254.156  Vlan3923
Test15           default 1    FULL/DROTHER   00:00:33   10.17.254.35   Vlan3911
Test16           default 1    FULL/DR        00:00:34   10.17.254.33   Vlan3911
Test17 default      1    FULL/DR        00:00:36   10.17.254.138  Ethernet12
Test18           default 1    FULL/DR        00:00:37   10.17.254.2    Vlan3901
switch>
```

The `show ip ospf neighbor summary` command displays a single line of summary information for each OSPFv2 neighbor.

## Example

This command displays the summary information for the OSPFv2 neighbors.

```
switch#show ip ospf neighbor summary
OSPF Router with (Process ID 1) (VRF default)
0 neighbors are in state DOWN
0 neighbors are in state GRACEFUL RESTART
2 neighbors are in state INIT
0 neighbors are in state LOADING
0 neighbors are in state ATTEMPT
18 neighbors are in state FULL
0 neighbors are in state EXCHANGE
0 neighbors are in state 2 WAYS
0 neighbors are in state EXCH START
switch>
```

### 14.2.3.5.5 Viewing OSPFv2 Routes

The `show ip routes` command provides an OSPFv2 option.

## Examples

- This command displays all of a switch's routes.

```
switch#show ip route
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP

Gateway of last resort:
S0.0.0.0/0 [1/0] via 10.255.255.1
C10.255.255.0/24 is directly connected, Management1
C10.168.0.0/24 is directly connected, Vlan1
C10.168.2.0/24 is directly connected, Vlan2
O10.168.3.0/24 [110/20] via 10.168.0.1
O10.168.103.0/24 [110/20] via 10.168.0.1
C10.168.104.0/24 is directly connected, Loopback0
switch#
```

- This command displays the switches OSPFv2 routes.

```
switch#show ip route ospf
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP

O10.168.3.0/24 [110/20] via 10.168.0.1
O10.168.103.0/24 [110/20] via 10.168.0.1
switch#
```

Use the **ping** command to determine the accessibility of a route.

### Example

This command pings an OSPFv2 route.

```
switch#ping 10.168.0.1
PING 10.168.0.1 (10.168.0.1) 72(100) bytes of data.
 80 bytes from 10.168.0.1: icmp_seq=1 ttl=64 time=0.148 ms
 80 bytes from 10.168.0.1: icmp_seq=2 ttl=64 time=0.132 ms
 80 bytes from 10.168.0.1: icmp_seq=3 ttl=64 time=0.136 ms
 80 bytes from 10.168.0.1: icmp_seq=4 ttl=64 time=0.137 ms
 80 bytes from 10.168.0.1: icmp_seq=5 ttl=64 time=0.136 ms

--- 10.168.0.1 ping statistics ---
 5 packets transmitted, 5 received, 0% packet loss, time 7999ms
 rtt min/avg/max/mdev = 0.132/0.137/0.148/0.015 ms
switch#
```

#### 14.2.3.5.6 Viewing OSPFv2 SPF Logs

The **show ip ospf spf-log** command displays when and how long the switch took to run a full SPF calculation for OSPF.

### Example

This command displays the SPF information for OSPF.

```
switch#show ip ospf spf-log
OSPF Process 172.26.0.22
When      Duration(msec)
13:01:34  1.482
13:01:29  1.547
13:01:24  1.893
13:00:50  1.459
13:00:45  1.473
13:00:40  2.603
11:01:49  1.561
11:01:40  1.463
11:01:35  1.467
11:01:30  1.434
11:00:54  1.456
11:00:49  1.472
11:00:44  1.582
15:01:49  1.575
15:01:44  1.470
15:01:39  1.679
15:01:34  1.601
15:00:57  1.454
15:00:52  1.446
15:00:47  1.603
switch>
```

## 14.2.4 OSPFv2 Configuration Examples

This section describes the commands required to configure three OSPFv2 topologies.

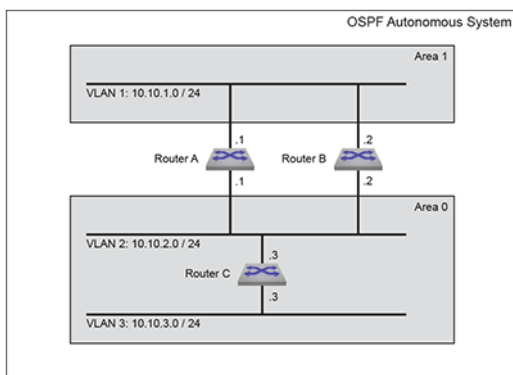

- [OSPFv2 Configuration Example 1](#)
- [OSPFv2 Configuration Example 2](#)
- [OSPFv2 Configuration Example 3](#)

### 14.2.4.1 OSPFv2 Configuration Example 1

The OSPF Autonomous System in example 1 contains two areas that are connected through two routers. The backbone area also contains an internal router that connects two subnets.

#### 14.2.4.1.1 Example 1 Topology

[OSPFv2 Example 1](#) displays the Example 1 topology. Two ABRs connect area 0 and area 1 Router A and Router B. Router C is an internal router that connects two subnets in area 0.

**Figure 33: OSPFv2 Example 1**

#### Area 1 Configuration

Area 1 contains one subnet that is accessed by Router A and Router B.

- Router A: The subnet 10.10.1.0/24 is accessed through VLAN 1.
- Router B: The subnet 10.10.1.0/24 is accessed through VLAN 1.
- Each router uses simple authentication, with password abcdefgh.
- Designated Router (DR): Router A.
- Backup Designated Router (BDR): Router B.
- Each router defines an interface cost of 10.
- Router priority is not specified for either router on area 1.

#### Area 0 ABR Configuration

Area 0 contains one subnet that is accessed by ABRs Router A and Router B.

- Router A: The subnet 10.10.2.0/24 is accessed through VLAN 2.
- Router B: The subnet 10.10.2.0/24 is accessed through VLAN 2.
- Designated Router (DR): Router B.
- Backup Designated Router (BDR): Router A.
- Each router uses simple authentication, with password ijklmnop.
- Each router defines an interface cost of 20.
- Each router defines a retransmit-interval of 10.
- Each router defines a transmit-delay of 2.
- Router priority is specified such that Router B will be elected as the Designated Router.

## Area 0 IR Configuration

Area 0 contains one internal router that connects two subnets.

- Router C: The subnet 10.10.2.0/24 is accessed through VLAN 2.
- Router C: The subnet 10.10.3.0/24 is accessed through VLAN 3.
- The subnet 10.10.2.0/24 link is configured as follows:
  - Interface cost of 20.
  - Retransmit-interval of 10.
  - Transmit-delay of 2.
- The subnet 10.10.3.0/24 link is configured as follows:
  - Interface cost of 20.
  - Dead interval of 80 seconds.

### 14.2.4.1.2 Example 1 Code

This code configures the OSPFv2 instances on the three switches.

#### 1. Configure the interface addresses.

##### a. Router A interfaces:

```
switch-A(config)#interface vlan 1
switch-A(config-if-vl1)#ip address 10.10.1.1/24
switch-A(config-if-vl1)#interface vlan 2
switch-A(config-if-vl2)#ip address 10.10.2.1/24
```

##### b. Router B interfaces:

```
switch-B(config)#interface vlan 1
switch-B(config-if-vl1)#ip address 10.10.1.2/24
switch-B(config-if-vl1)#interface vlan 2
switch-B(config-if-vl2)#ip address 10.10.2.2/24
```

##### c. Router C interfaces:

```
switch-C(config)#interface vlan 2
switch-C(config-if-vl2)#ip address 10.10.2.3/24
switch-C(config-if-vl2)#interface vlan 3
switch-C(config-if-vl3)#ip address 10.10.3.3/24
```

#### 2. Configure the interface OSPFv2 parameters.

##### a. Router A interfaces:

```
switch-A(config-if-vl2)#interface vlan 1
switch-A(config-if-vl1)#ip ospf authentication-key abcdefgh
switch-A(config-if-vl1)#ip ospf cost 10
switch-A(config-if-vl1)#ip ospf priority 6
switch-A(config-if-vl1)#interface vlan 2
switch-A(config-if-vl2)#ip ospf authentication-key ijklmnop
switch-A(config-if-vl2)#ip ospf cost 20
switch-A(config-if-vl2)#ip ospf retransmit-interval 10
switch-A(config-if-vl2)#ip ospf transmit-delay 2
switch-A(config-if-vl2)#ip ospf priority 4
```

##### b. Router B interfaces:

```
switch-B(config-if-vl2)#interface vlan 1
switch-B(config-if-vl1)#ip ospf authentication-key abcdefgh
```

```
switch-B(config-if-vl1)#ip ospf cost 10
switch-B(config-if-vl1)#ip ospf priority 4
switch-B(config-if-vl1)#interface vlan 2
switch-B(config-if-vl2)#ip ospf authentication-key ijklmnop
switch-B(config-if-vl2)#ip ospf cost 20
switch-B(config-if-vl2)#ip ospf retransmit-interval 10
switch-B(config-if-vl2)#ip ospf transmit-delay 2
switch-B(config-if-vl2)#ip ospf priority 6
```

c. Router C interfaces:

```
switch-C(config-if-vl3)#interface vlan 2
switch-C(config-if-vl2)#ip ospf cost 20
switch-C(config-if-vl2)#ip ospf retransmit-interval 10
switch-C(config-if-vl2)#ip ospf transmit-delay 2
switch-C(config-if-vl2)#interface vlan 3
switch-C(config-if-vl3)#ip ospf cost 20
switch-C(config-if-vl3)#ip ospf dead-interval 80
```

3. Attach the network segments to the areas.

a. Router A interfaces:

```
switch-A(config-if-vl2)#router ospf 1
switch-A(config-router-ospf)#router-id 169.10.0.1
switch-A(config-router-ospf)#network 10.10.1.0/24 area 1
switch-A(config-router-ospf)#network 10.10.2.0/24 area 0
```

b. Router B interfaces:

```
switch-B(config-if-vl2)#router ospf 1
switch-B(config-router-ospf)#router-id 169.10.0.2
switch-B(config-router-ospf)#network 10.10.1.0/24 area 1
switch-B(config-router-ospf)#network 10.10.2.0/24 area 0
```

c. Router C interfaces:

```
switch-C(config-if-vl3)#router ospf 1
switch-C(config-router-ospf)#router-id 169.10.0.3
switch-C(config-router-ospf)#network 10.10.2.0/24 area 0
switch-C(config-router-ospf)#network 10.10.3.0/24 area 0
```

#### 14.2.4.2 OSPFv2 Configuration Example 2

The AS in example 2 contains three areas. Area 0 connects to the other areas through different routers. The backbone area contains an internal router that connects two subnets. Area 0 is normal; the other areas are stub areas.

##### 14.2.4.2.1 Example 2 Topology

[OSPFv2 Example 2](#) displays the Example 2 topology. One ABR (Router B) connects area 0 and area 10.42.110.0; another ABR (router C) connects area 0 and area 36.56.0.0. Router A is an internal router that connects two subnets in area 0.

**Figure 34: OSPFv2 Example 2**

#### Area 10.42.110.0 Configuration

Area 10.42.110.0 contains one subnet that is accessed by Router B.

- Router B: The subnet 10.42.110.0 is accessed through VLAN 15.
- Router B uses simple authentication, with password abcdefgh.
- Each router defines a interface cost of 10.

#### Area 10.56.0.0 Configuration

Area 10.56.0.0 contains one subnet that is accessed by Router C.

- Router C: The subnet 10.56.0.0 is accessed through VLAN 21.
- Router C uses simple authentication, with password ijklmnop.
- Each router defines a interface cost of 20.

#### Area 0 ABR Configuration

Area 0 contains two subnets. ABR Router B connects one subnet to area 10.42.110.0. ABR Router C connects the other subnet to area 10.56.0.0.

- Router B: The subnet 10.119.254.0/24 is accessed through VLAN 16.
- Router C: The subnet 10.119.251.0/24 is accessed through VLAN 20.
- Designated Router (DR): Router B.
- Backup Designated Router (BDR): Router C.
- Each ABR uses simple authentication, with password ijklmnop
- Each router defines an interface cost of 20.
- Each router defines a retransmit-interval of 10.
- Each router defines a transmit-delay of 2.

---

## Area 0 IR Configuration

Area 0 contains two subnets connected by an internal router.

- Router A: The subnet 10.119.254.0/24 is accessed through VLAN 16.
- Router A: The subnet 10.119.251.0/24 is accessed through VLAN 20.
- The subnet 10.42.110.0 is configured as follows:
  - Interface cost of 10.
- The subnet 10.56.0.0/24 is configured as follows:
  - Interface cost of 20.
  - Retransmit-interval of 10.
  - Transmit-delay of 2.

### 14.2.4.2.2 Example 2 Code

#### 1. Configure the interface addresses.

##### a. Router A interfaces:

```
switch-A(config)#interface vlan 16
switch-A(config-if-vl16)#ip address 10.119.254.2/24
switch-A(config-if-vl16)#interface vlan 20
switch-A(config-if-vl20)#ip address 10.119.251.1/24
```

##### b. Router B interfaces:

```
switch-B(config)#interface vlan 15
switch-B(config-if-vl15)#ip address 10.42.110.1/24
switch-B(config-if-vl15)#interface vlan 16
switch-B(config-if-vl16)#ip address 10.119.254.1/24
```

##### c. Router C interfaces:

```
switch-C(config)#interface vlan 20
switch-C(config-if-vl20)#ip address 10.119.251.2/24
switch-C(config-if-vl20)#interface vlan 21
switch-C(config-if-vl21)#ip address 10.56.0.1/24
```

#### 2. Configure the interface OSPFv2 parameters.

##### a. Router A interfaces:

```
switch-A(config-if-vl20)#interface vlan 16
switch-A(config-if-vl16)#ip ospf cost 10
switch-A(config-if-vl16)#interface vlan 20
switch-A(config-if-vl20)#ip ospf cost 20
switch-A(config-if-vl20)#ip ospf retransmit-interval 10
switch-A(config-if-vl20)#ip ospf transmit-delay 2
```

##### b. Router B interfaces:

```
switch-B(config-if-vl16)#interface vlan 15
switch-B(config-if-vl15)#ip ospf authentication-key abcdefgh
switch-B(config-if-vl15)#ip ospf cost 10
switch-B(config-if-vl15)#interface vlan 16
switch-B(config-if-vl16)#ip ospf authentication-key ijklmnop
switch-B(config-if-vl16)#ip ospf cost 20
switch-B(config-if-vl16)#ip ospf retransmit-interval 10
switch-B(config-if-vl16)#ip ospf transmit-delay 2
switch-B(config-if-vl16)#ip ospf priority 6
```

## c. Router C interfaces:

```
switch-C(config-if-vl21)#interface vlan 20
switch-C(config-if-vl20)#ip ospf authentication-key ijklmnop
switch-C(config-if-vl20)#ip ospf cost 20
switch-C(config-if-vl20)#ip ospf retransmit-interval 10
switch-C(config-if-vl20)#ip ospf transmit-delay 2
switch-C(config-if-vl20)#ip ospf priority 4
switch-C(config-if-vl20)#interface vlan 21
switch-C(config-if-vl21)#ip ospf authentication-key ijklmnop
switch-C(config-if-vl21)#ip ospf cost 20
switch-C(config-if-vl21)#ip ospf dead-interval 80
```

## 3. Attach the network segments to the areas.

## a. Router A interfaces:

```
switch-A(config-if-vl20)#router ospf 1
switch-A(config-router-ospf)#router-id 10.24.1.1
switch-A(config-router-ospf)#network 10.119.254.0/24 area 0
switch-A(config-router-ospf)#network 10.119.251.0/24 area 0
switch-A(config-router-ospf)#area 0 range 10.119.251.0 0.0.7.255
```

## b. Router B interfaces:

```
switch-B(config-if-vl16)#router ospf 1
switch-B(config-router-ospf)#router-id 10.24.1.2
switch-B(config-router-ospf)#area 10.42.110.0 stub
switch-B(config-router-ospf)#network 10.42.110.0/24 area 10.42.110.0
switch-B(config-router-ospf)#network 10.119.254.0/24 area 0
```

## c. Router C interfaces:

```
switch-C(config-if-vl21)#router ospf 1
switch-C(config-router-ospf)#router-id 10.24.1.3
switch-C(config-router-ospf)#area 10.56.0.0 stub 0
switch-C(config-router-ospf)#network 10.119.251.0/24 area 0
switch-C(config-router-ospf)#network 10.56.0.0/24 area 36.56.0.0
```

## 14.2.4.3 OSPFv2 Configuration Example 3

The AS in example 3 contains two areas that connect through one ABR.

- Area 0: Backbone area contains two internal routers that connect three subnets, one ASBR, and one ABR that connects to Area 1.
- Area 1: NSSA contains one internal router, one ASBR, and one ABR that connects to the backbone.

## 14.2.4.3.1 Example 3 Topology

**OSPFv2 Example 3** displays the Example 3 topology. One ABR connects area 0 and area 1. Router C is an ABR that connects the areas. Router A is an internal router that connects two subnets in area 1. Router D and Router E are internal routers that connect subnets in area 0. Router B and Router F are ASBRs that connect static routes outside the AS to area 1 and area 0, respectively.

**Figure 35: OSPFv2 Example 3**

### Area 0 ABR Configuration

ABR Router C connects one area 0 subnet to an area 1 subnet.

- Router C: The subnet 10.10.2.0/24 is accessed through VLAN 11.
- Authentication is not configured on the interfaces.
- All interface OSPFv2 parameters are set to their default values.

### Area 0 IR Configuration

Area 0 contains two internal routers, each of which connects two of the three subnets in the area.

- Router D: The subnet 10.10.2.0/24 is accessed through VLAN 11.
- Router D: The subnet 10.10.3.0/24 is accessed through VLAN 12.
- Router E: The subnet 10.10.3.0/24 is accessed through VLAN 12.
- Router E: The subnet 10.10.4.0/24 is accessed through VLAN 13.
- All interface OSPFv2 parameters are set to their default values.

### Area 0 ASBR Configuration

ASBR Router F connects one area 0 subnet to an external subnet.

- Router F: The subnet 10.10.4.0/24 is accessed through VLAN 13.
- Router F: The subnet 12.15.1.0/24 is accessed through VLAN 14.
- All interface OSPFv2 parameters are set to their default values.

### Area 1 ABR Configuration

ABR Router C connects one area 0 subnet to area 1.

- Router C: The subnet 10.10.1.0/24 is accessed through VLAN 10.
- Authentication is not configured on the interface.
- All interface OSPFv2 parameters are set to their default values.

### Area 1 IR Configuration

Area 1 contains one internal router that connects two subnets in the area.

- Router A: The subnet 10.10.1.0/24 is accessed through VLAN 10.
- Router A: The subnet 10.10.5.0/24 is accessed through VLAN 9.
- All interface OSPFv2 parameters are set to their default values.

## Area 1 ASBR Configuration

ASBR Router B connects one area 1 subnet to an external subnet.

- Router B: The subnet 10.10.1.0/24 is accessed through VLAN 10.
- Router B: The subnet 16.29.1.0/24 is accessed through VLAN 15.
- All interface OSPFv2 parameters are set to their default values.

### 14.2.4.3.2 Example 3 Code

#### 1. Configure the interfaces.

##### a. Router A interfaces:

```
switch-A(config)#interface vlan 10
switch-A(config-if-vl10)#ip address 10.10.1.1/24
switch-A(config-if-vl10)#interface vlan 9
switch-A(config-if-vl11)#ip address 10.10.5.1/24
```

##### b. Router B interfaces:

```
switch-B(config)#interface vlan 10
switch-B(config-if-vl10)#ip address 10.10.1.2/24
switch-B(config-if-vl10)#interface vlan 15
switch-B(config-if-vl18)#ip address 16.29.1.1/24
```

##### c. Router C interfaces:

```
switch-C(config)#interface vlan 10
switch-C(config-if-vl10)#ip address 10.10.1.3/24
switch-C(config-if-vl10)#interface vlan 11
switch-C(config-if-vl11)#ip address 10.10.2.2/24
```

##### d. Router D interfaces:

```
switch-D(config)#interface vlan 11
switch-D(config-if-vl11)#ip address 10.10.2.1/24
switch-D(config)#interface vlan 12
switch-D(config-if-vl12)#ip address 10.10.3.1/24
```

##### e. Router E interfaces:

```
switch-E(config)#interface vlan 12
switch-E(config-if-vl12)#ip address 10.10.3.2/24
switch-E(config)#interface vlan 13
switch-E(config-if-vl13)#ip address 10.10.4.1/24
```

##### f. Router F interfaces:

```
switch-F(config)#interface vlan 13
switch-F(config-if-vl13)#ip address 10.10.4.2/24
switch-F(config)#interface vlan 14
switch-F(config-if-vl14)#ip address 12.15.1.1/24
```

#### 2. Attach the network segments to the areas.

##### a. Router A interfaces:

```
switch-A(config-if-vl10)#router ospf 1
switch-A(config-router-ospf)#router-id 170.21.0.1
switch-A(config-router-ospf)#area 1 NSSA
switch-A(config-router-ospf)#network 10.10.1.0/24 area 1
```

---

**b. Router B interfaces:**

```
switch-B(config-if-vl10)#router ospf 1  
switch-B(config-router-ospf)#router-id 170.21.0.2  
switch-B(config-router-ospf)#area 1 NSSA  
switch-B(config-router-ospf)#network 10.10.1.0/24 area 1
```

**c. Router C interfaces:**

```
switch-C(config-if-vl11)#router ospf 1  
switch-C(config-router-ospf)#router-id 170.21.0.3  
switch-C(config-router-ospf)#area 1 NSSA  
switch-C(config-router-ospf)#network 10.10.1.0/24 area 1  
switch-C(config-router-ospf)#network 10.10.2.0/24 area 0
```

**d. Router D interfaces:**

```
switch-D(config-if-vl12)#router ospf 1  
switch-D(config-router-ospf)#router-id 170.21.0.4  
switch-D(config-router-ospf)#network 10.10.2.0/24 area 0  
switch-D(config-router-ospf)#network 10.10.3.0/24 area 0
```

**e. Router E interfaces:**

```
switch-E(config-if-vl13)#router ospf 1  
switch-E(config-router-ospf)#router-id 170.21.0.5  
switch-E(config-router-ospf)#network 10.10.3.0/24 area 0  
switch-E(config-router-ospf)#network 10.10.4.0/24 area 0
```

**f. Router F interfaces:**

```
switch-F(config-if-vl14)#router ospf 1  
switch-F(config-router-ospf)#router-id 170.21.0.6  
switch-F(config-router-ospf)#network 10.10.4.0/24 area 0  
switch-F(config-router-ospf)#redistribute static
```

## 14.2.5 OSPFv2 Commands

### Global Configuration Mode

- `ip ospf router-id output-format hostnames`
- `router ospf`

### Interface Configuration Mode

- `ip ospf area`
- `ip ospf authentication`
- `ip ospf authentication-key`
- `ip ospf cost`
- `ip ospf dead-interval`
- `ip ospf disabled`
- `ip ospf hello-interval`
- `ip ospf message-digest-key`
- `ip ospf network point-to-point`
- `ip ospf priority`
- `ip ospf retransmit-interval`
- `ip ospf transmit-delay`

### Router-OSPFv2 Configuration Mode

- `adjacency exchange-start threshold (OSPFv2)`
- `area default-cost (OSPFv2)`
- `area filter (OSPFv2)`
- `area nssa (OSPFv2)`
- `area nssa default-information-originate (OSPFv2)`
- `area nssa no-summary (OSPFv2)`
- `area not-so-stubby lsa type-7 convert type-5 (OSPFv2)`
- `area range (OSPFv2)`
- `area stub (OSPFv2)`
- `auto-cost reference-bandwidth (OSPFv2)`
- `compatible (OSPFv2)`
- `default-information originate (OSPFv2)`
- `distance ospf (OSPFv2)`
- `dn-bit-ignore (OSPFv2)`
- `log-adjacency-changes (OSPFv2)`
- `max-lsa (OSPFv2)`
- `max-metric router-lsa (OSPFv2)`
- `maximum-paths (OSPFv2)`
- `network area (OSPFv2)`
- `no area (OSPFv2)`
- `passive-interface default (OSPFv2)`
- `passive-interface <interface> (OSPFv2)`
- `point-to-point routes (OSPFv2)`
- `redistribute (OSPFv2)`
- `router-id (OSPFv2)`
- `shutdown (OSPFv2)`
- `summary-address`

- 
- timers lsa rx min interval (OSPFv2)
  - timers lsa tx delay initial (OSPFv2)
  - timers spf delay initial (OSPFv2)

#### **Display and Clear Commands**

- clear ip ospf neighbor
- show ip ospf
- show ip ospf border-routers
- show ip ospf database database-summary
- show ip ospf database <link state list>
- show ip ospf database <link-state details>
- show ip ospf interface
- show ip ospf interface brief
- show ip ospf lsa-log
- show ip ospf neighbor
- show ip ospf neighbor adjacency-changes
- show ip ospf neighbor state
- show ip ospf neighbor summary
- show ip ospf request queue
- show ip ospf retransmission queue
- show ip ospf spf-log

### 14.2.5.1 auto-cost reference-bandwidth (OSPFv2)

The **auto-cost reference-bandwidth** command is a factor in the formula that calculates the default OSPFv2 cost for Ethernet interfaces.

$\text{OSPFv2-cost} = (\text{auto-cost value} * 1 \text{ Mbps}) / \text{interface bandwidth}$

The switch uses a minimum OSPFv2-cost of one. The switch rounds down all non-integer results.

On a 10G Ethernet interface:

- if auto-cost = 100, then OSPFv2-cost = 100 Mbps / 10 Gbps = 0.01, and the default cost is set to 1.
- if auto-cost = 59000, then OSPFv2-cost = 59000 Mbps / 10 Gbps = 5.9, and the default cost is set to 5.

The **no auto-cost reference-bandwidth** and **default auto-cost reference-bandwidth** command removes the **auto-cost reference-bandwidth** command from **running-config**. When this parameter is not set, the default cost for Ethernet interfaces is the default **ip ospf cost** value of 10.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
auto-cost reference-bandwidth rate
no auto-cost reference-bandwidth rate
default auto-cost reference-bandwidth rate
```

#### Parameter

*rate* Values range from 1 to 4294967 . Default is 100.

#### Example

To configure a default cost of 20 on 10G Ethernet interfaces:

1. Calculate the required auto-cost value:  
 $\text{auto-cost} = (\text{OSPFv2-cost} * \text{interface bandwidth}) / 1 \text{ Mbps} = (20 * 10000 \text{ Mbps}) / 1 \text{ Mbps} = 200000$
2. Configure this value as the auto-cost reference-bandwidth.

```
switch(config)#router ospf 6
switch(config-router-ospf)#auto-cost reference-bandwidth 200000
switch(config-router-ospf)#
```

---

### 14.2.5.2 adjacency exchange-start threshold (OSPFv2)

The `adjacency exchange-start threshold` command sets the exchange-start options for an OSPF instance.

The `no adjacency exchange-start threshold` and `default adjacency exchange-start threshold` command resets the default by removing the corresponding a `adjacency exchange-start threshold` command from *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
default adjacency exchange-start threshold
adjacency exchange-start threshold peers
no adjacency exchange-start threshold
```

#### Parameters

*peers* Value ranges from 1 4294967295. Default value is 10.

#### Example

This command sets the adjacency exchange start threshold to 20045623.

```
switch(config)#router ospf 6
switch(config-router-ospf)#adjacency exchange-start threshold 20045623
switch(config-router-ospf)#
```

### 14.2.5.3 area default-cost (OSPFv2)

The `area default-cost` command specifies the cost for the default summary routes sent into a specified area. The default-cost is set to 10.

The `no area default-cost` and `default area default-cost` command resets the default-cost value of the specified area to 10 by removing the corresponding `area default-cost` command from `running-config`. The `no area (OSPFv2)` command removes all area commands for the specified area from `running-config`, including the `area default-cost` command.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
area area_id default-cost def_cost
no area area_id default-cost def_cost
default area area_id default-cost def_cost
```

#### Parameters

- *area\_id* Area number. <0 to 4294967295> or <0.0.0.0 to 255.255.255.255> `running-config` stores value in dotted decimal notation.
- *def\_cost* Value ranges from 1 to 65535. Default value is 10.

#### Example

This command configures a cost of 15 for default summary routes that an ABR sends into area 23.

```
switch(config)#router ospf 6
switch(config-router-ospf)#area 23 default-cost 15
switch(config-router-ospf)#
```

### 14.2.5.4 area filter (OSPFv2)

The `area filter` command prevents an area from receiving Type 3 Summary LSAs from a specified subnet.

The `no area filter` and `default area filter` commands remove the specified `area filter` command from `running-config`. The `no area` command (see [no area \(OSPFv2\)](#)) removes all area commands for the specified area from `running-config`, including `area filter` commands.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
area area_id filter net_addr
no area area_id filter net_addr
default area area_id filter net_addr
```

#### Parameters

- *area\_id* Area number. <0 to 4294967295> or <0.0.0.0 to 255.255.255.255> `running-config` stores value in dotted decimal notation.
- *net\_addr* Network IP address. Entry formats include address-prefix (CIDR) and address-mask. `running-config` stores value in CIDR notation.

#### Example

---

This command prevents the switch from entering Type 3 LSAs originating from the 10.1.1.0/24 subnet into its area 2 LSDB.

```
switch(config)#router ospf 6  
switch(config-router-ospf)#area 2 filter 10.1.1.0/24  
switch(config-router-ospf)#
```

### 14.2.5.5 area not-so-stubby lsa type-7 convert type-5 (OSPFv2)

The `area not-so-stubby lsa type-7 convert type-5` command configures the switch to always translate Type-7 link-state advertisement (LSAs) to Type-5 LSAs.

The `no area not-so-stubby lsa type-7 convert type-5` and `no area not-so-stubby lsa type-7 convert type-5` commands allow LSAs to be translated dynamically by removing the `no area not-so-stubby lsa type-7 convert type-5` command from *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
area area_id not-so-stubby lsa type-7 convert type-5
```

```
no area area_id not-so-stubby lsa type-7 convert type-5
```

```
default area area_id not-so-stubby lsa type-7 convert type-5
```

#### Parameters

- *area\_id* Area number.
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always **normal**.
  - *running-config* stores value in dotted decimal notation.

#### Example

This command configures the switch to always translate Type-7 link-state advertisement (LSAs) to Type-5 LSAs.

```
switch(config-router-ospf) #area 3 not-so-stubby lsa type-7 convert type-5
switch(config-router-ospf) #
```

---

### 14.2.5.6 area nssa (OSPFv2)

The `area nssa` command configures an OSPFv2 area as a not-so-stubby area (NSSA). All routers in an AS must specify the same area type for identically numbered areas.

NSSA ASBRs advertise external LSAs that are part of the area, but do not advertise external LSAs from other areas.

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

The `no area nssa` command configures the specified area as a normal area by removing the specified `area nssa` command from *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
area area_id nssa [TYPE]
```

```
no area area_id nssa [TYPE]
```

```
default area area_id nssa [TYPE]
```

#### Parameters

- *area\_id* All parameters except *area\_id* can be placed in any order.
  - Valid formats: integer <1 to **4294967295**> or dotted decimal <**0.0.0.1** to **255.255.255.255**>
  - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
  - *running-config* stores value in dotted decimal notation.
- TYPE Area type. Values include:
  - <*no parameter*>
  - nssa-only

#### Example

This command configures area 3 as a NSSA area.

```
switch(config-router-ospf) #area 3 nssa nssa-only  
switch(config-router-ospf) #
```

### 14.2.5.7 area nssa default-information-originate (OSPFv2)

The **default area nssa default-information-originate** command sets default route origination for the NSSA, allowing the redistribute policy to advertise a default route if one is present. The resulting OSPF behavior depends on the presence of an installed static default route and on whether static routes are redistributed in OSPF (using the [redistribute \(OSPFv2\)](#) command). The **no area nssa default-information-originate** command disables advertisement of the default route for the NSSA regardless of the redistribute policy. See [Advertisement of Default Route](#) for details.

Areas are **normal** by default; area type configuration is required only for stub and NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

Default route origination is configured differently for different area types and supports three area types:

- Normal areas: advertisement of the default route is configured for all normal areas using the [default-information originate \(OSPFv2\)](#) command.
- Stub areas: the default route is automatically advertised in stub areas and cannot be configured.
- Not So Stubby Areas (NSSAs): advertisement of the default route is configured per area using the [area nssa default-information-originate \(OSPFv2\)](#) or [area nssa no-summary \(OSPFv2\)](#) command.

**Table 65: Advertisement of Default Route**

| Static Default Route Installed | Redistribute Static | Command Form                | Advertise in ABR | Advertise in ASBR |
|--------------------------------|---------------------|-----------------------------|------------------|-------------------|
| no                             | no                  | <b>default</b> or <b>no</b> | no               | no                |
| no                             | no                  | standard                    | yes              | no                |
| no                             | yes                 | <b>default</b>              | yes              | yes               |
| no                             | yes                 | <b>no</b>                   | no               | no                |
| no                             | yes                 | standard                    | yes              | no                |
| yes                            | no                  | <b>default</b> or <b>no</b> | no               | no                |
| yes                            | no                  | standard                    | yes              | yes               |
| yes                            | yes                 | <b>default</b>              | yes              | yes               |
| yes                            | yes                 | <b>no</b>                   | no               | no                |
| yes                            | yes                 | standard                    | yes              | yes               |

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
area area_id nssa default-information-originate [VALUE][TYPE][EXCL]
```

```
no area area_id nssa default-information-originate
```

```
default area area_id nssa default-information-originate
```

#### Parameters

- *area\_id* All parameters except *area\_id* can be placed in any order.

- Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
- Area 0 (or 0.0.0.0) is not configurable; it is always **normal**.
- **running-config** stores value in dotted decimal notation.
- VALUE Values include:
  - <no parameter> Default value of 1.
  - metric <1-65535>
- TYPE Values include:
  - <no parameter>.
  - metric-type <1-2>
- EXCL Values include:
  - <no parameter>.
  - **nssa-only**

### Example

This command configures area 3 as an NSSA and generates a type 7 default LSA within the NSSA.

```
switch(config-router-ospf) #area 3 nssa default-information-originate
nssa-only
switch(config-router-ospf) #
```

#### 14.2.5.8 area nssa no-summary (OSPFv2)

The **area nssa no-summary** command configures the switch stop importing type-3 summary LSAs into the not-so-stubby area and sets the default summary route into the NSSA in order to reach the inter-area prefixes.

The **no area nssa no-summary** and **default area nssa no-summary** commands allow type-3 summary LSAs into the NSSA area.

The **no area nssa** and **default area nssa** commands configure the specified area as a normal area.

### Command Mode

Router-OSPF Configuration

### Command Syntax

```
area area_id nssa no-summary
no area area_id nssa no-summary
default area area_id nssa no-summary
```

### Parameters

- *area\_id* Area number.
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
  - **running-config** stores value in dotted decimal notation.

### Examples

- This command directs the device not to import type-3 summary LSAs into the NSSA area

```
switch(config) #router ospf 6
switch(config-router-ospf) #area 1.1.1.1 nssa no-summary
switch(config-router-ospf) #
```

- This command directs the device to import type-3 summary LSAs into the NSSA area.

```
switch(config)#router ospf 6  
switch(config-router-ospf)#no area 1.1.1.1 nssa no-summary  
switch(config-router-ospf)#
```

---

### 14.2.5.9 area range (OSPFv2)

The **area range** command configures OSPF area border routers (ABRs) to consolidate or summarize routes, to set the cost setting routes, and to suppress summary route advertisements.

The **no area (OSPFv2)** command removes all area commands for the specified area from **running-config**.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
area area_id range net_addr [ADVERTISE_SETTING][COST_SETTING]
```

```
no area area_id range net_addr [ADVERTISE_SETTING][COST_SETTING]
```

```
default area area_id range net_addr [ADVERTISE_SETTING][COST_SETTING]
```

#### Parameters

- *area\_id* Area number. <0 to 4294967295> or <0.0.0.0 to 255.255.255.255> **running-config** stores value in dotted decimal notation.
- *net\_addr*
- ADVERTISE\_SETTING Values include
  - <no parameter>
  - **advertise**
  - **not-advertise**
- Values include
  - <no parameter>
  - **cost range\_cost** Value ranges from 1 to 65535.

#### Examples

- The **network area** command assigns two subnets to an area. The **area range** command summarizes the addresses, which the ABR advertises in a single LSA.

```
switch(config)#router ospf 6
switch(config-router-ospf)#network 10.1.25.80 0.0.0.240 area 5
switch(config-router-ospf)#network 10.1.25.112 0.0.0.240 area 5
switch(config-router-ospf)#area 5 range 10.1.25.64 0.0.0.192
switch(config-router-ospf)#
```

- The **network area** command assigns a subnet to an area, followed by an **area range** command that suppresses the advertisement of that subnet.

```
switch(config-router-ospf)#network 10.12.31.0/24 area 5
switch(config-router-ospf)#area 5 range 10.12.31.0/24 not-advertise
switch(config-router-ospf)#
```

### 14.2.5.10 area stub (OSPFv2)

The **area stub** command sets the area type of an OSPF area to **stub**. All devices in an AS must specify the same area type for identically numbered areas.

The **no area stub** command remove the specified stub area from the OSPFv2 instance by deleting all **area stub** commands from **running-config** for the specified area.

The **no area stub command** configure the specified area as a normal area.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
area area_id stub [summarize]
```

```
no area area_id stub [summarize]
```

```
default area area_id stub [summarize]
```

#### Parameters

- *area\_id* Area number.
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
  - **running-config** stores value in dotted decimal notation.
- summarize Area type. Values include:
  - <no parameter>
  - no-summary

#### Examples

- These commands configure area 45 as a stub area.

```
switch(config)#router ospf 3  
switch(config-router-ospf)#area 45 stub  
switch(config-router-ospf)#
```

- This command configures area 10.92.148.17 as a stub area.

```
switch(config-router-ospf)#area 10.92.148.17 stub  
switch(config-router-ospf)#
```

---

### 14.2.5.11 clear ip ospf neighbor

The `clear ip ospf` command clears the neighbors statistics per interface.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ip ospf [PROCESS_ID] neighbor [LOCATION][VRF_INSTANCE]
```

#### Parameters

- PROCESS\_ID OSPFv2 process ID. Values include:
  - *<no parameter>*
  - *<1 to 65535>*
- LOCATION IP Address or interface peer group name. Values include:
  - *\** clears all OSPF IPv4 neighbors.
  - *ipv4\_addr*
  - *ethernet e\_num*
  - *loopback l\_num*
  - *port-channel p\_num*
  - *vlan v\_num*
- VRF\_INSTANCE Specifies the VRF instance.
  - *vrf vrf\_name* configures the *vrf\_name* instance.

#### Examples

- This command resets all OSPF neighbor statistics.

```
switch#clear ip ospf neighbor *
switch#
```

- This command resets the OSPF neighbor statistics for the specified Ethernet 3 interface.

```
switch#clear ip ospf neighbor ethernet 3
switch#
```

### 14.2.5.12 compatible (OSPFv2)

The **compatible** command allows the selective disabling of compatibility with RFC 2328.

The **no compatible** and **default compatible** commands reverts OSPF to RFC 2328 compatible and removes the compatible statement from running-config.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
compatible rfc1583
```

```
no compatible rfc1583
```

```
default compatible rfc1583
```

#### Example

- This command sets the OSPF compatibility list with RFC 1583.

```
switch(config)#router ospf 6  
switch(config-router-ospf)#compatible rfc1583  
switch(config-router-ospf)#
```

- This command disables RFC 1583 compatibility.

```
switch(config)#router ospf 6  
switch(config-router-ospf)# no compatible rfc1583  
switch(config-router-ospf)#
```

---

### 14.2.5.13 default-information originate (OSPFv2)

The **default-information originate** command enables default route origination for normal areas. The user may configure the metric value and metric type used in LSAs. The **always** option will cause the ASBR to create and advertise a default route whether or not one is configured.

The **no default-information originate** command prevents the advertisement of the default route. The **default default-information originate** command enables default route origination with default values (metric type 2, metric=1).

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
default-information originate [FORCE][VALUE][TYPE][MAP]
```

```
no default-information originate
```

```
default default-information originate
```

#### Parameters

All parameters can be placed in any order.

- **FORCE** Advertisement forcing option. Values include:
  - *<no parameter>*
  - **always**
- **VALUE** Values include:
  - *<no parameter>*
  - **metric <1-65535>**
- **TYPE** Values include:
  - *<no parameter>*
  - **metric-type <1-2>**
- **MAP** Sets attributes in the LSA based on a route map. Values include:
  - *<no parameter>*
  - **route-map *map\_name***.

#### Examples

- These commands will always advertise the OSPFv2 default route regardless of whether the switch has a default route configured.

```
switch(config)#router ospf 1
switch((config-router-ospf)#default-information originate always
switch(config-router-ospf)#show active
router ospf 1
  default-information originate always
```

- These commands advertise a default route with a metric of 100 and an external metric type of 1 if a default route is configured.

```
switch(config)#router ospf 1
switch((config-router-ospf)#default-information originate metric 100
metric-type 1
```

### 14.2.5.14 distance ospf (OSPFv2)

The `distance ospf` command specifies the administrative distance for intra-area, inter-area, or external OSPF routes. The command must be issued separately for each route type being configured. The default administrative distance for all routes is 110.

The `no distance ospf` and `default distance ospf` commands remove the corresponding `distance ospf` command from *running-config*, returning the OSPFv2 administrative distance setting for the specified route type to the default value of 110.

**Note:** OSPF links will flap if the administrative distance value is adjusted while OSPF is running, whether it is adjusted by entering the `distance ospf` command directly through the CLI or by applying a configuration file that contains the command.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
distance ospf [externallinter-arealintra-area]
```

```
no distance ospf [externallinter-arealintra-area]
```

```
default distance ospf [externallinter-arealintra-area]
```

#### Parameters

- `external` Sets administrative distance for external routes.
- `inter-area` Sets administrative distance for inter-area routes.
- `intra-area` Sets administrative distance for intra-area routes.
- `distance` Values range from 1 to 255. Default value is 110 for all types.

#### Example

This command configures an administrative distance of 85 for all OSPFv2 intra-area routes on the switch. If issued while OSPF is running, this command will cause OSPF links to flap.

```
switch(config)#router ospf 6
switch(config-router-ospf)#distance ospf intra-area 85
switch(config-router-ospf)#
```

---

### 14.2.5.15 distribute-list in

A distribute list uses a route map or prefix list to filter specific routes from incoming OSPF LSAs. Filtering occurs after SPF calculation. The filtered routes are not installed on the switch, but are still included in LSAs sent by the switch. The **distribute-list in** command creates a distribute list in the configuration mode OSPF instance.

If a prefix list is used, destination prefixes that do not match the prefix list will not be installed. If a route map is used, routes may be filtered based on address, next hop, or metric. OSPF external routes may also be filtered by metric type or tag.

The **no distribute-list in** and **default distribute-list in** commands remove the **distribute-list in** command from *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
distribute-list {prefix-list | route-map} list_name in
no distribute-list {prefix-list | route-map}
default distribute-list {prefix-list | route-map}
```

#### Parameters

- **prefix-list** Specifies a prefix-list as the filter.
- **route-map** Specifies a route-map as the filter.
- **list\_name** The name of the prefix-list or route-map used to filter routes from incoming LSAs.

#### Related Commands

[area filter \(OSPFv2\)](#)

[redistribute \(OSPFv2\)](#)

#### Example

These commands configure a prefix list named dist\_list1 in OSPF instance 5 to filter certain routes from incoming OSPF LSAs.

```
switch(config) #router ospf 5
switch(config-router-ospf) #distribute-list prefix-list dist_list1 in
switch(config-router-ospf) #
```

### 14.2.5.16 dn-bit-ignore (OSPFv2)

The **dn-bit-ignore** command results in the DN bit in Type 3 Summary LSAs to be ignored during the shortest path first (SPF) calculations.

The **no dn-bit-ignore** and **default dn-bit-ignore** commands result in the DN bit in Type 3 Summary LSAs to not be ignored during SPF calculations.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
dn-bit-ignore
```

```
no dn-bit-ignore
```

```
default dn-bit-ignore
```

#### Examples

- This command ignores the DN bit.

```
switch(config)#router ospf 6  
switch(config-router-ospf)#dn-bit-ignore  
switch(config-router-ospf)#
```

- This command causes the DN bit not to be ignored.

```
switch(config)#router ospf 6  
switch(config-router-ospf)#no dn-bit-ignore  
switch(config-router-ospf)#
```

---

### 14.2.5.17 ip ospf area

The `ip ospf area` command enables OSPFv2 on an interface and associates the area to the interface.

The `no ip ospf area` and `default ip ospf area` commands disable OSPFv2 on the configuration mode interface and remove the configured area from the system.

**Note:** The per interface configuration has precedence over the OSPF Configuration mode. In other words, the area configured by the `ip ospf area` command has precedence over the area configured by the `network area` command.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf area area_id
```

```
no ip ospf area area_id
```

```
default ip ospf area area_id
```

#### Parameters

*area\_id* The area ID. The valid values are **0** to **4294967295** or a decimal range between **0.0.0.0** and **255.255.255.255**.

#### Example

These commands enable OSPFv2 on the et2 interface and associates area identifier 1.1.1.1 to the interface.

```
switch(config)#Interface ethernet 2  
switch(config-if-Et2)# ip address 1.0.0.1/24  
switch(config-if-Et2)# ip ospf area 1.1.1.1  
router ospf 1
```

### 14.2.5.18 ip ospf authentication

The `ip ospf authentication` command enables OSPFv2 authentication for the configuration mode interface..

The `no ip ospf authentication` and `default ip ospf authentication` commands disable OSPFv2 authentication on the configuration mode interface by removing the corresponding `ip ospf authentication` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf authentication [METHOD]
```

```
no ip ospf authentication
```

```
default ip ospf authentication
```

#### Parameters

- METHOD OSPFv2 authentication method. Options include:
  - *<no parameter>*
  - message-digest

#### Examples

- This command enables simple authentication on VLAN 12.

```
switch(config)#interface vlan 12  
switch(config-if-vl12)#ip ospf authentication  
switch(config-if-vl12)#
```

- This command enables message-digest authentication on VLAN 12.

```
switch(config-if-vl12)#ip ospf authentication message-digest  
switch(config-if-vl12)#
```

---

### 14.2.5.19 ip ospf authentication-key

The `ip ospf authentication-key` command configures the OSPFv2 authentication password for the configuration mode interface.

The `no ip ospf authentication-key` and `default ip ospf authentication-key` commands removes the OSPFv2 authentication password from the configuration mode interface by removing the corresponding `ip ospf authentication-key` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf authentication-key [ENCRYPT_TYPE] key_text
no ip ospf authentication-key
default ip ospf authentication-key
```

#### Parameters

- `ENCRYPT_TYPE` Encryption level of the `key_text` parameter. Values include:
  - `<no parameter>` the `key_text` is in clear text.
  - `0` `key_text` is in clear text. Equivalent to `<no parameter>`.
  - `7` `key_text` is MD5 encrypted.
- `key_text` the authentication-key password.

#### Example

This command specifies a password in clear text.

```
switch(config)#interface vlan 12
switch(config-if-Vl12)#ip ospf authentication-key 0 code123
switch(config-if-Vl12)#show active
interface Vlan12
    ip ospf authentication-key 7 baY1lFzVbcx4yHq1IhmMdw==
switch(config-if-Vl12)#
```

The *running-config* stores the password as an encrypted string.

### 14.2.5.20 ip ospf cost

The `ip ospf cost` command configures the OSPFv2 cost for the configuration mode interface. The default cost depends on the interface type:

- Ethernet: determined by the `auto-cost reference-bandwidth (OSPFv2)` command.
- Port channel: 10.
- VLAN: 10.

The `no ip ospf cost` and `default ip ospf cost` commands restore the default OSPFv2 cost for the configuration mode interface by removing the corresponding `ip ospf cost` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf cost interface_cost
```

```
no ip ospf cost
```

```
default ip ospf cost
```

#### Parameters

*interface\_cost* Value ranges from 1 to 65535; default is 10.

#### Example

This command configures a cost of 15 for VLAN 2.

```
switch(config)#interface vlan 2  
switch(config-if-Vl2)#ip ospf cost 15  
switch(config-if-Vl2)#
```

---

### 14.2.5.21 ip ospf dead-interval

The `ip ospf dead-interval` command configures the dead interval for the configuration mode interface.

The `no ip ospf dead-interval` and `default ip ospf dead-interval` commands restore the default dead interval of 40 seconds on the configuration mode interface by removing the corresponding `ip ospf dead-interval` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf dead-interval time
```

```
no ip ospf dead-interval
```

```
default ip ospf dead-interval
```

#### Parameters

*time* Value ranges from 1 to 8192; default is 40.

#### Example

This command configures a dead interval of 120 seconds for VLAN 4.

```
switch(config)#interface vlan 4  
switch(config-if-Vl4)#ip ospf dead-interval 120  
switch(config-if-Vl4)#
```

### 14.2.5.22 ip ospf disabled

The **ip ospf disabled** command disables OSPFv2 on the configuration mode interface without disrupting the OSPFv2 configuration. When OSPFv2 is enabled on the switch, the it is also enabled by default on all interfaces.

The OSPFv2 instance is disabled on the entire switch with the **shutdown (OSPFv2)** command.

The **no ip ospf disabled** and **default ip ospf disabled** commands enable OSPFv2 on the configuration mode interface by removing the corresponding **ip ospf disabled** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf disabled
```

```
no ip ospf disabled
```

```
default ip ospf disabled
```

#### Examples

- This command shuts down OSPFv2 activity on VLAN 5.

```
switch(config)#interface vlan 5
switch(config-if-V15)#ip ospf disabled
switch(config-if-V15)#
```

- This command resumes OSPFv2 activity on VLAN 5.

```
switch(config-if-V15)#no ip ospf disabled
switch(config-if-V15)#
```

### 14.2.5.23 ip ospf hello-interval

The **ip ospf hello-interval** command configures the OSPFv2 hello interval for the configuration mode interface.

The same hello interval should be specified for Each OSPFv2 neighbor, and should not be longer than any neighbors dead interval.

The **no ip ospf hello-interval** and **default ip ospf hello-interval** commands restore the default hello interval of 10 seconds on the configuration mode interface by removing the **ip ospf hello-interval** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf hello-interval time
```

```
no ip ospf hello-interval
```

```
default ip ospf hello-interval
```

---

**Parameter**

*time* Hello interval (seconds). Values range from 1 to 8192; default is 10.

**Example**

This command configures a hello interval of 30 seconds for VLAN 2.

```
switch(config)#interface vlan 2  
switch(config-if-V12)#ip ospf hello-interval 30  
switch(config-if-V12)#
```

#### 14.2.5.24 ip ospf message-digest-key

The **ip ospf message-digest-key** command configures a message digest authentication key for the configuration mode interface.

The **no ip ospf message-digest-key** and **default ip ospf message-digest-key** commands remove the message digest authentication key for the specified key ID on the configuration mode interface by deleting the corresponding **ip ospf message-digest-key** command from **running-config**.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
ip ospf message-digest-key key_id md5 ENCRYPT_TYPE key_text
```

```
no ip ospf message-digest-key key_id
```

```
default ip ospf message-digest-key key_id
```

##### Parameters

- *key\_id* Key ID number. Value ranges from 1 to 255.
- ENCRYPT\_TYPE Encryption level of the *key\_text* parameters. Values include:
  - *<no parameter>*
  - **0** *key\_text*
  - **7** *key\_text*
- *key\_text* message key (password).

##### Example

This command configures *code123* as the MD5 key with a corresponding key ID of 23.

```
switch(config)#interface vlan 12  
switch(config-if-vl12)#ip ospf message-digest-key 23 md5 0 code123  
switch(config-if-vl12)#
```

The **running-config** stores the password as an encrypted string.

---

### 14.2.5.25 ip ospf network point-to-point

The **ip ospf network point-to-point** command sets the configuration mode interface as a point-to-point link. By default, interfaces are configured as broadcast links.

The **no ip ospf network** and **default ip ospf network** commands set the configuration mode interface as a broadcast link by removing the corresponding **ip ospf network** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf network point-to-point
```

```
no ip ospf network
```

```
default ip ospf network
```

#### Examples

- These commands configure Ethernet interface 10 as a point-to-point link.

```
switch(config)#interface ethernet 10  
switch(config-if-Et10)#ip ospf network point-to-point  
switch(config-if-Et10)#
```

- This command restores Ethernet interface 10 as a broadcast link.

```
switch(config-if-Et10)#no ip ospf network  
switch(config-if-Et10)#
```

### 14.2.5.26 ip ospf priority

The **ip ospf priority** command configures OSPFv2 router priority for the configuration mode interface..

The **no ip ospf priority** and **default ip ospf priority** commands restore the default priority (1) on the configuration mode interface by removing the corresponding **ip ospf priority** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration Interface-Port-Channel Configuration Interface-VLAN Configuration

#### Command Syntax

```
ip ospf priority priority_level
```

```
no ip ospf priority
```

```
default ip ospf priority
```

#### Parameters

*priority\_level* priority level. Value ranges from 0 to 255. Default value is 1.

#### Examples

- This command configures a router priority of 15 for VLAN 8.

```
switch(config)#interface vlan 8
```

```
switch(config-if-Vl8)#ip ospf priority 15  
switch(config-if-Vl8)#
```

- This command restores the router priority of 1 for VLAN 7.

```
switch(config)#interface vlan 7  
switch(config-if-Vl7)#no ip ospf priority  
switch(config-if-Vl7)#
```

---

### 14.2.5.27 ip ospf retransmit-interval

The **ip ospf retransmit-interval** command configures the link state advertisement retransmission interval for the interface.

The **no ip ospf retransmit-interval** and **default ip ospf retransmit-interval** commands restore the default retransmission interval of 5 seconds on the configuration mode interface by removing the corresponding **ip ospf retransmit-interval** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf retransmit-interval period
no ip ospf retransmit-interval
default ip ospf retransmit-interval
```

#### Parameters

*period* Retransmission interval (seconds). Value ranges from 1 to 8192; default is 5.

#### Example

This command configures a retransmission interval of 15 seconds for VLAN 3.

```
switch(config)#interface vlan 3
switch(config-if-Vl3)#ip ospf retransmit-interval 15
switch(config-if-Vl3)#
```

### 14.2.5.28 ip ospf router-id output-format hostnames

The `ip ospf router-id output-format hostnames` command causes the switch to display DNS names in place of numeric OSPFv2 router IDs in all OSPFv2 show commands, including:

- `show ip ospf`
- `show ip ospf border-routers`
- `show ip ospf database <link state list>`
- `show ip ospf database database-summary`
- `show ip ospf database <link-state details>`
- `show ip ospf interface`
- `show ip ospf neighbor`
- `show ip ospf request queue`
- `show ip ospf retransmission queue`

The `no ip ospf router-id output-format hostnames` and `default ip ospf router-id output-format hostnames` commands remove the `ip ospf router-id output-format hostnames` command from *running-config*, restoring the default behavior of displaying OSPFv2 router IDs by their numeric value.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip ospf router-id output-format hostnames
no ip ospf router-id output-format hostnames
default ip ospf router-id output-format hostnames
```

#### Example

This command programs the switch to display OSPFv2 router IDs by the corresponding DNS name in subsequent show commands.

```
switch(config)#ip ospf router-id output-format hostnames
switch(config)#
```

---

### 14.2.5.29 ip ospf transmit-delay

The `ip ospf transmit-delay` command configures the transmission delay for OSPFv2 packets over the configuration mode interface.

The `no ip ospf transmit-delay` and `default ip ospf transmit-delay` commands restore the default transmission delay (one second) on the configuration mode interface by removing the corresponding `ip ospf transmit-delay` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip ospf transmit-delay trans
```

```
no ip ospf transmit-delay
```

```
default ip ospf transmit-delay
```

#### Parameters

*trans* LSA transmission delay (seconds). Value ranges from 1 to 8192; default is 1.

#### Example

This command configures a transmission delay of 5 seconds for VLAN 6.

```
switch(config)#interface vlan 6  
switch(config-if-Vl6)#ip ospf transmit-delay 5  
switch(config-if-Vl6)#
```

### 14.2.5.30 log-adjacency-changes (OSPFv2)

The **log-adjacency-changes** command enables syslog messages to be sent when it detects OSPFv2 link state changes or when it detects that a neighbor has gone up or down. Log message sending is enabled by default.

The **default log-adjacency-changes** command restores the default state by removing the **log-adjacency-changes** statement from *running-config*.

The default option (sending a message only when a neighbor goes up or down) is active when running-config does not contain any form of the command. Entering the command in any form replaces the previous command state in *running-config*.

The **no log-adjacency-changes** disables link state change syslog reporting.

The **default log-adjacency-changes** command restores the default state by removing the **log-adjacency-changes detail** or **no log-adjacency-changes** statement from *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
log-adjacency-changes detail
no log-adjacency-changes
default log-adjacency-changes
```

#### Examples

- This command configures the switch to send a syslog message when a neighbor goes up or down.

```
switch(config)#router ospf 6
switch(config-router-ospf)#log-adjacency-changes
switch(config-router-ospf)#
```

- After entering the command, **show active** does not display a **log-adjacency-changes** statement.

```
switch(config-router-ospf)#show activerouter ospf 1
switch(config-router-ospf)#
```

- This command configures the switch to send a syslog message when it detects any link state change.

```
switch(config-router-ospf)#log-adjacency-changes detail
switch(config-router-ospf)#
```

- After entering the command, **show active** displays a **log-adjacency-changes detail** command.

```
switch(config-router-ospf)#show active router ospf 1
log-adjacency-changes detail
switch(config-router-ospf)#
```

---

### 14.2.5.31 maximum-paths (OSPFv2)

The **maximum-paths** command controls the number of parallel routes that OSPFv2 supports. The default maximum is 16 paths.

The **no maximum-paths** and **default maximum-paths** commands restore the maximum number of parallel routes that OSPFv2 supports on the switch to the default value of 16 by placing the **maximum-paths 16** statement in *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
maximum-paths paths
```

```
no maximum-paths
```

```
default maximum-paths
```

#### Parameters

- *paths* Maximum number of parallel routes.

Value ranges from 1 to the number of interfaces available per ECMP group, which is platform dependent.

- Arad: Value ranges from 1 to 128. Default value is 128.
  - FM6000: Value ranges from 1 to 32. Default value is 32.
  - PetraA: Value ranges from 1 to 16. Default value is 16.
  - Trident: Value ranges from 1 to 32. Default value is 32.
  - Trident II: Value ranges from 1 to 128. Default value is 128.

#### Example

This command configures the maximum number of OSPFv2 parallel paths to 12.

```
switch(config)#router ospf 6  
switch(config-router-ospf)#maximum-paths 12  
switch(config-router-ospf)#
```

### 14.2.5.32 max-lsa (OSPFv2)

The `max-lsa` command specifies the maximum number of LSAs allowed in the LSDB. Setting the limit to zero removes the LSDB restriction and disables LSA overload actions. Actions triggered by LSDB overload conditions include:

- **Warning:** the switch logs OSPF MAXLSAWARNING if the LSDB contains a specified percentage of the LSA maximum.
- **Temporary shutdown:** when the LSDB exceeds the LSA maximum, OSPFv2 is disabled and does not accept or acknowledge new LSAs. The switch re-starts OSPFv2 after a specified period (the default is five minutes).
- **Permanent shutdown:** the switch permanently disables OSPFv2 after performing a specified number of temporary shutdowns (the default is five). This state usually indicates the need to resolve a network condition that consistently generates excessive LSA packets.

The `no max-lsa` and `default max-lsa` commands restore all LSA overload parameters to their default settings.

**Note:** if OSPFv2 has entered permanent shutdown, it can also be restarted by increasing the LSA limit to a value larger than the number of LSAs in the database. Setting the max-LSA value to zero will also restart OSPFv2, and will disable overload protection.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
max-lsa lsa_num [WARNING] [IGNORE_TIME] [IGNORE_COUNT] [RESET]
```

```
no max-lsa
```

```
default max-lsa
```

#### Parameters

- `lsa_num` Maximum number of LSAs. Value ranges from 0 to 100,000.
  - **0** Disables overload protection.
  - **1 to 100000** Specifies maximum value; default value is 12,000.
- `WARNING` Warning threshold, as a percentage of the maximum number of LSAs (% of `lsa_num`).
  - `<no parameter>` Default of 75%.
  - `percent` Ranges from 25 to 99.
- `IGNORE_TIME` Temporary shutdown period (minutes). Options include:
  - `<no parameter>` Default value of 5 minutes.
  - `ignore-time period` Value ranges from 1 to 60.
- `IGNORE_COUNT` Number of temporary shutdowns required to trigger a permanent shutdown.
  - `<no parameter>` Default value of 5.
  - `ignore-count episodes` Ranges from 1 to 20.
- `RESET` Period of not exceeding LSA limit required to reset temporary shutdown counter to zero.
  - `<no parameter>` Default value of 5 minutes
  - `reset-time r_period` Ranges from 1 to 60.

#### Example

This command defines an LSA limit of 8,000 and other parameters.

```
switch(config-router-ospf) #max-lsa 8000 40 ignore-time 6 ignore-count 3
reset-time 20
switch(config-router-ospf) #
```

### 14.2.5.33 max-metric router-lsa (OSPFv2)

The **max-metric router-lsa** command configures OSPF to include the maximum value in LSA metric fields to keep other network devices from using the switch as a preferred intermediate SPF hop.

The **no max-metric router-lsa** and **default max-metric router-lsa** commands disable the advertisement of a maximum metric.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
no max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
default max-metric router-lsa [EXTERNAL][STUB][STARTUP][SUMMARY]
```

#### Parameters

All parameters can be placed in any order.

- EXTERNAL Advertised metric value. Values include:
  - *<no parameter>* Default value of 1.
  - external-lsa <1 to 16777215> Default value is **0xFF0000**.
- STUB Advertised metric type. Values include:
  - *<no parameter>* Default value of 2.
  - include-stub
- STARTUP Limit scope of LSAs. Values include:
  - *<no parameter>*
  - on-startup
  - on-startup wait-for-bgp
  - on-startup <5 to 86400>

**wait-for-bgp** or an **on-start** time value is not included in **no** and **default** commands.

- SUMMARY Advertised metric value. Values include:
  - *<no parameter>*
  - summary-lsa
  - summary-lsa <1 to 16777215>

#### Example

This command configures OSPF to include the maximum value in LSA metric fields until BGP has converged:

```
switch(config-router-ospf) #max-metric router-lsa on-startup wait-for-bgp
switch(config-router-ospf) #
```

---

### 14.2.5.34 network area (OSPFv2)

The **network area** command assigns the specified IPv4 subnet to an OSPFv2 area.

The **no network area** and **default network area** commands delete the specified network area assignment by removing the corresponding **network area** command from **running-config**.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
network ipv4_subnet area area_id
no network ipv4_subnet area area_id
default network ipv4_subnet area area_id
```

#### Parameters

- *ipv4\_subnet* IPv4 subnet. Entry formats include address-prefix (CIDR) or address-wildcard mask. **running-config** stores value in CIDR notation.
- *area\_id* Area number. <0 to 4294967295> or <0.0.0.0 to 255.255.255.255> **running-config** stores value in dotted decimal notation.

#### Example

These equivalent commands each assign the subnet 10.1.10.0/24 to area 0.

```
switch(config-router-ospf) #network 10.1.10.0 0.0.0.255 area 0
switch(config-router-ospf) #
switch(config-router-ospf) #network 10.1.10.0/24 area 0
switch(config-router-ospf) #
```

### 14.2.5.35 no area (OSPFv2)

The `no area <type>` command removes the corresponding `area <type>` command from *running-config*:

- `no/default area not-so-stubby lsa type-7 convert type-5` commands remove the `translate type7 always` parameter without changing the area type.
- `no/default area nssa`, `no/default area stub`, and `no/default area stub no-summary` commands restore the areas type to **normal**. [OSPFv2 Commands](#)
- `no/default area default-information-originate` command removes all area commands for the specified area from *running-config*
- `no/default area` command removes all area commands for the specified area from *running-config*
- `no/default area` command removes all area commands for the specified area from *running-config*

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
no area area_id [TYPE]
```

```
default area area_id [TYPE]
```

#### Parameters

- *area\_id* area number.
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always **normal**.
  - *Running-config* stores value in dotted decimal notation.
- TYPE Area type. Values include:
  - nssa
  - nssa translate type7 always
  - **stub**
  - stub no-summary

#### Examples

- These commands remove area 1 from the running configuration.

```
switch(config)#router ospf 6
switch(config-router-ospf)#no area 1
switch(config-router-ospf)#
```

- These commands remove area 10.92.148.17 as an NSSA.

```
switch(config-router-ospf)#no area 10.92.148.17 nssa
switch(config-router-ospf)#
```

---

### 14.2.5.36 passive-interface default (OSPFv2)

The **passive-interface default** command configures all interfaces as OSPFv2 passive by default. The switch advertises the passive interface as part of the router LSA.

The **passive-interface <interface> (OSPFv2)** configures the OSPFv2 active-passive status for a specific interface:

- When **passive-interface default** is not set, all interfaces are OSPFv2 active by default and passive interfaces are denoted by **passive-interface <interface>** statements in **running-config**.
- When **passive-interface default** is set, all interfaces are OSPFv2 passive by default and active interfaces are denoted by **no passive-interface <interface>** statements in **running-config**.

The **no passive-interface** and **default passive-interface** commands configures all interfaces as OSPFv2 active by default by removing the **passive-interface default** statement from **running-config**.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
passive-interface default
no passive-interface default
default passive-interface default
```

#### Examples

- This command configures the default interface setting as OSPFv2 passive. This command also removes all **passive-interface <interface>** statements from **running-config**.

```
switch(config)#router ospf 6
switch(config-router-ospf)#passive-interface default
switch(config-router-ospf)#
```

- This command configures the default interface setting as OSPFv2 active. This command also removes all **no passive-interface <interface>** statements from **running-config**.

```
switch(config-router-ospf)#no passive-interface default
switch(config-router-ospf)#
```

### 14.2.5.37 passive-interface <interface> (OSPFv2)

The **passive-interface** command disables OSPFv2 on an interface range. The switch advertises the passive interface as part of the LSA.

The default OSPFv2 interface activity is configured by the **passive-interface default (OSPFv2)** command:

- When **passive-interface default** is not set, all interfaces are OSPFv2 active by default and passive interfaces are denoted by **passive-interface <interface>** statements in *running-config*.
- When **passive-interface default** is set, all interfaces are OSPFv2 passive by default and active interfaces are denoted by **no passive-interface <interface>** statements in *running-config*.

The **no passive-interface** command enables OSPFv2 on the specified interface range. The **default passive-interface** command sets the interface to the default interface activity setting by removing the corresponding **passive-interface** or **no passive-interface** statement from *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
passive-interface INTERFACE_NAME
no passive-interface INTERFACE_NAME
default passive-interface INTERFACE_NAME
```

#### Parameters

- INTERFACE\_NAME Interface to be configured. Options include:
  - ethernet *e\_range*
  - port-channel *p\_range*
  - vlan *v\_range*
  - vxlan *vx\_range*

#### Examples

- These commands configure Ethernet interfaces 2 through 5 as passive interfaces.

```
switch(config)#router ospf 6
switch(config-router-ospf)#passive-interface ethernet 2-5
switch(config-router-ospf)#
```

- This command configures VLAN interfaces 50-54, 61, 68, and 102-120 as passive interfaces.

```
switch(config-router-ospf)#passive-interface vlan 50-54,61,68,102-120
switch(config-router-ospf)#
```

- This command configures VLAN 2 as an active interface.

```
switch(config-router-ospf)#no passive-interface vlan 2
switch(config-router-ospf)#
```

---

### 14.2.5.38 point-to-point routes (OSPFv2)

The **point-to-point routes** command enables the switch to maintain a local routing information base (RIB) to store information it learns from its neighbors.

The **no point-to-point routes** and **default point-to-point routes** commands program the switch to include point-to-point links in its RIB by removing the **point-to-point routes** command from running-config.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

**point-to-point routes**

**no point-to-point routes**

**default point-to-point routes**

#### Examples

- This command configures the switch to optimize the local RIB by not including point-to-point routes.

```
switch(config)#router ospf 6  
switch(config-router-ospf)#no point-to-point routes  
switch(config-router-ospf)#
```

- This command configures the switch to include point-to-point routes.

```
switch(config-router-ospf)#point-to-point routes  
switch(config-router-ospf)#
```

### 14.2.5.39 redistribute (OSPFv2)

The **redistribute** command enables the advertising of all specified routes on the switch into the OSPFv2 domain as external routes.

The **no redistribute** and **default redistribute** commands remove the corresponding **redistribute** command from **running-config**, disabling route redistribution for the specified route type.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
redistribute ROUTE_TYPE [ROUTE_MAP]
no redistribute ROUTE_TYPE [ROUTE_MAP]
default redistribute ROUTE_TYPE [ROUTE_MAP]
```

#### Parameters

- **ROUTE\_TYPE** Source from which routes are redistributed. Options include:
  - connected routes that are established when IPv4 is enabled on an interface.
  - BGP routes from a BGP domain.
  - RIP routes from a RIP domain.
  - static IP static routes.
- **ROUTE\_MAP** Route map that determines the routes that are redistributed. Options include:
  - *<no parameter >*
  - *route-map map\_name*

#### Examples

- The **redistribute static** command starts the advertising of static routes as OSPFv2 external routes.

```
switch(config)#router ospf 6
switch(config-router-ospf)#redistribute static
switch(config-router-ospf)#
```

- The **no redistribute bgp** command stops the advertising of BGP routes as OSPFv2 external routes.

```
switch(config-router-ospf)#no redistribute bgp
switch(config-router-ospf)#
```

---

#### 14.2.5.40 router ospf

The **router ospf** command places the switch in router-ospf configuration mode. The switch will create a process ID for the new instance if one does not already exist. The **exit** command returns the switch to global configuration mode.

The **show ip ospf** command displays the process ID of the OSPFv2 instances configured on the switch.

The **no router ospf** and **default router ospf** commands delete the specified OSPFv2 instance.

Router-ospf configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting router-ospf configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

Refer to Router-OSPFv2 Configuration Mode for a list of commands available in router-ospf configuration mode.

##### Command Mode

Global Configuration

##### Command Syntax

```
router ospf process_id [VRF_INSTANCE]
no router ospf process_id [VRF_INSTANCE]
default router ospf process_id [VRF_INSTANCE]
```

##### Parameters

- *process\_id* OSPFv2 process ID. Values range from 1 to 65535.
- VRF\_INSTANCE
  - *<no parameter>* Configures the default VRF instance.
  - *vrf vrf\_name* Configures the *vrf\_name* instance.

##### Examples

- This command creates an OSPFv2 instance with process ID 145 in the main VRF.

```
switch(config)#router ospf 145
switch(config-router-ospf)#
```

- This command deletes the specified OSPFv2 instance.

```
switch(config)#no router ospf 145
switch(config)#
```

### 14.2.5.41 router-id (OSPFv2)

The **router-id** command assigns a router ID for an OSPFv2 instance. This number uniquely identifies the router within an Autonomous System. Status commands use the router ID to identify the switch.

The switch sets the router ID to the first available alternative in the following list:

1. The **router-id** command.
2. The loopback IP address, if a loopback interface is configured on the switch.
3. The highest IP address present on the router.

**Note:** When configuring VXLAN on an MLAG, always manually configure the OSPFv2 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The **no router-id** and **default router-id** commands remove the router ID command from *running-config*; the switch uses the loopback or highest address as the router ID.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
router-id [identifier]
```

```
no router-id [identifier]
```

```
default router-id [identifier]
```

#### Parameters

*identifier* Value ranges from 0.0.0.0 to 255.255.255.255.

#### Example

This command assigns 10.5.4.2 as the router ID for the OSPFv2 instance.

```
switch(config)#router ospf 6  
switch(config-router-ospf)#router-id 10.5.4.2  
switch(config-router-ospf)#
```

---

#### 14.2.5.42 show ip ospf border-routers

The **show ip ospf border-routers** command displays the internal OSPFv2 routing table entries to area border routers (ABRs) and autonomous system boundary routers (ASBRs) for each of the OSPFv2 areas.

##### Command Mode

EXEC

##### Command Syntax

```
show ip ospf border-routers [VRF_INSTANCE]
```

##### Parameters

- VRF\_INSTANCE Specifies the VRF instance.
  - *<no parameter>* displays information from all VRFs, or from context-active VRF if set.
  - *vrf vrf\_name* displays information from the specified VRF.

##### Example

This command displays the ABRs and ASBRs.

```
switch#show ip ospf border-routers
OSPF Process 10.17.0.42, VRF default

Router ID      Area          Type
10.17.0.1     0.0.0.0      ASBR
switch>
```

### 14.2.5.43 show ip ospf database database-summary

The **show ip ospf database database-summary** command displays the number of link state advertisements in the OSPFv2 database.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf [AREA] database database-summary [VRF_INSTANCE]
```

#### Parameters

- VRF\_INSTANCE Specifies the VRF instance.
  - *<no parameter>* displays information from all VRFs, or from context-active VRF if set.
  - *vrf vrf\_name* displays information from the specified VRF.
- AREA areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
  - *<no parameter>*
  - *process\_id*
  - *process\_id area\_id*
  - *process\_id* input range: <1 to 65535>
  - *area\_id* input range: <0 to 4294967295> or <0.0.0.0 to 255.255.255.255>

#### Example

This command displays the LSDB content summary for area 0.

```
switch#show ip ospf 1 0 database database-summary

LSA Type      Count
Router        18
Network       21
Summary Net   59
Summary ASBR  4
Type-7 Ext    0
Opaque Area   0
Type-5 Ext    4238
Opaque AS     0
Total         4340

switch>
```

---

#### 14.2.5.44 show ip ospf database <link state list>

The **show ip ospf database <link state list>** command displays the OSPFv2 link state advertisements that originate on a specified switch.

##### Command Mode

EXEC

##### Command Syntax

```
show ip ospf [AREA] database [ROUTER] [VRF_INSTANCE]
```

##### Parameters

- **AREA** Areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
  - *<no parameter>*
  - *process\_id*
  - *process\_id area\_id*
  - *process\_id* value ranges from 1 to 65535.
  - *area\_id* is entered in decimal or dotted decimal notation.
- **ROUTER** Router or switch for which the command provides data. Options include:
  - *<no parameter>*
  - *adv-router [a.b.c.d]*
  - *self-originate*
- **VRF\_INSTANCE** Specifies the VRF instance.
  - *<no parameter>* displays information from all VRFs, or from context-active VRF if set.
  - *vrf vrf\_name* displays information from the specified VRF.

##### Example

This command displays OSPFv2 LSAs that originate at the router with a router ID of 10.26.0.31.

```
switch#show ip ospf database adv-router 10.26.0.31

OSPF Router with ID(10.26.0.23) (Process ID 1) (VRF default)

switch>
```

### 14.2.5.45 show ip ospf database <link-state details>

The `show ip ospf database <link-state details>` command displays details of the specified link state advertisements.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf [AREA] database LINKSTATE_TYPE linkstate_id [ROUTER] [VRF_INSTANCE]
```

#### Parameters

- **AREA** Areas for which command displays data. Specifying an individual area requires entering the process ID where the area is located. Options include:
  - `<no parameter>`
  - `process_id`
  - `process_id area_id`
  - `process_id` input range: <1 to 65535>
  - `area_id` input range: <0 to 4294967295> or <0.0.0.0 to 255.255.255.255>
- **LINKSTATE\_TYPE** Link state types. Parameter options include:
  - `detail` Displays all link states.
  - `router`
  - `network`
  - `summary`
  - `asbr-summary`
  - `external`
  - `nssa-external`
  - `opaque-link`
  - `opaque-area`
  - `opaque-as`
- **linkstate\_id** Network segment described by the LSA (dotted decimal notation).

Value depends on the LSA type.

- **ROUTER** Router or switch for which the command provides data. Options include:
  - `<no parameter>`
  - `adv-router [a.b.c.d]`
  - `self-originate`
- **VRF\_INSTANCE** Parameter has no effect; this command displays information about the specified process and area regardless of VRF.
  - `<no parameter>` displays information from all VRFs, or from context-active VRF if set.
  - `vrf vrf_name` displays information from the specified VRF.

#### Examples

- This command displays the router link states contained in the area 2 LSDB.

```
switch#show ip ospf 1 2 database router

OSPF Router with ID(10.168.103.1) (Process ID 1) (VRF default)

#### 14.2.5.46 show ip ospf interface brief

The `show ip ospf interface brief` command displays a summary of OSPFv2 information.

##### Command Mode

EXEC

##### Command Syntax

```
show ip ospf [PROCESS_ID] interface brief [VRF_INSTANCE]
```

##### Parameters

- PROCESS\_ID OSPFv2 process ID. Values include:
  - *<no parameter>*
  - *<1 to 65535>*
- VRF\_INSTANCE Specifies the VRF instance.
  - *<no parameter>* displays information from all VRFs, or from context-active VRF if set.
  - *vrf vrf\_name* displays information from the specified VRF.

### 14.2.5.47 show ip ospf interface

The **show ip ospf interface** command displays interface information that is related to OSPFv2.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf [PROCESS_ID] interface [INTERFACE_NAME][VRF_INSTANCE]
```

#### Parameters

- PROCESS\_ID OSPFv2 process ID. Values include:
  - *<no parameter>*
  - *<1 to 65535>*
- INTERFACE\_NAME Interface type and number. Values include
  - *<no parameter>*
  - ethernet *e\_num*
  - loopback *l\_num*
  - port-channel *p\_num*
  - vlan *v\_num*
- VRF\_INSTANCE Specifies the VRF instance.
  - *<no parameter>* displays information from all VRFs, or from context-active VRF if set.
  - *vrf vrf\_name* displays information from the specified VRF.

#### Related Command

[show ip ospf interface brief](#)

#### Example

This command displays complete OSPFv2 information for VLAN 1.

```
switch#show ip ospf interface vlan 1
Vlan1 is up, line protocol is up (connected)
Internet Address 10.168.0.1/24, VRF default, Area 0.0.0.0
Process ID 1, Router ID 10.168.103.1, Network Type BROADCAST, Cost: 10
Transmit Delay is 1 sec, State BDR, Priority 1
Designated Router is 10.168.104.2
Backup Designated router is 10.168.103.1
Timer intervals configured, Hello 10, Dead 40, Retransmit 5
Neighbor Count is 1
MTU is 1500
switch>
```

### 14.2.5.48 show ip ospf lsa-log

The `show ip ospf lsa-log` command displays log entries when LSA update messages are sent or received for OSPF.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf [PROCESS_ID] ospf-log
```

#### Parameters

- PROCESS\_ID OSPFv2 process ID. Values include:
  - `<no parameter>`
  - `<1 to 65535>`

#### Example

This command displays log entries when LSA update messages are sent or received for OSPF.

```
switch#show ip ospf lsa-log
OSPF Process 3.3.3.3, LSA Throttling Log:
[04:21:09] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
value 2000 msec
[04:21:08] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new
hold value 900 msec
[04:21:00] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
value 3000 msec
[04:21:00] type 1: 3.3.3.3/32 [3.3.3.3], event 4, maxwait value changed,

hold value 1000 msec
switch#
```

---

#### 14.2.5.49 show ip ospf neighbor adjacency-changes

The **show ip ospf neighbor adjacency-changes** command displays the OSPFv2 neighbor adjacency change log for specified interfaces.

##### Command Mode

EXEC

##### Command Syntax

```
show ip ospf neighbor [INTERFACE_NAME][NEIGHBOR] adjacency-changes  
[VRF_INSTANCE]
```

##### Parameters

- **INTERFACE\_NAME** Interface type and number. Values include:
  - *<no parameter>*
  - ethernet *e\_num*
  - loopback *l\_num*
  - port-channel *p\_num*
  - vlan *v\_num*
- **NEIGHBOR** OSPFv2 neighbor. Options include:
  - *<no parameter>*
  - *ipv4\_addr*
  - *host\_name*
- **VRF\_INSTANCE** Specifies the VRF instance.
  - *<no parameter>* displays information from all VRFs, or from context-active VRF if set.
  - *vrf vrf\_name* displays information from the specified VRF.

##### Example

This command displays the adjacency changes to VLAN 2.

```
switch#show ip ospf neighbor vlan 2 adjacency-changes  
[08-04 08:55:32] 10.168.104.2, interface Vlan2 adjacency established  
[08-04 09:58:51] 10.168.104.2, interface Vlan2 adjacency dropped:  
  interface went  
down  
[08-04 09:58:58] 10.168.104.2, interface Vlan2 adjacency established  
[08-04 09:59:34] 10.168.104.2, interface Vlan2 adjacency dropped:  
  interface went  
down  
[08-04 09:59:42] 10.168.104.2, interface Vlan2 adjacency established  
[08-04 10:01:40] 10.168.104.2, interface Vlan2 adjacency dropped: nbr did  
  not  
list our router ID  
[08-04 10:01:46] 10.168.104.2, interface Vlan2 adjacency established  
switch>
```

### 14.2.5.50 show ip ospf neighbor state

The `show ip ospf neighbor state` command displays the state information on OSPF neighbors on a per-interface basis.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf neighbor state STATE_NAME [VRF_INSTANCE]
```

#### Parameters

- STATE\_NAME Output filtered by the devices OSPF state. Options include valid OSPF states:
  - 2-ways
  - attempt
  - down
  - exch-start
  - exchange
  - full
  - graceful-restart
  - init
  - loading
- VRF\_INSTANCE Specifies the VRF instance.
  - *<no parameter>* displays information from all VRFs, or from context-active VRF if set.
  - *vrf vrf\_name* displays information from the specified VRF.

#### Example

This command displays OSPF information for neighboring routers that are fully adjacent.

```
switch#show ip ospf neighbor state full
Neighbor ID   VRF      Pri   State          Dead Time   Address          Interface
Test1         default  1     FULL/BDR       00:00:35   10.17.254.105   Vlan3912
Test2         default  1     FULL/BDR       00:00:36   10.17.254.29    Vlan3910
Test3         default  1     FULL/DR        00:00:35   10.25.0.1       Vlan101
Test4         default  1     FULL/DROTHER   00:00:36   10.17.254.67    Vlan3908
Test5         default  1     FULL/DROTHER   00:00:36   10.17.254.68    Vlan3908
Test6         default  1     FULL/BDR       00:00:32   10.17.254.66    Vlan3908
Test7         default  1     FULL/DROTHER   00:00:34   10.17.36.4      Vlan3036
Test8         default  1     FULL/BDR       00:00:35   10.17.36.3      Vlan3036
Test9         default  1     FULL/DROTHER   00:00:31   10.17.254.13    Vlan3902
Test10        default  1     FULL/BDR       00:00:37   10.17.254.11    Vlan3902
Test11        default  1     FULL/DROTHER   00:00:33   10.17.254.163   Vlan3925
Test12        default  1     FULL/DR        00:00:37   10.17.254.161   Vlan3925
Test13        default  1     FULL/DROTHER   00:00:31   10.17.254.154   Vlan3923
Test14        default  1     FULL/BDR       00:00:39   10.17.254.156   Vlan3923
Test15        default  1     FULL/DROTHER   00:00:33   10.17.254.35    Vlan3911
Test16        default  1     FULL/DR        00:00:34   10.17.254.33    Vlan3911
Test17        default  1     FULL/DR        00:00:36   10.17.254.138   Ethernet12
Test18        default  1     FULL/DR        00:00:37   10.17.254.2     Vlan3901
switch>
```

---

### 14.2.5.51 show ip ospf neighbor summary

The **show ip ospf neighbor summary** command displays a single line of summary information for each OSPFv2 neighbor.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf [PROCESS_ID] neighbor summary [VRF_INSTANCE]
```

#### Parameters

- PROCESS\_ID OSPFv2 process ID. Values include:
  - *<no parameter>*
  - *<1 to 65535>*
- VRF\_INSTANCE Specifies the VRF instance.
  - *<no parameter>* displays information from all VRFs, or from context-active VRF if set.
  - *vrf vrf\_name* displays information from the specified VRF.

#### Example

This command displays the summary information for the OSPFv2 neighbors.

```
switch#show ip ospf neighbor summary
OSPF Router with (Process ID 1) (VRF default)
0 neighbors are in state DOWN
0 neighbors are in state GRACEFUL RESTART
2 neighbors are in state INIT
0 neighbors are in state LOADING
0 neighbors are in state ATTEMPT
18 neighbors are in state FULL
0 neighbors are in state EXCHANGE
0 neighbors are in state 2 WAYS
0 neighbors are in state EXCH START
switch>
```

### 14.2.5.52 show ip ospf neighbor

The **show ip ospf neighbor** command displays OSPFv2 neighbor information for specified interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf [PROCESS_ID] neighbor [INTERFACE_NAME] [NEIGHBOR] [DATA]
[VRF_INSTANCE]
```

#### Parameters

- PROCESS\_ID OSPFv2 process ID. Values include:
  - *<no parameter>*
  - *<1 to 65535>*
- INTERFACE\_NAME Interface type and number. Values include:
  - *<no parameter>*
  - ethernet *e\_num*
  - loopback *l\_num*
  - port-channel *p\_num*
  - vlan *v\_num*
- NEIGHBOR OSPFv2 neighbor. Options include:
  - *<no parameter>*
  - *ipv4\_addr*
- DATA Type of information the command displays. Values include:
  - *<no parameter>*
  - detail
- VRF\_INSTANCE Specifies the VRF instance.
  - *<no parameter>* displays information from all VRFs, or from context-active VRF if set.
  - *vrf vrf\_name* displays information from the specified VRF.

#### Examples

- This command displays the switches neighbors.

```
switch#show ip ospf neighbor
Neighbor IDVRFPriStateDead TimeAddressInterface
10.168.104.2default1FULL/DR00:00:3510.168.0.2Vlan1
10.168.104.2default8FULL/BDR00:00:3110.168.2.2Vlan2
switch>
```

- This command displays details about the neighbors to VLAN 2.

```
switch#show ip ospf neighbor vlan 2 detail
Neighbor 10.168.104.2, VRF default, interface address 10.168.2.2
In the area 0.0.0.2 via interface Vlan2
Neighbor priority is 8, State is FULL, 13 state changes
Adjacency was established 00:01:25:48 ago
DR is 10.168.2.1 BDR is 10.168.2.2
Options is E
Dead timer due in 00:00:34
switch>
```

---

### 14.2.5.53 show ip ospf request queue

The **show ip ospf request queue** command displays a list of all OSPFv2 link state advertisements (LSAs) requested by a router.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf request queue [VRF_INSTANCE]
```

#### Parameters

VRF\_INSTANCE Specifies the VRF instance.

- *<no parameter>* displays information from all VRFs, or from context-active VRF if set.
- *vrf vrf\_name* displays information from the specified VRF.

#### Example

This command displays an LSA request list.

```
switch#show ip ospf request queue
Neighbor 10.168.104.2 vrf default interface: 10.168.0.2 address vlan1
Type LS ID ADV RTR Seq No Age Checksum
Neighbor 10.168.104.2 vrf default interface: 10.168.2.2 address vlan2
Type LS ID ADV RTR Seq No Age Checksum
switch>
```

#### 14.2.5.54 show ip ospf retransmission queue

The **show ip ospf retransmission queue** command displays a list of all OSPFv2 link state advertisements (LSAs) waiting to be re-sent.

##### Command Mode

EXEC

##### Command Syntax

```
show ip ospf retransmission queue [VRF_INSTANCE]
```

##### Parameters

- VRF\_INSTANCE Specifies the VRF instance.
  - *<no parameter>* displays information from all VRFs, or from context-active VRF if set.
  - *vrf vrf\_name* displays information from the specified VRF.

##### Example

This command displays an empty retransmission list.

```
switch#show ip ospf retransmission queue
Neighbor 10.168.104.2 vrf default interface vlan1 address 10.168.0.2
LSA retransmission not currently scheduled. Queue length is 0

TypeLink IDADV RouterAgeSeq# Checksum
Neighbor 10.168.104.2 vrf default interface vlan2 address 10.168.2.2
LSA retransmission not currently scheduled. Queue length is 0

TypeLink IDADV RouterAgeSeq# Checksum
switch>
```

---

### 14.2.5.55 show ip ospf spf-log

The `show ip ospf spf-log` command displays when and how long the switch took to run a full SPF calculation for OSPF.

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf [PROCESS_ID] ospf-log
```

#### Parameters

- PROCESS\_ID OSPFv2 process ID. Values include:
  - *<no parameter>*
  - **<1 to 65535>**

#### Example

This command displays the SPF information for OSPF.

```
switch#show ip ospf spf-log
OSPF Process 172.26.0.22
When      Duration(msec)
13:01:34  1.482
13:01:29  1.547
13:01:24  1.893
13:00:50  1.459
13:00:45  1.473
13:00:40  2.603
11:01:49  1.561
11:01:40  1.463
11:01:35  1.467
11:01:30  1.434
11:00:54  1.456
11:00:49  1.472
11:00:44  1.582
15:01:49  1.575
15:01:44  1.470
15:01:39  1.679
15:01:34  1.601
15:00:57  1.454
15:00:52  1.446
15:00:47  1.603
switch>
```

### 14.2.5.56 show ip ospf

The `show ip ospf` command displays OSPFv2 routing information

#### Command Mode

EXEC

#### Command Syntax

```
show ip ospf [PROCESS_ID][VRF_INSTANCE]
```

#### Parameters

- PROCESS\_ID OSPFv2 process ID. Values include:
  - `<no parameter>`
  - `<1 to 65535>`
- VRF\_INSTANCE Specifies the VRF instance.
  - `<no parameter>` configures the default VRF instance.
  - `vrf vrf_name` configures the `vrf_name` instance.

#### Example

This command displays configuration parameters, operational statistics, status of the OSPFv2 instance, and a brief description of the areas on the switch.

```
switch#show ip ospf
Routing Process "ospf 1" with ID 10.168.103.1 VRF default
Supports opaque LSA
Maximum number of LSA allowed 12000
Threshold for warning message 75%
Ignore-time 5 minutes, reset-time 5 minutes
Ignore-count allowed 5, current 0
It is an area border router
Hold time between two consecutive SPF's 5000 msec
SPF algorithm last executed 00:00:09 ago
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msec
Number of external LSA 0. Checksum Sum 0x000000
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of LSA 27.
Number of areas in this router is 3. 3 normal 0 stub 0 nssa
Area BACKBONE(0.0.0.0)
Number of interfaces in this area is 2
It is a normal area
Area has no authentication
SPF algorithm executed 153 times
Number of LSA 8. Checksum Sum 0x03e13a
Number of opaque link LSA 0. Checksum Sum 0x000000
Area 0.0.0.2
Number of interfaces in this area is 1
It is a normal area
Area has no authentication
SPF algorithm executed 153 times
Number of LSA 11. Checksum Sum 0x054e57
Number of opaque link LSA 0. Checksum Sum 0x000000
Area 0.0.0.3
Number of interfaces in this area is 1
It is a normal area
Area has no authentication
SPF algorithm executed 5 times
Number of LSA 6. Checksum Sum 0x02a401
Number of opaque link LSA 0. Checksum Sum 0x000000
```

### 14.2.5.57 shutdown (OSPFv2)

The **shutdown** command disables OSPFv2 on the switch. OSPFv2 is disabled on individual interfaces with the **shutdown (OSPFv2)** command.

The **no shutdown** and **default shutdown** commands enable the OSPFv2 instance by removing the **shutdown** statement from the OSPF block in *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

#### Examples

- This command disables OSPFv2 activity on the switch.

```
switch(config)#router ospf 6  
switch(config-router-ospf)#shutdown  
switch(config-router-ospf)#
```

- This command resumes OSPFv2 activity on the switch.

```
switch(config-router-ospf)#no shutdown  
switch(config-router-ospf)#
```

### 14.2.5.58 summary-address

The **summary-address** command allows aggregation of external routes advertised by an OSPF ASBR. It is used to aggregate AS External and NSSA External LSAs.

The **default summary-address** and **no summary-address** commands delete the current **summary-address** configurations.

#### Command Mode

Router Configuration Mode

#### Command Syntax

```
summary-address {ip_address subnet_mask | ip_prefix} [attribute_map WORD | not_advertise | tag]
```

```
default summary-address {ip_address summary_mask | ip_prefix}
```

```
no summary-address {ip_address summary_mask | ip_prefix}
```

#### Parameters

- *ip\_address subnet\_mask* IPv4 subnet in dotted decimal notation.
- *ip\_prefix* IPv4 subnet in CIDR notation.
- *attribute\_map WORD* allows using a route-map to set the attributes to be advertised in the LSA. Options include:
  - set metric
  - set metric-type
  - set tag
- *not\_advertise* suppresses the advertisement of contributing external prefixes by the router
- *tag* allows setting the tag in the advertised external LSA. The tag value ranges from 0 to 4294967295. The default value is zero.

#### Guidelines

This feature reduces the size of External LSDB in OSPF, does not impact inter area and intra area LSAs. This command installs a Null0 route in FIB when at least one contributor is present.

#### Restriction

Only OSPF redistributed routes are aggregated.

#### Example

This command advertises an external LSA for 50.0.0.0/16 prefix if at least one BGP contributing route is present which falls in the subnet 50.0.0.0/16.

**Note:** The **show** commands display aggregation of BGP prefixes 50.0.0.0/24 and 50.0.1.0/24 into one OSPF AS External LSA for 50.0.0.0/16 prefix. A route-map is to set metric and tag for the advertised LSA.

```
switch(config)#router ospf 5
switch(config-router-ospf)#redistribute bgp
switch(config-router-ospf)#summary-address 50.0.0.0/16 attribute-map
BGP_AGGR
switch(config-router-ospf)#exit
switch(config)#show ip route bgp

---

### 14.2.5.59 timers lsa rx min interval (OSPFv2)

The `timers lsa rx min interval` command sets the minimum interval for acceptance of identical link-state advertisements (LSAs) from OSPFv2 neighbors.

The `no timers lsa rx min interval` and `default timers lsa rx min interval` commands restore the minimum interval to the default of one second by removing the `timers lsa rx min interval` command from *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
timers lsa rx min interval lsa_time  
no timers lsa rx min interval  
default timers lsa rx min interval
```

#### Parameter

*lsa\_time* Minimum time (in milliseconds) after which the switch will accept an identical LSA from OSPFv2 neighbors. Default is 1000 (1 second).

#### Example

This command sets the minimum LSA arrival interval to ten milliseconds.

```
switch(config)#router ospf 6  
switch(config-router-ospf)#timers lsa rx min interval 10  
switch(config-router-ospf)#
```

### 14.2.5.60 timers lsa tx delay initial (OSPFv2)

The `timers lsa tx delay initial` command sets the rate-limiting values for OSPF link-state advertisement generation.

The `no timers lsa tx delay initial` and `default timers throttle lsa all` commands restore the defaults by removing the `timers lsa tx delay initial` command from *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
timers lsa tx delay initial initial_delay min_hold max_wait
```

```
no timers lsa tx delay initial
```

```
default timers lsa tx delay initial
```

#### Parameters

- *initial\_delay* Value ranges from 0 to 600000 (ms). Default is 1000.
- *min\_hold* Value ranges from 0 to 600000 (ms). Default is 5000.
- *max\_wait* Value ranges from 0 to 600000 (ms). Default is 5000.

#### Example

This command sets the rate-limiting values for OSPF link-state advertisements to 10 milliseconds.

```
switch(config)#router ospf 6  
switch(config-router-ospf)#timers lsa tx delay initial 10  
switch(config-router-ospf)#
```

### 14.2.5.61 timers spf delay initial (OSPFv2)

The purpose of SPF throttling is to delay shortest path first (SPF) calculations when network topology is changing rapidly. The `timers spf delay initial` command controls the intervals at which the switch will perform SPF calculations. The command sets three values:

- **Initial delay:** how long the switch waits to perform an SPF calculation after a topology change in a network that has been stable throughout the hold interval. Because a topology change often causes several link state updates to be sent, the initial delay is configured to allow the network to settle before the switch performs an SPF calculation. If an additional topology change occurs during the initial interval, the SPF calculation still takes place after the expiration of the initial delay period and no other change is made to the throttle timers.
- **Hold interval:** this is an additional wait timer which scales to slow SPF calculations during periods of network instability. If a network change occurs during the hold period, an SPF calculation is scheduled to occur at the expiration of the hold interval. Subsequent hold intervals are doubled if further topology changes occur during a hold interval until either the hold interval reaches its configured maximum or no topology change occurs during the interval. If the next topology change occurs after the expiration of the hold interval, the hold interval is reset to its configured value and the SPF calculation is scheduled to take place after the initial delay.
- **Maximum interval:** the maximum time the switch will wait after a topology change before performing an SPF calculation.

The `no timers spf delay initial` and `default timers spf delay initial` commands restore the default OSPFv2 SPF calculation intervals by removing the `timers spf delay initial` command from *running-config*.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

```
timers spf delay initial initial_delay hold_interval max_interval
no timers spf
default timers spf
```

#### Parameters

- *initial\_delay* Initial delay between a topology change and SPF calculation. Value ranges from 0 to 65535000 (ms). Default is 0 (ms).
- *hold\_interval* Additional wait time after SPF calculation to allow the network to settle. If a topology change occurs during the hold interval, another SPF calculation is scheduled to occur after the hold interval expires. The next hold interval is doubled if topology changes occur during the hold interval. If doubling exceeds the maximum value, the maximum value is used instead. Value ranges from 0 to 65535000 (ms). Default is 5000 (ms).
- *max\_interval* Maximum hold interval before the switch will perform an SPF calculation. Value ranges from 0 to 65535000 (ms). Default is 5000 (ms).

#### Example

These commands set the SPF timers on the switch.

```
switch(config)#router ospf 6
switch(config-router-ospf)#timers spf 5 100 20000
switch(config-router-ospf)#
```

## 14.3 Open Shortest Path First – Version 3

Open Shortest Path First (OSPF) is a link-state routing protocol that operates within a single autonomous system. OSPF version 3 is defined by RFC 5340.

This chapter contains the following sections.

- [OSPFv3 Introduction](#)
- [OSPFv3 Conceptual Overview](#)
- [Configuring OSPFv3](#)
- [OSPFv3 Configuration Examples](#)
- [OSPFv3 Commands](#)

### 14.3.1 OSPFv3 Introduction

OSPFv3 is based on OSPF version 2 and includes enhancements that utilize IPv6 features. However, OSPFv3 is configured and operates independently of any implementation of OSPFv2 on the switch. OSPFv2 features that OSPFv3 implements include:

- Packet types
- Neighbor discovery and adjacency formation mechanisms
- LSA aging and flooding
- SPF calculations
- DR election procedure
- Multiple area support
- Router-ID (32 bits)

The following list describes the OSPFv3 differences and enhancements from OSPFv2:

- IPv6 128-bit addresses
- Use of link-local addresses
- OSPFv3 runs over links instead of subnets
- Support flood pacing

Arista switches support the following OSPFv3 functions:

- A single OSPFv3 instance for each VRF
- Intra- and inter-area routing
- Type 1 and 2 external routing
- Broadcast and P2P interfaces
- Stub areas
- Redistribution of static and connected routes into OSPFv3

### 14.3.2 OSPFv3 Conceptual Overview

This section contains the following topics:

- [Storing Link States](#)
- [Topology](#)
- [Link Updates](#)
- [OSPFv3 Security](#)
- [Flood Pacing](#)

### 14.3.2.1 Storing Link States

OSPFv3 is a dynamic, link-state routing protocol, where links represent routable paths. Dynamic routing protocols calculate the most efficient path between locations based on bandwidth and device status.

A link state advertisement (LSA) is an OSPFv3 packet that communicates a router's topology to other routers. The link state database (LSDB) stores an area's topology database and is composed of LSAs received from other routers. Routers update the LSDB by storing LSAs from other routers.

### 14.3.2.2 Topology

An autonomous system (AS) is the IP domain within which a dynamic protocol controls the routing of traffic. In OSPFv3, an AS is composed of areas, which define the LSDB computation boundaries. All routers in an area store identical LSDBs. Routers in different areas exchange updates without storing the entire database, reducing information maintenance on large, dynamic networks.

An AS shares internal routing information from its areas and external routing information from other processes to inform routers outside the AS about routes the network can access. Routers that advertise routes on other ASs commit to carry data to the IP space on the route.

OSPFv3 defines these routers:

- Internal router (IR) a router whose interfaces are contained in a single area. All IRs in an area maintain identical LSDBs.
- Area border router (ABR) a router that has interfaces in multiple areas. ABRs maintain one LSDB for each connected area.
- Autonomous system boundary router (ASBR) a gateway router connecting the OSPFv3 domain to external routes, including static routes and routes from other autonomous systems.

[OSPFv3 Router Types](#) displays the OSPFv3 router types.

**Figure 36: OSPFv3 Router Types**

OSPFv3 areas are assigned a number between 0 and 4,294,967,295. Area numbers are often expressed in dotted decimal notation, similar to IP addresses.

Each AS has a backbone area, designated as area 0, that connects to all other areas. The backbone receives routing information from all areas, then distributes it to the other areas as required.

OSPFv3 area types include:

- Normal area accepts intra-area, inter-area, and external routes. The backbone is a normal area.
- Stub area does not receive router advertisements external to the AS. Stub area routing is based on a default route.

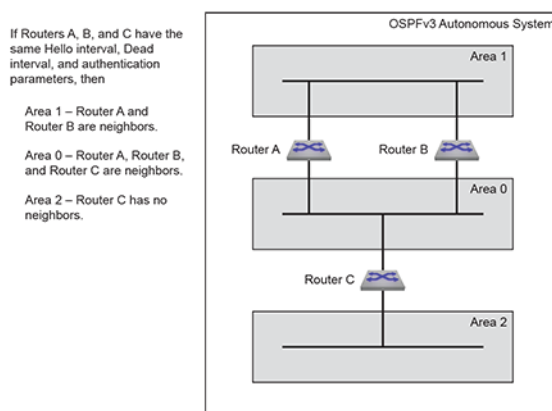

### 14.3.2.3 Link Updates

Routers periodically send hello packets to advertise status and establish neighbors. A router's hello packet includes IP addresses of other routers from which it received a hello packet within the time specified by the router dead interval. Routers become neighbors when they detect each other in their hello packets if they:

- share a common network segment.
- are in the same area.
- have the same hello interval, dead interval, and authentication parameters.

Neighbors form adjacencies to exchange LSDB information. A neighbor group uses hello packets to elect a Designated Router (DR) and Backup Designated Router (BDR). The DR and BDR become adjacent to all other neighbors, including each other. Only adjacent neighbors share database information.

[OSPFv3 Neighbors](#) illustrates OSPFv3 neighbors.

**Figure 37: OSPFv3 Neighbors**

The DR is the central contact for database exchanges. Switches send database information to their DR, which relays the information to the other neighbors. All routers in an area maintain identical LSDBs. Switches also send database information to their BDR, which stores this data without distributing it. If the DR fails, the BDR distributes LSDB information to its neighbors.

OSPFv3 routers distribute LSAs by sending them on all of their active interfaces. The router does not send hello packets from passive interfaces preventing adjacencies. The router does not process any OSPFv2 packets received on a passive interface.

When a router's LSDB is changed by an LSA, it sends the changes to the BDR and DR for distribution to the other neighbors. Routing information is updated only when the topology changes.

Routing devices use Dijkstra's algorithm to calculate the shortest path to all known destinations, based on cumulative route cost. The cost of an interface indicates the transmission overhead and is usually inversely proportional to its bandwidth.

### 14.3.2.4 OSPFv3 Security

The OSPFv3 protocol relies on the IPsec Authentication Header (AH) and Encapsulating Security Payload (ESP) header to provide data integrity, authentication and confidentiality. Transport mode provides IPsec to OSPFv3 packets.

The IPsec SA has Security Policy Index (SPI), HMAC algorithm, and a secret key as parameters. These parameters are used to compute Integrity Check Value (ICV), that is used to authenticate peers. When authentication is enabled, all corresponding peers must use same SA parameters to clear OSPFv3 ICV verification. SA can be configured at both area and interface levels.

**Note:** On the same area or interface, EOS allows security configuration with either AH or ESP but not both. We can have one area or interface configured with AH and another with ESP.

#### 14.3.2.4.1 OSPFv3 Authentication

While sending OSPFv3 packets, the HMAC-MD5 or SHA algorithm hash is inserted in the IPsec header and the packet is sent over the wire for peer authentication.

While receiving OSPFv3 packets, the computed hash is verified with the one present in the IPsec header. If it fails, OSPFv3 packets are discarded.

#### 14.3.2.4.2 OSPFv3 Encryption

ESP provides confidentiality to OSPFv3 packets. When confidentiality is enabled, ESP encrypts the sent data and decrypts the received data. OSPFv3 packets that are not encapsulated with security payload are discarded.

OSPFv3 encryption uses algorithms of Triple Data Encryption Standard (3DES) and Advanced Encryption Standard (AES). 3DES uses a 192 bit key, whereas the AES key length varies by 128, 192 and 256 bits.

#### 14.3.2.5 Flood Pacing

OSPFv3 flood pacing allows configuring the minimum interval between the transmission of consecutive Link State (LS) update packets in a network. Flood pacing provides the following benefits:

- Prevents the rapid drain of flood queue by sending consecutive LSU packets with a delay
- Helps mitigate high CPU or socket buffer utilization issues that occur when a switch instantly floods a large number of LSAs
- When LSDB is updated frequently, an incremented flood pacing interval scales down LSA flooding

**Note:** A high flood pacing interval may lead to convergence delays in large OSPF LSDBs.

### 14.3.3 Configuring OSPFv3

These sections describe basic OSPFv3 configuration steps:

- [Configuring an OSPFv3 Instance](#)
- [Configuring OSPFv3 Areas](#)
- [Configuring Interfaces for OSPFv3](#)
- [Enabling OSPFv3](#)
- [Configuring OSPFv3 Security](#)
- [Configuring OSPFv3 Flood Pacing](#)
- [Displaying OSPFv3 Status](#)

#### 14.3.3.1 Configuring an OSPFv3 Instance

##### 14.3.3.1.1 Entering OSPFv3 Configuration Mode

OSPFv3 configuration commands apply to the specified OSPFv3 instance. To perform OSPFv3 configuration commands, the switch must be in router-OSPFv3 configuration mode. The `ipv6 router ospf` command places the switch in router-OSPFv3 configuration mode, creating an OSPFv3 instance if OSPFv3 was not previously instantiated on the switch. If no VRF is specified, the OSPFv3 instance is in the default VRF. To instantiate or configure OSPFv3 on a non-default VRF, specify that VRF when using the `ipv6 router ospf` command.

The process ID identifies the OSPFv3 instance and is local to the router. Neighbor OSPFv3 routers can have different process IDs. OSPFv3 instances configured in different VRFs on the switch must have different process IDs.

The switch supports one OSPFv3 instance for each VRF. When an OSPFv3 instance already exists, the `ipv6 router ospf` command must specify its process ID (and VRF, if it is not configured in the default VRF). Attempts to define additional instances in the same VRF will generate errors. The `show ipv6 ospf` command displays information about OSPFv3 instances, including their process IDs.

### Example

This command places the switch in router-OSPFv3 configuration mode for the default VRF. If OSPFv3 was not previously instantiated in the default VRF, the command creates an OSPFv3 instance in the default VRF with a process ID of 9.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#show active
ipv6 router ospf 9
switch(config-router-ospf3)#
```

#### 14.3.3.1.2 Defining the Router ID

The router ID is a 32-bit number assigned to a router running OSPFv3. This number uniquely labels the router within an Autonomous System. Status commands identify the switch through the router ID. When configuring OSPFv3 instances in multiple VRFs, each should have a different router ID.

**Note:** A router ID is required to run OSPF, and Arista recommends setting the router ID manually for the following reasons: 1) If there are no IPv4 addresses configured on the switch, a manually configured router ID is required. 2) The router ID also does not change if the interface status or IP address changes, which can cause confusion if the ID has been selected automatically.

The switch sets the router ID to the first available alternative in the following list:

1. The `router-id` command.
2. The loopback IPv6 address, if a loopback interface is active on the switch.
3. The highest IPv6 address on the router.

**Note:** When configuring VXLAN on an MLAG, always manually configure the OSPFv3 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The `router-id (OSPFv3)` command configures the router ID for an OSPFv3 instance.

### Example

This command assigns 15.1.1.1 as the OSPFv3 router ID.

```
switch(config-router-ospf3)#router-id 15.21.4.9
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  router-id 15.21.4.9
switch(config-router-ospf3)#
```

#### 14.3.3.1.3 Global OSPFv3 Parameters

These router-OSPFv3 configuration mode commands define OSPFv3 behavior for the OSPFv3 instance under which they are used.

---

## Logging Adjacency Changes

The `log-adjacency-changes (OSPFv3)` command configures the switch to log OSPFv3 link-state changes and transitions of OSPFv3 neighbors into the up or down state.

### Examples

- This command configures the switch to log transitions of OSPFv3 neighbors into the up or down state.

```
switch(config-router-ospf3)#log-adjacency-changes
switch(config-router-ospf3)#
```

- This command configures the switch to log all OSPFv3 link-state changes.

```
switch(config-router-ospf3)#log-adjacency-changes detail
switch(config-router-ospf3)#
```

## Intra-Area Distance

The `distance ospf intra-area (OSPFv3)` command configures the administrative distance for routes contained in a single OSPFv3 area. Administrative distances compare dynamic routes configured by different protocols. The default administrative distance for intra-area routes is 10.

### Example

This command configures an administrative distance of 90 for OSPFv3 intra-area routes.

```
switch(config-router-ospf3)#distance ospf intra-area 90
switch(config-router-ospf3)#show active
ipv6 router ospf 9
    distance ospf intra-area 90
switch(config-router-ospf3)#
```

## Passive Interfaces

The `passive-interface (OSPFv3)` command prevents the transmission of hello packets on the specified interface. Passive interfaces drop all adjacencies and do not form new adjacencies. Although passive interfaces do not send or receive LSAs, other interfaces may generate LSAs for the network segment. The router does not send OSPFv3 packets from a passive interface or process OSPFv3 packets received on a passive interface. The router advertises the passive interface in the router LSA.

The `no passive-interface` command re-enables OSPFv3 processing on the specified interface.

### Examples

- This command configures VLAN 200 as a passive interface.

```
switch(config-router-ospf3)#passive-interface vlan 200
switch(config-router-ospf3)#show active
ipv6 router ospf 9
    passive-interface Vlan200
switch(config-router-ospf3)#
```

- This command configures VLAN 200 as an active interface.

```
switch(config-router-ospf3)#no passive-interface vlan 200
switch(config-router-ospf3)#show active
ipv6 router ospf 9
switch(config-router-ospf3)#
```

## Redistributing Connected Routes

Redistributing connected routes causes the OSPFv3 instance to advertise all connected routes on the switch as external OSPFv3 routes. Connected routes are routes that are established when IPv6 is enabled on an interface.

### Example

The `redistribute (OSPFv3) connected` command converts connected routes to OSPFv3 external routes.

```
switch(config-router-ospf3)#redistribute connected
switch(config-router-ospf3)#show active
ipv6 router ospf 9
    redistribute connected
switch(config-router-ospf3)#
```

## Redistributing Static Routes

Redistributing static routes causes the OSPFv3 instance to advertise all static routes on the switch as external OSPFv3 routes. The switch does not support redistributing individual static routes.

### Example

The `redistribute (OSPFv3) static` command converts static routes to OSPFv3 external routes.

```
switch(config-router-ospf3)#redistribute static
switch(config-router-ospf3)#show active
ipv6 router ospf 9
    redistribute static
switch(config-router-ospf3)#
```

### 14.3.3.2 Configuring OSPFv3 Areas

OSPFv3 areas are configured through area commands. The switch must be in router-OSPFv3 configuration mode, as described in [Entering OSPFv3 Configuration Mode](#), to run area commands.

Areas are assigned a 32-bit number that is expressed in decimal or dotted-decimal notation. When an OSPFv3 instance configuration contains multiple areas, the switch only configures areas associated with its interfaces.

#### 14.3.3.2.1 Configuring the Area Type

The `no area (OSPFv3)` command specifies the area type. The switch supports three area types:

- Normal area: Area that accepts intra-area, inter-area, and external routes. The backbone area (area 0) is a normal area.
- Stub area: Area where external routes are not advertised. External routes are reached through a default summary route (0.0.0.0) inserted into stub areas. Networks with no external routes do not require stub areas.

The default area type is normal.

### Example

These commands configures area 200 as a NSSA area and 300 as a stub area.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 200 nssa
switch(config-router-ospf3)#area 300 stub
switch(config-router-ospf3)#show active
```

```
ipv6 router ospf 9
  area 0.0.0.200
  area 0.0.1.44 stub
switch(config-router-ospf3) #
```

### 14.3.3.2.2 Configuring Area Parameters

These router-OSPFv3 configuration mode commands define OSPFv3 behavior in a specified area.

#### Default Summary Route Cost

The **area default-cost (OSPFv3)** command specifies the cost of the default summary route that ABRs send into a stub area or NSSA. Summary routes, also called inter-area routes, originate in areas different than their destination. When the **area default-cost** command is not configured for an area, the default-cost of that area is set to 10.

#### Example

This command configures a cost of 25 for the default summary route in area 0.0.1.194 (450).

```
switch(config-router-ospf3) #area 450 default-cost 25
switch(config-router-ospf3) #show active
ipv6 router ospf 9
  area 0.0.1.194 default-cost 25
```

#### Area Stub

The **area stub (OSPFv3)** command configures the area type of an OSPFv3 area. All routers in an AS must specify the same area type for identically numbered areas.

Stub areas are areas in which external routes are not advertised. To reach these external routes, the stub area uses a default summary route (0.0.0.0). Networks without external routes do not require stub areas.

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

#### Examples

- This command configures area 45 as a stub area.

```
switch(config) #ipv6 router ospf 3
switch(config-router-ospf3) #area 45 stub
switch(config-router-ospf3) #
```

- This command configures area 10.92.148.17 as a stub area.

```
switch(config-router-ospf3) #area 10.92.148.17 stub
switch(config-router-ospf3) #
```

#### Area Range

The **area range (OSPFv3)** command is used by OSPFv3 area border routers (ABRs) to consolidate or summarize routes, to configure a cost setting for those routes, and to suppress summary route advertisements.

By default, an ABR creates a summary LSA for each route in an area and advertises that LSA to adjacent areas. The **area range (OSPFv3)** command aggregates routing information on area boundaries, allowing the ABR to use one summary LSA to advertise multiple routes.

#### Examples

- These commands consolidate and summarize routes at an area boundary 1.

```
switch(config)#ipv6 router ospf 1
switch(config-router-ospf3)#area 1 range 2001:0DB8:0:1::/64
switch(config-router-ospf3)#
```

- These commands change the address range status to DoNotAdvertise. Neither one of the individual intra-area routes falling under range or the ranged prefix is advertised as summary LSA.

```
switch(config)#ipv6 router ospf 1
switch(config-router-ospf3)#area 1 range 2001:0DB8:0:1::/64 not-
advertise
switch(config-router-ospf3)#
```

### 14.3.3.3 Configuring Interfaces for OSPFv3

OSPFv3 interface configuration commands enable OSPFv3 on an interface, assign the interface to an area, and specify transmission parameters for routed ports and SVIs that handle OSPFv3 packets.

#### 14.3.3.3.1 Assigning an Interface to an Area

The `ipv6 ospf area` command enables OSPFv3 on the configuration mode interface and associates the specified area to the interface. Each routed interface can be associated with one OSPFv3 area; subsequent `ipv6 ospf area` commands that designate a different area on an interface replace any existing command for the interface.

#### Example

These commands enable OSPFv3 instance 9 on VLAN interface 200 and associate area 0 to the interface.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 ospf 9 area 0
switch(config-if-Vl200)#show active
interface Vlan200
  ipv6 ospf 9 area 0.0.0.0
switch(config-if-Vl200)#
```

#### 14.3.3.3.2 Configuring Intervals

Interval configuration commands determine OSPFv3 packet transmission characteristics for a specified VLAN interface. Interval configuration commands are entered in vlan-interface configuration mode.

#### Hello Interval

The hello interval specifies the period between consecutive hello packet transmissions from an interface. Each OSPFv3 neighbor should specify the same hello interval, which should not be longer than any neighbors dead interval.

The `ospfv3 hello-interval` command configures the hello interval for the configuration mode interface. The default is 10 seconds.

#### Example

These commands configure a hello interval of 45 seconds for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 hello-interval 45
switch(config-if-Vl200)#show active
interface Vlan200
```

```
ospfv3 hello-interval 45
switch(config-if-Vl200) #
```

### Dead Interval

The dead interval specifies the period that an interface waits for an OSPFv3 packet from a neighbor before it disables the adjacency under the assumption that the neighbor is down. The dead interval should be configured identically on all OSPFv3 neighbors and be longer than the hello interval of any neighbor.

The `ospfv3 dead-interval` command configures the dead interval for the configuration mode interface. The default is 40 seconds.

### Example

This command configures a dead interval of 75 seconds for VLAN 200.

```
switch(config) #interface vlan 200
switch(config-if-Vl200) #ospfv3 dead-interval 75
switch(config-if-Vl200) #show active
interface Vlan200
    ospfv3 dead-interval 75
switch(config-if-Vl200) #
```

### Retransmission Interval

Routers that send OSPFv3 advertisements to an adjacent router expect to receive an acknowledgment from that neighbor. Routers that do not receive an acknowledgment will retransmit the advertisement. The retransmission interval specifies the period between retransmissions.

The `ospfv3 ipv6 retransmit-interval` command configures the LSA retransmission interval for the configuration mode interface. The default retransmission interval is 5 seconds.

### Example

This command configures a retransmission interval of 25 seconds for VLAN 200.

```
switch(config) #interface vlan 200
switch(config-if-Vl200) #ospfv3 ipv6 retransmit-interval 25
switch(config-if-Vl200) #show active
interface Vlan200
    ospfv3 ipv6 retransmit-interval 25
switch(config-if-Vl200) #
```

### Transmission Delay

The transmission delay is an estimate of the time that an interface requires to transmit a link-state update packet. OSPFv3 adds this delay to the age of outbound packets to more accurately reflect the age of the LSA when received by a neighbor.

The `ospfv3 transmit-delay` command configures the transmission delay for the configuration mode interface. The default transmission delay is one second.

### Example

This command configures a transmission delay of 10 seconds for VLAN 200.

```
switch(config) #interface vlan 200
switch(config-if-Vl200) #ospfv3 transmit-delay 10
switch(config-if-Vl200) #show active
interface Vlan200
    ospfv3 transmit-delay 10
```

```
switch(config-if-Vl200) #
```

### 14.3.3.3 Configuring Interface Parameters

#### Interface Cost

The OSPFv3 interface cost reflects the overhead of sending packets across the interface. The cost is typically assigned to be inversely proportional to the bandwidth of the interface. The `ospfv3 cost` command configures the OSPFv3 cost for the configuration mode interface. The default cost is 10.

#### Example

This command configures a cost of 50 for VLAN 200.

```
switch(config) #interface vlan 200
switch(config-if-Vl200) #ospfv3 cost 50
switch(config-if-Vl200) #show active
interface Vlan200
    ospfv3 cost 50
switch(config-if-Vl200) #
```

#### Router Priority

Router priority determines preference during designated router (DR) and backup designated router (BDR) elections. Routers with higher priority numbers have preference over other routers. Routers with a priority of zero cannot be elected as a DR or BDR.

The `ospfv3 priority` command configures router priority for the configuration mode interface. The default priority is 1.

#### Example

This command configures a router priority of 128 for VLAN 200.

```
switch(config) #interface vlan 200
switch(config-if-Vl200) #ospfv3 priority 128
switch(config-if-Vl200) #show active
interface Vlan200
    ospfv3 priority 128
switch(config-if-Vl200) #
```

### 14.3.3.4 Enabling OSPFv3

#### 14.3.3.4.1 IP Routing

OSPFv3 requires that IPv6 unicast routing is enabled on the switch. When IP routing is not enabled, entering OSPFv3 configuration mode generates a message.

#### Examples

- This message is displayed if, when entering router-OSPFv3 configuration mode, IPv6 unicast routing is not enabled.

```
switch(config) #ipv6 router ospf 9
! IPv6 routing not enabled
switch(config-router-ospf3) #
```

- This command enables IP routing on the switch.

```
switch(config)#ipv6 unicast-routing
```

#### 14.3.3.4.2 Disabling OSPFv3

The **shutdown (OSPFv3)** disables OSPFv3 operations on the switch without disrupting the OSPFv3 configuration. To disable OSPFv3 on an interface, remove the **ipv6 ospf area** statement for the corresponding interface.

The **no shutdown** command resumes OSPFv3 activity.

##### Examples

- This command disables OSPFv3 activity on the switch.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#shutdown
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  shutdown
switch(config-router-ospf3)#
```

- This command resumes OSPFv3 activity on the switch.

```
switch(config-router-ospf3)#no shutdown
switch(config-router-ospf3)#show active
ipv6 router ospf 9
switch(config-router-ospf3)#
```

#### 14.3.3.5 Configuring OSPFv3 Security

You can configure OSPFv3 security for either an area or an interface, or both, using either an Authentication Header (AH) or an Encapsulating Security Payload (ESP).

When OSPFv3 security is configured on an area, the configured settings apply to all interfaces in that area. Interface-specific configuration overrides configuration on the area to which the interface belongs.

##### 14.3.3.5.1 Configuring OSPFv3 Authentication

###### Configuring OSPFv3 Authentication for Areas

The **area authentication ipsec spi** command configures OSPFv3 authentication on an area.

##### Example

This command configures OSPFv3 authentication on an area with MD5 hash algorithm.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 0.0.0.0 authentication ipsec spi 34 md5
0 8FD6158BFE81ADD961241D8E4169D411
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 0.0.0.0 authentication ipsec spi 34 md5 7 $1$cNpcrQ11cz
qdvKAZkLtYVr6I7+R3niuWouDKKYCFNs4/XOWG/Iap5Q==
switch(config-router-ospf3)#
```

###### Configuring OSPFv3 Authentication for Interfaces

The **ospfv3 authentication ipsec spi** command configures OSPFv3 authentication on an interface.

##### Example

This command configures OSPFv3 authentication on an interface with MD5 hash algorithm.

```
switch(config-if-Et9)#ospfv3 authentication ipsec spi 3456 md5 0
8FD6158BFE81ADD961241D8E4169D411
switch(config-if-Et9)#show active
interface Ethernet9
  no switchport
  ospfv3 authentication ipsec spi 3456 md5 7 $1$xtmcMSPzEn+Njp8Lb4qryVV
OjKcjsrYuv6dxlO+nSwKQdaiRt2RPTQ==
switch(config-if-Et9)#
```

#### 14.3.3.5.2 Configuring OSPFv3 Encryption

##### Configuring OSPFv3 Encryption for Areas

The `area encryption ipsec spi` command configures OSPFv3 security on an area.

##### Example

This command configures OSPFv3 security on an area with 3DES-CBC encryption and MD5 hash algorithm.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 0.0.0.0 encryption ipsec spi 5678 esp
3des-cbc md5 passphrase 0 8FD6158BFE81ADD961241D8E4169D411
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase 7
$1$cNpcrQ1lczqdvKAZKLtYVr6I7+R3niuWouDKKYCFNs4/XOWG/Iap5Q==
switch (config-router-ospf3)#
```

##### Configuring OSPFv3 Encryption for Interfaces

The `ospfv3 encryption ipsec spi` command configures OSPFv3 security on an interface.

##### Example

This command configures OSPFv3 security on an interface with 3DES-CBC encryption and SHA1 algorithm.

```
switch(config)#interface ethernet 9
switch(config-if-Et9)#ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1
passphrase 0 2fd4e1c67a2d28fced849ee1bb76e7391b93eb12
switch(config-if-Et9)#show active
interface Ethernet9
  no switchport
  ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 7
$1$VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfbV4VXKNOOQF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9)#
```

#### 14.3.3.6 Configuring OSPFv3 Flood Pacing

Flood pacing can be configured for global OSPFv3 instances and address families. The `timers pacing flood` command configures OSPFv3 flood pacing.

##### Examples

- This command configures OSPFv3 flood pacing timer to 50 ms in the global OSPFv3 instance.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#timers pacing flood 50
switch(config-router-ospf3)#show ipv6 ospf
```

```

Routing Process "ospfv3 9" with ID 13.13.13.13 and Instance 0 VRF
default
  FIPS mode disabled
  It is not an autonomous system boundary router and is not an area
border router
  Minimum LSA arrival interval 1000 msec
  Initial LSA throttle delay 1000 msec
  Minimum hold time for LSA throttle 5000 msec
  Maximum wait time for LSA throttle 5000 msec
  Interface flood pacing timer 50 msec
  It has 0 fully adjacent neighbors
  Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
  Number of LSAs 1
  Initial SPF schedule delay 0 msec
  Minimum hold time between two consecutive SPF's 5000 msec
  Current hold time between two consecutive SPF's 5000 msec
  Maximum wait time between two consecutive SPF's 5000 msec
  SPF algorithm last executed 21d19h ago
  No scheduled SPF
  Adjacency exchange-start threshold is 20
  Maximum number of next-hops supported in ECMP is 32
  Number of backbone neighbors is 0
  Graceful-restart is not configured
  Graceful-restart-helper mode is enabled
  Area 0.0.0.0
    Number of interface in this area is 0
    It is a normal area
    SPF algorithm executed 2 times

```

- This command configures OSPFv3 flood pacing timer to 50 ms for ipv4 address family.

```

switch(config)#router ospfv3
switch(config-router-ospfv3)#address-family ipv4
switch(config-router-ospfv3-af)#timers pacing flood 50
switch(config-router-ospfv3-af)#show ospfv3
OSPFv3 address-family ipv4
Routing Process "ospfv3" with ID 11.1.11.1 and Instance 64 VRF default
  FIPS mode disabled
  It is not an autonomous system boundary router and is not an area
border router
  Minimum LSA arrival interval 1000 msec
  Initial LSA throttle delay 1000 msec
  Minimum hold time for LSA throttle 5000 msec
  Maximum wait time for LSA throttle 5000 msec
  Interface flood pacing timer 50 msec
  It has 0 fully adjacent neighbors
  Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
  Number of LSAs 1
  Initial SPF schedule delay 0 msec
  Minimum hold time between two consecutive SPF's 5000 msec
  Current hold time between two consecutive SPF's 5000 msec
  Maximum wait time between two consecutive SPF's 5000 msec
  SPF algorithm last executed 00:01:05 ago
  No scheduled SPF
  Adjacency exchange-start threshold is 20
  Maximum number of next-hops supported in ECMP is 32
  Number of backbone neighbors is 0
  Graceful-restart is not configured
  Graceful-restart-helper mode is enabled
  Area 0.0.0.0
    Number of interface in this area is 0
    It is a normal area
    SPF algorithm executed 2 times

```

### 14.3.3.7 Displaying OSPFv3 Status

This section describes OSPFv3 **show** commands that display OSPFv3 status. General switch methods that provide OSPFv3 information include pinging routes, viewing route status (**show ip route** command), and viewing the configuration (**show running-config** command).

#### 14.3.3.7.1 OSPFv3 Summary

The **show ipv6 ospf** command displays general OSPFv3 configuration information, operational statistics and status for the OSPFv3 instance, followed by a brief description of the areas configured on the switch.

##### Example

- This command displays OSPFv3 routing process information.

```
switch(config-router-ospf3)#show ipv6 ospf
Routing Process "ospfv3 1" with ID 1.1.1.1 and Instance 0 VRF default
  It is not an autonomous system boundary router and is not an area
  border router
  Minimum LSA arrival interval 1000 msec
  Initial LSA throttle delay 1000 msec
  Minimum hold time for LSA throttle 5000 msec
  Maximum wait time for LSA throttle 5000 msec
  Interface flood pacing timer 50 msec
  It has 0 fully adjacent neighbors
  ...
  Graceful-restart is not configured
  Graceful-restart-helper mode is enabled
```

#### 14.3.3.7.2 Viewing OSPFv3 on the Interfaces

The **show ipv6 ospf interface** command displays OSPFv3 information for switch interfaces configured for OSPFv3. Different command options allow the display of either all interfaces or a specified interface. The command can also be configured to display complete information or a brief summary.

##### Example

This command displays OSPFv3 information for interfaces where OSPFv3 is enabled.

```
switch#show ipv6 ospf interface
Ethernet17 is up
  Interface Address fe80::48c:73ff:fe00:1319%Ethernet12, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State Backup DR, Priority 1
  Designated Router is 10.37.0.37
  Backup Designated Router is 10.37.0.23
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
Vlan31 is up
  Interface Address fe80::48c:73ff:fe00:1319%Vlan31, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State Backup DR, Priority 1
  Designated Router is 10.37.0.22
  Backup Designated Router is 10.37.0.23
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
Vlan32 is up
  Interface Address fe80::48c:73ff:fe00:1319%Vlan32, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State DR Other, Priority 1
```

```

Designated Router is 10.37.0.11
Backup Designated Router is 10.37.0.22
Timer intervals configured, Hello 10, Dead 40, Retransmit 5
Neighbor Count is 2
switch#

```

### 14.3.3.7.3 Viewing the OSPFv3 Database

The `show ipv6 ospf database <link state list>` command displays the LSAs in the LSDB for the specified area. If no area is listed, the command displays the contents of the database for each area on the switch. The database command provides options to display subsets of the LSDB database, a summary of database contents, and the link states that comprise the database.

#### Example

This command displays the OSPFv3 database of link state advertisements (LSAs).

```

switch#show ipv6 ospf database
Routing Process "ospf 9":

  AS Scope LSDB

Type          Link ID      ADV Router   Age          Seq#         Checksum
AEX           0.0.0.5     10.37.0.37   15 0x80000005  0x00be82
AEX           0.0.0.9     10.37.0.22   1747 0x8000002b  0x00df56
AEX           0.0.0.3     10.37.0.46   599 0x8000002d  0x00651d

Area 0.0.0.0 LSDB

Type          Link ID      ADV Router   Age          Seq#         Checksum
RTR           0.0.0.0     10.37.0.32   234 0x80000031  0x00585a
NTW           0.0.0.26    10.37.0.32   271 0x80000005  0x005609
NAP           0.0.0.26    10.37.0.32   274 0x80000005  0x00964c

Interface vlan3911 LSDB

Type          Link ID      ADV Router   Age          Seq#         Checksum
LNK           0.0.0.38    10.37.0.22   267 0x80000005  0x00a45a
LNK           0.0.0.23    10.37.0.23   270 0x8000002c  0x005b7e

Interface vlan3902 LSDB

Type          Link ID      ADV Router   Age          Seq#         Checksum

LNK           0.0.0.37    10.37.0.22   7 0x8000002b  0x00ce23
LNK           0.0.0.22    10.37.0.23   250 0x8000002d  0x00c350

switch#

```

### 14.3.3.7.4 Viewing OSPFv3 Neighbors

The `show ipv6 ospf neighbor` command displays information about the routers that are neighbors to the switch. Command options allow the display of summary or detailed information about the neighbors to all areas and interfaces on the switch. The command also allows for the display of neighbors to individual interfaces or areas. The `adjacency-changes` option displays the interfaces adjacency changes.

#### Example

This command displays the switch's neighbors.

```
switch#show ipv6 ospf neighbor
Routing Process "ospf 9":
Neighbor 10.37.0.37 priority is 1, state is Full
  In area 0.0.0.0 interface et12
  DR is 10.37.0.37 BDR is 10.37.0.23
  Options is 0
  Dead timer is due in 37 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
  In area 0.0.0.0 interface vlan3911
  DR is 10.37.0.22 BDR is 10.37.0.23
  Options is 0
  Dead timer is due in 31 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
  In area 0.0.0.0 interface vlan3902
  DR is 10.37.0.11 BDR is 10.37.0.22
  Options is 0
  Dead timer is due in 31 seconds
Neighbor 10.37.0.22 priority is 1, state is Full
  In area 0.0.0.0 interface vlan3908
  DR is 10.37.0.22 BDR is 10.37.0.21
  Options is 0
  Dead timer is due in 39 seconds

switch#
```

#### 14.3.3.7.5 Viewing OSPFv3 Routes

The **show ipv6 routes** command provides an OSPFv3 option.

##### Example

This command displays the switch's OSPFv3 routes.

```
switch#show ipv6 route ospf
IPv6 Routing Table - 43 entries
Codes: C - connected, S - static, K - kernel, O - OSPF, B - BGP, R - RIP,
A -
Aggregate

O   fd7a:3279:81a4:1112::/64 [150/11]
    via fe80::21c:41ff:fe00:d120, Ethernet12
O   fd7a:3279:81a4:1114::/64 [150/11]
    via fe80::21c:41ff:fe00:d120, Ethernet12
O   fd7a:3279:81a4:1124::/64 [10/20]
    via fe80::21c:41ff:fe01:5fe1, Vlan3901
    via fe80::21c:41ff:fe01:5fe1, Vlan3902
    via fe80::21c:41ff:fe01:5fe1, Vlan3908
O   fd7a:3279:81a4:1a00::25/128 [150/11]
    via fe80::21c:41ff:fe00:d120, Ethernet12
O   fd7a:3279:81a4:1a00::28/128 [150/11]
    via fd7a:3279:81a4:fe40::5, Vlan3908
```

### 14.3.4 OSPFv3 Configuration Examples

This section describes the commands required to configure three OSPFv3 topologies.

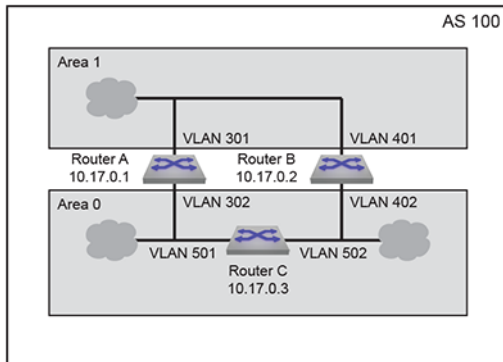

### 14.3.4.1 OSPFv3 Configuration Example 1

The AS in Example 1 contains two areas that are connected through two routers. The backbone area also contains an internal router that connects two links.

#### 14.3.4.1.1 Example 1 Topology

[OSPFv3 Example 1](#) displays the Example 1 topology. Two ABRs connect area 0 and area 1 Router A and Router B. Router C is an internal router that connects two links in area 0. Area 0 is normal; area 1 is stub.

**Figure 38: OSPFv3 Example 1**

#### Area 1 Configuration

Area 1 contains links to ABRs Router A and Router B.

- Router A is accessed through VLAN 301.
- Router B is accessed through VLAN 401.
- Designated Router (DR): Router A.
- Backup Designated Router (BDR): Router B.
- Each router defines an interface cost of 10.
- Router priority is not specified for either router on area 1.

#### Area 0 ABR Configuration

Area 0 contains links to ABRs Router A and Router B.

- Router A is accessed through VLAN 302.
- Router B is accessed through VLAN 402.
- Designated Router (DR): Router B.
- Backup Designated Router (BDR): Router A.
- Each router defines an interface cost of 20.
- Each router defines a retransmit-interval of 10.
- Each router defines a transmit-delay of 2.
- Router priority is specified such that Router B will be elected as the Designated Router.

#### Area 0 IR Configuration

Area 0 contains two links to an internal router.

- Router C is accessed through VLAN 501 and VLAN 502.
- VLAN 501 is configured as follows:
  - Interface cost of 20.

- Retransmit-interval of 10.
- Transmit-delay of 2.
- VLAN 502 is configured as follows:
  - Interface cost of 20.
  - Dead interval of 80 seconds.

#### 14.3.4.1.2 Example 1 Code

This code configures the OSPFv3 instances on the three switches.

##### 1. Configure the areas and router IDs.

###### a. Router A OSPFv3 instance configuration:

```
switch-A(config)#ipv6 router ospf 100
switch-A(config-router-ospfv3)#area 1 stub
switch-A(config-router-ospfv3)#router-id 10.17.0.1
```

###### b. Router B OSPFv3 instance configuration:

```
switch-B(config)#ipv6 router ospf 100
switch-B(config-router-ospfv3)#area 1 stub
switch-B(config-router-ospfv3)#router-id 10.17.0.2
```

###### c. Router C OSPFv3 instance configuration: interfaces:

```
switch-C(config)#ipv6 router ospf 100
switch-C(config-router-ospfv3)#router-id 10.17.0.3
```

##### 2. Configure the interface OSPFv3 area and transmission parameters.

###### a. Router A interfaces:

```
switch-A(config)#interface vlan 301
switch-A(config-if-Vl301)#ipv6 ospf 100 area 1
switch-A(config-if-Vl301)#ospfv3 cost 10
switch-A(config-if-Vl301)#ospfv3 priority 6
switch-A(config-if-Vl301)#exit
switch-A(config)#interface vlan 302
switch-A(config-if-Vl302)#ipv6 ospf 100 area 0
switch-A(config-if-Vl302)#ospfv3 cost 20
switch-A(config-if-Vl302)#ospfv3 ipv6 retransmit-interval 10
switch-A(config-if-Vl302)#ospfv3 transmit-delay 2
switch-A(config-if-Vl302)#ospfv3 priority 4
```

###### b. Router B interfaces:

```
switch-B(config)#interface vlan 401
switch-B(config-if-Vl401)#ipv6 ospf 100 area 1
switch-B(config-if-Vl401)#ospfv3 cost 10
switch-B(config-if-Vl401)#ospfv3 priority 4
switch-B(config-if-Vl401)#exit
switch-B(config)#interface vlan 402
switch-B(config-if-Vl402)#ipv6 ospf 100 area 0
switch-B(config-if-Vl402)#ospfv3 cost 20
switch-B(config-if-Vl402)#ospfv3 ipv6 retransmit-interval 10
switch-B(config-if-Vl402)#ospfv3 transmit-delay 2
switch-B(config-if-Vl402)#ospfv3 priority 6
```

c. Router C interfaces:

```
switch-C(config)#interface vlan 501
switch-C(config-if-Vl501)#ipv6 ospf 100 area 0
switch-C(config-if-Vl501)#ospfv3 cost 20
switch-C(config-if-Vl501)#ospfv3 ipv6 retransmit-interval 10
switch-C(config-if-Vl501)#ospfv3 transmit-delay 2
switch-C(config-if-Vl501)#exit
switch-C(config)#interface vlan 502
switch-C(config-if-Vl502)#ipv6 ospf 100 area 0
switch-C(config-if-Vl502)#ospfv3 cost 20
switch-C(config-if-Vl502)#ospfv3 dead-interval 80
```

#### 14.3.4.2 OSPFv3 Configuration Example 2

The AS in Example 2 contains three areas. Area 0 connects to the other areas through different routers and contains an internal router connecting two links. Area 0 is normal; the other areas are stub areas.

##### 14.3.4.2.1 Example 2 Topology

OSPFv3 Example 2 displays the Example 2 topology. One ABR (Router B) connects area 0 and area 1; another ABR (router C) connects area 0 and area 2. Router A is an internal router that connects two links in area 0.

Figure 39: OSPFv3 Example 2

#### Area 1 Configuration

Area 1 contains one link that is accessed by Router B.

- Router B is accessed through VLAN 601.

- The router defines a interface cost of 10.

### Area 2 Configuration

Area 2 contains one link that is accessed by Router C.

- Router C is accessed through VLAN 802.
- The router defines a interface cost of 20.

### Area 0 ABR Configuration

One ABR Router B link connects area 1 to area 0. One ABR Router C link connects area 0 to area 2.

- Router B is accessed through VLAN 602.
- Router C is accessed through VLAN 801.
- Designated Router (DR): Router B.
- Backup Designated Router (BDR): Router C.
- Each router defines an interface cost of 20.
- Each router defines a retransmit-interval of 10.
- Each router defines a transmit-delay of 2.

### Area 0 IR Configuration

Area 0 contains links connected by an internal router.

- Router A is accessed through VLAN 701 and 702.
- The VLAN 701 link is configured as follows:
  - Interface cost of 10.
- The VLAN 702 link is configured as follows:
  - Interface cost of 20.
  - Retransmit-interval of 10.
  - Transmit-delay of 2.

#### 14.3.4.2.2 Example 2 Code

1. Configure the areas and router IDs.
  - a. Router A OSPFv3 instance configuration:

```
switch-A(config)#ipv6 router ospf 200
switch-A(config-router-ospfv3)#router-id 10.24.1.10
```

- b. Router B OSPFv3 instance configuration:

```
switch-B(config)#ipv6 router ospf 200
switch-B(config-router-ospfv3)#area 1 stub
switch-B(config-router-ospfv3)#router-id 10.24.2.10
```

- c. Router C OSPFv3 instance configuration:

```
switch-C(config)#ipv6 router ospf 200
switch-C(config-router-ospfv3)#area 1 stub
switch-C(config-router-ospfv3)#router-id 10.25.2.12
```

2. Configure the interface OSPFv3 area and transmission parameters.

- a. Router A interfaces:

```
switch-A(config)#interface vlan 701
```

```
switch-A(config-if-Vl701)#ipv6 ospf 200 area 0
switch-A(config-if-Vl701)#ospfv3 cost 10
switch-A(config-if-Vl701)#exit
switch-A(config)#interface vlan 702
switch-A(config-if-Vl702)#ipv6 ospf 200 area 0
switch-A(config-if-Vl702)#ospfv3 cost 20
switch-A(config-if-Vl702)#ospfv3 ipv6 retransmit-interval 10
switch-A(config-if-Vl702)#ospfv3 transmit-delay 2
```

**b. Router B interfaces:**

```
switch-B(config)#interface vlan 601
switch-B(config-if-Vl601)#ospfv3 200 area 1
switch-B(config-if-Vl601)#ospfv3 cost 10
switch-B(config-if-Vl601)#exit
switch-B(config)#interface vlan 602
switch-B(config-if-Vl602)#ospfv3 200 area 0
switch-B(config-if-Vl602)#ospfv3 cost 20
switch-B(config-if-Vl602)#ospfv3 ipv6 retransmit-interval 10
switch-B(config-if-Vl602)#ospfv3 transmit-delay 2
switch-B(config-if-Vl602)#ospfv3 priority 6
```

**c. Router C interfaces:**

```
switch-C(config)#interface vlan 801
switch-C(config-if-Vl801)#ospfv3 200 area 0
switch-C(config-if-Vl801)#ospfv3 cost 20
switch-C(config-if-Vl801)#ospfv3 ipv6 retransmit-interval 10
switch-C(config-if-Vl801)#ospfv3 transmit-delay 2
switch-C(config-if-Vl801)#exit
switch-C(config)#interface vlan 802
switch-C(config-if-Vl802)#ospfv3 200 area 2
switch-C(config-if-Vl802)#ospfv3 cost 20
switch-C(config-if-Vl802)#ospfv3 dead-interval 80
```

### 14.3.4.3 OSPFv3 Configuration Example 3

The AS in Example 3 contains two areas that connect through one ABR. Each area also contains an ASBR that connects static routes to the AS.

#### 14.3.4.3.1 Example 3 Topology

[OSPFv3 Example 3](#) displays the Example 3 topology. One ABR connects area 0 and area 1. Router C is an ABR that connects the areas. Router A is an internal router that connects two links in area 1. Router D and Router E are internal routers that connect links in area 0. Router B and Router F are ASBRs that connect static routes outside the AS to area 1 and area 0, respectively.

**Figure 40: OSPFv3 Example 3**

### Area 0 ABR Configuration

ABR Router C connects one area 0 link to an area 1 link.

- Router C is accessed through VLAN 1302.
- All interface OSPFv3 parameters are set to their default values.

### Area 0 IR Configuration

Area 0 contains two internal routers, each of which connects two of the three links in the area.

- Router D is accessed through VLAN 1401 and VLAN 1402.
- Router E is accessed through VLAN 1501 and VLAN 1502.
- All interface OSPFv3 parameters are set to their default values.

### Area 0 ASBR Configuration

ASBR Router F connects one area 0 link to an external link.

- Router F is accessed through VLAN 1601.
- Router F connects to the external AS through VLAN 1602.
- All interface OSPFv3 parameters are set to their default values.

### Area 1 ABR Configuration

ABR Router C connects one area 0 link to an area 1 link.

- Router C is accessed by area 1 through VLAN 1301.
- Router C is accessed by area 0 through VLAN 1302.
- All interface OSPFv3 parameters are set to their default values.

### Area 1 IR Configuration

Area 1 contains one internal router that connects two links in the area.

- Router A is accessed through VLAN 1101 and VLAN 1102.
- All interface OSPFv3 parameters are set to their default values.

### Area 1 ASBR Configuration

ASBR Router B connects one area 1 link to an external link.

- Router B is access through VLAN 1201.
- Router B connects to the external AS through VLAN 1202.
- All interface OSPFv3 parameters are set to their default values.

#### 14.3.4.3.2 Example 3 Code

##### 1. Configure the areas and router IDs.

###### a. Router A OSPFv3 instance configuration:

```
switch-A(config)#ipv6 router ospf 300
switch-A(config-router-ospfv3)#router-id 10.12.15.10
switch-A(config-router-ospfv3)#area 1 stub
```

###### b. Router B OSPFv3 instance configuration:

```
switch-B(config)#ipv6 router ospf 300
switch-B(config-router-ospfv3)#router-id 10.12.15.12
switch-B(config-router-ospfv3)#area 1 stub
```

###### c. Router C OSPFv3 instance configuration:

```
switch-C(config)#ipv6 router ospf 300
switch-C(config-router-ospfv3)#router-id 10.12.15.13
switch-C(config-router-ospfv3)#area 1 stub
```

###### d. Router D OSPFv3 instance configuration:

```
switch-D(config)#ipv6 router ospf 300
switch-D(config-router-ospfv3)#router-id 10.12.15.14
```

###### e. Router E OSPFv3 instance configuration:

```
switch-E(config)#ipv6 router ospf 300
switch-E(config-router-ospfv3)#router-id 10.12.15.15
```

###### f. Router F OSPFv3 instance configuration:

```
switch-F(config)#ipv6 router ospf 300
switch-F(config-router-ospfv3)#router-id 10.12.15.31
```

##### 2. Configure the interfaces.

###### a. Router A interfaces:

```
switch-A(config)#interface vlan 1101
switch-A(config-if-Vl1101)#ospfv3 300 area 1
switch-A(config-if-Vl1101)#exit
switch-A(config)#interface vlan 1102
switch-A(config-if-Vl1102)#ospfv3 300 area 1
```

###### b. Router B interfaces:

```
switch-B(config)#interface vlan 1201
switch-B(config-if-Vl1201)#ospfv3 300 area 1
switch-B(config-if-Vl1201)#exit
```

###### c. Router C interfaces:

```
switch-C(config)#interface vlan 1301
switch-C(config-if-Vl1301)#ospfv3 300 area 1
switch-C(config-if-Vl1301)#exit
```

```
switch-C(config)#interface vlan 1302  
switch-C(config-if-Vl1302)#ospfv3 300 area 0
```

**d. Router D interfaces:**

```
switch-D(config)#interface vlan 1401  
switch-D(config-if-Vl1401)#ospfv3 300 area 0  
switch-D(config-if-Vl1401)#exit  
switch-D(config)#interface vlan 1402  
switch-D(config-if-Vl1402)#ospfv3 300 area 0
```

**e. Router E interfaces:**

```
switch-E(config)#interface vlan 1501  
switch-E(config-if-Vl1501)#ospfv3 300 area 0  
switch-E(config-if-Vl1501)#exit  
switch-E(config)#interface vlan 1502  
switch-E(config-if-Vl1502)#ospfv3 300 area 0
```

**f. Router F interfaces:**

```
switch-F(config)#interface vlan 1601  
switch-F(config-if-Vl1601)#ospfv3 300 area 0  
switch-F(config-if-Vl1601)#exit
```

---

## 14.3.5 OSPFv3 Commands

### Global Configuration Mode

- `clear ospfv3 ipv6 force-spf`
- `ipv6 router ospf`

### Interface Configuration Mode

- `ipv6 ospf area`
- `ospfv3 authentication ipsec spi`
- `ospfv3 cost`
- `ospfv3 dead-interval`
- `ospfv3 encryption ipsec spi`
- `ospfv3 hello-interval`
- `ospfv3 ipv6 retransmit-interval`
- `ospfv3 network`
- `ospfv3 priority`
- `ospfv3 transmit-delay`

### Router-OSPFv3 Configuration Mode

- `adjacency exchange-start threshold (OSPFv3)`
- `area authentication ipsec spi`
- `area default-cost (OSPFv3)`
- `area encryption ipsec spi`
- `area nssa (OSPFv3)`
- `area nssa default-information-originate (OSPFv3)`
- `area not-so-stubby lsa type-7 convert type-5 (OSPFv3)`
- `area range (OSPFv3)`
- `area stub (OSPFv3)`
- `default-information originate (OSPFv3)`
- `default-metric (OSPFv3)`
- `distance ospf intra-area (OSPFv3)`
- `log-adjacency-changes (OSPFv3)`
- `max-metric router-lsa (OSPFv3)`
- `maximum-paths (OSPFv3)`
- `no area (OSPFv3)`
- `passive-interface (OSPFv3)`
- `redistribute (OSPFv3)`
- `router-id (OSPFv3)`
- `shutdown (OSPFv3)`
- `timers`
- `timers lsa rx min interval (OSPFv3)`
- `timers lsa tx delay initial (OSPFv3)`
- `timers spf delay initial (OSPFv3)`

### Display Commands

- `show ipv6 ospf`
- `show ipv6 ospf border-routers`

- `show ipv6 ospf database`
- `show ipv6 ospf database<link-state details>`
- `show ipv6 ospf database <link state list>`
- `show ipv6 ospf database link`
- `show ipv6 ospf database link if-name`
- `show ipv6 ospf database link if-type`
- `show ipv6 ospf interface`
- `show ipv6 ospf lsa-log`
- `show ipv6 ospf neighbor`
- `show ipv6 ospf neighbor state`
- `show ipv6 ospf neighbor summary`
- `show ipv6 ospf spf-log`
- `show ospfv3`

---

### 14.3.5.1 adjacency exchange-start threshold (OSPFv3)

The `adjacency exchange-start threshold` command sets the exchange-start options for an OSPF instance.

The `no adjacency exchange-start threshold` and `default adjacency exchange-start threshold` command resets the default by removing the corresponding `adjacency exchange-start threshold` command from *running-config*.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
adjacency exchange-start threshold peers
no adjacency exchange-start threshold
default adjacency exchange-start threshold
```

#### Parameters

*peers* Value ranges from 1 4294967295. Default value is 10.

#### Example

This command sets the adjacency exchange start threshold to 156923.

```
switch(config)#ipv6 router ospf 3
switch(config-router-ospf3)#adjacency exchange-start threshold 156923
switch(config-router-ospf3)#
```

### 14.3.5.2 area authentication ipsec spi

The `area authentication ipsec spi` command configures OSPFv3 authentication on an area.

The `default area authentication` and `no area authentication` commands delete the OSPFv3 authentication on an area.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
area area_id authentication ipsec spi spi_value {md5|sha1} {0 unencrypted_key | 7 hidden_key | KEY}
```

```
area area_id authentication ipsec spi spi_value {md5|sha1} passphrase {0 unencrypted_key | 7 hidden_key | LINE}
```

```
no area area_id authentication ipsec spi spi_value {md5| sha1} passphrase {0 unencrypted_key | 7 hidden_key | LINE}
```

```
default area area_id authentication ipsec spi spi_value {md5| sha1} passphrase {0 unencrypted_key | 7 hidden_key | LINE}
```

#### Parameters

- **area** *area\_id* configures OSPF area ID in either IP address or decimal formats. The value for decimal format ranges from 0 to 4294967295.
- **spi** *spi\_value* configures the IPsec Security Parameter Index. The value ranges from 0 to 4294967295.
- **md5** configures HMAC-MD5 hash algorithm.
- **sha1** configures HMAC-SHA1 algorithm.
- **0 unencrypted\_key** configures either a 192 bit 3DES key or 128/192/256 bit AES key in an unencrypted format.
- **7 encrypted\_key** configures either a 192 bit 3DES key or 128/192/256 bit AES key in an encrypted format.
- **KEY** configures either a 128 bit MD5 key or a 140 bit SHA1 key.
- **passphrase** configures passphrase for authentication and encryption. Options include:
  - **0 unencrypted\_passphrase** configures an unencrypted key.
  - **7 encrypted\_passphrase** configures an encrypted key.
  - **LINE** uses passphrase string to derive keys for authentication and encryption.

#### Related Commands

- [ospfv3 authentication ipsec spi](#)
- [area encryption ipsec spi](#)

#### Guidelines

Passphrase and key value are exclusive. MD5 and SHA1 keys are derived from the configured passphrase.

#### Restriction

On the same area, EOS allows security configuration with either AH or ESP but not both. We can have one area configured with AH and another with ESP.

#### Examples

- This command configures OSPFv3 authentication on an area with MD5 hash algorithm.

```
switch(config)#ipv6 router ospf 9
```

```

switch(config-router-ospf3)#area 0.0.0.0 authentication ipsec spi 34
md5 0 8FD6158BFE81ADD961241D8E4169D411
switch(config-router-ospf3)#show active
ipv6 router ospf 9
    area 0.0.0.0 authentication ipsec spi 34 md5 7 $1$cNpcrQ11cz
qdvKAZkLtYVr6I7+R3niuWouDKKYCFNs4/XOWG/Iap5Q==
switch(config-router-ospf3)#

```

- This command configures OSPFv3 authentication on an area with SHA1 algorithm.

```

switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 0.0.0.0 authentication ipsec spi 5789
sha1 passphrase 7 $1$Ab754G00HbG11IKq1C171yUKscUlpFTpvcQxQIhjJm1OUzGJD
h4bLWxSdKHvWMo6
switch(config-router-ospf3)#show active
ipv6 router ospf 9
    area 0.0.0.0 authentication ipsec spi 5789 sha1 passphrase 7
Ab754G00HbG11IKq1C171yUKscUlpFTpvcQxQIhjJm1OUzGJDh4bLWxSdKHvWMo6
switch(config-router-ospf3)#

```

- This command deletes the OSPFv3 authentication on an area.

```

switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#show active
ipv6 router ospf 9
    area 1.1.1.1 authentication ipsec spi 2437 md5 7 cNpcrQ11czqdv
KAZkLtYVr6I7+R3niuWouDKKYCFNs4/XOWG/Iap5Q==
    area 0.0.0.0 authentication ipsec spi 5789 sha1 passphrase 7
Ab754G00HbG11IKq1C171yUKscUlpFTpvcQxQIhjJm1OUzGJDh4bLWxSdKHvWMo6
switch(config-router-ospf3)#no area 0.0.0.0 authentication
switch(config-router-ospf3)#show active
ipv6 router ospf 9
    area 1.1.1.1 authentication ipsec spi 2437 md5 7 cNpcrQ11czqdv
KAZkLtYVr6I7+R3niuWouDKKYCFNs4/XOWG/Iap5Q==
switch(config-router-ospf3)#

```

### 14.3.5.3 area default-cost (OSPFv3)

The `area default-cost` command sets the cost for the default summary routes sent into an area. When the `area default-cost` command is not configured for an area, the default-cost of that area is set to 10.

The `no area default-cost` and `default area default-cost` command resets the default-cost value of the specified area to 10 by removing the corresponding `area default-cost` command from *running-config*. The `no area (OSPFv3)` command removes all area commands for the specified area from *running-config*, including the `area default-cost` command.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
area area_id default-cost def_cost
no area area_id default-cost
default area area_id default-cost
```

#### Parameters

- *area\_id* area number. <0 to 4294967295> or <0.0.0.0 to 255.255.255.255> *Running-config* stores value in dotted decimal notation.
- *def\_cost* Values range from 1 to 65535.

#### Example

These commands configure a cost of 15 for default summary routes that an ABR sends into area 100.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 100 default 15
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 0.0.0.100 default-cost 15
switch(config-router-ospf3)#
```

---

#### 14.3.5.4 area encryption ipsec spi

The `area encryption ipsec spi` command configures OSPFv3 security on an area.

The `default area encryption` and `no area encryption` commands delete the OSPFv3 security on an area.

##### Command Mode

Router-OSPFv3 Configuration

##### Command Syntax

```
area area_id encryption ipsec spi spi_value esp{3des-cbc| aes-128-cbc | aes-192-cbc  
| aes-256-cbc}{ 0 unencrypted_key | 7 encrypted_key}{ md5| sha1}{ 0 unencrypted_key | 7  
encrypted_key | KEY}
```

```
area area_id encryption ipsec spi spi_value esp null{md5 | sha1} { 0 unencrypted_key | 7  
encrypted_key | KEY}
```

```
area area_id encryption ipsec spi spi_value esp{3des-cbc | aes-128-cbc | aes-192-cbc |  
aes-256-cbc | null} {md5 | sha1} { 0 unencrypted_key | 7 encrypted_key | LINE}
```

```
no area area_id encryption
```

```
default area area_id encryption
```

##### Parameters

- `area area_id` configures OSPF area ID in either IP address or decimal formats. The value for decimal format ranges from 0 to 4294967295.
- `spi spi_value` configures the value for IPsec Security Parameter Index. The value ranges from 0 to 4294967295.
- `3des-cbc` configures ESP with 3DES-CBC encryption.
- `aes-128-cbc` configures ESP with AES-128-CBC encryption.
- `aes-192-cbc` configures ESP with AES-192-CBC encryption.
- `aes-256-cbc` configures ESP with AES-256-CBC encryption.
- `null` configures ESP with null encryption.
- `0 unencrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an unencrypted format.
- `7 encrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an encrypted format.
- `KEY` configures either a 128 bit MD5 key or a 140 bit SHA1 key.
- `md5` configures HMAC-MD5 hash algorithm.
- `sha1` configures HMAC-SHA1 algorithm.
- `passphrase` configures passphrase for authentication and encryption. Options include:
  - `0 unencrypted_passphrase` configures an unencrypted key.
  - `7 encrypted_passphrase` configures an encrypted key.
  - `LINE` uses passphrase string to derive keys for authentication and encryption.

##### Related Commands

- [area authentication ipsec spi](#)
- [ospfv3 encryption ipsec spi](#)

##### Guidelines

**Passphrase** and **key** values are exclusive. **MD5** and **SHA1** keys are derived from the configured passphrase.

##### Restriction

On the same area, EOS allows security configuration with either AH or ESP but not both. We can have one area configured with AH and another with ESP.

### Examples

- This command configures OSPFv3 security on an area with 3DES-CBC encryption and MD5 hash algorithm.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#area 0.0.0.0 encryption ipsec spi 5678 esp
3des-cbc md5 passphrase 0
8FD6158BFE81ADD961241D8E4169D411
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase
  7
  $1$cNpcrQ11czqdvKazKLtYVr6I7+R3niuWouDKKYCFNs4/XOWG/Iap5Q==
switch (config-router-ospf3)#
```

- This command deletes the OSPFv3 security on an area.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  area 0.0.0.0 encryption ipsec spi 5678 esp 3des-cbc md5 passphrase
  7
  $1$cNpcrQ11czqdvKazKLtYVr6I7+R3niuWouDKKYCFNs4/XOWG/Iap5Q==
switch(config-router-ospf3)#no area 0.0.0.0 encryption
switch(config-router-ospf3)#show active
ipv6 router ospf 9
switch(config-router-ospf3)#
```

---

### 14.3.5.5 area not-so-stubby lsa type-7 convert type-5 (OSPFv3)

The `area not-so-stubby lsa type-7 convert type-5` command configures the switch to always translate Type-7 link-state advertisement (LSAs) to Type-5 LSAs.

The `no area not-so-stubby lsa type-7 convert type-5` and `no area not-so-stubby lsa type-7 convert type-5` commands allow LSAs to be translated dynamically by removing the `no area not-so-stubby lsa type-7 convert type-5` command from **running-config**.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
area area_id not-so-stubby lsa type-7 convert type-5
no area area_id not-so-stubby lsa type-7 convert type-5
default area area_id not-so-stubby lsa type-7 convert type-5
```

#### Parameters

- *area\_id*
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
  - **Running-config** stores value in dotted decimal notation.

#### Example

These commands configure the switch to always translate Type-7 link-state advertisement (LSAs) to Type-5 LSAs.

```
switch(config)#ipv6 router ospf 3
switch(config-router-ospf3)#area 3 not-so-stubby lsa type-7 convert
type-5
switch(config-router-ospf)#
```

### 14.3.5.6 area nssa (OSPFv3)

The `area nssa` command configures an OSPFv3 area as a not-so-stubby area (NSSA). All routers in an AS must specify the same area type for identically numbered areas.

NSSA ASBRs advertise external LSAs that are part of the area, but do not advertise external LSAs from other areas.

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

The `no area nssa` command configures the specified area as a normal area by removing the specified `area nssa` command from **running-config**.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
area area_id nssa[TYPE]
no area area_id nssa[TYPE]
default area area_id nssa[TYPE]
```

#### Parameters

- *area\_id*
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
  - **Running-config** stores value in dotted decimal notation.
- TYPE
  - Values include:
  - <no parameter>
  - **nssa-only**

#### Example

This command configures area 3 as a NSSA area.

```
switch(config)#ipv6 router ospf 1
switch(config-router-ospf3)#area 3 nssa nssa-only
switch(config-router-ospf3)#
```

### 14.3.5.7 area nssa default-information-originate (OSPFv3)

The `area nssa default-information-originate` command sets an area as an NSSA and the generation of a type 7 default LSA is created if a default route exists in the routing table.

The switch supports three area types:

Areas are **normal** by default; area type configuration is required only for stub NSSA areas. Area 0 is always a normal area and cannot be configured through this command.

The `no area` and `default area` commands remove the specified area from the OSPFv3 instance by deleting all `area` commands from *running-config* for the specified area, including the `area default-cost (OSPFv3)` command.

The `no area stub` and `default area stub` commands configure the specified area as a normal area.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
area area_id nssa default-information-originate [VALUE][TYPE][EXCL]
no area area_id nssa default-information-originate [VALUE][TYPE][EXCL]
default area area_id nssa default-information-originate [VALUE][TYPE][EXCL]
```

#### Parameters

All parameters except *area\_id* can be placed in any order.

- *area\_id*
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always normal.
  - *Running-config* stores value in dotted decimal notation.
- VALUE Values include:
  - <no parameter>
  - **metric** <1-65535>
- TYPE Values include:
  - <no parameter>
  - **metric-type** <1-2>
- EXCL Values include:
  - <no parameter>
  - **nssa-only**

#### Examples

- These commands sets area 1 as NSSA only and generates a type 7 default LSA if a default route exists in the routing table.

```
switch(config-router-ospf3)#area 3 nssa default-information-originate
nssa-only
switch(config-router-ospf3)#
```

- These commands generates a type 7 default route.

```
switch(config-router-ospf3)#area 3 nssa default-information-originate
switch(config-router-ospf3)#
```

### 14.3.5.8 area range (OSPFv3)

The **area range** command is used by OSPFv3 area border routers to summarize routes.

The **no area range** and **default area range** commands remove the area-range by deleting the corresponding **area range** command from *running-config*.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]
```

```
no area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]
```

```
default area area_id range net_addr [ADVERTISE_SETTING] [COST_SETTING]
```

#### Parameters

- *area\_id* <0 to 4294967295> or <0.0.0.0 to 255.255.255.255>
- *net\_addr*
- ADVERTISE\_SETTING specifies the LSA advertising activity. Values include
  - <no parameter>
  - **advertise**
  - **not-advertise**
- COST\_SETTING Values include
  - <no parameter>
  - **cost** *range\_cost* Value ranges from 1 to 65535.

#### Examples

- These commands summarize routes at an area boundary 1.

```
switch(config)#ipv6 router ospf 1
switch(config-router-ospf3)#area 1 range 2001:0DB8:0:1::/64
switch(config-router-ospf3)#
```

- These commands modify the address range status to DoNotAdvertise.

```
switch(config)#ipv6 router ospf 1
switch(config-ospf6-router)#area 1 range 2001:0DB8:0:1::/64 not-
advertise
switch(config-ospf6-router)#
```

---

### 14.3.5.9 area stub (OSPFv3)

The **area stub** command configures the area type of an OSPFv3 area.

Areas are **normal** by default;.

The **no area stub** command configures the specified area as a normal area.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
area area_id stub
```

```
no area area_id stub
```

```
default area area_id stub
```

#### Parameters

- *area\_id*
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always **normal**.
  - **Running-config** stores value in dotted decimal notation.

#### Examples

- This command configures area 45 as a stub area.

```
switch(config)#ipv6 router ospf 3  
switch(config-router-ospf3)#area 45 stub  
switch(config-router-ospf3)#
```

- This command configures area 10.92.148.17 as a stub area.

```
switch(config-router-ospf3)#area 10.92.148.17 stub  
switch(config-router-ospf3)#
```

### 14.3.5.10 clear ospfv3 ipv6 force-spf

The `clear ospfv3 ipv6 force-spf` command starts the SPF algorithm without clearing the OSPF database.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ospfv3 ipv6 force-spf [VRF_INSTANCE]
```

#### Parameters

- VRF\_INSTANCE Values include:
  - *<no parameter>* Action is performed in the default VRF.
  - *vrf vrf\_name* Action is performed in the specified VRF.

#### Example

This command restarts the SPF algorithm in the default VRF without first clearing the OSPFv3 database.

```
switch(config)#clear ospfv3 ipv6 force-spf  
switch(config)#
```

---

### 14.3.5.11 default-information originate (OSPFv3)

The **default-information originate** command generates a default external route into an OSPF domain.

The **no default-information originate** and **default default-information originate** command removes the configuration from the *running-config*.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
default-information originate [DURATION][VALUE][TYPE][MAP]
```

```
no default-information originate
```

```
default default-information originate
```

#### Parameters

All parameters can be placed in any order.

- DURATION Values include:
  - *<no parameter>*
  - *always*
- VALUE Values include:
  - *<no parameter>*
  - *metric <1-65535>*
- TYPE Values include:
  - *<no parameter>*
  - *metric-type <1-2>*
- MAP Values include:
  - *<no parameter>*
  - *route-map map\_name*

#### Examples

- These commands will advertise the OSPFv3 default route regardless of whether the switch has a default route configured.

```
switch(config)#ipv6 router ospf 1
switch(config-router-ospf3)#default-information originate always
switch(config-router-ospf3)#show active
ipv6 router ospf 1
    default-information originate always
```

- These commands configures OSPF area 1 as metric of 100 for the default route with an external metric type of Type 1.

```
switch(config)#ipv6 router ospf 1
switch(config-router-ospf3)#default-information originate metric 100
metric-type 1
switch(config-router-ospf3)#show active
ipv6 router ospf 1
    default-information originate metric 100 metric-type 1
switch(config-router-ospf3)#
```

### 14.3.5.12 default-metric (OSPFv3)

The **default-metric** command sets default metric value for routes redistributed into the OSPFv3 domain.

The **no default-metric** and **default default-metric** commands restores the default metric to its default value of 10 by removing the **default-metric** command from **running-config**.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
default-metric def_metric
```

```
no default-metric
```

```
default default-metric
```

#### Parameter

*def\_metric* Values range from 1 to 65535. Default value is 10.

#### Example

These commands configure a default metric of 30 for routes redistributed into OSPFv3.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#default-metric 30
switch(config-router-ospf3)#show active
ipv6 router ospf 9
    default-metric 30
switch(config-router-ospf3)#
```

---

### 14.3.5.13 distance ospf intra-area (OSPFv3)

The **distance ospf intra-area** command sets the administrative distance for routes in a single OSPFv3 area. The default is 110.

The **no distance ospf intra-area** and **default distance ospf intra-area** commands remove the **distance ospf intra-area** command from *running-config*, returning the OSPFv3 intra-area distance setting to the default value of 110.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
distance ospf intra-area distance
no distance ospf intra-area
default distance ospf intra-area
```

#### Parameter

*distance* Values range from 1 to 255. Default is 110.

#### Example

This command configures a distance of 90 for all OSPFv3 intra-area routes on the switch.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#distance ospf intra-area 90
switch(config-router-ospf3)#show active
ipv6 router ospf 9
    distance ospf intra-area 90
switch(config-router-ospf3)#
```

### 14.3.5.14 ipv6 ospf area

The `ipv6 ospf area` command enables OSPFv3 on the interface and associates the area to the interface.

OSPFv3 areas are configured in by `no area (OSPFv3)` commands in router-OSPFv3 configuration mode

The `no ipv6 ospf area` and `default ipv6 ospf area` commands disable OSPFv3 on the configuration mode interface by removing the corresponding `ipv6 ospf area` command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ipv6 ospf process_id [area area_id]
```

```
no ipv6 ospf process_id [area area_id]
```

```
default ipv6 ospf process_id [area area_id]
```

#### Parameters

- *process\_id* Values range from 1 to 65535.
- *area\_id*
  - Valid formats: integer <0 to 4294967295> or dotted decimal <0.0.0.0 to 255.255.255.255>
  - **Running-config** stores value in dotted decimal notation.

#### Example

These commands enable OSPFv3 on VLAN interface 200 and associates area 0 to the interface.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ipv6 ospf 9 area 0
switch(config-if-Vl200)#show active
interface Vlan200
    ipv6 ospf 9 area 0.0.0.0
switch(config-if-Vl200)#
```

---

### 14.3.5.15 ipv6 router ospf

The `ipv6 router ospf` command places the switch in router-OSPFv3 configuration mode and creates an OSPFv3 instance if one does not already exist. Note that each OSPFv3 instance on the switch must have a unique process ID. A router ID for the new instance will be created if one does not already exist.

The `show ipv6 ospf` command displays the router ID of each OSPFv3 instance configured on the switch.

The `no ipv6 router ospf` and `default ipv6 router ospf` command deletes the OSPFv3 instance.

Refer to the [Router-OSPFv3 Configuration Mode](#) command for a list of commands available in router-OSPFv3 configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
ipv6 router ospf process_id [VRF_INSTANCE]
no ipv6 router ospf process_id [VRF_INSTANCE]
default ipv6 router ospf process_id [VRF_INSTANCE]
```

#### Parameters

- *process\_id* Values range from 1 to 65535.
- VRF\_INSTANCE Values include:
  - *<no parameter>* OSPF instance is in the default VRF.
  - *vrf vrf\_name* OSPF instance is the specified VRF.

#### Examples

- This command creates an OSPFv3 instance in the default VRF with process ID 9.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#show active
ipv6 router ospf 9
switch(config-router-ospf3)#
```

- This command deletes the OSPFv3 instance.

```
switch(config)#no ipv6 router ospf 9
switch(config)#
```

### 14.3.5.16 log-adjacency-changes (OSPFv3)

The **log-adjacency-changes** command enables syslog messages to be sent when it detects OSPFv3 link state changes or when it detects that a neighbor has gone up or down. Log message sending is enabled by default.

The **default log-adjacency-changes** command restores the default state by removing the **log-adjacency-changes** statement from *running-config*.

The default option (sending a message only when a neighbor goes up or down) is active when *running-config* does not contain any form of the command. Entering the command in any form replaces the previous command state in *running-config*.

The **no log-adjacency-changes** disables link state change syslog reporting.

The **default log-adjacency-changes** command restores the default state by removing the **log-adjacency-changes detail** or **no log-adjacency-changes** statement from *running-config*.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
log-adjacency-changes [INFO_LEVEL]
```

```
no log-adjacency-changes
```

```
default log-adjacency-changes
```

#### Parameters

- INFO\_LEVEL Options include
  - *<no parameter>* Sends messages when a neighbor goes up or down.
  - **detail** Sends messages for all neighbor state changes.

#### Example

This command configures the switch to send a syslog message when a neighbor state changes.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#log-adjacency-changes
switch(config-router-ospf3)#show active
ipv6 router ospf 9
    log-adjacency-changes
switch(config-router-ospf3)#
```

---

### 14.3.5.17 maximum-paths (OSPFv3)

The **maximum-paths** command sets the maximum number of parallel routes that OSPFv3 supports on the switch.

The **no maximum-paths** command restores the maximum number of parallel routes that OSPFv3 supports on the switch to the default value of 16 by removing the maximum-paths command from **running-config**.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
maximum-paths paths
```

```
no maximum-paths
```

```
default maximum-paths
```

#### Parameters

- *paths* Value range is platform dependent:
  - Arad: Value ranges from 1 to 128. Default value is 128.
  - FM6000: Value ranges from 1 to 32. Default value is 32.
  - PetraA: Value ranges from 1 to 16. Default value is 16.
  - Trident: Value ranges from 1 to 32. Default value is 32.
  - Trident II: Value ranges from 1 to 128. Default value is 128.

#### Example

This command configures the maximum number of OSPFv3 parallel paths to 12.

```
switch(config)#ipv6 router ospf 9  
switch(config-router-ospf3)#maximum-paths 12  
switch(config-router-ospf3)#
```

### 14.3.5.18 max-metric router-lsa (OSPFv3)

The **max-metric router-lsa** command configures OSPF to include the maximum value in LSA metric fields to keep other network devices from using the switch as a preferred intermediate SPF hop.

The **no max-metric router-lsa** and **default max-metric router-lsa** commands disable the advertisement of a maximum metric.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
max-metric router-lsa[EXTERNAL][STUB][STARTUP][SUMMARY]
no max-metric router-lsa[EXTERNAL][STUB][STARTUP][SUMMARY]
default max-metric router-lsa[EXTERNAL][STUB][STARTUP][SUMMARY]
```

#### Parameters

All parameters can be placed in any order.

- EXTERNAL Values include:
  - *<no parameter>* Default value of 1.
  - external-lsa
  - external-lsa <1 to 16777215> The default value is 0xFF0000.
- STUB Values include:
  - *<no parameter>* Default value of 2.
  - include-stub
- STARTUP Values include:
  - *<no parameter>*
  - on-startup
  - on-startup wait-for-bgp
  - on-startup <5 to 86400>

**wait-for-bgp** or an **on-start** time value is not included in **no** and **default** commands.

- SUMMARY Values include:
  - *<no parameter>* Metric is set to the default value of 1.
  - summary-lsa
  - summary-lsa <1 to 16777215>

#### Example

This command configures OSPFv3 to include the maximum value in LSA metric fields until BGP has converged:

```
switch(config-router-ospf3) #max-metric router-lsa on-startup wait-for-bgp
switch(config-router-ospf3) #
```

---

### 14.3.5.19 no area (OSPFv3)

The no **area** command removes all area configuration commands for the specified OSPFv3 area. Commands removed by the no area command include:

- area
- nssa
- range
- stub

Area settings can be removed individually; refer to the command description page of the desired command for details.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
no area area_id[TYPE]
```

```
default area area_id[TYPE]
```

#### Parameters

- *area\_id* area number.
  - Valid formats: integer <1 to 4294967295> or dotted decimal <0.0.0.1 to 255.255.255.255>
  - Area 0 (or 0.0.0.0) is not configurable; it is always **normal**.
  - **Running-config** stores value in dotted decimal notation.
- *TYPE* area type. Values include:
  - nssa
  - nssa translate type7 always
  - stub
  - stub no-summary

#### Example

This command remove the area 1 stub configuration.

```
switch(config)#ipv6 router ospf 9  
switch(config-router-ospf3)#no area 1 stub  
switch(config-router-ospf3)#
```

### 14.3.5.20 ospfv3 transmit-delay

The `ospfv3 transmit-delay` command configures the transmission delay for OSPFv3 packets.

The `no ospfv3 transmit-delay` and `default ospfv3 transmit-delay` commands restore the default transmission delay of one second on the configuration mode interface by removing the corresponding `ospfv3 transmit-delay` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ospfv3 transmit-delay trans
no ospfv3 transmit-delay
default ospfv3 transmit-delay
```

#### Parameter

*trans* Value ranges from 1 to 65535; default is 1.

#### Guideline

Arista devices also support the legacy `ipv6 ospf transmit-delay` command in certain software releases of the EOS.

#### Example

This command configures a transmission delay of 10 seconds for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 transmit-delay 10
switch(config-if-Vl200)#show active
interface Vlan200
    ospfv3 transmit-delay 10
switch(config-if-Vl200)#
```

---

### 14.3.5.21 ospfv3 authentication ipsec spi

The `ospfv3 authentication ipsec spi` command configures OSPFv3 authentication on an interface.

The `default ospfv3 authentication` and `no ospfv3 authentication` commands delete the OSPFv3 authentication on an interface.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
ospfv3 authentication ipsec spi spi_value {md5 | sha1}{0 unencrypted_key | 7 hidden_key | KEY}
```

```
ospfv3 authentication ipsec spi spi_value {md5 | sha1} passphrase { 0 unencrypted_passphrase | 7 hidden_passphrase | LINE}
```

```
no ospfv3 authentication
```

```
default ospfv3 authentication
```

#### Parameters

- `spi spi_value` configures IPsec Security Parameter Index. The value ranges from 0 to 4294967295.
- `md5` configures HMAC-MD5 hash algorithm.
- `sha1` configures HMAC-SHA1 algorithm.
- `0 unencrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an unencrypted format.
- `7 encrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an encrypted format.
- `KEY` configures either a 128 bit MD5 key or a 140 bit SHA1 key.
- `passphrase` configures passphrase for authentication and encryption. Options include:
  - `0 unencrypted_passphrase` configures an unencrypted passphrase.
  - `7 encrypted_passphrase` configures an encrypted passphrase.
  - `LINE` uses passphrase string to derive keys for authentication and encryption.

#### Related Commands

- [area authentication ipsec spi](#)
- [ospfv3 encryption ipsec spi](#)

#### Guidelines

**Passphrase** and *key* values are exclusive. **MD5** and **SHA1** keys are derived from the configured passphrase. Arista devices also support the legacy `ipv6 ospf authentication ipsec spi` command in certain software releases of the EOS.

#### Restriction

On the same interface, EOS allows security configuration with either AH or ESP but not both. We can have one interface configured with AH and another with ESP.

#### Examples

- This command configures OSPFv3 authentication on an interface with MD5 hash algorithm.

```
switch(config)#interface ethernet 9
switch(config-if-Et9)#ospfv3 authentication ipsec spi 3456 md5 0
8FD6158BFE81ADD961241D8E4169D411
switch(config-if-Et9)#show active
interface Ethernet9
```

```

no switchport
ospfv3 authentication ipsec spi 3456 md5 7 $1$xtmcMSPzEn+Njp8Lb4qryVV
OjKcjsrYuv6dx10+nSwKQdaiRt2RPTQ==
switch(config-if-Et9)#

```

- This command configures OSPFv3 authentication on an interface with SHA1 algorithm.

```

switch(config)#interface ethernet 9
switch(config-if-Et9)#ospfv3 authentication ipsec spi 987 sha1 7
$1$VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOOQF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9)#show active
interface Ethernet9
no switchport
ospfv3 authentication ipsec spi 987 sha1 7
$1$VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOOQF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9)#

```

- This command deletes the OSPFv3 authentication on an interface.

```

switch(config)#interface ethernet 9
switch(config-if-Et9)#show active
interface Ethernet9
no switchport
ospfv3 authentication ipsec spi 3456 md5 7 $1$xtmcMSPzEn+Njp8Lb4qryVV
OjKcjsrYuv6dx10+nSwKQdaiRt2RPTQ==
switch(config-if-Et9)#no ospfv3 authentication
switch(config-if-Et9)#show active
interface Ethernet9
no switchport
switch(config-if-Et9)#

```

---

### 14.3.5.22 ospfv3 cost

The `ospfv3 cost` command sets the OSPFv3 cost for the interface. The default OSPFv3 cost is 10.

The `no ospfv3 cost` and `default ospfv3 cost` commands restore the default cost of 10 for the configuration mode interface by removing the corresponding `ospfv3 cost` command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ospfv3 cost interface_cost
```

```
no ospfv3 cost
```

```
default ospfv3 cost
```

#### Parameters

*interface\_cost* Value ranges from 1 to 65535; default is 10.

#### Guideline

Arista devices also support the legacy `ipv6 ospf cost` command in certain software releases of the EOS.

#### Example

This command configures a cost of 50 for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 cost 50
switch(config-if-Vl200)#show active
interface Vlan200
    ospfv3 cost 50
switch(config-if-Vl200)#
```

### 14.3.5.23 ospfv3 dead-interval

The `ospfv3 dead-interval` command sets the OSPFv3 dead interval.

The `no ospfv3 dead-interval` and `default ospfv3 dead-interval` commands restore the default dead interval of 40 seconds on the configuration mode interface by removing the corresponding `ospfv3 dead-interval` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ospfv3 dead-interval time
no ospfv3 dead-interval
default ospfv3 dead-interval
```

#### Parameters

- *time* Value ranges from 1 to 65535; default is 40.

#### Guideline

Arista devices also support the legacy `ipv6 ospf dead-interval` command in certain software releases of the EOS.

#### Example

This command configures a dead interval of 75 seconds for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 dead-interval 75
switch(config-if-Vl200)#show active
interface Vlan200
    ospfv3 dead-interval 75
switch(config-if-Vl200)#
```

---

### 14.3.5.24 ospfv3 encryption ipsec spi

The `ospfv3 encryption ipsec spi` command configures OSPFv3 security on an interface.

The `default ospfv3 encryption` and `no ospfv3 encryption` commands delete the OSPFv3 security on an interface.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
ospfv3 encryption ipsec spi spi_value esp {3des-cbc | aes-128-cbc | aes-128-cbc | aes-192-cbc}{ 0unencrypted_key | 7 encrypted_key}{ md5 | sha1}{ 0unencrypted_key | 7 encrypted_key | KEY}
```

```
ospfv3 encryption ipsec spi spi_value esp {3des-cbc | aes-128-cbc | aes-128-cbc | aes-192-cbc}{ 0unencrypted_key | 7 encrypted_key}{ md5 | sha1} passphrase {0unencrypted_passphrase | 7 encrypted_passphrase | LINE}
```

```
ospfv3 encryption ipsec spi spi_value esp null {md5 | sha1}{ 0unencrypted_key | 7 encrypted_key | KEY}
```

```
ospfv3 encryption ipsec spi spi_value esp {md5 | sha1} passphrase {0unencrypted_passphrase | 7 encrypted_passphrase | LINE}
```

```
default ospfv3 encryption
```

```
no ospfv3 encryption
```

#### Parameters

- `spi spi_value` configures the value for IPsec Security Parameter Index. The value ranges from 0 to 4294967295.
- `3des-cbc` configures ESP with 3DES-CBC encryption.
- `aes-128-cbc` configures ESP with AES-128-CBC encryption.
- `aes-192-cbc` configures ESP with AES-192-CBC encryption.
- `aes-256-cbc` configures ESP with AES-256-CBC encryption.
- `null` configures ESP with null encryption.
- `0 unencrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an unencrypted format.
- `7 encrypted_key` configures either a 192 bit 3DES key or 128/192/256 bit AES key in an encrypted format.
- `md5` configures HMAC-MD5 hash algorithm.
- `sha1` configures HMAC-SHA1 algorithm.
- `KEY` configures either a 128 bit MD5 key or a 140 bit SHA1 key.
- `passphrase` configures passphrase for authentication and encryption. Options include:
  - `0 unencrypted_passphrase` configures an unencrypted passphrase.
  - `7 encrypted_passphrase` configures an encrypted passphrase.
  - `LINE` uses passphrase string to derive keys for authentication and encryption.

#### Related Commands

- [area encryption ipsec spi](#)
- [ospfv3 authentication ipsec spi](#)

#### Guidelines

Passphrase and key value are exclusive. MD5 and SHA1 keys are derived from the configured passphrase. Arista devices also support the legacy `ipv6 ospf encryption ipsec spi` command in certain software releases of the EOS.

## Restrictions

On the same interface, EOS allows security configuration with either AH or ESP but not both. We can have one interface configured with AH and another with ESP.

## Examples

- This command configures OSPFv3 security on an interface with 3DES-CBC encryption and SHA1 algorithm.

```
switch(config)#interface ethernet 9
switch(config-if-Et9)#ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1
passphrase 0 2fd4e1c67a2d28fced849ee1bb76e7391b93eb12
switch(config-if-Et9)#show active
interface Ethernet9
  no switchport
  ospfv3 encryption ipsec spi 345 esp 3des-cbc sha1 passphrase 7
  $1$VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOOQF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9)#
```

- This command configures OSPFv3 security on an interface with 3DES-CBC encryption and MD5 hash algorithm.

```
switch(config)#interface ethernet 9
switch(config-if-Et9)#ospfv3 encryption ipsec spi 345 esp 3des-cbc md5
passphrase 7 $1$VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOOQF7HJBp5
VvXTfBaVYbgCkWU
switch(config-if-Et9)#show active
interface Ethernet9
  no switchport
  ospfv3 encryption ipsec spi 345 esp 3des-cbc md5 passphrase 7
  $1$VmUkWk6IL2S343bR3BbH0RhgvxHhwBpfvB4VXKNOOQF7HJBp5VvXTfBaVYbgCkWU
switch(config-if-Et9)#
```

- This command deletes the OSPFv3 security on an interface.

```
switch(config)#interface ethernet 9
switch(config-if-Et9)#show active
interface Ethernet9
  no switchport
  ospfv3 encryption ipsec spi 3456 md5 7 $1$xtmcMSPzEn+Njp8Lb4qryVV
  OjKcjsrYuv6dxl0+nSwKQdaiRt2RPTQ==
switch(config-if-Et9)#no ospfv3 encryption
switch(config-if-Et9)#show active
interface Ethernet9
  no switchport
switch(config-if-Et9)#
```

---

### 14.3.5.25 ospfv3 hello-interval

The **ospfv3 hello-interval** command sets the OSPFv3 hello interval. The hello interval is the period between the transmission of consecutive hello packets.

Each OSPFv3 neighbor should be the same hello interval and should not be longer than any neighbors dead interval.

The **no ospfv3 hello-interval** and **default ospfv3 hello-interval** commands restore the default hello interval of 10 seconds on the configuration mode interface by removing the **ospfv3 hello-interval** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ospfv3 hello-interval time
no ospfv3 hello-interval
default ospfv3 hello-interval
```

#### Parameter

*time* Values range from 1 to 65535; default is 10.

#### Guideline

Arista devices also support the legacy **ipv6 ospf hello-interval** command in certain software releases of the EOS.

#### Example

This command configures a hello interval of 45 seconds for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 hello-interval 45
switch(config-if-Vl200)#show active
interface Vlan200
  ospfv3 hello-interval 45
switch(config-if-Vl200)#
```

### 14.3.5.26 ospfv3 ipv6 retransmit-interval

The `ospfv3 ipv6 retransmit-interval` command configures the link state advertisement retransmission interval.

The `no ospfv3 ipv6 retransmit-interval` and `default ospfv3 ipv6 retransmit-interval` commands restore the default retransmission interval of 5 seconds on the configuration mode interface by removing the corresponding `ospfv3 ipv6 retransmit-interval` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ospfv3 ipv6 retransmit-interval period
no ospfv3 ipv6 retransmit-interval
default ospfv3 ipv6 retransmit-interval
```

#### Parameter

*period* Value ranges from 1 to 65535; default is 5.

#### Example

This command configures a retransmission interval of 25 seconds for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 ipv6 retransmit-interval 25
switch(config-if-Vl200)#show active
interface Vlan200
    ospfv3 ipv6 retransmit-interval 25
switch(config-if-Vl200)#
```

---

### 14.3.5.27 ospfv3 network

The **ospfv3 network** command sets the configuration mode interface as a point-to-point link. By default, interfaces are set as broadcast links.

The **no ospfv3 network** and **default ospfv3 network** commands set the configuration mode interface as a broadcast link by removing the corresponding **ospfv3 network** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ospfv3 network point-to-point
```

```
no ospfv3 network
```

```
default ospfv3 network
```

#### Guideline

Arista devices also support the legacy **ipv6 ospf network** command in certain software releases of the EOS.

#### Examples

- This command configures VLAN interface 200 as a point-to-point link.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 network point-to-point
switch(config-if-Vl200)#show active
interface Vlan200
    ospfv3 network point-to-point
switch(config-if-Vl200)#
```

- This command restores Ethernet interface 10 as a broadcast link.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#no ospfv3 network
switch(config-if-Vl200)#show active
interface Vlan200
switch(config-if-Vl200)#
```

### 14.3.5.28 ospfv3 priority

The `ospfv3 priority` command configures the OSPFv3 router priority.

The `no ospfv3 priority` and `default ospfv3 priority` commands restore the default priority (1) on the interface by removing the corresponding `ospfv3 priority` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ospfv3 priority priority_level
```

```
no ospfv3 priority
```

```
default ospfv3 priority
```

#### Parameter

*priority\_level* Settings range from 0 to 255.

#### Guideline

Arista devices also support the legacy `ipv6 ospf priority` command in certain software releases of the EOS.

#### Example

This command configures a router priority of 128 for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#ospfv3 priority 128
switch(config-if-Vl200)#show active
interface Vlan200
    ospfv3 priority 128
switch(config-if-Vl200)#
```

---

### 14.3.5.29 passive-interface (OSPFv3)

The **passive-interface** command disables OSPF on an interface range. All interfaces are active by default.

The **no passive-interface** and **default passive-interface** commands enable OSPFv3 on the specified interface range by removing the corresponding **passive-interface** statements from *running-config*.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
passive-interface INTERFACE_NAME
no passive-interface INTERFACE_NAME
default passive-interface INTERFACE_NAME
```

#### Parameters

- INTERFACE\_NAME Options include:
  - ethernet *e\_range*
  - loopback *l\_range*
  - management *m\_range*
  - port-channel *p\_range*
  - vlan *v\_range*
  - vxlan *vx\_range*
  - default

Valid *e\_range*, *l\_range*, *m\_range*, *p\_range*, *v\_range*, and *vx\_range* formats include number, range, or comma-delimited list of numbers and ranges.

#### Example

This command configures VLAN interfaces 101 through 103 as passive interfaces.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#passive-interface vlan 101-103
switch(config-router-ospf3)#show active
ipv6 router ospf 9
    passive-interface Vlan101
    passive-interface Vlan102
    passive-interface Vlan103
switch(config-router-ospf3)#
```

### 14.3.5.30 redistribute (OSPFv3)

The **redistribute** command enables the advertising of all specified routes into the OSPFv3 domain as external routes.

The **no redistribute** and **default redistribute** commands remove the corresponding **redistribute** command from *running-config*, disabling route redistribution for the specified route type.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
[redistribute ROUTE_TYPE ROUTE_MAP]
```

```
no redistribute ROUTE_TYPE
```

```
default redistribute ROUTE_TYPE
```

#### Parameters

- ROUTE\_TYPE Options include:
  - BGP
  - connected
  - static
- ROUTE\_MAP Options include:
  - route-map *map\_name*

#### Example

The **redistribute static** command starts the advertising of static routes as OSPFv3 external routes.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#redistribute static
switch(config-router-ospf3)#show active
ipv6 router ospf 9
    redistribute connected
    redistribute static
switch(config-router-ospf3)#
```

---

### 14.3.5.31 router-id (OSPFv3)

The **router-id** command assigns the router ID for an OSPFv3 instance. The switch sets the router ID to the first available alternative in the following list:

1. The **router-id** command
2. The loopback IP address
3. The highest IP address present on the device.

**Note:** When configuring VXLAN on an MLAG, always manually configure the OSPFv3 router ID to prevent the switch from using the common VTEP IP address as the router ID.

The **no router-id** and **default router-id** commands remove the router ID command from *running-config*.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
router-id identifier
```

```
no router-id
```

```
default router-id
```

#### Parameters

*identifier* Value ranges from 0.0.0.0 to 255.255.255.255 (dotted decimal notation).

#### Example

This command assigns 10.10.1.4 as the router ID for the OSPFv3 instance.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#router-id 10.10.1.4
switch(config-router-ospf3)#show active
ipv6 router ospf 9
    router-id 15.10.1.4
switch(config-router-ospf3)#
```

### 14.3.5.32 show ipv6 ospf border-routers

The `show ipv6 ospf border-routers` command displays the OSPF routing table entries.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf border-routers [VRF_INSTANCE]
```

#### Parameters

- VRF\_INSTANCE Values include:
  - `<no parameter>` Displays information for all VRFs.
  - `vrf vrf_name` Displays information for the specified VRF.

#### Example

This command displays the ABRs and ASBRs configured in the switch in all VRFs.

```
switch#show ipv6 ospf border-routers
Routing Process "ospf 9", VRF default
  Router 10.37.0.32 area 0.0.0.0 ASBR
  Router 10.37.0.18 area 0.0.0.0 ASBR
  Router 10.37.0.22 area 0.0.0.0 ASBR ABR
  Router 10.37.0.31 area 0.0.0.0 ASBR ABR
  Router 10.37.0.58 area 0.0.0.0 ASBR
  Router 10.37.0.37 area 0.0.0.0 ASBR
  Router 10.37.0.22 area 0.0.0.2 ASBR ABR
  Router 10.37.0.31 area 0.0.0.2 ASBR ABR
switch>
```

---

### 14.3.5.33 show ipv6 ospf database link if-name

The `show ipv6 ospf database link` command displays link state advertisement details. The switch can return link state data about a single area or for all areas on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf database link if-name[INTF_ID][LS_ID][ROUTER][ DATA_LEVEL]
```

#### Parameters

- INTF\_ID Options include:
  - ethernet *e\_range* Ethernet interface list.
  - loopback *l\_range* Loopback interface list.
  - management *m\_range* Management interface list.
  - port-channel *p\_range* Channel group interface list.
  - vlan *v\_range* VLAN interface list.
  - vxlan *vx\_range* VXLAN interface list.

Valid *range* formats include number, range, or comma-delimited list of numbers and ranges.

- LS\_ID Options include:
  - *<no parameter>*
  - *<A.B.C.D>*
- ROUTER Options include:
  - *<no parameter>*
  - adv-router *[a.b.c.d]*
  - self-originate
- DATA\_LEVEL Options include:
  - *<no parameter>*
  - detail

#### Example

This command displays information for Ethernet 4/1 link state advertisements.

```
switch#show ipv6 ospf database link if-name ethernet 4/1
Codes: AEX - AS External, GRC - Grace,
       IAP - Inter Area Prefix, IAR - Inter Area Router,
       LNK - Link, NAP - Intra Area Prefix,
       NSA - Not So Stubby Area, NTW - Network,
       RTR - Router

Routing Process "ospf 1":

switch>
```

### 14.3.5.34 show ipv6 ospf database link if-type

The **show ipv6 ospf database link** command displays information of the link state advertisements. The switch can return link state data about a single area or for all areas on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf database link if-type [INTF_TYPE][LS_ID][ROUTER][DATA_LEVEL]
```

#### Parameters

- INTF\_TYPE
  - broadcast
  - nbma
  - p2mp
  - p2p
- LS\_ID Options include:
  - *<no parameter>*
  - *<A.B.C.D>*
- ROUTER Options include:
  - *<no parameter>*
  - adv-router [*a.b.c.d*]
  - self-originate
- DATA\_LEVEL Options include:
  - *<no parameter>*
  - detail

#### Example

This command displays LSA information for the interfaces configured for broadcast transmissions.

```
switch#show ipv6 ospf database link if-type broadcast
Codes: AEX - AS External, GRC - Grace,
       IAP - Inter Area Prefix, IAR - Inter Area Router,
       LNK - Link, NAP - Intra Area Prefix,
       NSA - Not So Stubby Area, NTW - Network,
       RTR - Router

Routing Process "ospf 1":

  Interface et4 LSDB

Type          Link ID      ADV Router  Age          Seq#         Checksum
LNK           0.0.0.61    10.26.0.49  1378        0x80000027  0x00f8b0

```

```
switch>
```

### 14.3.5.35 show ipv6 ospf database <link state list>

The `show ipv6 ospf database <link state list>` command displays the OSPF link state advertisements that originate on a switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf database [FILTER][LINKSTATE_ID][ROUTER][DATA_LEVEL]
```

#### Parameters

- **FILTER** Filters the output of the command by specifying areas. Options include:
  - `<no parameter>`
  - `area <A.B.C.D>`
  - `area backbone`
  - `as`
  - `as external`
- **LINKSTATE\_ID** Options include:
  - `<no parameter>`
  - `<A.B.C.D>`
- **ROUTER** Options include:
  - `<no parameter>`
  - `adv-router [a.b.c.d]`
  - `self-originate`
- **DATA\_LEVEL** Options include:
  - `<no parameter>`
  - `detail`

#### Example

This command displays the OSPFv3 database of link state advertisements.

```
switch#show ipv6 ospf database 10.26.0.23
Codes: AEX - AS External, GRC - Grace,
       IAP - Inter Area Prefix, IAR - Inter Area Router,
       LNK - Link, NAP - Intra Area Prefix,
       NSA - Not So Stubby Area, NTW - Network,
       RTR - Router

Routing Process "ospf 9":

  AS Scope LSDB

Type          Link ID      ADV Router   Age         Seq#         Checksum

switch>

### 14.3.5.36 show ipv6 ospf database link

The **show ipv6 ospf database link** command displays details of the specified link state advertisements. The switch can return link state data about a single area or for all areas on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf database link [LINKSTATE_ID][ROUTER][DATA_LEVEL]
```

#### Parameters

- LINKSTATE\_ID Options include:
  - *<no parameter>*
  - *<A.B.C.D>*
- ROUTER Options include:
  - *<no parameter>*
  - *adv-router [a.b.c.d]*
  - *self-originate*
- DATA\_LEVEL Options include:
  - *<no parameter>*
  - *detail*

#### Example

This command displays information about the Open Shortest Path First (OSPF).

```
switch#show ipv6 ospf database link
Codes: AEX - AS External, GRC - Grace,
       IAP - Inter Area Prefix, IAR - Inter Area Router,
       LNK - Link, NAP - Intra Area Prefix,
       NSA - Not So Stubby Area, NTW - Network,
       RTR - Router

Routing Process "ospf 9":

switch>
```

---

### 14.3.5.37 show ipv6 ospf database

The **show ipv6 ospf database** command displays data from the OSPF database. The switch can return link state data for a single VRF or for all VRFs on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf database[ VRF_INSTANCE]
```

#### Parameters

- VRF\_INSTANCE Values include:
  - *<no parameter>* Displays information for all VRFs.
  - *vrf vrf\_name* Displays information for the specified VRF.

#### Example

This command displays OSPF database information for VRF blue.

```
switch#show ipv6 ospf database vrf blue
Codes: AEX - AS External, GRC - Grace,
       IAP - Inter Area Prefix, IAR - Inter Area Router,
       LNK - Link, NAP - Intra Area Prefix,
       NSA - Not So Stubby Area, NTW - Network,
       RTR - Router
Routing Process "ospf 9", VRF blue
AS Scope LSDB
switch>
```

### 14.3.5.38 show ipv6 ospf database<link-state details>

The `show ipv6 ospf database <link-state details>` command displays detailed information about the specified link state advertisements. The switch can return link state data about a single area or for all areas on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf database [FILTER][LINK_TYPE][LINKSTATE_ID][ROUTER][DATA_LEVEL]
```

#### Parameters

- FILTER Filters the output of the command by specifying areas. Options include:
  - area <A.B.C.D>
  - area backbone
- LINK\_TYPE Parameter options include:
  - router
  - network
  - inter-area-prefix
  - inter-area-router
  - intra-area-prefix
  - nssa
- LINKSTATE\_ID Options include:
  - <no parameter>
  - <A.B.C.D>
- ROUTER Options include:
  - <no parameter>
  - adv-router [a.b.c.d]
  - self-originate
- DATA\_LEVEL Options include:
  - <no parameter>
  - detail

#### Example

This command displays the OSPF database summary.

```
switch#show ipv6 ospf database detail
Codes: AEX - AS External, GRC - Grace,
       IAP - Inter Area Prefix, IAR - Inter Area Router,
       LNK - Link, NAP - Intra Area Prefix,
       NSA - Not So Stubby Area, NTW - Network,
       RTR - Router

### 14.3.5.39 show ipv6 ospf interface

The **show ipv6 ospf interface** command displays OSPFv3 information on interfaces where OSPFv3 is enabled.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf interface [VRF_INSTANCE]
```

#### Parameters

- VRF\_INSTANCE Values include:
  - *<no parameter>* Displays information for all VRFs.
  - *vrf vrf\_name* Displays information for the specified VRF.

#### Example

This command displays OSPFv3 information for interfaces where OSPFv3 is enabled.

```
switch#show ipv6 ospf interface
Ethernet17 is up
  Interface Address fe80::48c:73ff:fe00:1319, VRF default, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State Backup DR, Priority 1
  Designated Router is 10.37.0.37
  Backup Designated Router is 10.37.0.23
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
  Options are R E V6
Vlan31 is up
  Interface Address fe80::48c:73ff:fe00:1319, VRF default, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State Backup DR, Priority 1

  Backup Designated Router is 10.37.0.23
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 1
  Options are R E V6
Vlan32 is up
  Interface Address fe80::48c:73ff:fe00:1319, VRF default, Area 0.0.0.0
  Network Type Broadcast, Cost 10
  Transmit Delay is 1 sec, State DR Other, Priority 1
  Designated Router is 10.37.0.11
  Backup Designated Router is 10.37.0.22
  Timer intervals configured, Hello 10, Dead 40, Retransmit 5
  Neighbor Count is 2
  Options are R E V6
switch>
```

### 14.3.5.40 show ipv6 ospf lsa-log

The `show ipv6 ospf lsa-log` command displays log entries when LSA update messages are sent or received for OSPFv3.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf [PROCESS_ID] lsa-log [VRF_INSTANCE]
```

#### Parameters

- PROCESS\_ID OSPFv3 process ID. Values include:
  - *<no parameter>* Displays information for all process IDs.
  - *<1 to 65535>* Displays information for the specified process ID.
- VRF\_INSTANCE Values include:
  - *<no parameter>* Displays information for all VRFs.
  - *vrf vrf\_name* Displays information for the specified VRF.

#### Example

This command displays log entries when LSA update messages are sent or received for OSPFv3.

```
switch#show ipv6 ospf lsa-log
OSPF3 Process 3.3.3.3, VRF default, LSA Throttling Log:
[04:21:09] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
value 2000 msecs
[04:21:08] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new
hold value 900 msecs
[04:21:00] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
value 3000 msecs
[04:21:00] type 1: 3.3.3.3/32 [3.3.3.3], event 4, maxwait value changed,
new hold value 3000
msecs
/* Here the maxwait value was changed to 3000 from earlier 32000, this is
not part of the log */
[04:20:42] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
value 32000 msecs
[04:20:10] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
value 32000 msecs
[04:19:54] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
value 16000 msecs
[04:19:46] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
value 8000 msecs
[04:19:42] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
value 4000 msecs
[04:19:40] type 1: 3.3.3.3/32 [3.3.3.3], event 1, backed off, new hold
value 2000 msecs
[04:19:39] type 1: 3.3.3.3/32 [3.3.3.3], event 2, backoff restarted, new
hold value 900 msecs
[04:19:22] type 1: 4.4.4.4/32 [4.4.4.4], event 3, discarded, was early by
995 msecs
[04:19:22] type 1: 3.3.3.3/32 [3.3.3.3], event 0, backoff started, new
hold value 1000 msecs
switch>
```

---

#### 14.3.5.41 show ipv6 ospf neighbor state

The `show ipv6 ospf neighbor state` command displays the state information on OSPF neighbors on a per-interface basis.

##### Command Mode

EXEC

##### Command Syntax

```
show ipv6 ospf neighbor state STATE_NAME [VRF_INSTANCE ]
```

##### Parameters

- STATE\_NAME Values include:
  - 2-ways
  - attempt
  - down
  - exch-start
  - exchange
  - full
  - restart
  - init
  - loading
- VRF\_INSTANCE Values include:
  - *<no parameter>* Displays information for all VRFs.
  - *vrf vrf\_name* Displays information for the specified VRF.

##### Example

This command displays OSPF information for neighboring devices that are adjacent.

```
switch#show ipv6 ospf neighbor state full
Routing Process "ospf 3":
switch>
```

### 14.3.5.42 show ipv6 ospf neighbor summary

The `show ipv6 ospf neighbor summary` command displays a single line of state information for each OSPFv3 neighbor.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf neighbor summary [VRF_INSTANCE]
```

#### Parameters

- VRF\_INSTANCE Values include:
  - <no parameter> Displays information for all VRFs.
  - vrf *vrf\_name* Displays information for the specified VRF.

#### Example

This command shows the summary information for the OSPFv3 neighbors.

```
switch#show ipv6 ospf neighbor summary
Routing Process "ospf 1":
  3 neighbors are in state Down
  3 neighbors are in state Full
  5 neighbors are in state Init
  0 neighbors are in state Loading
  0 neighbors are in state Attempt
  3 neighbors are in state Restarting
  0 neighbors are in state Exchange
  3 neighbors are in state 2 Ways
  0 neighbors are in state Exch Start
switch>
```

---

### 14.3.5.43 show ipv6 ospf neighbor

The `show ipv6 ospf neighbor` command displays OSPFv3 neighbor information.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf neighbor [VRF_INSTANCE]
```

#### Parameters

- VRF\_INSTANCE Values include:
  - `<no parameter>` Displays information for all VRFs.
  - `vrf vrf_name` Displays information for the specified VRF.

#### Example

This command displays the switch's neighbors.

```
switch#show ipv6 ospf neighbor
Routing Process "ospf 9":
Neighbor 10.37.0.37 VRF default priority is 1, state is Full
  In area 0.0.0.0 interface et12
  DR is 10.37.0.37 BDR is 10.37.0.23
  Options is 0
  Dead timer is due in 37 seconds
Neighbor 10.37.0.22 VRF default priority is 1, state is Full
  In area 0.0.0.0 interface vlan3911
  DR is 10.37.0.22 BDR is 10.37.0.23
  Options is 0
  Dead timer is due in 31 seconds
Neighbor 10.37.0.11 VRF default priority is 1, state is Full
  In area 0.0.0.0 interface vlan3902
  DR is 10.37.0.11 BDR is 10.37.0.22
  Options is 0
  Dead timer is due in 33 seconds
Neighbor 10.37.0.22 VRF default priority is 1, state is Full
  In area 0.0.0.0 interface vlan3902
  DR is 10.37.0.11 BDR is 10.37.0.22
  Options is 0
  Dead timer is due in 31 seconds
Neighbor 10.37.0.22 VRF default priority is 1, state is Full
  In area 0.0.0.0 interface vlan3923
  DR is 10.37.0.22 BDR is 10.37.0.46
  Options is 0
  Dead timer is due in 31 seconds
Neighbor 10.37.0.22 VRF default priority is 1, state is Full
  In area 0.0.0.0 interface vlan3908
  DR is 10.37.0.22 BDR is 10.37.0.21
  Options is 0
  Dead timer is due in 39 seconds
Neighbor 10.37.0.22 VRF default priority is 1, state is Full
  In area 0.0.0.2 interface vlan3992
  DR is 10.37.0.22 BDR is 10.37.0.23
  Options is 0
  Dead timer is due in 39 seconds
switch>
```

### 14.3.5.44 show ipv6 ospf spf-log

The `show ipv6 ospf spf-log` command displays when and how long the switch took to run a full SPF calculation for OSPFv3.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf [PROCESS_ID] spf-log [VRF_INSTANCE]
```

#### Parameters

- PROCESS\_ID OSPFv3 process ID. Values include:
  - *<no parameter>* Displays information for all process IDs.
  - *<1 to 65535>* Displays information for the specified process ID.
- VRF\_INSTANCE Values include:
  - *<no parameter>* Displays information for all VRFs.
  - *vrf vrf\_name* Displays information for the specified VRF.

#### Example

This command displays the SPF information for OSPFv3 in all VRFs.

```
switch#show ipv6 ospf spf-log
OSPF3 Process 172.26.0.22, VRF default
TIME          EVENT                               REASON
04:54:52.070  SPF ran for 0.70 ms
04:54:52.070  Scheduled after 0 ms           Router LSA generation
04:54:39.151  SPF ran for 0.71 ms
04:54:39.151  Scheduled after 0 ms           Router LSA generation
04:54:12.071  SPF ran for 0.56 ms
04:54:12.070  Scheduled after 0 ms           Router LSA generation
04:54:04.153  SPF ran for 0.29 ms
04:53:59.153  Scheduled after 4999 ms        Router LSA generation
04:53:59.153  SPF ran for 0.25 ms
04:53:59.151  Scheduled after 0 ms           Router LSA generation
04:53:33.081  SPF ran for 0.3 ms
04:53:33.081  Scheduled after 0 ms           ECMP max nexthop cfg change
switch>
```

---

### 14.3.5.45 show ipv6 ospf

The `show ipv6 ospf` command displays information about OSPFv3 routing.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 ospf [access-list | border-routers | database | interface | lsa-log | neighbor | request-list  
| retransmission-list | spf-log | vrf ] Process ID
```

#### Parameters

- `<no parameters>` displays the complete configuration of OSPFv3 address family and routing process.
- `access-list` displays the information of configured OSPFv3 access-list. Options include:
  - `<no parameters>` displays the information of all configured OSPFv3 access lists.
  - `WORD` displays the information of the specified access list.
  - `summary` displays the summary of all configured access lists.
- `border-routers` displays the information of configured OSPFv3 border and boundary routers. Options include:
  - `<no parameters>` displays the information of all configured OSPFv3 borders and boundary routers.
  - `vrf` displays the OSPFv3 borders and boundary routers information of the specified Virtual Routing and Forwarding (VRF).
- `database` displays the summary of database. Options include:
  - `<no parameters>` displays the complete summary of database.
  - `ipv4` displays the database information of link state ID.
  - `adv-router` displays the database information of advertising router link states.
  - `area` displays the database information filtered by area scope LSAs.
  - `as` displays the database information filtered by AS scope LSAs.
  - `database-summary` displays the count of LSAs in OSPFv3 database.
  - `detail` displays the detailed information of LSA.
  - `link` displays the database information filtered by link scoped LSAs.
  - `self-originate` displays the database information of self-originated link states.
  - `vrf` displays the VRF information in OSPFv3 database.
- `interface` displays the information of OSPFv3 interfaces. Options include:
  - `<no parameters>` displays the information of all OSPFv3 interfaces.
  - Ethernet `eth_num` displays the information of the specified Ethernet interface. The value ranges from 1 to 24.
  - Loopback `lb_num` displays the information of the specified loop back interface. The value ranges from 0 to 1000.
  - Port-Channel `pc_num` displays the interface or sub-interface information of the specified port channel. The interface and sub-interface values of port channel ranges from `<1-1000>` and `<1-2000>`.`<1-4094>` respectively.
  - Tunnel `t_num` displays the information of the specified tunnel. The value ranges from 0 to 255.
  - Vlan `vlan_num` displays the information of the specified VLAN interface. The value ranges from 1 to 4094.
  - vrf `vrf_name` displays the information of the specified VRF.
- `lsa-log` displays the log entries of OSPFv3 LSA updates.
- `neighbor` displays the list of OSPFv3 neighbors.
- `request-list` displays the list of all OSPFv3 LSAs requested by a router.

- `retransmission-list` displays the list of all OSPFv3 LSAs waiting to be re-sent.
- `spf-log` displays the start-time, duration of completion, and reason of delay to calculate the OSPFv3 Sender Policy Framework (SPF).
- `vrf vrf_name` displays the information of specified VRF.
- `Process ID` displays the OSPFv3 configuration of the specified process ID. The value ranges from 1 to 65535.

### Examples

- This command displays OSPFv3 routing information for all VRFs.

```
switch#show ipv6 ospf
Routing Process "ospfv3 0" with ID 11.1.11.1 and Instance 0 VRF default
  FIPS mode disabled
  It is not an autonomous system boundary router and is not an area
  border router
  Minimum LSA arrival interval 1000 msec
  Initial LSA throttle delay 1000 msec
  Minimum hold time for LSA throttle 5000 msec
  Maximum wait time for LSA throttle 5000 msec
  It has 0 fully adjacent neighbors
  Number of areas in this router is 0. 0 normal, 0 stub, 0 nssa
  Number of LSAs 0
  Initial SPF schedule delay 0 msec
  Minimum hold time between two consecutive SPFs 5000 msec
  Current hold time between two consecutive SPFs 5000 msec
  Maximum wait time between two consecutive SPFs 5000 msec
  SPF algorithm last executed 00:07:13 ago
  No scheduled SPF
  Adjacency exchange-start threshold is 20
  Maximum number of next-hops supported in ECMP is 32
  Number of backbone neighbors is 0
  Graceful-restart is not configured
  Graceful-restart-helper mode is enabled
```

- This command displays the log entries of OSPFv3 LSA updates.

```
switch#show ipv6 ospf lsa-log

### 14.3.5.46 show ospfv3

The **show ospfv3** command displays the OSPFv3 configuration of OSPFv3 address family and routing process.

#### Command Mode

EXEC

#### Command Syntax

```
show ospfv3 [access-list | border-routers | database | interface | ipv4 | ipv6 | lsa-log | neighbor | request-list | retransmission-list | spf-log | vrf]
```

#### Parameters

- *<no parameters>* displays the complete configuration of OSPFv3 address family and routing process.
- **access-list** displays the information of configured OSPFv3 access-list. Options include:
  - *<no parameters>* displays the information of all configured OSPFv3 access lists.
  - **WORD** displays the information of the specified access list.
  - **summary** displays the summary of all configured access lists.
- **border-routers** displays the information of configured OSPFv3 border and boundary routers. Options include:
  - *<no parameters>* displays the information of all configured OSPFv3 borders and boundary routers.
  - **vrf** displays the OSPFv3 borders and boundary routers information of the specified Virtual Routing and Forwarding (VRF).
- **database** displays the summary of database. Options include:
  - *<no parameters>* displays the complete summary of database.
  - **ipv4** displays the database information of link state ID.
  - **adv-router** displays the database information of advertising router link states.
  - **area** displays the database information filtered by area scope LSAs.
  - **as** displays the database information filtered by AS scope LSAs.
  - **database-summary** displays the count of LSAs in OSPFv3 database.
  - **detail** displays the detailed information of LSA.
  - **link** displays the database information filtered by link scoped LSAs.
  - **self-originate** displays the database information of self-originated link states.
  - **vrf** displays the VRF information in OSPFv3 database.
- **interface** displays the information of OSPFv3 interfaces. Options include
  - *<no parameters>* displays the information of all OSPFv3 interfaces.
  - **Ethernet *eth\_num*** displays the information of the specified Ethernet interface. The value ranges from 1 to 24.
  - **Loopback *lb\_num*** displays the information of the specified loop back interface. The value ranges from 0 to 1000.
  - **Port-Channel *pc\_num*** displays the interface or sub-interface information of the specified port channel. The interface and sub-interface values of port channel ranges from <1-1000> and <1-2000>.<1-4094> respectively.
  - **Tunnel *t\_num*** displays the information of the specified tunnel. The value ranges from 0 to 255.
  - **Vlan *vlan\_num*** displays the information of the specified VLAN interface. The value ranges from 1 to 4094.
  - **vrf *vrf\_name*** displays the information of the specified VRF.
- **ipv4** displays the IPv4 address family information.
- **ipv6** displays the IPv6 address family information.

- `lsa-log` displays the log entries of OSPFv3 LSA updates.
- `neighbor` displays the list of OSPFv3 neighbors.
- `request-list` displays the list of all OSPFv3 LSAs requested by a router.
- `retransmission-list` displays the list of all OSPFv3 LSAs waiting to be re-sent.
- `spf-log` displays the start-time, duration of completion, and reason of delay to calculate the OSPFv3 Sender Policy Framework (SPF).
- `vrf vrf_name` displays the information of specified VRF.

### Examples

- This command displays the complete configuration of OSPFv3 address family and routing process.

```
switch#show ospfv3
OSPFv3 address-family ipv6
Routing Process "ospfv3" with ID 13.13.13.13 and Instance 0 VRF default
  FIPS mode disabled
  It is not an autonomous system boundary router and is not an area
  border router
  Minimum LSA arrival interval 1000 msec
  Initial LSA throttle delay 1000 msec
  Minimum hold time for LSA throttle 5000 msec
  Maximum wait time for LSA throttle 5000 msec
  Interface flood pacing timer 50 msec
  It has 0 fully adjacent neighbors
  Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
  Number of LSAs 1
  Initial SPF schedule delay 0 msec
  Minimum hold time between two consecutive SPFs 5000 msec
  Current hold time between two consecutive SPFs 5000 msec
  Maximum wait time between two consecutive SPFs 5000 msec
  SPF algorithm last executed 3d23h ago
  No scheduled SPF
  Adjacency exchange-start threshold is 20
  Maximum number of next-hops supported in ECMP is 32
  Number of backbone neighbors is 0
  Graceful-restart is not configured
  Graceful-restart-helper mode is enabled
  Area 0.0.0.0
    Number of interface in this area is 0
    It is a normal area
    SPF algorithm executed 2 times
```

- This command displays the count of LSAs in OSPFv3 database.

```
switch#show ospfv3 database database-summary
OSPFv3 address-family ipv4
Routing Process "ospfv3" Instance 64 VRF default

LSA Type          Count

### 14.3.5.47 shutdown (OSPFv3)

The **shutdown** command disables OSPFv3 on the switch.

OSPFv3 is disabled by default on individual interfaces and enabled through **ipv6 ospf area** commands.

The **no shutdown** and **default shutdown** commands enable the OSPFv3 instance by removing the **shutdown** statement from the OSPFv3 block in running-config.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

#### Example

This command disables OSPFv3 activity on the switch.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#shutdown
switch(config-router-ospf3)#show active
ipv6 router ospf 9
  shutdown
switch(config-router-ospf3)#
```

#### 14.3.5.48 timers lsa rx min interval (OSPFv3)

The **timers lsa rx min interval** command sets the minimum interval for accepting identical link-state advertisements (LSAs) from OSPFv3 neighbors.

The **no timers lsa rx min interval** and **default timers lsa rx min interval** commands restore the minimum interval to the default value of one second by removing the **timers lsa rx min interval** command from *running-config*.

##### Command Mode

Router-OSPFv3 Configuration

Router-OSPFv3 Address-Family

IPv4/IPv6 Configuration

##### Command Syntax

```
timers lsa rx min interval lsa_time
no timers lsa rx min interval
default timers lsa rx min interval
```

##### Parameter

*lsa\_time* Minimum time (in milliseconds) after which the switch accepts an identical LSA from OSPFv3 neighbors. Value ranges from 0 to 600000 (ms). Default value is 1000 milliseconds (1 second).

##### Example

This command sets the minimum LSA arrival interval to ten milliseconds.

```
switch(config) #router ospfv3
switch(config-router-ospfv3) #timers lsa rx min interval 10
switch(config-router-ospfv3) #
```

---

### 14.3.5.49 timers lsa tx delay initial (OSPFv3)

The `timers lsa tx delay initial` command sets the rate-limiting values for OSPFv3 Link-State Advertisement (LSA) generation.

The `no timers lsa tx delay initial` and `default timers lsa tx delay initial` commands restore the default LSA rate-limiting values by removing the `timers lsa tx delay initial` command from *running-config*.

#### Command Mode

Router-OSPFv3 Configuration

Router-OSPFv3 Address-Family

IPv4/IPv6 Configuration

#### Command Syntax

```
timers lsa tx delay initial initial_delay min_hold max_wait
```

```
no timers lsa tx delay initial
```

```
default timers lsa tx delay initial
```

#### Parameters

- *initial\_delay* Initial delay in milliseconds to generate the first instance of LSAs. Value ranges from 0 to 600000 (ms). The default value is 1000 ms.
- *min\_hold* Minimum hold interval available in milliseconds between the generation of same LSA. Value ranges from 1 to 600000 (ms). The default interval is 5000 ms.
- *max\_wait* Maximum hold interval available in milliseconds between the generation of same LSA. Value ranges from 1 to 600000 (ms). The default interval is 5000 ms.

#### Example

These commands set the LSA transmission timers on the switch.

```
switch(config) #router ospfv3
switch(config-router-ospfv3) #
switch(config-router-ospfv3) #timers lsa tx delay initial 5 100 20000
switch(config-router-ospfv3) #
```

### 14.3.5.50 timers spf delay initial (OSPFv3)

The purpose of SPF throttling is to delay Shortest Path First (SPF) calculations when network topology is changing rapidly. The `timers spf delay initial` command controls the intervals of SPF calculations in a switch. The command sets three values:

- **Initial delay:** Initial wait by a switch to calculate SPF after a topology change in a network that has been stable throughout the hold interval. Because a topology change often requires several link state updates to be sent, the initial delay is configured to allow the network to settle before the switch calculates SPF. If an additional topology change occurs during the initial interval, the SPF calculation still takes place after the initial delay period has expired and no other change is made to the throttle timers.
- **Hold interval:** This is an additional wait timer that reduces the frequency of SPF calculations during periods of network instability. If a network change occurs during the hold period, an SPF calculation is scheduled to occur when the hold interval expires. Subsequent hold intervals are doubled if further topology changes occur during a hold interval until either the hold interval reaches its configured maximum or no topology change occurs during the interval. If the next topology change occurs after the hold interval expires, the hold interval is reset to its configured value and the SPF calculation is scheduled to take place after the initial delay.
- **Maximum interval:** The maximum wait time of a switch after a topology change before performing an SPF calculation.

The `no timers spf delay initial` and `default timers spf delay initial` commands restore the default OSPFv3 SPF calculation intervals by removing the `timers spf delay initial` command from `running-config`.

#### Command Mode

Router-OSPFv3 Configuration

Router-OSPFv3 Address-Family

IPv4/IPv6 Configuration

#### Command Syntax

```
timers spf delay initial initial_delay hold_interval max_interval
```

```
no timers spf
```

```
default timers spf
```

#### Parameters

- *initial\_delay* Initial delay between a topology change and SPF calculation. Value ranges from 0 to 65535000 (ms). The default value is 0 ms.
- *hold\_interval* Additional wait time after SPF calculation to allow the network to settle. If a topology change occurs during the hold interval, another SPF calculation is scheduled to occur after the hold interval expires. The next hold interval is doubled if topology changes occur during the hold interval. If doubling exceeds the maximum value, the maximum value is used instead. Value ranges from 0 to 65535000 (ms). The default value is 5000 ms.
- *max\_interval* The maximum hold interval before a switch calculates SPF. Value ranges from 0 to 65535000 (ms). The default value is 5000 ms.

#### Example

These commands set the SPF timers on the switch.

```
switch(config)#router ospfv3
switch(config-router-ospfv3)#
switch(config-router-ospfv3)#timers spf delay initial 5 100 20000
switch(config-router-ospfv3)#
```

### 14.3.5.51 timers

The **timers** command configures the minimum interval between the transmission of consecutive LS update packets in a network.

The **no timers** and **default timers** commands set the configured timer value to its default.

#### Command Mode

Router-OSPFv3 Configuration

#### Command Syntax

```
timers {lsa | out-delay| pacing | throttle}
no timers {lsa | out-delay| pacing | throttle}
deault timers {lsa | out-delay| pacing | throttle}
```

#### Parameters

- lsa configures threshold for the retransmission of LSA. Option includes:
  - arrival configures the OSPF LSA arrival timer.
- out-delay configures the delay to flood router LSA in milliseconds. Option includes:
  - *out-delay\_time* minimum interval in milliseconds between accepting the same LSAs. The value ranges from 0 to 65000 milliseconds. The default value is zero.
- pacing configures the OSPF packet pacing. Option includes:
  - flood configures the OSPF flood pacing.
- throttle configures ospf throttle timers. Options include:
  - lsaconfigures threshold for the retransmission of LSA.
  - spfconfigures the time between SPF calculations.

#### Examples

- This command configures OSPFv3 flood pacing timer to 50 ms in the global OSPFv3 instance.

```
switch(config)#ipv6 router ospf 9
switch(config-router-ospf3)#timers pacing flood 50
switch(config-router-ospf3)#show ospfv3
Routing Process "ospfv3 9" with ID 13.13.13.13 and Instance 0 VRF
default
  FIPS mode disabled
  It is not an autonomous system boundary router and is not an area
  border router
  Minimum LSA arrival interval 1000 msec
  Initial LSA throttle delay 1000 msec
  Minimum hold time for LSA throttle 5000 msec
  Maximum wait time for LSA throttle 5000 msec
  Interface flood pacing timer 50 msec
  It has 0 fully adjacent neighbors
  Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
  Number of LSAs 1
  Initial SPF schedule delay 0 msec
  Minimum hold time between two consecutive SPFs 5000 msec
  Current hold time between two consecutive SPFs 5000 msec
  Maximum wait time between two consecutive SPFs 5000 msec
  SPF algorithm last executed 21d19h ago
  No scheduled SPF
  Adjacency exchange-start threshold is 20
  Maximum number of next-hops supported in ECMP is 32
  Number of backbone neighbors is 0
  Graceful-restart is not configured
```

```
Graceful-restart-helper mode is enabled
Area 0.0.0.0
  Number of interface in this area is 0
  It is a normal area
  SPF algorithm executed 2 times
```

- This command configures the OSPFv3 flood pacing timer to 50 ms in IPv4 address family.

```
switch(config)#router ospfv3
switch(config-router-ospfv3)#address-family ipv4
switch(config-router-ospfv3-af)#timers pacing flood 50
switch(config-router-ospfv3-af)#show ospfv3
OSPFv3 address-family ipv4
Routing Process "ospfv3" with ID 11.1.11.1 and Instance 64 VRF default
  FIPS mode disabled
  It is not an autonomous system boundary router and is not an area
  border router
  Minimum LSA arrival interval 1000 msec
  Initial LSA throttle delay 1000 msec
  Minimum hold time for LSA throttle 5000 msec
  Maximum wait time for LSA throttle 5000 msec
  Interface flood pacing timer 50 msec
  It has 0 fully adjacent neighbors
  Number of areas in this router is 1. 1 normal, 0 stub, 0 nssa
  Number of LSAs 1
  Initial SPF schedule delay 0 msec
  Minimum hold time between two consecutive SPF's 5000 msec
  Current hold time between two consecutive SPF's 5000 msec
  Maximum wait time between two consecutive SPF's 5000 msec
  SPF algorithm last executed 00:10:38 ago
  No scheduled SPF
  Adjacency exchange-start threshold is 20
  Maximum number of next-hops supported in ECMP is 32
  Number of backbone neighbors is 0
  Graceful-restart is not configured
  Graceful-restart-helper mode is enabled
  Area 0.0.0.0
    Number of interface in this area is 0
    It is a normal area
    SPF algorithm executed 2 times
```

## 14.4 IS-IS

Intermediate System-to-Intermediate System (IS-IS) intra-domain routing information exchange protocol is designed by the International Organization for Standardization to support connectionless networking. This protocol is a dynamic routing protocol.

This chapter contains the following sections.

- [IS-IS Introduction](#)
- [IS-IS Segment Routing](#)
- [IS-IS Graceful Restart](#)
- [IS-IS Configuration](#)
- [IS-IS Commands](#)

### 14.4.1 IS-IS Introduction

IS-IS is a link-state protocol, which uses the shortest path first (SPF) algorithm. IS-IS and the OSPF protocol are similar in many aspects. As an interior gateway protocol (IGP), IS-IS runs inside an autonomous system (AS).

---

To enable IS-IS, you must instantiate an IS-IS routing instance and assign it to an interface. Arista IS-IS support includes IS-IS segment routing and IS-IS graceful restart.

### 14.4.2 IS-IS Segment Routing

Segment Routing (SR) provides a mechanism to simplify the definition of end-to-end paths within IGP topologies by encoding paths as sequences of topological sub-paths, called segments. The IS-IS protocol advertises these segments in four different ways: node segments, prefix segments, proxy-node segments, and adjacency segments.

Node segments represent a node in an IGP topology. A proxy segment are generally associated with an IP(v6) address received from a router that does not support IS-IS SR. Prefix segments represent an ECMP-aware shortest path to a prefix (or a node), as per the state of the IGP topology. Adjacency segments represent a hop over a specific adjacency between two nodes in IGP.

### 14.4.3 IS-IS Graceful Restart

IS-IS Graceful Restart (GR) is a mechanism to prevent routing protocol re-convergence during a processor switchover or device downtime. Normally, when a router restarts, all the neighboring routers associated with that router detect that the device has gone down and remove routes from that neighbor. When the router restarts, the session is re-established and data transfer continues. During the restart, the removal and re-insertion of routes will result in data loss. This can be prevented by configuring graceful restart on the device.

When IS-IS is used as the interior gateway protocol (IGP), the following EOS features require nonstop forwarding (NSF) and support for the graceful restart from IS-IS:

- Accelerated Software Upgrade phase 2 (ASU2)
- planned Stateful Switchover (SSO) initiated by an operator for maintenance, or unplanned SSO due to failures on the active supervisor
- RIB agent restart due to software failures

With IS-IS Graceful Restart (GR) configured, a redundancy switchover from active to standby supervisor, or ASU2, or restart of the IS-IS software (the RIB agent) should be a hitless event if the GR completes successfully. Neighboring routers will continue to forward traffic to the restarting router and traffic forwarding through the restarting router continues without loss. If GR is successful, the failure of a router should be completely transparent to network applications.

ISIS Graceful Restart (GR) is compatible with the following platforms:

- IS-IS GR with unplanned software restart is supported on all platforms.
- IS-IS GR with SSO is supported on modular dual-supervisor platforms.
- IS-IS GR with ASU2 is supported on platforms that support ASU2.

### 14.4.4 IS-IS Configuration

These sections describe IS-IS configuration tasks:

- [Enabling IS-IS](#)
- [Configuring IS-IS Optional Global Parameters](#)
- [Configuring Optional IS-IS Interface Parameters](#)
- [Configuring IS-IS Segment Routing](#)
- [Configuring IS-IS Graceful Restart \(GR\)](#)
- [Disabling IS-IS](#)
- [Displaying IS-IS Information](#)

### 14.4.4.1 Enabling IS-IS

To enable IS-IS, each of the following tasks must be performed.

- [Enabling IS-IS Globally and Specifying an IS-IS Instance](#)
- [Configuring the Network Entity Title \(NET\)](#)
- [Setting the Address Family Configuration](#)
- [Enabling IS-IS on a Specified Interface](#)

#### 14.4.4.1.1 Enabling IS-IS Globally and Specifying an IS-IS Instance

The switch supports only one IS-IS routing instance per VRF. The routing instance uniquely identifies the switch to other devices. IS-IS configuration commands apply globally to the IS-IS instance.

The switch must be in router IS-IS configuration mode to run IS-IS configuration commands. The `router isis` command places the switch in router IS-IS configuration mode.

##### Example

- These commands create an IS-IS routing instance named Osiris in the default VRF and place the switch in IS-IS configuration mode for that instance.

```
switch(config)#router isis Osiris
switch(config-router-isis)#
```

#### 14.4.4.1.2 Configuring the Network Entity Title (NET)

After creating an IS-IS routing instance, configure the Network Entity Title (NET) with the `net` command. The NET defines the IS-IS area address and the system ID of the device.

##### Example

- These commands configure the NET by specifying the IS-IS area address and the system ID of the device.

```
switch(config)#router isis Osiris
switch(config-router-isis)#net 49.0001.1010.1040.1030.00
```

#### 14.4.4.1.3 Setting the Address Family Configuration

The `address-family` command enables the address families that IS-IS will route and places the switch in the configuration mode for that address family. The address families supported are IPv4 unicast and IPv6 unicast.

##### Example

- These commands enable and enter the address family mode for IPv4 unicast.

```
switch(config)#router isis Osiris
switch(config-router-isis)#address-family ipv4 unicast
switch(config-router-isis-af)#
```

#### 14.4.4.1.4 Enabling IS-IS on a Specified Interface

After enabling IS-IS globally, enable it on an interface with the `isis enable` command.

##### Example

- These commands enable IS-IS on Ethernet interface 4.

```
switch(config-router-isis)#interface ethernet 4
switch(config-if-Eth4)#isis enable Osiris
```

#### 14.4.4.2 Configuring IS-IS Optional Global Parameters

After globally enabling IS-IS, the following global parameters may be configured.

- [Setting the Router Type](#)
- [Configuring Redistribution of Connected or Static Non-ISIS Routes](#)
- [Configuring Redistribution of Connected or Static non-ISIS Routes into Level-1 or Level-2](#)
- [Configuring Redistribution of BGP Routes into ISIS](#)
- [Setting the Overload Bit](#)
- [Configuring IS-IS MD5 Authentication](#)
- [Setting the SPF Interval](#)
- [Configuring IS-IS Segment Routing Global Adjacency-SID](#)
- [Enabling Logging for Peer Changes](#)
- [Setting the IS-IS hostname](#)
- [Configuring IS-IS Multi-Topology](#)

##### 14.4.4.2.1 Setting the Router Type

The `is-type` command sets the routing level for an IS-IS instance.

###### Example

- These commands specify level-2 for the IS-IS instance.

```
switch(config)#router isis Osiris
switch(config-router-isis)#is-type level-2
switch(config-router-isis)#
```

##### 14.4.4.2.2 Configuring Redistribution of Connected or Static Non-ISIS Routes

The `redistribute (IS-IS)` command configures redistribution of connected or static non-ISIS routes.

###### Example

- These commands redistribute connected routes into the IS-IS domain.

```
switch(config)#router isis Osiris
switch(config-router-isis)#redistribute connected
switch(config-router-isis)#
```

##### 14.4.4.2.3 Configuring Redistribution of Connected or Static non-ISIS Routes into Level-1 or Level-2

Non-ISIS routes can be exported into level-1, level-2, or both using a route map. By default, the routes are exported only to level-2; to export to level-1 or to both levels, configure the route map using the `set isis level` command. The level-1 or level-2 routes can also be filtered using the route maps match statement. The route map is then used when redistributing routes in ISIS with the `redistribute (IS-IS)` command.

Use the `show isis database detail` command to make sure that the route shows up in the exported level.

###### Examples

- The following commands configure a route map called `rm` to set the IS-IS level to level-1, then use it to redistribute connected routes.

```
switch(config)#route-map rm
switch(config-route-map-rm)#set isis level level-1
switch(config-route-map-rm)#router isis osiris
switch(config-router-isis)#redistribute connected route-map rm
switch(config-router-isis)#
```

- The following command displays IS-IS database information and confirms that the level has been set to level-1.

```
switch#show isis database detail
ISIS Instance: inst1 VRF: default
ISIS Level 1 Link State Database
LSPID Seq Num Cksum Life IS Flags
1111.1111.1001.00-00 10 63306 751 L2 <>
NLPID: 0xCC(IPv4) 0x8E(IPv6)
Area address: 49.0001
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

#### 14.4.4.2.4 Configuring Redistribution of BGP Routes into ISIS

The `redistribute bgp route-map` command redistributes the BGP routes from the specified route map into IS-IS. Only one route map can be specified; reissuing the command overrides any previous configuration.

The `no redistribute bgp` and `default redistribute bgp` commands disable BGP route redistribution from the specified domain by removing the `redistribute bgp` statement from *running-config*.

The command is available in both router IS-IS configuration mode and the address-family submode. The command is rejected if configured in both modes at the same time. Issuing the `no` or `default` command in router IS-IS configuration mode has no effect on redistribution configured in the address-family submode.

**Note:** If the command is configured in an address-family submode, it only redistributes routes from that address family. If it is configured in router-ISIS mode, it applies to all enabled address families.

#### Examples

- These commands redistribute IPv4 BGP routes from the route map called `bgp-to-isis-v4` into the ISIS domain.

```
switch(config)#router isis 1
switch(config-router-isis)#address-family ipv4
switch(config-router-isis-af)#redistribute bgp route-map bgp-to-isis-v4
switch(config-router-isis-af)#
```

- These commands redistribute all BGP routes from the route map `bgp-to-isis` into ISIS.

```
switch(config)#router isis 1
switch(config-router-isis)#redistribute bgp route-map bgp-to-isis
```

#### 14.4.4.2.5 Setting the Overload Bit

The `set-overload-bit` command used without the `on-startup` option, informs other devices not to use the local router to forward transit traffic. When used with the `on-startup` option, the overload bit is set for the interval specified after startup.

---

In scenarios when Border Gateway Protocol (BGP) routes are resolved using an Interior Gateway Protocol (IGP), if the transit router reboots and becomes available again, the IGP will consider the transit router as an optimal path again. After rebooting, the transit router will blackhole traffic until the transit router learns the external destination reachability information via BGP.

### Examples

- These commands configure the switch and sets the overload bit to 120 seconds after startup.

```
switch(config)#router isis Osiris
switch(config-router-isis)#set-overload-bit on-startup 120
switch(config-router-isis)#
```

- These commands configure the overload bit until BGP converges. If BGP fails to converge within the set timeout default period, then the overload bit gets cleared.

```
switch(config)#router isis Osiris
switch(config-router-isis)#set-overload-bit on-startup wait-for-bgp
switch(config-router-isis)#set-overload-bit on-startup wait-for-bgp
timeout 750
switch(config-router-isis)#
```

#### 14.4.4.2.6 Configuring IS-IS MD5 Authentication

To configure authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated, use the `authentication mode` and `authentication key` commands. To configure authentication on the interface, causing IS-IS Hellos to be authenticated, use the `isis authentication mode` and `isis authentication key` commands on the interface.

Two forms of authentication are supported by the IS-IS routing protocol: Clear-text authentication and MD5 authentication. The difference between the two forms of authentication is in the level of security provided. In the case of clear-text authentication, the password is specified as text in the authentication TLV, making it possible for an attacker to break authentication by sniffing and capturing IS-IS PDUs on the network. Arista recommends using the MD5 authentication.

HMAC MD5 authentication provides much stronger authentication by computing the message digest (on the IS-IS PDU contents) using the secret key to produce a hashed message authentication code (HMAC). Different modes of authentication can be specified on the interface, which authenticates IIH PDUs (IS-IS hello PDUs), and globally in the router IS-IS mode, in which the LSPs, CSNPs and PSNPs are authenticated. Area-wide and domain-wide authentication can be specified for L1 and L2 routers respectively.

### Example

- These commands configure authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

```
switch(config)#router isis 1
switch(config-router-isis)#authentication mode md5
switch(config-router-isis)#authentication key secret
switch(config-router-isis)#
```

- These commands configure authentication on the interface causing IS-IS Hellos to be authenticated.

```
switch(config)#interface Ethernet 3/6
switch(config-if-Et3/6)#isis authentication mode text
switch(config-if-Et3/6)#isis authentication key 7 cAm28+9a/xPi0
4o7hjd8Jw==
switch(config-if-Et3/6)#
```

To maximize interoperability, Arista recommends using the same key in both interface mode and in router isis mode.

#### 14.4.4.2.7 Setting the SPF Interval

The SPF timer interval defines the maximum interval between two successive SPF calculations. IS-IS runs SPF calculations following a change in the network topology or the link-state database. The `spf-interval` command defines the following intervals:

- **Maximum wait interval:** The maximum time a switch will wait before running an SPF after a topology change.
- **Initial wait interval:** In a network that has been stable throughout the hold interval, this interval defines the initial wait time of a switch for performing an SPF calculation after a topology change. As several link-state updates must be sent after a topology change, the initial wait interval allows the network to settle before a switch computes an SPF. If the topology changes during an initial wait interval, an SPF is calculated after the initial wait interval expires and no further changes are made to throttle timers.
- **Hold time:** This interval delays SPF calculations during network instability. If the topology changes during a hold time, an SPF is computed when the hold time expires. Subsequent hold intervals are doubled up to the configured maximum wait interval for continuous topology changes. If the next topology change occurs after the hold interval expires, the hold interval is reset to its configured value and the SPF is computed after the initial wait interval.

**Note:** EOS does not support configuring topology-specific SPF timers in multi-topology deployments and IS-IS level-specific SPF timers.

#### Example

This command configures maximum wait interval, initial wait interval, and hold time to 10 seconds, 2000 ms, and 1000 ms respectively.

```
switch(config)#router isis inst1
switch(config-router-isis)#spf-interval 10 2000 1000
```

#### 14.4.4.2.8 Configuring IS-IS Segment Routing Global Adjacency-SID

IS-IS Segment Routing (SR) supports global adjacency SIDs for point-to-point interfaces. The adjacency SID is configured as an index using the adjacency-segment command.

Global adjacency segments are represented using an index instead of actual MPLS labels. The index is an offset into the Segment Routing Global Block (SRGB) advertised by a router, resulting in an MPLS label. The default value of SRGB in EOS is Base: 900000 and Size: 65536.

The same index may be used to configure multiple interfaces so that MPLS forms an ECMP group, and the same index may be applied to IPv4 and IPv6 adjacencies.

#### Example

- In this example, the global adjacency is configured on a point-to-point interface Ethernet Et1, with an index value 10.

```
switch(config-if-Et1)#adjacency-segment ipv4 p2p index 10 global
```

#### Displaying Adjacency SID Information

The command `show isis segment-routing adjacency-segments` displays the global adjacency SID value and other related information.

#### Examples

- In this example an interface is configured as follows:

```
interface Ethernet1
 ip address 1.1.1.1/24
 ipv6 address 1000::1/64
 isis enable isis1
 isis network point-to-point
 adjacency-segment ipv4 p2p index 1 global
 adjacency-segment ipv6 p2p index 2 global
```

- The show output for the above interface configuration:

```
Switch#show isis segment-routing adjacency-segments

System ID: 1000.0000.0002          Instance: isis1
SR supported Data-plane: MPLS      SR Router ID: 1.1.1.4
Adj-SID allocation mode: SR-adjacencies
Adj-SID allocation pool: Base: 100000   Size: 16384
Adjacency Segment Count: 2
Flag Descriptions: F: Ipv6 address family, B: Backup, V: Value
                   L: Local, S: Set

Segment Status codes: L1 - Level-1 adjacency, L2 - Level-2 adjacency, P2P -
Point-to-Point adjacency, LAN - Broadcast adjacency

Locally Originated Adjacency Segments
Adj IP Address      Local Intf  SID      SID Source  Flags                               Type
-----
1.1.1.2            Et1        1        Configured  F:0 B:0 V:0 L:0 S:0               P2P L1
fe80::1:ff:fe65:0 Et1        2        Configured  F:1 B:0 V:0 L:0 S:0               P2P L1

Received Global Adjacency Segments
SID                Originator      Neighbor      Flags
-----
0                  rtrmpls1      1000.0000.0002  F:0 B:0 V:0 L:0 S:0
```

#### 14.4.4.2.9 Enabling Logging for Peer Changes

The `log-adjacency-changes (IS-IS)` command configures the switch to send syslog messages when it detects IS-IS neighbor adjacency state changes.

##### Example

- These commands configure the switch to send a syslog message when a neighbor goes up or down.

```
switch(config)#router isis Osiris
switch(config-router-isis)#log-adjacency-changes
switch(config-router-isis)#
```

#### 14.4.4.2.10 Setting the IS-IS hostname

The `is-hostname` command configures the use of a human-readable string to represent the symbolic name of an IS-IS router. It also changes the output of IS-IS show commands, to show the IS-IS hostname in place of system IDs if the corresponding IS-IS hostname is known. However, syslogs still use IS-IS system IDs and not the IS-IS hostname.

By default if there's a hostname configured on the switch, it is used as the IS-IS hostname. It is also possible to deconfigure an assigned hostname for IS-IS using the `no is-hostname` command. When the IS-IS hostname is removed, the switch goes back to using the switch's hostname as the IS-IS hostname.

##### Examples

- These commands configure the IS-IS hostname to the symbolic name ishost1 for the IS-IS router.

```
switch(config)#router isis inst1
switch(config-router-isis)#is-hostname ishost1
switch(config-router-isis)#
```

- These commands unconfigure the IS-IS hostname of the symbolic name ishost1 for the IS-IS router.

```
switch(config)#router isis inst1
switch(config-router-isis)#no is-hostname ishost1
switch(config-router-isis)#
```

#### 14.4.4.2.11 Configuring IS-IS Multi-Topology

The `multi-topology` command configures IS-IS Multi-Topology (MT) support (disabled by default), enabling an IS-IS router to compute a separate topology for IPv4 and IPv6 links in the network. With MT configured, not all the links in a network need to support both IPv4 and IPv6. Some can support IPv4 or IPv6 individually. The IPv4 SPF will install IPv4 routes using the IPv4 topology, and similarly, the IPv6 SPF will install IPv6 routes using the IPv6 topology. Without MT support, all links in an IS-IS network need to support the same set of address families.

When MT is enabled, and each link has a separate IPv4 metric and IPv6 metric.

The `isis ipv6 metric` command configures the IPv6 metric.

The `isis multi-topology` command configures the IPv4 or IPv6 address family individually on an interface with both IPv4 and IPv6 addresses.

The address families that are enabled on an interface are based on the global address families enabled in router IS-IS configuration mode, and the addresses configured on the interface. To enable a particular address family on an interface, it needs to have an address configured in that address family. In the case where both IPv4 and IPv6 address families are enabled in router IS-IS configuration mode, then if an interface has IPv4 and IPv6 addresses, both IPv4 and IPv6 address families are enabled on that interface. In the case of an interface with only an IPv4 address family, the IPv4 address family is enabled on that interface. Where an interface only has an IPv6 address family, the IPv6 address family is enabled on that interface. Finally, where only the IPv6 address family is enabled in router IS-IS config mode and MT is enabled, then the IPv6 address family is enabled on all interfaces which have an IPv6 address configured.

#### Examples

- These commands configure MT for the IS-IS router.

```
switch(config)#router isis 1
switch(config-router-isis)#address-family ipv6 unicast
switch(config-router-isis-af)#multi-topology
switch(config-router-isis-af)#
```

- These commands unconfigure MT for the IS-IS router.

```
switch(config)#router isis 1
switch(config-router-isis)#address-family ipv6 unicast
switch(config-router-isis-af)#no multi-topology
switch(config-router-isis-af)#
```

- These commands configure the IPv6 metric.

```
switch(config)#interface Ethernet 5/6
switch(config-if-Et5/6)#isis ipv6 metric 30
switch(config-if-Et5/6)#
```

- These commands configure the IPv4 address family on an interface with both IPv4 and IPv6 addresses.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#isis multi-topology address-family ipv4 unicast
switch(config-if-Et1)#
```

- These commands configure the IPv6 address family on an interface with both IPv4 and IPv6 addresses.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#isis multi-topology address-family ipv6 unicast
switch(config-if-Et1)#
```

- These commands configure both the IPv4 and IPv6 address families on an interface.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#no isis multi-topology address-family unicast
switch(config-if-Et1)#
```

#### 14.4.4.3 Configuring Optional IS-IS Interface Parameters

After globally enabling IS-IS, the following parameters may be configured on individual interfaces.

- [Setting the Hello Packet Interval](#)
- [Configuring the Hello Multiplier for the Interface](#)
- [Configuring the IS-IS Metric](#)
- [Setting the LSP Transmission Interval](#)
- [Setting the IS-IS Priority](#)
- [Configuring an Interface as Passive](#)
- [Configuring BFD support for IS-IS for IPv4](#)

##### 14.4.4.3.1 Setting the Hello Packet Interval

The `isis hello-interval` command sets the time interval between the hello packets that maintain an IS-IS adjacency.

###### Example

- These commands configure a hello interval of 60 seconds for Ethernet 4.

```
switch(config)#interface ethernet 4
switch(config-if-Et4)#isis hello-interval 60
switch(config-if-Et4)#
```

##### 14.4.4.3.2 Configuring the Hello Multiplier for the Interface

The switch maintains the adjacency by sending/receiving hello packets. When receiving no hello packets from the peer within a time interval, the local switch considers the neighbors invalid.

The `isis hello-multiplier` command calculates the hold time announced in hello packets by multiplying this number with the configured `isis hello-interval`.

###### Example

- These commands configure a hello multiplier of 5 for Ethernet 4.

```
switch(config)#interface ethernet 4
switch(config-if-Et4)#isis hello-interval 60
```

```
switch(config-if-Et4)#isis hello-multiplier 5
switch(config-if-Et4)#
```

#### 14.4.4.3.3 Configuring the IS-IS Metric

The `isis metric` command sets the cost for sending information over a specific interface. At present only wide metrics are supported.

##### Example

These commands configure a metric cost of 30 for sending information over Ethernet 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#isis metric 30
switch(config-if-Et5)#
```

#### 14.4.4.3.4 Setting the LSP Transmission Interval

The `isis lsp tx interval` command configures the minimum interval between successive LSP transmissions on an interface.

##### Example

- This command sets the LSP transmission interval on interface Ethernet 5 to 50 milliseconds.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#isis lsp tx interval 50
switch(config-if-Et5)#
```

#### 14.4.4.3.5 Setting the IS-IS Priority

The `isis priority` command determines which device will be the Designated Intermediate System (DIS). The device with the highest priority on the LAN will become the DIS.

##### Example

- These commands configure a device priority of 60 on interface Ethernet 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#isis priority 60
switch(config-if-Et5)#
```

#### 14.4.4.3.6 Configuring an Interface as Passive

The `isis passive` and `passive (IS-IS)` commands configure IS-IS interfaces as passive to interfaces where adjacencies are wanted. The interface does not send or receive IS-IS packets when configured as passive.

##### Examples

- These commands configure Ethernet interface 10 as a passive interface.

```
switch(config)#interface ethernet 10
switch(config-if-Et10)#isis passive
switch(config-if-Et10)#
```

- These commands configure Ethernet interface 10 as a passive interface in the router IS-IS mode.

```
switch(config)#router isis Osiris
switch(config-router-isis)#passive interface ethernet 10
```

```
switch(config-router-isis)#
```

#### 14.4.4.3.7 Configuring BFD support for IS-IS for IPv4

The `isis bfd` and `bfd all-interfaces` commands configure Bidirectional Forwarding Detection (BFD). BFD is supported for both IS-IS IPv4 and IPv6 routes.

##### Examples

- These commands enable BFD (for the IPv4 address family) for all the interfaces on which IS-IS is enabled. By default, BFD is disabled on all interfaces.

```
switch(config)#router isis 1
switch(config-router-isis)#address-family ipv4
switch(config-router-af)#bfd all-interfaces
switch(config-router-af)#
```

- These commands enable BFD on an IS-IS interface.

```
switch(config)#interface Ethernet 5/6
switch(config-if-Et5/6)#isis bfd
switch(config-if-Et5/6)#
```

#### 14.4.4.4 Configuring IS-IS Segment Routing

Global IS-IS Segment Routing (IS-IS SR) commands are accessed in Segment-Routing MPLS mode, under the router IS-IS configuration mode. Interface-specific IS-IS SR commands are accessed in interface configuration mode.

##### 14.4.4.4.1 Starting the MPLS Agent

The routing information base (RIB) or IS-IS agent provides IS-IS segment routing, but the actual installation of LFIB entries pertaining to SR information provided by IS-IS is handled by the MPLS agent in EOS, which is disabled by default. To enable the MPLS agent, use the following commands.

**Note:** IP(v6) routing must be enabled as a prerequisite.

##### Example

- The following commands enable IP routing and the MPLS agent on the switch.

```
switch(config)#ip routing
switch(config)#mpls ip
switch(config)#
```

##### 14.4.4.4.2 Enabling IS-IS SR

By default, IS-IS SR is disabled. You must enable it explicitly by issuing the `no shutdown (IS-IS SR)` command in Segment-Routing MPLS configuration mode.

##### Example

- The following commands enable IS-IS SR.

```
switch(config)#router isis instance1
switch(config-router-isis)#segment-routing mpls
switch(config-router-isis-sr-mpls)#no shutdown
switch(config-router-isis-sr-mpls)#
```

#### 14.4.4.4.3 Disabling IS-IS Segment Routing

To administratively disable IS-IS SR, issue the `shutdown (IS-IS SR)` command in Segment-Routing MPLS configuration mode. To disable IS-IS SR and delete all IS-IS SR configuration, issue the `no segment-routing mpls` command in router ISIS configuration mode.

##### Example

- The following commands administratively disable IS-IS SR.

```
switch(config)#router isis instance1
switch(config-router-isis)#segment-routing mpls
switch(config-router-isis-sr-mpls)#shutdown
switch(config-router-isis-sr-mpls)#
```

- The following commands disable IS-IS SR and delete all IS-IS SR configuration.

```
switch(config)#router isis instance1
switch(config-router-isis)#no segment-routing mpls
switch(config-router-isis)#
```

#### 14.4.4.4.4 SRGB (Segment Routing Global Range)

The global segments such as Prefix-SID, Node-SID, Proxy-node-SID are represented using indices of actual MPLS labels. These indices are offset on the SRGB advertised by a router to derive the respective MPLS label. The default value of SRGB in EOS is Base: 900000, Size: 65536. In other words, the labels that any global segment could represent is between 900000-965535. The MPLS label range is categorized and reserved into pools based on the applications using these labels. The default values of label ranges in these pools are:

- Dynamic Global Range--(100000) (262144)
- IS-IS SR Global Range -- (900000) (65536)
- Static Global Range -- (16) (99984)

**Note:** SRGB can be configured to fit in different MPLS ranges as long as it does not fall under an MPLS range already assigned for usage by other applications.

##### Example

```
switch(config)#mpls label range isis-sr 900000 65536
```

#### 14.4.4.4.5 Configuring Node-SID

Node segments are indices associated with routers within an IS-IS SR domain. This is done by associating node-segments with prefix mask length /32 (IPv4) or /128 (IPv6) addresses. Node segments are carried as sub-TLVs (type-length-value) in IP reachability TLVs for the prefixes with which these segments are associated. Node segments are configured on IS-IS enabled Loop-back interface(s) as shown in the example below.

##### Examples

- The following commands are used to associate a node-segment with an IPv4 address.

```
switch(config)#int loopback 1
switch(config-if-Lo1)#ip address 21.1.1.1/32
switch(config-if-Lo1)#node-segment ipv4 index 5
```

- The following commands are used to associate a node-segment with an IPv6 address.

```
switch(config)#int loopback 1
switch(config-if-Lo1)#ipv6 add 2000::24/128
```

```
switch(config-if-Lo1)#node-segment ipv6 index 5
```

- The following example shows a warning thrown at the CLI when a /32 or /128 address is not configured on the interface.

```
switch(config)#int loopback 1
switch(config-if-Lo1)#ip address 21.1.1.1/24
switch(config-if-Lo1)#node-segment ipv4 index 1
! /32 IPv4 address is not configured on the interface
```

- The following command removes the node-segment from IS-IS SR from an interface.

```
switch(config-if-Lo1)#no node-segment ipv4 index 1
```

#### 14.4.4.4.6 Configuring Prefix-SIDs

Prefix segments are associated with any IS-IS prefix a router is originating an IP Reachability TLV for. These segments are carried as sub-TLVs in IP Reachability TLVs of the prefixes with which these segments are associated. Prefix segments are configured under segment-routing MPLS configuration mode in IS-IS.

**Note:** The configured prefix segment is effective, only if, the prefix for which a prefix-SID configured becomes a part of IS-IS by enabling IS-IS on interfaces, or by redistribution from other protocols etc.

#### Example

- The following commands are used to associate a prefix segment with an IPv4 address with index value of 50.

```
switch(config)#router isis instance1
switch(config-router-isis)#segment-routing mpls
switch(config-router-isis-sr-mpls)#prefix-segment 1.1.1.0/24 index 50
```

#### 14.4.4.4.7 Configuring Proxy-Node SIDs

Node segments represent a device (node) by attaching a segment (index) with a /32, /128 prefix which generally is configured on a loopback interface. There are routers which do not support segment routing, and there might be a situation where it is required to assign node identifiers on such routers. To overcome this shortfall, a router that supports IS-IS SR is made to proxy by configuring a proxy-node-SID for a IS-IS prefix originating from the router that does not support IS-IS SR.

#### Example

- A proxy-node SID associates a /32 or a /128 route with an SID as shown below.

```
switch(config)#router isis instance1
switch(config-router-isis)#segment-routing mpls
switch(config-router-isis-sr-mpls)#proxy-node-segment 1.1.1.0/32 index
50
```

Although the general use case is to configure a proxy node segment on a router that is not originating the prefix with which we want to associate the proxy-node SID, it is not prohibited to configure one for self-originated prefixes.

Configuring proxy-node-SIDs enables a router to send out a Binding-SID TLV with details pertaining to the prefix and SID.

**Note:** A Binding-SID can carry a range of prefixes and an associated range of SIDs, but at present the EOS does not support to configure such ranges with one binding segment TLV in

IS-IS SR. However, we do process ranges of prefixes and SIDs if received from devices that support such configurations.

#### 14.4.4.4.8 Configuring Anycast-SID

An Anycast-SID is a prefix segment that identifies a set of routers and not a specific router. It enforces the ECMP-aware shortest-path forwarding towards the closest node of the anycast set.

An example of such an anycast group could be a set of routers A1, A2, A3, and A4 where at least one router of A1, A2, A3, and A4 advertises the prefix SID corresponding to the anycast address (which can be a prefix originating on all of A1, A2, A3 and A4 a loop-back address, maybe).

In general use case, all the routers of the anycast group would have the same prefix-SID configured for the anycast IP address present on them.

**Note:** That for Anycast-SID to work as expected, the SRGB on the members of the anycast group should be same.

#### 14.4.4.4.9 Configuring router-ID

A router that support IS-IS SR need to advertise its SR data-plane capability and the range of MPLS label values it uses for segment routing, this is advertised by inserting SR-Capability sub-TLV in the Router Capabilities TLV.

A Router Capability TLV is now sent in IS-IS LSPs when Segment routing is enabled and it is necessary for a Router Capability TLV to carry a router-ID. This router-ID could be configured in EOS under the segment routing MPLS configuration mode. If no router-ID is configured, the router automatically picks up the highest IPv4 address configured on the router for an router-ID.

#### 14.4.4.4.10 Configuring IS-IS Static Adjacency SID

Adjacency segments for IS-IS adjacencies are statically configured on the switch, so that these values are preserved even when the switch restarts. Static adjacency segments are configured per address family on any interface (including Port-Channel, VLANs and SVIs). They are configured and advertised as labels.

These are the few points to be considered while configuring the static adjacency SIDs:

- The same label can be configured on multiple interfaces so that MPLS can form ECMP, the same value can be applied to IPv4 and IPv6 adjacency.
- Static adjacency SID is applied only to p2p interface, and has local scope. When interface type changes to LAN, then dynamic adjacency SID is assigned.
- When Static adjacency SIDs are configured, then simply replace dynamic adjacency SIDs which are advertised to other routers and installed in the local LFIB.
- Static adjacency SID is applied regardless of Adjacency Segment Allocation Mode.
- When Static adjacency SID is disabled, then normal rules for dynamic adjacency SID is applied (it automatically applies a value based on Adjacency Segment Allocation Mode as described in IS-IS Segment Routing TOI document).

#### Example

```
switch(config-if-Et1) #adjacency-segment ipv4 p2p index 50 global
```

They can be a label (local) or index (global) and we can assign multiple adjacency segments per link.

Where label-value must be within the SR Local Block (SRLB) that can be found in the output of show mpls label range command as shown.

| Start | End | Size | Usage |
|-------|-----|------|-------|
| ----- |     |      |       |

|         |         |        |                |
|---------|---------|--------|----------------|
| 0       | 15      | 16     | reserved       |
| 16      | 99999   | 99984  | static mpls    |
| 100000  | 362143  | 262144 | free (dynamic) |
| 362144  | 899999  | 537856 | unassigned     |
| 900000  | 965535  | 65536  | isis-sr        |
| 900000  | 965535  | 65536  | bgp-sr         |
| 965536  | 1031071 | 65536  | srlb           |
| 1031072 | 1036287 | 5216   | unassigned     |
| 1036288 | 1048575 | 12288  | l2evpn         |

#### 14.4.4.4.11 Configuring Adjacency Segment Label Range

Adjacency Segments are MPLS labels assigned to IS-IS adjacencies. These labels are shared with other routers in the domain by adding them in adjacency-SID sub-TLVs which are inserted in neighbor Reachability TLVs in IS-IS.

The MPLS labels (adjacency segments) are incrementally allocated to adjacencies, as the transition to Up state, from a adjacent set of MPLS labels pre-allocated by MPLS agent. This label range extends from 100000 to 116383 (base: 100000, size: 16384) by default. This could be changed by the following configuration:

##### Example

```
switch(config)#mpls label range dynamic 200000 131072
```

The dynamic label pool is shared between LDP and IS-IS SR Adjacency Segments.

#### 14.4.4.4.12 Configuring Adjacency Segment Allocation Mode

Adjacency Segments are allocated to all IS-IS adjacencies based on the IS-IS routers that have advertised IS-IS SR capability or to none of the adjacencies. The command adjacency-segment allocation is used to configure this under the segment-routing MPLS configuration mode.

The default behavior is to allocate adjacency segments to adjacencies of SR supporting devices.

##### Example

```
switch(config-router-isis-sr-mpls)#adjacency-segment allocation sr-peer
```

#### 14.4.4.4.13 Adjacency Segment Persistence across Link Flaps

Adjacency segments are allocated to IS-IS adjacencies based on configured adjacency segment allocation mode mentioned above.

If an adjacency that has been allocated label L goes down, L is reserved for this adjacency for a duration of 3600 seconds from the time of the adjacency down event. Only the adjacency that owned this label before going down could reclaim label L in this duration.

#### 14.4.4.4.14 Troubleshooting IS-IS Segment Routing

- The `show tech-support ribd` command has a section starting with the string SR Book Keeper which has extensive information on state of IS-IS SR on the router.
- In-case, if IS-IS SR is configured but SR related TLVs/sub, but, TLVs are not being sent in IS-IS LSPs.
  - Ensure that MPLS has been enabled (MPLD IP) enabled.
  - Check if segment routing is administratively shut down.
  - A segment might have been configured for a prefix not yet being advertised in IS-IS.
- In case, if Adjacency Segments are not being advertised.

- Check if the adjacency segment mode is correctly set.
- Adjacency Mode is set to all SR supported interfaces (default setting) and the peer does not support SR.
- Generally, it is good to not have same prefix with different indices or same index with different prefixes. There are CLI prohibitions that ensure that a router is not sending out conflicting sets of prefixes and associated SIDs. As there is possibility of receiving conflicting prefix-segments from other devices, there are ways to resolve the following three types of conflicts: prefix+SID conflict, SID conflict and prefix conflict.
  - Prefix+SID Conflict: When there are two prefix segments which have both the prefix and SID have same values, the one from the higher system ID is chosen for LFIB processing.
  - Prefix Conflict: If the two prefix segments which have same Prefix are from two different system than the one from higher system ID is chosen. If they are originated from same system ID than we choose the prefix segment of smaller SID.
  - SID Conflict: If the two prefix segments which have same SID are from two different system than the one from higher system ID is chosen. If they are originated from same system than the one which is of smaller prefix length is chosen. If prefix length is also same than the one with smaller address is chosen.

For a given prefix, if both a proxy-node segment and prefix-SID are received, the prefix-SID advertised is preferred while the proxy-node segment is ignored.

The `show tech-support ribd` displays detail information about IS-IS SRs internal state, and more information on conflicts and chosen active segments could be found under the SR Book Keeper section of `show tech-support ribd` command as shown.

```
Received Prefix Segments:
-----
Prefix      | Value | Index/Label | Type   | SystemID      | spfgen
* - Active, # - Duplicate pfx, + - duplicate SID
-----
*1.0.3.0/24  3      Index       Prefix  1111.1111.1002  0
*1.0.5.1/32  0      Index       Node   1111.1111.1002  0
*1.0.6.1/32  2      Index       Node   1111.1111.1003  39
*1.0.7.1/32  14     Index       Node   1111.1111.1001  39
#1.0.7.1/32
```

10 Index Proxy 1111.1111.1003 39

#### 14.4.4.5 Disabling IS-IS

An IS-IS instance can be shut down globally or can be disabled on individual interfaces.

The `shutdown (IS-IS)` command shuts down an IS-IS instance globally.

##### Example

- These commands disable IS-IS globally without modifying the IS-IS configuration.

```
switch(config)#router isis Osiris
switch(config-router-isis)#shutdown
switch(config-router-isis)#
```

The `no isis enable` command disables IS-IS on an interface.

##### Example

- These commands disable IS-IS on interface Ethernet 4.

```
switch(config-router-isis)#interface ethernet 4
```

```
switch(config-if-Eth4) #no isis enable
```

#### 14.4.4.6 Configuring IS-IS Graceful Restart (GR)

By default, IS-IS graceful restart is disabled. Use the graceful-restart command to configure graceful restart on an IS-IS router. By default IS-IS graceful-restart-helper functionality is enabled, and to disable it use no graceful-restart-helper command.

##### Examples

- In this example IS-IS graceful restart is configured with t2 wait time of 30 seconds for level-1 routes.

```
switch(config) #router isis 1
switch(config-router-isis) #graceful-restart t2 level-1 30
```

t2 is the maximum wait time for the LSP database to synchronize (SPF computation is not done while t2 is running). t2 can be configured for either level-1 or level-2 through the CLI. The default value is 30 seconds, and the allowed configuration range is 5 to 300 seconds.

- In this example an ISIS graceful restart is configured with restart-hold-time of 50 seconds.

```
switch(config) #router isis 1
switch(config-router-isis) #graceful-restart restart-hold-time 50
```

In case of a planned restart, the hold time advertised by the IS-IS router prior to restart should be greater than the time for which the router is expected to be offline. Otherwise, neighboring routers will bring down the adjacency before the restarting router has a chance to send a restart request in its hello packet, which may result in traffic loss.

In case of ASU2, the IS-IS router instance will advertise a hello hold time of <restart-hold-time> on those interfaces for which the configured hold time is less than restart-hold-time. This is done just before the router restarts.

**Note:** Once the router has restarted, the routers advertised hello hold time will depend on the hello-interval and hello-multiplier configuration on each interface as before. By default, the restart-hold-time is disabled.

For Graceful Restart to be successful, the hold time advertised by the router should be greater than the time it takes for Graceful Restart to complete. If the restarting router is DIS, hold time advertised is 1/3rd of the configured value (default is 9s). We recommend increasing the hold time for the DIS to a higher value before a planned restart; otherwise, it may result in traffic loss.

#### 14.4.4.7 Displaying IS-IS Information

The following sections describe display and verification of IS-IS settings and of peer and connection configuration:

- [Displaying the Link State Database](#)
- [Displaying the Interface Information for the IS-IS Instance](#)
- [Displaying IS-IS Neighbor Information](#)
- [Displaying IS-IS Instance Information](#)
- [Displaying IS-IS Segment Routing Information](#)
- [Verifying IS-IS Graceful Restart \(GR\) Information](#)

##### 14.4.4.7.1 Displaying the Link State Database

To display the link state database of IS-IS, use the `show isis database` command.

##### Example

- This command displays the IS-IS link state database.

```
switch#show isis database
ISIS Instance: Osiris
  ISIS Level 2 Link State Database
    LSPID          Seq Num   Cksum   Life   IS Flags
    1212.1212.1212.00-00  4         714     1064  L2 <>
    1212.1212.1212.0a-00  1         57417   1064  L2 <>
    2222.2222.2222.00-00  6         15323   1116  L2 <>
    2727.2727.2727.00-00  10        15596   1050  L2 <>
    3030.3030.3030.00-00  12        62023   1104  L2 <>
    3030.3030.3030.c7-00  4         53510   1104  L2 <>
switch>
```

#### 14.4.4.7.2 Displaying the Interface Information for the IS-IS Instance

To display interface information related to the IS-IS instance, use the `show isis interface` command.

##### Example

- This command displays IS-IS interface information.

```
switch#show isis interface

ISIS Instance: Osiris
Interface Vlan20:
  Index: 59 SNPA: 0:1c:73:c:5:7f
  MTU: 1497 Type: broadcast
  Level 2:
    Metric: 10, Number of adjacencies: 2
    LAN-ID: 1212.1212.1212, Priority: 64
    DIS: 1212.1212.1212, DIS Priority: 64
Interface Ethernet30:
  Index: 36 SNPA: 0:1c:73:c:5:7f
  MTU: 1497 Type: broadcast
  Level 2:
    Metric: 10, Number of adjacencies: 1
    LAN-ID: 3030.3030.3030, Priority: 64
    DIS: 3030.3030.3030, DIS Priority: 64
switch>
```

#### 14.4.4.7.3 Displaying IS-IS Neighbor Information

To display general information for IS-IS neighbors that the device sees, use `show isis neighbors`.

##### Example

- This command displays information for IS-IS neighbors that the device sees.

```
switch#show isis neighbor
Inst Id   System Id           Type  Interface   SNPA           State  Hold
time
  10      2222.2222.2222     L2    Vlan20      2:1:0:c:0:0    UP     30
  10      1212.1212.1212     L2    Vlan20      2:1:0:d:0:0    UP     9
  10      3030.3030.3030     L2    Ethernet30  2:1:0:b:0:0    UP     9
switch>
```

#### 14.4.4.7.4 Displaying IS-IS Instance Information

To display the system ID, Type, Interface, IP address, State and Hold information for IS-IS instances, use the `show isis summary` command. The command is also used to verify the configured maximum wait interval, initial wait interval, and hold time of SPF timers in IS-IS instances. This command also displays values of the current SPF interval, last level-1 SPF run, and last level-2 SPF run.

##### Example

- This command displays general information about IS-IS instances.

```
switch#show isis summary
ISIS Instance: Osiris
  System ID: 1010.1040.1030, administratively enabled, attached
  Internal Preference: Level 1: 115, Level 2: 115
  External Preference: Level 1: 115, Level 2: 115
  IS-Type: Level 2, Number active interfaces: 1
  Routes IPv4 only
  Last Level 2 SPF run 2:32 minutes ago
  Area Addresses:
    10.0001
  level 2: number dis interfaces: 1, LSDB size: 1
switch>
```

- This command displays the SPF interval information about IS-IS instances.

```
switch(config-router-isis-af)#show isis summary

ISIS-IS Instance: 1 VRF: default
  System ID: 0000.0000.0001, administratively enabled
  Multi Topology disabled, not attached
  IPv4 Preference: Level 1: 115, Level 2: 115
  IPv6 Preference: Level 1: 115, Level 2: 115
  IS-Type: Level 1 and 2, Number active interfaces: 0
  Routes both IPv4 and IPv6

                                Max wait(s) Initial wait(ms) Hold
interval(ms)
LSP Generation Interval:         5                50                50
SPF Interval:                    2                1000               1000
Current SPF hold interval(ms): Level 1: 1000, Level 2: 1000
Last Level 1 SPF run 1 seconds ago
Last Level 2 SPF run 1 seconds ago
Authentication mode: Level 1: None, Level 2: None
Graceful Restart: Disabled, Graceful Restart Helper: Enabled
Area Addresses:
  49.0001
  level 1: number dis interfaces: 0, LSDB size: 1
  level 2: number dis interfaces: 0, LSDB size: 1
```

#### 14.4.4.7.5 Displaying IS-IS Segment Routing Information

IS-IS Segment Routing information is displayed using the following commands:

- `show isis database detail`
- `show isis segment-routing`
- `show isis segment-routing global-blocks`
- `show isis segment-routing prefix-segments`
- `show isis segment-routing prefix-segments self-originated`
- `show isis segment-routing adjacency-segments`
- `show mpls label ranges`

- `show mpls segment-routing bindings`
- `show mpls lfib route`
- `show mpls lfib route <label value>`

### show isis database detail

The `show isis database detail` command provides a view of LSPDB of different devices in the IS-IS domain. The output displays the TLVs and sub-TLVs that are being self-originated or the ones that have been received from other routers.

### Example

```
switch#show isis database detail
ISIS Instance: inst1 VRF: default
  ISIS Level 2 Link State Database
  LSPID Seq Num Cksum Life IS Flags
  1111.1111.1001.00-00 10 63306 751 L2 <>
  NLPID: 0xCC(IPv4) 0x8E(IPv6)
  Area address: 49.0001
  Interface address: 1.0.7.1
  Interface address: 1.0.0.1
  Interface address: 2000:0:0:47::1
  Interface address: 2000:0:0:40::1

```

### show isis segment-routing

The `show isis segment-routing` command displays the summary information on IS-IS SR status.

### Example

```
switch(config)#show isis segment-routing
System ID: 1111.1111.1002 Instance: inst1
SR supported Data-plane: MPLS SR Router ID: 252.252.2.252
SR Global Block( SRGB ): Base: 900000 Size: 65536
Adj-SID allocation mode: SR-adjacencies
Adj-SID allocation pool: Base: 100000 Size: 16384
```

```

All Prefix Segments have      : P:0 E:0 V:0 L:0
All Adjacency Segments have  : F:0 B:0 V:1 L:1 S:0
ISIS Reachability Algorithm  : SPF (0)
Number of ISIS segment routing capable peers: 3
Self-Originated Segment Statistics:
Node-Segments                : 2
Prefix-Segments              : 2
Proxy-Node-Segments          : 0
Adjacency Segments           :

```

### About the Output

The first line of the output shows the IS-IS system ID of this device and the name of the instance with which IS-IS is configured.

The supported data plane is shown against the SR supported Data-plane field whereas the Router ID being advertised in the Router Capability is mentioned in the SR Router ID Field.

The SRGB in use and the MPLS label pool being used for adjacency segment allocation are mentioned in this output. The current adjacency allocation mode which refers to whether we are allocating adjacency segments to all IS-IS adjacencies or only those adjacencies which support SR or None of the adjacencies is shown in the Adj-SID allocation mode field.

Flag contents of All Prefix Segments originated on this router, Flag contents of All Adjacency Segments originated on this router and supported IS-IS Reachability Algorithm have been provided through this command output and they carry the meaning as per the IS-IS SR IETF draft.

This show command provides a statistics related to IS-IS SR in terms of various counters ranging from number of IS-IS SR enabled peers, number of Node-SIDs, prefix-SIDs, proxy-node-segments and adjacency segments being originated on this router in IS-IS.

The **show isis segment-routing** command also provides information if segment routing has been administratively disabled as shown.

```

switch(config-router-isis-sr-mpls)#show isis segment-routing
! IS-IS (Instance: inst1) Segment Routing has been administratively
shutdown

```

### show isis segment-routing global-blocks

The **show isis segment-routing global-blocks** command lists the SRGBs in use by all SR supporting devices in IS-IS domain including the SRGB in use by IS-IS SR on this device.

#### Example

```

switch#show isis segment-routing global-blocks
System ID: 1111.1111.1002           Instance: inst1
SR supported Data-plane: MPLS       SR Router ID: 252.252.2.252
SR Global Block( SRGB ): Base: 900000 Size: 65536
Number of ISIS segment routing capable peers: 3
SystemId      Base      Size
-----
1111.1111.1002    900000    65536
1111.1111.1001    900000    65536

```

### show isis segment-routing prefix-segments

The **show isis segment-routing prefix-segments** command provides the details of all prefix segments being originated as well the segments received from IS-IS SR speakers in the domain.

## Example

```
switch#show isis segment-routing prefix-segments
System ID: 1111.1111.1002      Instance: inst1
SR supported Data-plane: MPLS  SR Router ID: 252.252.2.252
Node: 2 Proxy-Node: 2 Prefix: 2 Total Segments: 6
Flag Descriptions: R: Re-advertised, N: Node Segment, P: no-PHP
                      E: Explicit-NULL, V: Value, L: Local
Segment status codes: * - Self originated Prefix, L1 - level 1, L2 - level 2
Prefix      SID      Type      Flags      SystemID      Type
-----
1.0.7.1/32  2      Node      R:0 N:1 P:0 E:0 V:0 L:0  1111.1111.1001  L1
* 1.0.8.1/32  4      Node      R:0 N:1 P:0 E:0 V:0 L:0  1111.1111.1002  L2
1.0.11.0/24 10     Prefix    R:1 N:0 P:0 E:0 V:0 L:0  1111.1111.1001  L2
* 1.0.12.0/24 12     Prefix    R:1 N:0 P:0 E:0 V:0 L:0  1111.1111.1002  L2
1.0.15.1/32 18     Proxy-Node R:0 N:0 P:0 E:0 V:0 L:0  1111.1111.1001  L2
1.0.16.1/32 20     Proxy-Node R:0 N:0 P:0 E:0 V:0 L:0  1111.1111.1003  L2
```

## About the Output

After the usual output header that represents the system ID, instance name, etc and parameters of a router, there is a line depicting prefix segment counters. Each field in this line relates to the number of segments that are present in this routers IS-IS instance. For example, the above example shows that this device has 2 Node Segments (Self originated as well as the ones received from other IS-IS SR devices).

The main section of this show commands output is the section that lists all the prefix segments and related information like prefix, SID, type of segment (Prefix, Node, Proxy-Node), the flag values being carried in the sub-TLVs of these prefix segments and the system ID of the originating router. The Type field will be useful on a IS type level-1-2 router. It shows whether the installed prefix segment is from a level-1 prefix or a level-2 prefix.

## show isis segment-routing prefix-segments self-originated

The `show isis segment-routing prefix-segments self-originated` command output is identical to `show isis segment-routing prefix-segments` except, the fact that the former lists only self-originated prefix segments.

## show isis segment-routing adjacency-segments

The `show isis segment-routing adjacency-segments` displays list of all the adjacency segments that are being originated by IS-IS SR on a router.

## Example

```
switch#show isis segment-routing adjacency-segments
System ID: 1111.1111.1002      Instance: inst1
SR supported Data-plane: MPLS  SR Router ID: 252.252.2.252
Adj-SID allocation mode: SR-adjacencies
Adj-SID allocation pool: Base: 100000      Size: 16384
Adjacency Segment Count: 4
Adj IP-address      Local      Intf      Label      SID      Source      Flags      Type
-----
1.0.0.1             Vlan2472  100000    Dynamic    F:0      B:0 V:1     L:1 S:0    LAN L2
1.0.1.2             Vlan2579  100001    Dynamic    F:0      B:0 V:1     L:1 S:0    P2P L2
fe80::1:ff:fe01:0  Vlan2472  100002    Dynamic    F:0      B:0 V:1     L:1 S:0    LAN L2
fe80::1:ff:fe02:0  Vlan2579  100003    Dynamic    F:0      B:0 V:1     L:1 S:0    P2P L2
```

## About the Output

It consists allocation mode, MPLS label pool from which labels would be allocated to adjacencies, total count of adjacency segments allocated so far and the default flag values carried in all adj-SID sub-TLVs originating from this device.

The main section of the output lists all the adjacency segments allocated so far in six columns each pertaining to Adjacency IP address, local interface name, MPLS label value, SID source, flags in the

---

sub-TLV and the type of adj-SID respectively. The type of the adjacency segments depends on the IS-IS type of adjacency and the IS level.

### show mpls label ranges

The **show mpls label ranges** command displays the MPLS label range available on a router is categorized into different pools which cater to different applications running on the router.

The **isis-sr** refers to the SRGB use-case in IS-IS, and **isis (dynamic)** refers to the label pool that is used for dynamic allocation of adjacency segments in IS-IS.

### Example

```
switch#show mpls label ranges
Start      End        Size      Usage
-----
0          15         16        reserved
16         99999     99984     static mpls
100000     116383    16384     isis (dynamic)
116384     362143    245760    free (dynamic)
362144     899999    537856    unassigned
900000     965535    65536     isis-sr
```

### show mpls segment-routing bindings

The **show mpls segment-routing bindings** command displays the local label bindings and label bindings on the peer routers for each prefix that has a segment advertised. Peer ID here represents the IS-IS system ID of the peer.

### Example

```
switch#show mpls segment-routing bindings
1.0.7.1/32
  Local binding: Label: 900002
  Remote binding: Peer ID: 1111.1111.1001, Label: imp-null
  Remote binding: Peer ID: 1111.1111.1003, Label: 900002
1.0.8.1/32
  Local binding: Label: imp-null
  Remote binding: Peer ID: 1111.1111.1001, Label: 900004
  Remote binding: Peer ID: 1111.1111.1003, Label: 900004
1.0.9.1/32
  Local binding: Label: 900006
  Remote binding: Peer ID: 1111.1111.1001, Label: 900006
  Remote binding: Peer ID: 1111.1111.1003, Label: imp-null
```

### show mpls lfib route

The **show mpls lfib route** command displays the LFIB. Each LFIB entry has In-Label, Out-Label, metric, payload type, nexthop information, etc. fields. The source column depicts the MPLS control plane protocol that is responsible for the label binding that resulted in this LFIB route.

### Example

```
switch#show mpls lfib route
MPLS forwarding table (Label [metric] Vias) - 7 routes
MPLS next-hop resolution allow default route: False
Via Type Codes:
  M - Mpls Via, P - Pseudowire Via,
  I - IP Lookup Via, V - Vlan Via,
  VA - EVPN Vlan Aware Via, ES - EVPN Ethernet Segment Via,
  VF - EVPN Vlan Flood Via, AF - EVPN Vlan Aware Flood Via,
```

```

NG - Nexthop Group Via
Source Codes:
S - Static MPLS Route, B2 - BGP L2 EVPN,
B3 - BGP L3 VPN, R - RSVP,
P - Pseudowire, L - LDP,
IP - IS-IS SR Prefix Segment, IA - IS-IS SR Adjacency Segment,
IL - IS-IS SR Segment to LDP, LI - LDP to IS-IS SR Segment,
BL - BGP LU, ST - SR TE Policy,
DE - Debug LFIB

IA 100000 [1]
  via M, 1.0.1.2, pop
  payload autoDecide, ttlMode uniform, apply egress-acl
  interface Vlan2930
IA 100001 [1]
  via M, fe80::200:eff:fe02:0, pop
  payload autoDecide, ttlMode uniform, apply egress-acl
  interface Vlan2930
IP 900008 [1]
  via M, 1.0.1.2, swap 900008
  payload autoDecide, ttlMode uniform, apply egress-acl
  interface Vlan2930
IP 900009 [1]
  via M, fe80::200:eff:fe02:0, swap 900009
  payload autoDecide, ttlMode uniform, apply egress-acl
  interface Vlan2930

```

#### show mpls lfib route <label value>

The **show mpls lfib route <label value>** command provides information relevant to just the label value passed as an extension to the show command.

#### Example

```

switch#show mpls lfib route 900008
MPLS forwarding table (Label [metric] Vias) - 7 routes
MPLS next-hop resolution allow default route: False
Via Type Codes:
M - Mpls Via, P - Pseudowire Via,
I - IP Lookup Via, V - Vlan Via,
VA - EVPN Vlan Aware Via, ES - EVPN Ethernet Segment Via,
VF - EVPN Vlan Flood Via, AF - EVPN Vlan Aware Flood Via,
NG - Nexthop Group Via
Source Codes:
S - Static MPLS Route, B2 - BGP L2 EVPN,
B3 - BGP L3 VPN, R - RSVP,
P - Pseudowire, L - LDP,
IP - IS-IS SR Prefix Segment, IA - IS-IS SR Adjacency Segment,
IL - IS-IS SR Segment to LDP, LI - LDP to IS-IS SR Segment,
BL - BGP LU, ST - SR TE Policy,
DE - Debug LFIB
IP 900008 [1]
  via M, 1.0.1.2, swap 900008
  payload autoDecide, ttlMode uniform, apply egress-acl
  interface Vlan2930

```

#### 14.4.4.7.6 Verifying IS-IS Graceful Restart (GR) Information

GR State can be one of the following:

- Last Start/Restart was completed successfully.
- Last Start/Restart exited after t2 (level-1/level-2) expiry.

- Last Restart exited after t3 expiry.
- Start/Restart in progress.
- Graceful Restart was disabled during startup.

The following show commands are used to display the IS-IS graceful restart information.

- The **show isis graceful-restart vrf [vrf-name]** command displays the GR configuration and graceful-restart related state of the IS-IS instance as well as its neighbors.

### Example

```
switch#show isis graceful-restart vrf default
IS-IS Instance: 1 VRF: default
System ID: 0000.0000.0001
Graceful Restart: Enabled, Graceful Restart Helper: Enabled
State: Last Start exited after T2 (level-1) expiry
T1 : 3s
T2 (level-1) : 30s/20s remaining
T2 (level-2) : 30s/not running
T3 : not running
```

| System ID     | Type | Interface | Restart Capable | Status     |
|---------------|------|-----------|-----------------|------------|
| is-hostname-1 | L1L2 | Ethernet1 | Yes             | Running    |
| is-hostname-2 | L1   | Ethernet2 | Yes             | Restarting |

- The **show isis summary vrf [vrf-name]** command displays the graceful restart state and helper configuration.

### Example

```
switch#show isis summary vrf default
IS-IS Instance: 1 VRF: default
System ID: 0000.0000.0001, administratively enabled
....
Graceful Restart: Enabled, Graceful Restart Helper: Enabled
```

- The **show isis neighbors detail vrf [vrf-name]** command displays the helpers view of a restarting router.

### Example

```
switch#show isis neighbors detail vrf default
Instance VRF      System Id  Type Interface  SNPA      State Hold time  Circuit Id
1        default OT1       L1  Ethernet1  2:1:0:b  4:0:0  UP        29839  OT3.05
Area Address(es): 49.0001
SNPA: 2:1:0:b4:0:0
....
Graceful Restart: Supported, Status: Restarting (RR rcvd, RA sent, CSNP sent)
```

- The **show isis interface detail vrf [vrf-name]** command displays the graceful restart related stats for that interface.

### Example

```
switch#show isis interface detail vrf default
ISIS Instance: ISISQ VRF: default
Interface Ethernet1:
Index: 2 SNPA: P2P
...
Level 1:
Graceful Restart Status: RR sent, SA sent, RA rcvd, CSNP rcvd
```

## 14.4.5 IS-IS Commands

### Global Configuration Commands

- `clear isis neighbor`
- `router isis`

### Interface Configuration Commands

- `adjacency-segment`
- `authentication key`
- `authentication mode`
- `bfd all-interfaces`
- `isis authentication key`
- `isis authentication mode`
- `isis bfd`
- `isis enable`
- `isis hello-interval`
- `isis hello-multiplier`
- `isis ipv6 metric`
- `isis lsp tx interval`
- `isis metric`
- `isis multi-topology`
- `isis network`
- `isis passive`
- `isis priority`

### Router IS-IS Configuration Mode (Includes Address-Family Mode)

- `address-family`
- `graceful-restart (IS-IS)`
- `is-hostname`
- `is-type`
- `log-adjacency-changes (IS-IS)`
- `match isis level`
- `multi-topology`
- `net`
- `passive (IS-IS)`
- `redistribute (IS-IS)`
- `set isis level`
- `set-overload-bit`
- `shutdown (IS-IS)`
- `spf-interval`

### IS-IS Segment Routing Commands

- `segment-routing mpls`
- `mpls label range`
- `node-segment`
- `prefix-segment`
- `proxy-node-segment`

- 
- adjacency-segment
  - adjacency-segment (static)
  - show isis database detail
  - show isis segment-routing
  - show isis segment-routing global-blocks
  - show isis segment-routing prefix-segments
  - show mpls label ranges
  - show mpls segment-routing bindings
  - show mpls lfib route
  - show mpls lfib route <label value>

#### **Display Commands EXEC Mode**

- show isis database
- show isis graceful-restart vrf
- show isis hostname
- show isis interface
- show isis neighbors
- show isis network topology
- show isis segment-routing adjacency-segments
- show isis summary

### 14.4.5.1 address-family

The **address-family** command places the switch in address-family configuration mode.

Address-family configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The switch supports these address families:

- ipv4-unicast
- ipv6-unicast

The **no address-family** and **default address-family** commands delete the specified address-family from **running-config** by removing all commands previously configured in the corresponding address-family mode.

The **exit** command returns the switch to IS-IS configuration mode.

#### Command Mode

Router-IS-IS Configuration

#### Command Syntax

```
address-family [ipv4 | ipv6] [MODE]
```

```
no address-family [ipv4 | ipv6] [MODE]
```

```
default address-family [ipv4 | ipv6] [MODE]
```

#### Parameters

- address\_family Options include:
  - ipv4 IPv4 unicast
  - ipv6 IPv6 unicast
- MODE Options include:
  - <no parameter> Defaults to unicast.
  - **unicast** All IPv4 or IPv6 addresses are active.

#### Example

- These commands enter the address family mode for IPv4 unicast.

```
switch(config)#router isis Osiris
switch(config-router-isis)#address-family ipv4 unicast
switch(config-router-isis-af)#
```

- To exit from the IPv4 IS-IS unicast address family configuration mode, enter the following command.

```
switch(config)#router isis Osiris
switch(config-router-isis)#address-family ipv4 unicast
switch(config-router-isis-af)#exit
switch(config-router-isis)#
```

---

### 14.4.5.2 adjacency-segment (static)

The **adjacency-segment** command configures IS-IS adjacencies statically on the switch, so that these values are preserved even when the switch restarts. The **no** and the default form of the command places the switch back to the global configuration mode.

#### Command Mode

Interface Ethernet Configuration

#### Command Syntax

```
adjacency-segment <ipv4 | ipv6> p2p [[label <label-value>] | [index <index-value> global]]
```

#### Parameters

- *ipv4* IS-IS SR adjacency segment IPv4 interface configuration.
- *ipv6* IS-IS SR adjacency segment IPv6 interface configuration.
- *label* Label value to be assigned as Adj-SID for adjacency on this interface. Value ranges from 16 to 1048575.
- *index* Index to be assigned as Adj-SID for adjacency on this interface. Value ranges from 0 to 65535.
- *global* global adjacency SID.

#### Example

- This command allocates the adjacency segment to an IPv4 p2p interface with a index value 50.

```
switch(config-if-Et1)#adjacency-segment ipv4 p2p index 50 global
```

### 14.4.5.3 adjacency-segment

The **adjacency-segment** command allocates adjacency segments to all IS-IS adjacencies, or only those adjacencies which are to IS-IS routers that have advertised IS-IS SR capability, or to none of the adjacencies.

#### Command Mode

Segment-Routing MPLS Configuration

#### Command Syntax

**adjacency-segment** *allocation* [*all-interface* | *none* | *sr-peers*]

#### Parameters

- *allocation* Allocation of Adjacency Segments.
- *all-interfaces* Allocates adjacency segments to all IS-IS adjacencies.
- *none* Disable automatic adjacency segment allocation.
- *sr-peers* Allocate adjacency segments to IS-IS adjacencies with SR peers.

#### Example

- This command allocates the adjacency segment to an sr-peer.

```
switch(config-router-isis-sr-mpls)#adjacency-segment allocation sr-peer
```

---

#### 14.4.5.4 authentication key

The **authentication key** command configures the authentication key for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

The **no authentication key** and **default authentication key** commands disables the authentication key for the IS-IS instance.

##### Command Mode

ISIS-Router Configuration

##### Command Syntax

```
authentication key [0 / 7] [LAYER_VALUE]
```

```
no authentication key [0 / 7] [LAYER_VALUE]
```

```
default authentication key [0 / 7] [LAYER_VALUE]
```

##### Parameters

- LAYER\_VALUE layer value. Options include:
  - level-1
  - level-2

##### Example

- These commands configure authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

```
switch(config)#router isis 1  
switch(config-router-isis)#authentication key secret  
switch(config-router-isis)#
```

### 14.4.5.5 authentication mode

The `authentication mode` command configures authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

The `no authentication mode` and `default authentication mode` commands disables authentication for the IS-IS instance.

#### Command Mode

ISIS-Router Configuration

#### Command Syntax

```
authentication mode <md5 / text> [LAYER_VALUE]
```

```
no authentication mode <md5 / text> [LAYER_VALUE]
```

```
default authentication mode <md5 / text> [LAYER_VALUE]
```

#### Parameters

- LAYER\_VALUE Layer value. Options include:
  - level-1
  - level-2

#### Example

- These commands configure authentication for the IS-IS instance causing LSPs, CSNPs and PSNPs to be authenticated.

```
switch(config)#router isis 1
switch(config-router-isis)#authentication mode md5
switch(config-router-isis)#
```

---

#### 14.4.5.6 bfd all-interfaces

The **bfd all-interfaces** command enables Bidirectional Forwarding Detection (BFD) for all IS-IS-enabled interfaces in the IPv4 or IPv6 address family.

Use the **isis bfd** command to configure BFD on a specific interface.

##### Command Mode

Router-IS-IS Address-Family Configuration

##### Command Syntax

**bfd all-interfaces**

##### Example

- These commands enable BFD for all the interfaces on which IS-IS is enabled. By default, BFD is disabled on all the interfaces.

```
switch(config)#router isis 1  
switch(config-router-isis)#address-family ipv4  
switch(config-router-af)#bfd all-interfaces  
switch(config-router-af)#
```

### 14.4.5.7 clear isis neighbor

The **clear isis neighbor** command clears IS-IS adjacencies that exist on an interface, or at a specific level, or the adjacencies formed with a given neighbor (either with a system ID or a hostname).

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear isis neighbor {Neighbor-ID | all | interface} [level-1 | level-2 | level-1-2]
```

#### Parameters

- *Neighbor-ID* Clears adjacencies based on the system ID or the hostname of a neighbor.
- *all* Clears all adjacencies.
- *interface* Clears adjacencies for a specific interface.
- *level-1* level 1 only.
- *level-1-2* level 1-2 point-to-point only.
- *level-2* level 2 only.

#### Examples

- This command clears IS-IS adjacencies with a neighbor af86.3032.1a0f.

```
switch#clear isis neighbor af86.3032.1a0f
2 neighbors cleared on instance 1
switch#
```

- This command clears all IS-IS adjacencies on an interface et1.

```
switch#clear isis neighbor interface et1
4 neighbors cleared on instance 1
switch#
```

- This command clears IS-IS adjacencies with a neighbor af86.3032.1a0f and on interface et1.

```
switch#clear isis neighbor af86.3032.1a0f interface et1
2 neighbors cleared on instance 1
switch#
```

- This command clears all IS-IS adjacencies at Level 1 and on interface et1.

```
switch#clear isis neighbor interface et1 level-1
2 neighbors cleared on instance 1
switch#
```

- This command clears Level 1-2 point-to-point adjacencies only.

```
switch#clear isis neighbor all level-1-2
0 neighbors cleared on instance 1
switch#
```

---

### 14.4.5.8 graceful-restart (IS-IS)

The **graceful-restart** command configures IS-IS graceful-restart. The command provides options to configure the *t2* time or the *restart-hold-time*.

*t2* is the maximum wait time for the LSP database to synchronize (SPF computation is not done while *t2* is running). *t2* can be configured for either level-1 or level-2 routes.

*restart-hold-time* is the hold time advertised by the router to its neighbors before undergoing ASU2 fast reboot.

The **no graceful-restart** and **default graceful-restart** commands disables the IS-IS graceful-restart configuration from **running-config**.

#### Command Mode

Router-IS-IS Configuration

#### Command Syntax

```
graceful-restart <t2 | restart-hold-time> <value>
```

```
no graceful-restart <t2 | restart-hold-time> <value>
```

```
default graceful-restart <t2 | restart-hold-time> <value>
```

#### Parameters

- *value* The time in seconds. Value ranges from 5 to 300 seconds.
- *restart-hold-time* Sets the hold time when restarting.
- *t2* Sets the LSP database sync wait time.

#### Examples

- In this example an ISIS graceful restart is configured with *t2* wait time of 30 seconds for level-1 routes.

```
switch(config)#router isis 1
switch(config-router-isis)#graceful-restart t2 level-1 30
```

- In this example an ISIS graceful restart is configured with *restart-hold-time* of 50 seconds.

```
switch(config)#router isis 1
switch(config-router-isis)#graceful-restart restart-hold-time 50
```

### 14.4.5.9 is-hostname

The **is-hostname** command configures the use of a human-readable string to represent the symbolic name of an IS-IS router. It also changes the output of IS-IS show commands, to show the IS-IS hostname in place of system IDs if the corresponding IS-IS hostname is known. However, syslogs still use IS-IS system IDs and not the IS-IS hostname.

By default, if a hostname is configured on the switch, it is used as the IS-IS hostname. It is also possible to unconfigure an assigned hostname for IS-IS using the **no is-hostname** command. When the IS-IS hostname is removed, the switch goes back to using the switch's hostname as the IS-IS hostname.

#### Command Mode

Router-IS-IS Configuration

#### Command Syntax

```
is-hostname <string>
```

```
no is-hostname
```

#### Examples

- These commands configure the IS-IS hostname to the symbolic name ishost1 for the IS-IS router.

```
switch(config)#router isis inst1  
switch(config-router-isis)#is-hostname ishost1  
switch(config-router-isis)#
```

- These commands unconfigure the IS-IS hostname of the symbolic name ishost1 for the IS-IS router.

```
switch(config)#router isis inst1  
switch(config-router-isis)#no is-hostname ishost1  
switch(config-router-isis)#
```

---

#### 14.4.5.10 isis authentication key

The `isis authentication key` command configures the authentication key on the interface causing IS-IS Hellos to be authenticated.

The `no isis authentication mode` and `default isis authentication mode` commands disables the authentication key for the IS-IS instance.

##### Command Mode

Interface-Ethernet Configuration

##### Command Syntax

```
isis authentication key [0 | 7] [LAYER_VALUE]
```

```
no isis authentication key [0 | 7] [LAYER_VALUE]
```

```
default isis authentication key [0 | 7] [LAYER_VALUE]
```

##### Parameters

- LAYER\_VALUE Layer value. Options include:
  - level-1
  - level-2

##### Example

- These commands configure authentication on the interface causing IS-IS Hellos to be authenticated.

```
switch(config)#interface Ethernet 3/6
switch(config-if-Et3/6)#isis authentication mode text
switch(config-if-Et3/6)#isis authentication key 7 cAm28+9a/xPi0
4o7hjd8Jw==
switch(config-if-Et3/6)#
```

### 14.4.5.11 isis authentication mode

The **isis authentication mode** command configures authentication on the interface causing IS-IS Hellos to be authenticated.

The **no isis authentication mode** and **default isis authentication mode** commands disables authentication for the IS-IS instance.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
isis authentication mode <md5 | text> [LAYER_VALUE]
```

```
no isis authentication mode <md5 | text> [LAYER_VALUE]
```

```
default isis authentication mode <md5 | text> [LAYER_VALUE]
```

#### Parameters

- LAYER\_VALUE Layer value. Options include:
  - level-1
  - level-2

#### Example

- These commands configure authentication on the interface causing IS-IS Hellos to be authenticated.

```
switch(config)#interface Ethernet 3/6
switch(config-if-Et3/6)#isis authentication mode text
switch(config-if-Et3/6)#isis authentication key 7 cAm28+9a/xPi0
4o7hjd8Jw==
switch(config-if-Et3/6)#
```

---

#### 14.4.5.12 isis bfd

The `isis bfd` command activates the corresponding IS-IS routing instance on the configuration mode interface. By default, the IS-IS routing instance is not enabled on an interface.

The `no isis enable` and `default isis enable` commands disable IS-IS on the configuration mode interface by removing the corresponding `isis enable` command from *running-config*.

##### Command Mode

Interface-Ethernet Configuration

##### Command Syntax

```
isis bfd
```

```
no isis bfd
```

```
default isis bfd
```

##### Example

- These commands enable BFD on IS-IS interfaces.

```
switch(config)#interface Ethernet 5/6
switch(config-if-Et5/6)#isis bfd
switch(config-if-Et5/6)#
```

### 14.4.5.13 isis enable

The **isis enable** command activates the corresponding IS-IS routing instance on the configuration mode interface. By default, the IS-IS routing instance is not enabled on an interface.

The **no isis enable** and **default isis enable** commands disable IS-IS on the configuration mode interface by removing the corresponding **isis enable** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
isis enable instance_id
```

```
no isis enable
```

```
default isis enable
```

#### Parameters

- ***instance\_id*** IS-IS instance name.

#### Examples

- These commands enable the IS-IS protocol on the interface Ethernet 4.

```
switch(config)#router isis Osiris  
switch(config-router-isis)#net 49.0001.1010.1040.1030.00  
switch(config-router-isis)#interface ethernet 4  
switch(config-if-Eth4)#isis enable Osiris
```

- These commands disable the IS-IS protocol on the interface Ethernet 4.

```
switch(config)#interface ethernet 4  
switch(config-if-Eth4)#no isis enable
```

---

#### 14.4.5.14 isis hello-interval

The **isis hello-interval** command sends Hello packets from applicable interfaces to maintain the adjacency through the transmitting and receiving of Hello packets. The Hello packet interval can be modified.

The **no isis hello-interval** and **default isis hello-interval** commands restore the default hello interval of 10 seconds on the configuration mode interface by removing the **isis hello-interval** command from *running-config*.

##### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
isis hello-interval time
```

```
no isis hello-interval
```

```
default isis hello-interval
```

##### Parameters

- *time* Values range from 1 to 300; default is 10.

##### Examples

- These commands configure a hello interval of 45 seconds for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#isis hello-interval 45
switch(config-if-Vl200)#
```

- These commands remove the configured hello interval of 45 seconds from VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#no isis hello-interval
switch(config-if-Vl200)#
```

- These commands configure a hello interval of 60 seconds for Ethernet 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#isis hello-interval 60
switch(config-if-Et5)#
```

- These commands remove the configured hello interval of 60 seconds from Ethernet 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no isis hello-interval
switch(config-if-Et5)#
```

### 14.4.5.15 isis hello-multiplier

The **isis hello-multiplier** command specifies the number of IS-IS hello packets missed by a neighbor before the adjacency is considered down.

The **no isis hello-multiplier** and **default isis hello-multiplier** commands restore the default hello interval of 3 on the configuration mode interface by removing the **isis hello-multiplier** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
isis hello-multiplier factor
```

```
no isis hello-multiplier
```

```
default isis hello-multiplier
```

#### Parameters

- *factor* Values range from 3 to 100; default is 3

#### Examples

- These commands configure a hello multiplier of 4 for VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#isis hello-multiplier 4
switch(config-if-Vl200)#
```

- These commands remove the configured hello multiplier of 4 from VLAN 200.

```
switch(config)#interface vlan 200
switch(config-if-Vl200)#no isis hello-multiplier
switch(config-if-Vl200)#
```

- These commands configure a hello multiplier of 45 for Ethernet 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#isis hello-multiplier 45
switch(config-if-Et5)#
```

- These commands remove the configured hello multiplier of 45 from Ethernet 5.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#no isis hello-multiplier
switch(config-if-Et5)#
```

### 14.4.5.16 isis ipv6 metric

The **isis ipv6 metric** command configures the IPv6 metric.

The **no isis ipv6 metric** and **default isis ipv6 metric** commands restore the default metric of 10 on the configuration mode interface.

#### Command Mode

Interface-Ethernet Configuration

---

## Command Syntax

```
isis ipv6 metric metric_value
```

```
no isis ipv6 metric
```

```
default isis ipv6 metric
```

## Parameters

- **metric\_value** Values range from 1 to 16777214; default is 10.

## Example

- These commands configure the IPv6 metric.

```
switch(config)#interface Ethernet 5/6  
switch(config-if-Et5/6)#isis ipv6 metric 30  
switch(config-if-Et5/6)#
```

### 14.4.5.17 isis lsp tx interval

The `isis lsp tx interval` command sets the interval at which IS-IS sends link-state information on the interface.

The `no isis lsp tx interval` and `default isis lsp tx interval` commands restores the default setting of 33 ms. by removing the `isis lsp tx interval` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
isis lsp tx interval period
```

```
no isis lsp tx interval
```

```
default isis lsp tx interval
```

#### Parameters

- *period* Value ranges from 1 through 3000. Default interval is 33 ms.

#### Examples

- This command sets the LSP interval on interface Ethernet 5 to 600 milliseconds.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#isis lsp tx interval 600  
switch(config-if-Et5)#
```

- This command removes the LSP interval on interface Ethernet 5.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#no isis lsp tx interval  
switch(config-if-Et5)#
```

---

### 14.4.5.18 isis metric

The **isis metric** command sets cost for sending information over an interface.

The **no isis metric** and **default isis metric** commands restore the metric to its default value of 10 by removing the **isis metric** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
isis metric metric_cost
```

```
no isis metric
```

```
default isis metric
```

#### Parameters

- *metric\_cost* Values range from 1 to 1677214. Default value is 10.

#### Examples

- These commands configure a metric cost of 30 for sending information over Ethernet 5.

```
switch(config)#router isis Osiris
switch(config-router-isis)#interface ethernet 5
switch(config-if-Et5)#isis metric 30
switch(config-if-Et5)#
```

- These commands remove the configured metric cost of 30 from Ethernet 5.

```
switch(config)#router isis Osiris
switch(config-router-isis)#interface ethernet 5
switch(config-if-Et5)#no isis metric
switch(config-if-Et5)#
```

### 14.4.5.19 isis multi-topology

The **isis multi-topology** command configures the IPv4 or IPv6 address family individually on an interface with both IPv4 and IPv6 addresses.

The **no isis multi-topology** and **default isis multi-topology** commands restores the default interface to both IPv4 and IPv6 address families.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
isis multi-topology address-family ipv4 unicast
no isis multi-topology address-family ipv4 unicast
default isis multi-topology address-family ipv4 unicast
```

#### Examples

- These commands configure the IPv4 address family on an interface with both IPv4 and IPv6 addresses.

```
switch(config)#interface Ethernet 5/6
switch(config-if-Et5/6)#isis multi-topology address-family ipv4 unicast
switch(config-if-Et5/6)#
```

- These commands configure the IPv6 address family on an interface with both IPv4 and IPv6 addresses.

```
switch(config)#interface Ethernet 5/6
switch(config-if-Et5/6)#isis multi-topology address-family ipv6 unicast
switch(config-if-Et5/6)#
```

- These commands configure both the IPv4 and IPv6 address families on an interface.

```
switch(config)#interface Ethernet 5/6
switch(config-if-Et5/6)#no isis multi-topology address-family unicast
switch(config-if-Et5/6)#
```

---

#### 14.4.5.20 isis network

The **isis network** command sets the configuration mode interface as a point-to-point link. By default, interfaces are configured as broadcast links.

The **no isis network** and **default isis network** commands set the configuration mode interface as a broadcast link by removing the corresponding **isis network** command from *running-config*.

##### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
isis network point-to-point
```

```
no isis network
```

```
default isis network
```

##### Examples

- These commands configure Ethernet interface 10 as a point-to-point link.

```
switch(config)#interface ethernet 10  
switch(config-if-Et10)#isis network point-to-point  
switch(config-if-Et10)#
```

- This command restores Ethernet interface 10 as a broadcast link.

```
switch(config-if-Et10)#no isis network  
switch(config-if-Et10)#
```

### 14.4.5.21 isis passive

The **isis passive** command disables IS-IS on an interface configured as passive. The switch won't send or process IS-IS packets received on passive interfaces. The switch will continue to advertise the IP address in the LSP.

The **no isis passive** command enables IS-IS on the interface. The **default isis passive** command sets the interface to the default interface activity setting by removing the corresponding **isis passive** or **no isis passive** statement from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
isis passive
```

```
no isis passive
```

```
default isis passive
```

#### Examples

- These commands configure Ethernet interface 10 as a passive interface.

```
switch(config)#router isis Osiris
switch(config-router-isis)#interface ethernet 10
switch(config-if-Et10)#isis passive
switch(config-if-Et10)#
```

- This command enables IS-IS on Ethernet interface 10.

```
switch(config-if-Et10)#no isis passive
switch(config-if-Et10)#
```

---

### 14.4.5.22 isis priority

The **isis priority** command sets the IS-IS priority for the interface.

The default priority is 64. The network device with the highest priority will be elected as the designated intermediate router to send link-state advertisements for that network.

The **no isis priority** and **default isis priority** commands restore the default priority (64) on the configuration mode interface.

#### Command Mode

Interface-Ethernet Configuration

Interface-Loopback Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
isis priority priority_level
```

```
no isis priority
```

```
default isis priority
```

#### Parameters

- *priority\_level* Value ranges from 0 to 127. Default value is 64.

#### Examples

- These commands configure a IS-IS priority of 60 on interface Ethernet 5.

```
switch(config)#router isis Osiris
switch(config-router-isis)#interface ethernet 5
switch(config-if-Et5)#isis priority 60
switch(config-if-Et5)#
```

- These commands restores the default IS-IS priority of 64 from interface Ethernet 5.

```
switch(config)#router isis Osiris
switch(config-router-isis)#interface ethernet 5
switch(config-if-Et5)#no isis priority
switch(config-if-Et5)#
```

- These commands configure the switch with a priority of 64 for VLAN 7.

```
switch(config)#interface vlan 7
switch(config-if-Vl7)#isis priority 64
switch(config-if-Vl7)#
```

- These command restores the default IS-IS priority of 64 for VLAN 7.

```
switch(config)#interface vlan 7
switch(config-if-Vl7)#no isis priority
switch(config-if-Vl7)#
```

### 14.4.5.23 is-type

The **is-type** command configures the routing level for an IS-IS instance.

An IS-IS router can be configured as Level-1-2 which can form adjacencies and exchange routing information with both Level-1 and Level-2 routers. A Level-1-2 router can be configured to transfer routing information from Level-1 to Level-2 areas and vice versa (via route leaking). By default, all routes from Level-1 area are always leaked into Level-2 network.

#### Command Mode

Router-IS-IS Configuration

#### Command Syntax

**is-type** LAYER\_VALUE

#### Parameters

- LAYER\_VALUE Layer value options include:
  - **level-1**
  - **level-1-2**
  - **level-2**

#### Example

- These commands configure Level 1-2 routing.

```
switch(config)#router isis Osiris
switch(config-router-isis)#is-type level-1-2
switch(config-router-isis)#
```

- These commands configure Level 2 routing.

```
switch(config)#router isis Osiris
switch(config-router-isis)#is-type level-2
switch(config-router-isis)#
```

---

#### 14.4.5.24 log-adjacency-changes (IS-IS)

The **log-adjacency-changes** command sets the switch to send syslog messages when it detects link state changes or when it detects that a neighbor state has changed.

The default option is active when **running-config** does not contain any form of the command. Entering the command in any form replaces the previous command state in **running-config**.

##### Command Mode

Router-IS-IS Configuration

##### Command Syntax

```
log-adjacency-changes
no log-adjacency-changes
default log-adjacency-changes
```

##### Examples

- These commands configure the switch to send a syslog message when a neighbor state changes.

```
switch(config)#router isis Osiris
switch(config-router-isis)#log-adjacency-changes
switch(config-router-isis)#
```

- These commands configure not to log the peer changes.

```
switch(config)#router isis Osiris
switch(config-router-isis)#no log-adjacency-changes
switch(config-router-isis)#
```

#### 14.4.5.25 match isis level

The **match isis level** command configures a route map to match on ISIS level. It filters the Level-1 or Level-2 routes by using route maps match statement.

The **no match isis level** and **default match isis level** commands disables the match ISIS level configuration from *running-config*.

##### Command Mode

Route-map Configuration

##### Command Syntax

```
match isis level [level-1|level-2]
no match isis level [level-1|level-2]
default match isis level [level-1|level-2]
```

##### Parameters

- level-1 IS-IS level 1.
- level-2 IS-IS level 2.

##### Example

- These commands place the switch in route-map mode, and configures a route map to match isis level to level-1.

```
switch(config)#route-map Test
switch(config-route-map-test)#match isis level level-1
```

---

#### 14.4.5.26 mpls label range

The `mpls label range` command derives the indices of the actual MPLS label on the SRGB advertised by the router. The default value of SRGB in EOS is Base: 900000, Size: 65536. In other words, the labels that any global segment could represent is between 900000-965535.

##### Command Mode

Global Configuration

##### Command Syntax

```
mpls label range <value>
```

##### Parameters

- *value* Specifies the Segment Routing global range.
  - `dynamic` Specifies labels reserved for dynamic assignment. Default value is (100000) (262144).
    - `IS-IS-sr` Specifies labels reserved for IS-IS SR global segment identifiers (SIDs). Default value is (900000) (65536).
    - `static` Specifies labels reserved for static MPLS routes. Default value is (16) (99984).

##### Example

- The following command configures an IS-IS SR global range with a value of (900000)-- starting label range, (65536)--Numbers of labels to reserve.

```
switch(config)#mpls label range isis-sr 900000 65536
```

### 14.4.5.27 multi-topology

The **multi-topology** command configures IS-IS Multi-Topology (MT) support (disabled by default), enabling an IS-IS router to compute a separate topology for IPv4 and IPv6 links in the network. With MT configured, not all the links in a network need to support both IPv4 and IPv6. Some can support IPv4 or IPv6 individually. The IPv4 SPF will install IPv4 routes using the IPv4 topology, and similarly the IPv6 SPF will install IPv6 routes using the IPv6 topology. Without MT support, all links in an IS-IS network need to support the same set of address families. When MT is enabled, and each link has a separate IPv4 metric and IPv6 metric.

The **no multi-topology** and **default multi-topology** commands restores the default interface to both IPv4 and IPv6 address families.

#### Command Mode

Router IS-IS Address-Family Configuration

#### Command Syntax

```
multi-topology
```

```
no multi-topology
```

```
default multi-topology
```

#### Examples

- These commands configure MT for the IS-IS router.

```
switch(config)#router isis 1  
switch(config-router-isis)#address-family ipv6 unicast  
switch(config-router-isis-af)#multi-topology  
switch(config-router-isis-af)#
```

- These commands unconfigure MT for the IS-IS router.

```
switch(config)#router isis 1  
switch(config-router-isis)#address-family ipv6 unicast  
switch(config-router-isis-af)#no multi-topology  
switch(config-router-isis-af)#
```

---

### 14.4.5.28 net

The **net** command configures the Network Entity Title of the IS-IS instance. By default, no NET is defined.

The **no net** and **default net** commands removes the NET from *running-config*.

#### Command Mode

Router-IS-IS Configuration

#### Command Syntax

```
net mask_hex
```

```
no net
```

```
default net
```

#### Parameters

- *mask\_hex* Mask value. Format is hh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.hhhh.00.

#### Examples

- These commands specify the NET as 49.0001.1010.1040.1030.00, in which the system ID is 1010.1040.1030, area ID is 49.0001.

```
switch(config)#router isis Osiris  
switch(config-router-isis)#net 49.0001.1010.1040.1030.00  
switch(config-router-isis)#
```

- These commands remove NET 49.0001.1010.1040.1030.00 from *running-config*.

```
switch(config)#router isis Osiris  
switch(config-router-isis)#no net 49.0001.1010.1040.1030.00  
switch(config-router-isis)#
```

### 14.4.5.29 node-segment

The **node-segment** command associates the node segments with prefix mask length /32 (IPv4) or /128 (IPv6) addresses. The **node-segment** command must be issued on an IS-IS-enabled loop back interface.

#### Command Mode

Loop-back Interface Configuration

#### Command Syntax

```
node-segment [ipv4 | ipv6] index <value>
```

#### Parameters

- *ipv4* Specifies the IPv4 node configuration.
- *ipv6* Specifies the IPv6 node configuration.
- *index* Node segment identifier.
- *value* Index to be mapped with IP prefix. Value ranges from 0-65535.

#### Examples

- The following commands are used to associate a node-segment with an IPv4 address.

```
switch(config)#int loopback 1
switch(config-if-Lo1)#ip address 21.1.1.1/32
switch(config-if-Lo1)#node-segment ipv4 index 5
```

- The following commands are used to associate a node-segment with an IPv6 address.

```
switch(config)#int loopback 1
switch(config-if-Lo1)#ipv6 add 2000::24/128
switch(config-if-Lo1)#node-segment ipv6 index 5
```

- The following example shows a warning thrown at the CLI when a /32 or /128 address is not configured on the interface.

```
switch(config)#int loopback 1
switch(config-if-Lo1)#ip address 21.1.1.1/24
switch(config-if-Lo1)#node-segment ipv4 index 1
! /32 IPv4 address is not configured on the interface
```

- The following command removes the node-segment from IS-IS SR from an interface.

```
switch(config-if-Lo1)#no node-segment ipv4 index 1
```

---

### 14.4.5.30 passive (IS-IS)

The **passive** command disables IS-IS on a passive interface. The switch will continue to advertise the IP address in the LSP.

The **no passive** command enables IS-IS on the interface. The **default passive** command sets the interface to the default interface activity setting by removing the corresponding **passive** or **no passive** statement from *running-config*.

#### Command Mode

Router-IS-IS Configuration

#### Command Syntax

```
passive INTERFACE_NAME
no passive INTERFACE_NAME
default passive INTERFACE_NAME
```

#### Parameters

- INTERFACE\_NAME Options include:
  - **ethernet** *e\_range* Ethernet interface list.
  - **loopback** *l\_range* Loopback interface list.
  - **port-channel** *p\_range* Channel group interface list.
  - **vlan** *v\_range* VLAN interface list.

Valid *e\_range*, *l\_range*, *p\_range*, and *v\_range* formats include number, range, or comma-delimited list of numbers and ranges.

#### Examples

- These commands configure Ethernet interface 10 as a passive interface.

```
switch(config)#router isis Osiris
switch(config-router-isis)#passive interface ethernet 10
```

- This command restores Ethernet interface 10 as an active interface.

```
switch(config-if-Et10)#no passive
switch(config-if-Et10)#
```

### 14.4.5.31 prefix-segment

The **prefix-segment** command associates prefix segments with any IS-IS prefix a router is originating an IP Reachability TLV for.

#### Command Mode

Segment-Routing MPLS Configuration

#### Command Syntax

```
prefix-segment ip-address index <value>
```

#### Parameters

- *ip-address* It can be IP address, or IP address with prefix, or an IPv6 address prefix.
- *index* Node segment identifier.
- *value* Index to be mapped with IP prefix. Value ranges from 0-65535.

#### Example

- The following commands are used to associate a prefix segment with an IPv4 address with index value of 50.

```
switch(config)#router isis instancel  
switch(config-router-isis)#segment-routing mpls  
switch(config-router-isis-sr-mpls)#prefix-segment 1.1.1.0/24 index 50
```

---

### 14.4.5.32 proxy-node-segment

The **proxy-node-segment** command configures a proxy-node-SID for a IS-IS prefix originating from the router that does not support IS-IS SR.

#### Command Mode

Segment-Routing MPLS Configuration

#### Command Syntax

```
proxy-node-segment ip-address index <value>
```

#### Parameters

- *ip-address* It can be IP address, or IP address with prefix, or an IPv6 address prefix.
- *index* Node segment identifier.
- *value* Index to be mapped with IP prefix. Value ranges from 0-65535.

#### Example

- A proxy-node-segment associates a /32 or a /128 route with an SID as shown below.

```
switch(config)#router isis instancel  
switch(config-router-isis)#segment-routing mpls  
switch(config-router-isis-sr-mpls)#proxy-node-segment 1.1.1.0/32 index  
50
```

### 14.4.5.33 redistribute (IS-IS)

The **redistribute** command redistributes the specified types of routes into IS-IS.

The **no redistribute** and **default redistribute** commands disable route redistribution from the specified domain by removing the corresponding **redistribute** statement from *running-config*.

#### Command Mode

Router-IS-IS Configuration

#### Command Syntax

```
redistribute ROUTE_TYPE
no redistribute ROUTE_TYPE
default redistribute ROUTE_TYPE
```

#### Parameters

- **ROUTE\_TYPE** The route type for which routes are redistributed. These are the option to include.
  - **bgpredistribute** BGP routes
  - **connectedredistribute** connected routes
  - **ospfredistribute** OSPF routes
  - **ospfv3redistribute** OSPFv3 routes
  - **staticredistribute** static routes

#### Examples

- These commands redistribute connected routes into the IS-IS domain.

```
switch(config)#router isis Test
switch(config-router-isis)#redistribute connected
```

- These commands redistribute static routes into the IS-IS domain.

```
switch(config)#router isis Test
switch(config-router-isis)#redistribute static
```

- These commands redistribute the BGP routes into ISIS domain in address-family mode.

```
Switch(config)#router isis 1
Switch(config-router-isis)#address-family ipv4
Switch(config-router-isis-af)#redistribute bgp route-map bgp-to-isis-v4
```

- These commands redistribute the BGP routes into ISIS domain in router-isis mode.

```
Switch(config)#router isis 1
Switch(config-router-isis)#redistribute bgp route-map bgp-to-isis
```

---

### 14.4.5.34 redistribute bgp route-map

The **redistribute bgp route-map** command redistributes the BGP routes from the specified route map into IS-IS. Only one route map can be specified; reissuing the command overrides any previous configuration.

The **no redistribute bgp** and **default redistribute bgp** commands disable BGP route redistribution from the specified domain by removing the **redistribute bgp** statement from *running-config*.

The command is available in both router IS-IS configuration mode and the address-family submode. The command is rejected if configured in both modes at the same time. Issuing the **no** or **default** command in router IS-IS configuration mode has no effect on redistribution configured in the address-family submode.

**Note:** If the command is configured in an address-family submode, it only redistributes routes from that address family. If it is configured in router-ISIS mode, it applies to all enabled address families.

#### Command Mode

Router-IS-IS Configuration

Router-IS-IS Address-Family Configuration

#### Command Syntax

```
redistribute bgp route-map map_name
```

```
no redistribute bgp
```

```
default redistribute ROUTE_TYPE
```

#### Parameters

*map\_name* Route map to be used for redistribution of BGP routes.

#### Examples

- These commands redistribute IPv4 BGP routes from the route map called bgp-to-isis-v4 into the ISIS domain.

```
switch(config)#router isis 1  
switch(config-router-isis)#address-family ipv4  
switch(config-router-isis-af)#redistribute bgp route-map bgp-to-isis-v4  
switch(config-router-isis-af)#
```

- These commands redistribute all BGP routes from the route map bgp-to-isis into ISIS.

```
switch(config)#router isis 1  
switch(config-router-isis)#redistribute bgp route-map bgp-to-isis
```

### 14.4.5.35 router isis

The **router isis** command places the switch in router ISIS configuration mode.

Router ISIS configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The **no router isis** command deletes the IS-IS instance.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
router isis instance_name [VRF_INSTANCE]
```

```
no router isis instance_name
```

```
default router isis instance_name
```

#### Parameters

- *instance\_name* routing instance.
- VRF\_INSTANCE
  - <no parameter>
  - **vrf** *vrf\_name*

#### Examples

- These commands places the switch in router IS-IS mode and creates an IS-IS routing instance named Osiris.

```
switch(config)#router isis Osiris  
switch(config-router-isis)#
```

- This command attempts to open an instance with a different routing instance name from that of the existing instance. The switch displays an error and stays in global configuration mode.

```
switch(config)#router isis Osiris  
% More than 1 ISIS instance is not supported  
switch(config)#
```

- This command deletes the IS-IS instance.

```
switch(config)#no router isis Osiris  
switch(config)#
```

---

### 14.4.5.36 segment-routing mpls

The **segment-routing mpls** command places the switch in the Segment-Routing MPLS configuration mode.

The **no segment-routing mpls** and **default segment-routing mpls** commands disable IS-IS SR and delete all IS-IS SR configuration.

#### Command Mode

Router IS-IS Configuration

#### Command Syntax

```
segment-routing mpls
```

```
no segment-routing mpls
```

```
default segment-routing mpls
```

#### Example

- The following commands place the switch in Segment-Routing MPLS configuration mode.

```
switch(config)#router isis instancel  
switch(config-router-isis)#segment-routing mpls  
switch(config-router-isis-sr-mpls)#
```

### 14.4.5.37 set isis level

The `set isis level` command configures a route map to set ISIS level.

The `no set isis level` and `default set isis level` commands disables the set ISIS level configuration from *running-config*.

#### Command Mode

Route-map Configuration

#### Command Syntax

```
set isis level [level-1 | level-2 | level-1-2]
no set isis level [level-1 | level-2 | level-1-2]
default set isis level [level-1 | level-2 | level-1-2]
```

#### Parameters

- level-1 IS-IS level 1.
- level-2 IS-IS level 2.
- level-1-2 IS-IS level 1 and level 2.

#### Example

- These commands place the switch in route-map mode, and configures a route map to set isis level to level-1.

```
switch(config)#route-map Test
switch(config-route-map-test)#set isis level level-1
```

---

### 14.4.5.38 set-overload-bit

The **set-overload-bit** command used without the on-startup option will inform other devices not to use this switch in SPF computation. When used with the on-startup parameter, the overload bit is set for the interval after startup.

The **no set-overload-bit** and **default set-overload-bit** commands removes the corresponding **set-overload-bit** command from *running-config*.

#### Command Mode

Router-IS-IS Configuration

#### Command Syntax

```
set-overload-bit TIMING
```

```
no set-overload-bit
```

```
default set-overload-bit
```

#### Parameters

- TIMING Options include:
  - <no parameter>
  - **on-startup** <1 to 3600>

#### Examples

- These commands configure the switch to sets the overload bit to 120 seconds after startup.

```
switch(config)#router isis Osiris  
switch(config-router-isis)#set-overload-bit on-startup 120  
switch(config-router-isis)#
```

- These commands remove the configured overload bit of 120 seconds from the **running-config**.

```
switch(config)#router isis Osiris  
switch(config-router-isis)#no set-overload-bit on-startup  
switch(config-router-isis)#
```

### 14.4.5.39 show isis database detail

The **show isis database detail** command displays a view of LSPDB of different devices in the IS-IS domain.

#### Command Mode

EXEC

#### Command Syntax

```
show isis database detail
```

#### Example

- The command output displays the TLVs and sub-TLVs that are being self-originated or the ones that have been received from other routers.

```
switch#show isis database detail

#### 14.4.5.40 show isis database

The **show isis database** command displays the link state database of IS-IS. The default command displays active routes and learned routes.

##### Command Mode

EXEC

##### Command Syntax

```
show isis database [INSTANCES][INFO_LEVEL]
```

```
show isis database [INFO_LEVEL] [VRF_INSTANCE]
```

##### Parameters

- INSTANCES Options include:
  - <no parameter>
  - *instance\_name*
- INFO\_LEVEL Options include:
  - <no parameter>
  - **detail**
- VRF\_INSTANCE Specifies the VRF instance.
  - <no parameter>
  - **vrf** *vrf\_name*

##### Display Values

- ISIS Instance
- LSPID
- Seq Num
- Cksum
- Life
- IS

##### Examples

- This command displays general information about the link state database of IS-IS.

```
switch#show isis database

#### 14.4.5.41 show isis graceful-restart vrf

The `show isis graceful-restart vrf` command displays the GR configuration and graceful-restart related state of the IS-IS instance as well as its neighbors.

##### Command Mode

EXEC

##### Command Syntax

```
show isis graceful-restart vrf <vrf-name>
```

##### Example

- In this example the `show isis graceful-restart` command displays the output for the default vrf instance.

```

switch#show isis graceful-restart vrf default
IS-IS Instance: 1 VRF: default

```

---

```
System ID: 0000.0000.0001
Graceful Restart: Enabled, Graceful Restart Helper: Enabled
State: Last Start exited after T2 (level-1) expiry
T1 : 3s
T2 (level-1) : 30s/20s remaining
T2 (level-2) : 30s/not running
T3 : not running
```

| System ID     | Type | Interface | Restart Capable | Status     |
|---------------|------|-----------|-----------------|------------|
| is-hostname-1 | L1L2 | Ethernet1 | Yes             | Running    |
| is-hostname-2 | L1   | Ethernet2 | Yes             | Restarting |

#### 14.4.5.42 show isis hostname

The **show isis hostname** command displays mapping between the System ID and IS-IS hostname.

##### Command Mode

EXEC

##### Command Syntax

```
show isis hostname
```

##### Example

- This command mapping between the System ID and IS-IS hostnames host1 and host2.

```
switch#show isis hostname  
ISIS Instance: 1 VRF: default  
Level System ID Hostname  
L1 1111.1111.1001 host1  
L1 1111.1111.1002 host2
```

---

#### 14.4.5.43 show isis interface

The `show isis interface` command displays interface information for the IS-IS instance.

##### Command Mode

EXEC

##### Command Syntax

```
show isis interface [INSTANCES][INTERFACE_NAME] [INFO_LEVEL]
```

```
show isis interface [INTERFACE_NAME] [INFO_LEVEL] [VRF_INSTANCE]
```

##### Parameters

- INSTANCES Options include:
  - <no parameter>
  - **instance\_name**
- INTERFACE\_NAME Values include
  - <no parameter> all interfaces.
  - **ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **loopback** *l\_num* Loopback interface specified by *l\_num*.
  - **management** *m\_num* Management interface specified by *m\_num*.
  - **port-channel** *p\_num* Port channel interface specified by *p\_num*.
  - **vlan** *v\_num* VLAN interface specified by *v\_num*.
  - **vxlan** *vx\_num* VXLAN interface specified by *vx\_num*.
- INFO\_LEVEL Options include:
  - <no parameter>
  - **detail**
- VRF\_INSTANCE specifies the VRF instance.
  - <no parameter>
  - **vrf** *vrf\_name*

##### Display Values

- ISIS Instance
- System ID
- Index
- MTU
- Metric
- LAN-ID
- DIS
- Type
- Interface
- SNPA
- State
- Hold time

##### Examples

- This command displays general IS-IS information for instance Osiris.

```
switch#show isis interface

ISIS Instance: Osiris
Interface Vlan20:
  Index: 59 SNPA: 0:1c:73:c:5:7f
```

```

```

---

#### 14.4.5.44 show isis neighbors

The `show isis neighbors` command displays IS-IS neighbor information.

##### Command Mode

EXEC

##### Command Syntax

```
show isis neighbors [INSTANCES] [INFO_LEVEL]
```

```
show isis neighbor [INFO_LEVEL] [VRF_INSTANCE]
```

##### Parameters

- INSTANCES Options include:
  - <no parameter>
  - *instance\_name*
- INFO\_LEVEL Options include:
  - <no parameter>
  - **detail**
- VRF\_INSTANCE Specifies the VRF instance.
  - <no parameter>
  - **vrf** *vrf\_name*

##### Display Values

- Inst. ID
- System ID
- Type
- Interface
- SNPA
- State
- Hold time
- Area Address

##### Example

- This command displays general information about the IS-IS neighbors.

```
switch(config)#show isis neighbors
```

| Inst Id | System Id      | Type | Interface  | SNPA        | State | Hold time |
|---------|----------------|------|------------|-------------|-------|-----------|
| 10      | 2222.2222.2222 | L2   | Vlan20     | 2:1:0:c:0:0 | UP    | 30        |
| 10      | 1212.1212.1212 | L2   | Vlan20     | 2:1:0:d:0:0 | UP    | 9         |
| 10      | 3030.3030.3030 | L2   | Ethernet30 | 2:1:0:b:0:0 | UP    | 9         |

```
switch(config)#
```

#### 14.4.5.45 show isis network topology

The **show isis network topology** command displays a list of all connected devices in all areas.

##### Command Mode

EXEC

##### Command Syntax

```
show isis network topology
show isis INSTANCES topology
show isis network topology VRF_INSTANCE
```

##### Parameter

- INSTANCES Options include:
  - <no parameter>
  - *instance\_name*
- VRF\_INSTANCE Specifies the VRF instance.
  - <no parameter>
  - *vrf vrf\_name*

##### Display Values

- System Id
- Metric
- Next-Hop
- Interface
- SNPA

##### Examples

- This command displays forwarding state for ports mapped to all VLANs.

```
switch#show isis network topology

ISIS Instance: Osiris VRF: default
  ISIS IP paths to level-2 routers
  System Id      Metric      Next-Hop      Interface      SNPA
  00e0.52b5.78002010.110.2.1  1/700e0.22b5.5843
switch>
```

- This command displays detailed information about the IS-IS neighbors.

```
switch(config)#show isis neighbors detail

Inst Id   System Id      Type Interface      SNPA              State Hold time
 10       2222.2222.2222  L2  Vlan20           2:1:0:c:0:0      UP      26

switch(config)#
```

#### 14.4.5.46 show isis segment-routing adjacency-segments

The **show isis segment-routing adjacency-segments** command displays the global adjacency SID value and other related information.

##### Command Mode

EXEC

##### Command Syntax

```
show isis segment-routing adjacency-segments
```

##### Examples

- In this example the **show isis segment-routing adjacency-segments** command displays the output for the interface configured like this:

```
interface Ethernet1
 ip address 1.1.1.1/24
 ipv6 address 1000::1/64
 isis enable isis1
 isis network point-to-point
 adjacency-segment ipv4 p2p index 1 global
 adjacency-segment ipv6 p2p index 2 global
```

- The show output for the above interface configuration:

```
switch#show isis segment-routing adjacency-segments

System ID: 1000.0000.0002          Instance: isis1
SR supported Data-plane: MPLS      SR Router ID: 1.1.1.4
Adj-SID allocation mode: SR-adjacencies
Adj-SID allocation pool: Base: 100000   Size: 16384
Adjacency Segment Count: 2
Flag Descriptions: F: Ipv6 address family, B: Backup, V: Value
                  L: Local, S: Set

Segment Status codes: L1 - Level-1 adjacency, L2 - Level-2 adjacency, P2P -
Point-to-Point adjacency, LAN - Broadcast adjacency

Locally Originated Adjacency Segments
Adj IP Address   Local Intf   SID   SID Source   Flags                               Type
-----
1.1.1.2         Et1          1     Configured   F:0 B:0 V:0 L:0 S:0   P2P L1
fe80::1:ff:fe65:0 Et1          2     Configured   F:1 B:0 V:0 L:0 S:0   P2P L1

Received Global Adjacency Segments
SID              Originator           Neighbor           Flags
-----
0                rtrmpls1            1000.0000.0002    F:0 B:0 V:0 L:0 S:0
```

- The following is the C-API output for the show isis segment-routing adjacency-segments command.

```
switch#show isis segment-routing adjacency-segments | json
{
  "vrfs": {
    "default": {

#### 14.4.5.47 show isis segment-routing global-blocks

The **show isis segment-routing global-blocks** command lists the SRGBs in use by all SR supporting devices in IS-IS domain including the SRGB in use by IS-IS SR on this device.

##### Command Mode

EXEC

##### Command Syntax

```
show isis segment-routing global-blocks
```

##### Example

```
switch#show isis segment-routing global-blocks
System ID: 1111.1111.1002           Instance: inst1
SR supported Data-plane: MPLS      SR Router ID: 252.252.2.252
SR Global Block( SRGB ): Base: 900000 Size: 65536
Number of ISIS segment routing capable peers: 3
SystemId           Base           Size
-----
1111.1111.1002    900000        65536
1111.1111.1001    900000        65536
```

#### 14.4.5.48 show isis segment-routing prefix-segments

The **show isis segment-routing prefix-segments** command provides the details of all prefix segments being originated as well the segments received from IS-IS SR speakers in the domain.

##### Command Mode

EXEC

##### Command Syntax

```
show isis segment-routing global-blocks
```

##### Example

```
switch#show isis segment-routing prefix-segments
System ID: 1111.1111.1002      Instance: inst1
SR supported Data-plane: MPLS  SR Router ID: 252.252.2.252
Node: 2 Proxy-Node: 2 Prefix: 2 Total Segments: 6
Flag Descriptions: R: Re-advertised, N: Node Segment, P: no-PHP
                    E: Explicit-NULL, V: Value, L: Local
Segment status codes: * - Self originated Prefix, L1 - level 1, L2 - level 2
-----
```

| Prefix        | SID | Type       | Flags                   | SystemID       | Type |
|---------------|-----|------------|-------------------------|----------------|------|
| 1.0.7.1/32    | 2   | Node       | R:0 N:1 P:0 E:0 V:0 L:0 | 1111.1111.1001 | L1   |
| * 1.0.8.1/32  | 4   | Node       | R:0 N:1 P:0 E:0 V:0 L:0 | 1111.1111.1002 | L2   |
| 1.0.11.0/24   | 10  | Prefix     | R:1 N:0 P:0 E:0 V:0 L:0 | 1111.1111.1001 | L2   |
| * 1.0.12.0/24 | 12  | Prefix     | R:1 N:0 P:0 E:0 V:0 L:0 | 1111.1111.1002 | L2   |
| 1.0.15.1/32   | 18  | Proxy-Node | R:0 N:0 P:0 E:0 V:0 L:0 | 1111.1111.1001 | L2   |
| 1.0.16.1/32   | 20  | Proxy-Node | R:0 N:0 P:0 E:0 V:0 L:0 | 1111.1111.1003 | L2   |

##### About the Output

After the usual output header that represents the system ID, instance name, etc and parameters of a router, there is a line depicting prefix segment counters. Each field in this line relates to the number of segments that are present in this routers IS-IS instance. For example, the above example shows that this device has 2 Node Segments (Self originated as well as the ones received from other IS-IS SR devices).

The main section of this show commands output is the section that lists all the prefix segments and related information like prefix, SID, type of segment (Prefix, Node, Proxy-Node), the flag values being carried in the sub-TLVs of these prefix segments and the system ID of the originating router. The Type field will be useful on a IS type level-1-2 router. It shows whether the installed prefix segment is from a level-1 prefix or a level-2 prefix.

#### 14.4.5.49 show isis segment-routing

The **show isis segment-routing** command displays the summary information on IS-IS SR status.

##### Command Mode

EXEC

##### Command Syntax

```
show isis segment-routing
```

##### Example

- The command output displays the summary information on IS-IS SR status.

```
switch(config)#show isis segment-routing
System ID: 1111.1111.1002           Instance: inst1
SR supported Data-plane: MPLS       SR Router ID: 252.252.2.252
SR Global Block( SRGB ): Base: 900000 Size: 65536
Adj-SID allocation mode: SR-adjacencies
Adj-SID allocation pool: Base: 100000 Size: 16384
All Prefix Segments have      : P:0 E:0 V:0 L:0
All Adjacency Segments have  : F:0 B:0 V:1 L:1 S:0
ISIS Reachability Algorithm : SPF (0)
Number of ISIS segment routing capable peers: 3
Self-Originated Segment Statistics:
Node-Segments      : 2
Prefix-Segments   : 2
Proxy-Node-Segments : 0
Adjacency Segments :
```

##### About the Output

The first line of the output shows the IS-IS system ID of this device and the name of the instance with which IS-IS is configured.

The supported data plane is shown against the SR supported Data-plane field, while the router ID being advertised in the Router Capability is mentioned in the SR Router ID field.

The SRGB in use and the MPLS label pool being used for adjacency segment allocation are mentioned in this output. The current adjacency allocation mode which refers to whether we are allocating adjacency segments to all IS-IS adjacencies or only those adjacencies which support SR or None of the adjacencies is shown in the Adj-SID allocation mode field.

Flag contents of All Prefix Segments originated on this router, Flag contents of All Adjacency Segments originated on this router and supported IS-IS Reachability Algorithm have been provided through this command output and they carry the meaning as per the IS-IS SR IETF draft.

This show command provides a statistics related to IS-IS SR in terms of various counters ranging from number of IS-IS SR enabled peers, number of Node-SIDs, prefix-SIDs, proxy-node-segments and adjacency segments being originated on this router in IS-IS.

The **show isis segment-routing** command also provides information if segment routing has been administratively disabled as shown.

```
switch(config-router-isis-sr-mpls)#sh isis segment-routing
```

! IS-IS (Instance: inst1) Segment Routing has been administratively shutdown

### 14.4.5.50 show isis summary

The **show isis summary** command displays information about the configured IS-IS instances.

#### Command Mode

EXEC

#### Command Syntax

```
show isis summary
```

```
show isis [INSTANCES] summary
```

```
show isis summary VRF_INSTANCE
```

#### Parameters

- INSTANCES Options include:
  - <no parameter>
  - *instance\_name*
- VRF\_INSTANCE Specifies the VRF instance.
  - <no parameter>
  - **vrf** *vrf\_name*

#### Display Values

- System ID
- IPv4 Preference
- IPv6 Preference
- IS-Types
- LSP Generation interval
- SPF Interval
- Current SPF Hold Interval
- IS-Types Run Time
- Area Addresses
- Designated Intermediate Systems (DIS) Interfaces
- Link State Database (LSDB) size

#### Display Status

- Multi Topology
- Authentication Mode
- Graceful Restart
- Graceful Restart Helper

#### Example

- This command displays general information about the configured IS-IS instances.

```
switch(config-router-isis-af)#show isis summary

IS-IS Instance: 1 VRF: default
System ID: 0000.0000.0001, administratively enabled
Multi Topology disabled, not attached
IPv4 Preference: Level 1: 115, Level 2: 115
IPv6 Preference: Level 1: 115, Level 2: 115
IS-Type: Level 1 and 2, Number active interfaces: 0
Routes both IPv4 and IPv6

                                Max wait(s)  Initial wait(ms)  Hold
interval(ms)
LSP Generation Interval:         5             50                50
SPF Interval:                    2             1000             1000
```

---

```
Current SPF hold interval(ms): Level 1: 1000, Level 2: 1000
Last Level 1 SPF run 1 seconds ago
Last Level 2 SPF run 1 seconds ago
Authentication mode: Level 1: None, Level 2: None
Graceful Restart: Disabled, Graceful Restart Helper: Enabled
Area Addresses:
  49.0001
level 1: number dis interfaces: 0, LSDB size: 1
level 2: number dis interfaces: 0, LSDB size: 1
```

### 14.4.5.51 show mpls label ranges

The `show mpls label ranges` command displays the MPLS label range available on a router is categorized into different pools which cater to different applications running on the router.

#### Command Mode

EXEC

#### Command Syntax

```
show mpls label ranges
```

#### Example

```
switch#show mpls label ranges
Start      End        Size      Usage
-----
0          15         16        reserved
16         99999     99984     static mpls
100000     116383    16384     isis (dynamic)
116384     362143    245760    free (dynamic)
362144     899999    537856    unassigned
900000     965535    65536     isis-sr
```

---

#### 14.4.5.52 show mpls lfib route <label value>

The `show mpls lfib route <label value>` command provides information relevant to just the label value passed as an extension to the show command.

##### Command Mode

EXEC

##### Command Syntax

```
show mpls lfib route <label value>
```

##### Example

```
switch#show mpls lfib route 900008
MPLS forwarding table (Label [metric] Vias) - 7 routes
MPLS next-hop resolution allow default route: False
Via Type Codes:
  M - Mpls Via, P - Pseudowire Via,
  I - IP Lookup Via, V - Vlan Via,
  VA - EVPN Vlan Aware Via, ES - EVPN Ethernet Segment Via,
  VF - EVPN Vlan Flood Via, AF - EVPN Vlan Aware Flood Via,
  NG - Nexthop Group Via
Source Codes:
  S - Static MPLS Route, B2 - BGP L2 EVPN,
  B3 - BGP L3 VPN, R - RSVP,
  P - Pseudowire, L - LDP,
  IP - IS-IS SR Prefix Segment, IA - IS-IS SR Adjacency Segment,
  IL - IS-IS SR Segment to LDP, LI - LDP to IS-IS SR Segment,
  BL - BGP LU, ST - SR TE Policy,
  DE - Debug LFIB
IP 900008 [1]
  via M, 1.0.1.2, swap 900008
  payload autoDecide, ttlMode uniform, apply egress-acl
  interface Vlan2930
```

### 14.4.5.53 show mpls lfib route

The `show mpls lfib route` command displays the LFIB. Each LFIB entry has In-Label, Out-Label, metric, payload type, nexthop information, etc. fields. The source column depicts the MPLS control plane protocol that is responsible for the label binding that resulted in this LFIB route.

#### Command Mode

EXEC

#### Command Syntax

```
show mpls lfib route
```

#### Example

```
switch#show mpls lfib route
MPLS forwarding table (Label [metric] Vias) - 7 routes
MPLS next-hop resolution allow default route: False
Via Type Codes:
  M - Mpls Via, P - Pseudowire Via,
  I - IP Lookup Via, V - Vlan Via,
  VA - EVPN Vlan Aware Via, ES - EVPN Ethernet Segment Via,
  VF - EVPN Vlan Flood Via, AF - EVPN Vlan Aware Flood Via,
  NG - Nexthop Group Via
Source Codes:
  S - Static MPLS Route, B2 - BGP L2 EVPN,
  B3 - BGP L3 VPN, R - RSVP,
  P - Pseudowire, L - LDP,
  IP - IS-IS SR Prefix Segment, IA - IS-IS SR Adjacency Segment,
  IL - IS-IS SR Segment to LDP, LI - LDP to IS-IS SR Segment,
  BL - BGP LU, ST - SR TE Policy,
  DE - Debug LFIB
IA 100000 [1]
  via M, 1.0.1.2, pop
  payload autoDecide, ttlMode uniform, apply egress-acl
  interface Vlan2930
IA 100001 [1]
  via M, fe80::200:eff:fe02:0, pop
  payload autoDecide, ttlMode uniform, apply egress-acl
  interface Vlan2930
IP 900008 [1]
  via M, 1.0.1.2, swap 900008
  payload autoDecide, ttlMode uniform, apply egress-acl
  interface Vlan2930
IP 900009 [1]
  via M, fe80::200:eff:fe02:0, swap 900009
  payload autoDecide, ttlMode uniform, apply egress-acl
  interface Vlan2930
```

---

#### 14.4.5.54 show mpls segment-routing bindings

The **show mpls segment-routing bindings** command displays the local label bindings and label bindings on the peer routers for each prefix that has a segment advertised. Peer ID here represents the IS-IS system ID of the peer.

##### Command Mode

EXEC

##### Command Syntax

```
show mpls segment-routing bindings
```

##### Example

```
switch#show mpls segment-routing bindings
1.0.7.1/32
  Local binding: Label: 900002
  Remote binding: Peer ID: 1111.1111.1001, Label: imp-null
  Remote binding: Peer ID: 1111.1111.1003, Label: 900002
1.0.8.1/32
  Local binding: Label: imp-null
  Remote binding: Peer ID: 1111.1111.1001, Label: 900004
  Remote binding: Peer ID: 1111.1111.1003, Label: 900004
1.0.9.1/32
  Local binding: Label: 900006
  Remote binding: Peer ID: 1111.1111.1001, Label: 900006
  Remote binding: Peer ID: 1111.1111.1003, Label: imp-null
```

### 14.4.5.55 shutdown (IS-IS SR)

The **shutdown** and **default shutdown** commands administratively disable IS-IS SR on the switch without modifying the IS-IS SR configuration.

The **no shutdown** command enables IS-IS SR.

#### Command Mode

Segment-Routing MPLS Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

#### Examples

- These commands administratively disable IS-IS SR on the switch but preserve the IS-IS SR configuration.

```
switch(config)#router isis Osiris  
switch(config-router-isis)#segment-routing mpls  
switch(config-router-isis-sr-mpls)#shutdown  
switch(config-router-isis-sr-mpls)#
```

- This command enables IS-IS SR on the switch.

```
switch(config)#router isis Osiris  
switch(config-router-isis)#segment-routing mpls  
switch(config-router-isis-sr-mpls)#no shutdown  
switch(config-router-isis-sr-mpls)#
```

---

#### 14.4.5.56 shutdown (IS-IS)

The **shutdown** command disables IS-IS on the switch without modifying the IS-IS configuration.

The **no shutdown** and **default shutdown** commands enable the IS-IS instance by removing the **shutdown** command from *running-config*.

##### Command Mode

Router-IS-IS Configuration

##### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

##### Examples

- These commands disable IS-IS on the switch.

```
switch(config)#router isis Osiris  
switch(config-router-isis)#shutdown  
switch(config-router-isis)#
```

- This command enables IS-IS on the switch.

```
switch(config)#router isis Osiris  
switch(config-router-isis)#no shutdown  
switch(config-router-isis)#
```

### 14.4.5.57 spf-interval

The **spf-interval** command sets the Shortest Path First (SPF) timer that defines the interval between IS-IS path calculations. The default value is two seconds.

This command also configures the maximum wait interval between any two SPF runs, initial wait interval before executing the first SPF computation, and the hold time between the first and second SPF runs.

The **no spf-interval** and **default spf-interval** commands restore the default maximum IS-IS path calculation interval to two seconds by removing the **spf-interval** command from **running-config**.

For information about viewing SPF interval values, see [Displaying IS-IS Instance Information](#).

#### Command Mode

Router-IS-IS Configuration

#### Command Syntax

```
spf-interval max-wait [initial-wait | hold-time]
```

```
no spf-interval
```

```
default spf-interval
```

#### Parameters

- *max-wait* Value ranges from 1 through 300 seconds. Default maximum wait interval is two seconds.
- *initial-wait* Value ranges from 1 through 300000 ms. Default initial wait interval is 1000 ms.
- *hold-time* Value ranges from 1 through 300000 ms. Default hold interval is 1000 ms.

#### Guidelines

EOS does not support configuring topology-specific SPF timers in multi-topology deployments and IS-IS level-specific SPF timers.

#### Examples

- This command configures the SPF maximum wait interval to 50 seconds.

```
switch(config)#router isis Osiris
switch(config-router-isis)#spf-interval 50
```

- This command configures maximum wait interval, initial wait interval, and hold time to 20 seconds, 10000 ms, and 5000 ms respectively.

```
switch(config)#router isis inst1
switch(config-router-isis)#spf-interval 20 10000 5000
```

- This command reverts the SPF interval configuration to its default value.

```
switch(config)#router isis Osiris
switch(config-router-isis)#no spf-interval
```

## 14.5 Border Gateway Protocol (BGP)

Border Gateway Protocol (BGP) exchanges routing information among neighboring routers in different Autonomous Systems (AS). Arista switches use BGP version 4+, incorporating the multiprotocol extensions defined by RFC 4760 so that BGP can carry both IPv4 and IPv6 routes simultaneously over a single BGP peering.

This section contains the following topics:

- 
- [BGP Conceptual Overview](#)
  - [Configuring BGP](#)
  - [BGP Examples](#)
  - [BGP Commands](#)

Arista switches support these BGP functions:

- a single BGP instance.
- simultaneous internal (iBGP) and external (eBGP) peering.
- multiprotocol BGP.
- BGP confederations.
- BGP Selective Route Download.
- BGP Route Reflection.

### 14.5.1 BGP Conceptual Overview

BGP is a protocol that exchanges routing information among neighboring routers in different autonomous systems through TCP sessions.

BGP neighbors (peers) communicate through a TCP session on port 179. They are established by manual configuration commands (static peers) or by creating a peer group listen range and accepting incoming peering requests in that range (dynamic peers). Internal BGP (iBGP) peers operate within a single autonomous system (AS). External BGP (eBGP) peers operate between autonomous systems. Border routers are on AS boundaries and exchange information with other autonomous systems; the primary function of border routers is distributing routes. Internal routers do not distribute route updates that they receive.

BGP defines a state machine for establishing connections. BGP routers maintain a state variable for each peer-to-peer session to track connection status. The state machine consists of these states:

- **Idle**: the router initializes BGP resources, refuses inbound BGP connection attempts, initiates a TCP connection to the peer, then transitions to the **Connect** state.
- **Connect**: the router waits for the TCP connection to complete, then sends an OPEN message to the peer and transitions to the **OpenSent** state if successful. If unsuccessful, it sets the **ConnectRetry** timer and transitions to the **Active** state upon expiry.
- **Active**: the router sets the **ConnectRetry** timer to zero and returns to the **Connect** state.
- **OpenSent**: the router waits for an OPEN message from the peer. After receiving a valid message, it transitions to the **OpenConfirm** state.
- **OpenConfirm**: the router waits for a keepalive message from its peer. If the message is received prior to a timeout expiry, the router transitions to the **Established** state. If the timeout expires or an error condition exists, the router transitions to the **Idle** state.
- **Established**: peers exchange UPDATE messages about routes they advertise. If an UPDATE message contains an error, the router sends a NOTIFICATION message and transitions to the **Idle** state.

During established BGP sessions, routers exchange UPDATE messages about the destinations to which they offer connectivity. The route description includes the destination prefix, prefix length, autonomous systems in the path, the next hop, and information that affects the acceptance policy of the receiving router. UPDATE messages also list destinations to which the router no longer offers connectivity.

BGP detects and eliminates routing loops while making routing policy decisions by using the network topology as defined by AS paths and path attributes.

### 14.5.2 Configuring BGP

These sections describe basic BGP configuration steps:

- [Configuring BGP Instances](#)
- [Configuring BGP Neighbors](#)
- [Configuring GTSM for BGP](#)
- [Configuring Routes](#)
- [Configuring Address Families](#)
- [Configuring Best-path Selection](#)
- [Configuring BGP Convergence](#)
- [Configuring BGP Graceful Shutdown Community](#)
- [Configuring BGP Selective Route Download](#)
- [Configuring BGP Route Reflector](#)
- [Configuring BGP Confederations](#)
- [BGP Operational Commands](#)

## 14.5.2.1 Configuring BGP Instances

### 14.5.2.1.1 Creating an Instance and Entering BGP Configuration Mode

The switch supports one BGP instance, which is associated with a specified autonomous system (AS). To other BGP peers, the AS number uniquely identifies the network to which the switch belongs. Arista switches support four-byte AS numbers as described in RFC 4893. Four-byte AS number capability is communicated to BGP peers in OPEN messages. When communicating with a BGP peer which does not support four-byte AS numbers, the switch will replace AS numbers greater than 65535 with the well-known two-byte AS number 23456 (also called AS\_TRANS), and encode the actual four-byte AS numbers using the AS4\_PATH attribute.

The switch must be in router-BGP configuration mode to run BGP configuration commands. The `router bgp` command places the switch in router-BGP configuration mode for creating a BGP instance if one was not previously created. BGP configuration commands apply globally to the BGP instance.

#### Example

- This command places the switch in router-BGP configuration mode. It also creates a BGP instance in AS 50 if an instance was not previously created.

```
switch(config)#router bgp 50
switch(config-router-bgp)#
```

When a BGP instance exists, the `router bgp` command must include its autonomous system. Any attempt to create a second instance results in an error message.

#### Example

- This command attempts to open a BGP instance with a different AS number from that of the existing instance. The switch displays an error and stays in global configuration mode.

```
switch(config)#router bgp 100
% BGP is already running with AS number 50
switch(config)#
```

### 14.5.2.1.2 Configuring BGP in a VRF

IPv6 VRF support in EOS allows application of a BGP configuration to a single VRF instance, overriding global commands. To apply VRF-specific BGP configuration, use the `vrf` command within router-BGP configuration mode to enter BGP VRF configuration mode. IPv6 BGP VRF configuration is

---

performed in the VRF submode of the router-BGP configuration mode. This submode is also where a route distinguisher (RD) is configured for a VRF on switches running Ethernet VPN (EVPN): use the `rd` ([Router-BGP VRF and VNI Configuration Modes](#)) command to configure an RD for a VRF.

## Examples

- These commands place the switch in BGP VRF configuration mode for VRF “purple.” Commands issued in this mode will override global BGP configuration for the specified VRF instance.

```
switch(config)#router bgp 1
switch(config-router-bgp)#vrf purple
switch(config-router-bgp)#
```

- These commands activate IPv6 address-family support for the IPv6 neighbor 2001:0DB8:8c01::1 in VRF “purple.”

```
switch(config-router-bgp-vrf-purple)#router-id 1.1.1.1
switch(config-router-bgp-vrf-purple)#neighbor 2001:0DB8:8c01::1 remote-
as 16
switch(config-router-bgp-vrf-purple)#address-family ipv6
switch(config-router-bgp-vrf-purple-af)#neighbor 2001:0DB8:8c01::1
activate
switch(config-router-bgp-vrf-purple-af)#
```

- This command configures a route distinguisher for VRF “purple.”

```
switch(config-router-bgp-vrf-purple)#rd 530:12
switch(config-router-bgp-vrf-purple)#
```

## 14.5.2.2 Configuring BGP Neighbors

### 14.5.2.2.1 Establishing BGP Neighbors

BGP neighbors, or peers, are established by configuration commands that initiate a TCP connection. BGP supports two types of neighbors:

- **Internal neighbors** are in the same autonomous system.
- **External neighbors** are in different autonomous systems.

BGP neighbors can be either static or dynamic:

- **Static neighbors** are established by manually configuring the connection.
- **Dynamic neighbors** are established by creating a listen range and accepting incoming connections from neighbors in that address range.

Static neighbors may belong to a static peer group, allowing them to be configured as a group. Configuration applied to an individual member of a static peer group overrides the group configuration for that peer. Dynamic neighbors must belong to a dynamic peer group, and can only be configured as a group.

### Static BGP Neighbors

The `neighbor remote-as` command connects the switch with a peer, establishing a static neighbor.

Once established, a static neighbor may be added to an existing peer group. Any configuration applied to the peer group then is inherited by the neighbor, unless a conflicting configuration has been entered for that peer. Settings applied to a member of the peer group override group settings.

**Note:** To establish a BGP session, there must be an IPv4 router ID configured in the same VRF or at least one L3 interface with an IPv4 address in the same VRF. If the VRF contains

no L3 interfaces with IPv4 addresses (for example, in an IPv6-only environment), configure an appropriate router ID using the `router-id` (BGP) command.

### Example

- These commands establish an internal BGP connection with the peer at 10.1.1.14.

```
switch(config)#router bgp 50
switch(config-router-bgp)#neighbor 10.1.1.14 remote-as 50
switch(config-router-bgp)#
```

- These commands establish an external BGP connection with the peer at 192.168.2.5.

```
switch(config)#router bgp 50
switch(config-router-bgp)#neighbor 192.168.2.5 remote-as 100
switch(config-router-bgp)#
```

### Dynamic BGP Neighbors

The `bgp listen range` command specifies a range of IPv4 addresses from which the switch will accept incoming dynamic BGP peering requests, and creates the named dynamic peer group to which those peers belong. Dynamic BGP neighbors are peers which have not been manually established, but are accepted into a dynamic peer group when the switch receives a peering request from them.

Dynamic peers cannot be configured individually, but inherit any configuration that is applied to the peer group to which they belong. Peering relationships with dynamic peers are terminated if the peer group is deleted.

### Example

- These commands create a peer group called “brazil” which accepts dynamic peering requests from the 192.168.2.0/24 subnet.

```
switch(config)#router bgp 50
switch(config-router-bgp)#bgp listen range 192.168.2.0/24 peer-group
brazil remote-as 50
switch(config-router-bgp)#
```

### Displaying Neighbor Connections

The `show ip bgp summary` and `show ip bgp neighbors` commands display neighbor connection status.

### Example

- This command indicates the connection state with the peer at 192.168.2.5 is **Estab** (established). The peer is an external neighbor because it is in AS 100 and the local server is in AS 50.e

```
switch#show ip bgp summary
BGP summary information for VRF default
BGP router identifier 192.168.104.2, local AS number 50
Neighbor Status Codes: m - Under maintenance
  Neighbor      V  AS  MsgRcvd  MsgSent  InQ  OutQ  Up/Down  State  PfxRcd
  PfxAcc
  192.168.2.5  4  100    198      281     0    0  03:11:31 Estab  12
  12
switch#
```

---

## Static BGP Peer Groups

A static BGP peer group is a collection of BGP neighbors which can be configured as a group. Once a static peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Neighbors added to the group will inherit any settings already created for the group. Static peer group members may also be configured individually, and the settings of an individual neighbor in the peer group override group settings for that neighbor.

When the default form of a BGP configuration command is entered for a member of a static peer group, the peer inherits that configuration from the peer group.

A static peer group is created with the `neighbor peer group (create)` command, or by using the `bgp listen range` command to accept dynamic peering requests. Once a static peer group has been created, static neighbors can be manually added to the group by using the `neighbor peer-group (neighbor assignment)` command. The `no neighbor peer-group (neighbor assignment)` command removes a neighbor from a static peer group.

The `no neighbor peer group (create)` command will delete a static peer group. When a peer group is deleted, the members of that group revert to their individual configurations, or to the system default for any attributes that have not been specifically configured for that peer.

## Examples

- These commands create a peer group named “akron.”

```
switch(config)#router bgp 50
switch(config-router-bgp)#neighbor akron peer-group
switch(config-router-bgp)#
```

- This command adds the neighbors at 1.1.1.1 and 2.2.2.2 to peer group “akron.”

```
switch(config-router-bgp)#neighbor 1.1.1.1 peer-group akron
switch(config-router-bgp)#neighbor 2.2.2.2 peer-group akron
switch(config-router-bgp)#
```

- These commands configure the members of peer group “akron,” but cause the neighbor at 1.1.1.1 to use the system default value for out-delay.

```
switch(config-router-bgp)#neighbor akron remote-as 109
switch(config-router-bgp)#neighbor akron out-delay 101
switch(config-router-bgp)#neighbor akron maximum-routes 12000
switch(config-router-bgp)#no neighbor 1.1.1.1 out-delay
switch(config-router-bgp)#
```

## Dynamic BGP Peer Groups

A dynamic BGP peer group is a collection of BGP neighbors in a specified address range which makes a peer request to the switch. Members of dynamic peer group are configured in groups and not as individuals. A dynamic peer group name is used as a parameter to apply the configuration across all the members in the group. Neighbors joining the group inherit any settings already created for the group.

The `bgp listen range` command is used to create a dynamic peer group. This command identifies the BGP peering request from a range of IP address, and names the dynamic peer group to which those peers belong to. The `bgp listen range` command can be configured to accept a peering request from a single AS number or to accept peer request from the range of AS numbers. To accept the request from the range of AS numbers use the peer filter option in the command as shown. If the peer filter referred by the `bgp listen range` command does not exist, or if the filter exists but has no match commands, it will accept any AS number.

-  **Note:** When a listen range command is modified, any existing dynamic neighbor that is already established will get reset.

To delete a dynamic peer group, use the no or default form of the `bgp listen range` command. All peering relationships with group members are terminated when the dynamic peer group is deleted.

### Example

- These commands create a dynamic peer group called “brazil” in a single AS, which accepts peering requests from the 192.0.2.0/24 subnet the single AS is 5.

```
switch(config)#router bgp 1
switch(config-router-bgp)#bgp listen range 192.0.2.0/24 peer-group
brazil
remote-as 5
switch(config-router-bgp)#
```

- These commands create a dynamic peer group called “brazil” in a range of ASNs, which accepts peering requests from the 192.0.2.0/24 subnet. The range of AS numbers is defined by peer filter option.

```
switch(config)#router bgp 1
switch(config-router-bgp)#bgp listen range 192.0.2.0/24 peer-group
brazil peer-filter group-1
switch(config-router-bgp)#
```

The `show ip bgp peer group` command displays the source of a listen range’s remote AS number definition as shown.

```
switch(config-router-bgp)#show ip bgp peer-group
BGP peer-group is brazil
BGP version 4
Listen-range subnets:
VRF default:
192.0.2.0/24, remote AS 5
192.0.2.0/24, peer filter group1
switch(config-router-bgp)#
```

#### 14.5.2.2.2 Peer Filter

A peer filter defines a set of rules to decide whether to accept or reject the incoming peer request based on the peer’s attributes. The peer filter is defined using a sequence number and a match statement, and supports one new match statement for matching against a range of BGP AS numbers. A peer filter is defined in peer filter configuration mode as shown. The peer filter command supports only matching AS ranges. Unlike route maps, peer filters do not support sets, continues or subroutines.

To delete a peer filter, use the `no peer filter` or `default peer filter` commands.

### Example

- These commands define a peer filter that accepts any AS number.

```
switch(config)#peer-filter group1
switch(config-peer-filter-group1)#10 match as-range 1-4294967295 result
accept
switch(config-peer-filter-group1)#
```

- These commands define a peer filter that accepts any AS number between 65000 and 65100 (inclusive) except 65008 and 65009.

```
switch(config)#peer-filter group2
switch(config-peer-filter-group2)#10 match as-range 65008-65009 result
reject
switch(config-peer-filter-group2)#20 match as-range 65000-65100 result
accept
switch(config-peer-filter-group2)#
```

- These commands define a peer filter that accepts 3 specific remote AS numbers.

```
switch(config)#peer-filter group3
switch(config-peer-filter-group3)#10 match as-range 65003 result accept
switch(config-peer-filter-group3)#20 match as-range 65007 result accept
switch(config-peer-filter-group3)#30 match as-range 65009 result accept
switch(config-peer-filter-group3)#
```

The `show peer-filter` command displays the peer filter definition.

```
switch(config)#show ip bgp peer-group3
peer-filter group3
  10 match as-range 65003 result accept
  20 match as-range 65007 result accept
  30 match as-range 65009 result accept
switch(config)#
```

#### 14.5.2.2.3 Special Considerations for IPv6

BGP predates the use of IPv6, and BGP configuration assumes IPv4 connections by default. The following additional steps are used to configure IPv6 BGP neighbors.

**Note:** To establish a BGP session, there must be an IPv4 router ID configured in the same VRF or at least one L3 interface with an IPv4 address in the same VRF. If the VRF contains no L3 interfaces with IPv4 addresses (e.g., in an IPv6-only environment), configure an appropriate router ID using the `router-id (BGP)` command.

#### Activating IPv6 Neighbors

By default, the switch does not negotiate or advertise IPv6 BGP routes. In order to establish a session with an IPv6 neighbor, it must be made active in the IPv6 address family. The `ipv6-unicast` option of the `bgp default` command causes the switch to send IPv6 capability messages and all network advertisements with IPv6 prefixes to all BGP neighbors. The `neighbor activate` command issued in IPv6 address family configuration mode does the same for a single BGP neighbor.

#### Examples

- These commands make all BGP neighbors active in the IPv6 address family.

```
switch(config)#router bgp 11
switch(config)#address-family ipv6
switch(config-router-bgp-af)#bgp default ipv6-unicast
switch(config-router-bgp-af)#exit
switch(config-router-bgp)#
```

- These commands make the BGP neighbor at 2001:0DB8:8c01::1 active in the IPv6 address family.

```
switch(config)#router bgp 11
switch(config)#address-family ipv6
switch(config-router-bgp-af)#neighbor 2001:0DB8:8c01::1 activate
```

```
switch(config-router-bgp-af) #exit
switch(config-router-bgp) #
```

### Sending IPv4 NLRIs over IPv6 Connections

The switch supports the exchange of IPv4 NLRIs with IPv6 neighbors. To enable this feature for all IPv6 neighbors, use the `ipv4-unicast transport ipv6` option of the `bgp default` command in IPv4 address family configuration mode. To enable it for a single IPv6 neighbor, use the `neighbor activate` command for that neighbor in IPv4 address family configuration mode.

To send IPv4 NLRIs to IPv6 neighbors, the IPv4 next-hop address must also be communicated. To explicitly configure an IPv4 next hop to send to a specific IPv6 neighbor, use the `neighbor local-v4-addr` command. In some network configurations, the switch can also be configured to automatically determine the best IPv4 next-hop address for an individual IPv6 neighbor or for all neighbors in the VRF using the `neighbor auto-local-addr` command.

### Examples

- These commands permit IPv4 NLRI transport over all IPv6 connections by making the IPv4 address family active on IPv6 BGP neighbors, then configure the switch to automatically select a local IPv4 address to be sent in NLRIs to the IPv6 neighbors in a peer group called “indianapolis.”

```
switch(config) #router bgp 11
switch(config-router-bgp) #address-family ipv4
switch(config-router-bgp-af) #bgp default ipv4-unicast transport ipv6
switch(config-router-bgp-af) #exit
switch(config-router-bgp) #neighbor indianapolis auto-local-addr
switch(config-router-bgp) #
```

- These commands permit IPv4 NLRI transport with the IPv6 neighbor at 2001:0DB8:8c01::1 using a local IPv4 address of 10.7.5.11.

```
switch(config) #router bgp 11
switch(config-router-bgp) #address-family ipv4
switch(config-router-bgp-af) #neighbor 2001:0DB8:8c01::1 activate
switch(config-router-bgp-af) #exit
switch(config-router-bgp) #neighbor 2001:0DB8:8c01::1 local-v4-addr
10.7.5.11
switch(config-router-bgp) #
```

#### 14.5.2.2.4 Maintaining Neighbor Connections

BGP neighbors maintain connections by exchanging KEEPALIVE, UPDATE, and NOTIFICATION messages. Neighbors that do not receive a message from a peer within a specified period (**hold time**) close the BGP session with that peer. Hold time is typically three times the period between scheduled KEEPALIVE messages. The default keepalive period is 60 seconds; default hold time is 180 seconds.

The `timers bgp` command configures the hold time and keepalive period. A peer retains its BGP connections indefinitely when its hold time is zero.

### Example

- This command sets the keepalive period to 15 seconds and the hold time to 45 seconds.

```
switch(config-router-bgp) #timers bgp 15 45
switch(config-router-bgp) #
```

The `show ip bgp neighbors` command displays the hold time.

## Example

- This command indicates the BGP hold time is 45 seconds.

```
switch#show ip bgp neighbors 10.100.100.2
BGP neighbor is 10.100.100.2, remote AS 100
BGP version 4, remote router ID 192.168.100.13, VRF default
  Negotiated BGP version 4
  Last read 00:00:05, last write 00:00:05
  Hold time is 45, keepalive interval is 15 seconds          <= hold
time
  Configured hold time is 45, keepalive interval is 15 seconds
  Connect timer is inactive
  Idle-restart timer is inactive
  BGP state is Established, up for 04:44:05
  Number of transitions to established: 11
  Last state was OpenConfirm
  Last event was RecvKeepAlive
  Last sent notification:Cease/administrative reset, Last time 04:44:09
  Last rcvd notification:Cease/peer de-configured, Last time 2d02h,
  First time 7d08h, Repeats 1
  Neighbor Capabilities:
  Multiprotocol IPv4 Unicast: advertised and received and negotiated
  Four Octet ASN: advertised and received
          <-----OUTPUT OMITTED FROM EXAMPLE----->
switch#
```

### 14.5.2.2.5 Neighbor Route Configuration

#### Maximum Routes

The `neighbor maximum-routes` command determines the number of BGP routes the switch accepts from a specified neighbor. The switch disables peering with the neighbor when this number is exceeded.

#### Example

- This command configures the switch to accept 15,000 routes from the peer at 192.168.18.24.

```
switch(config-router-bgp)#neighbor 192.168.18.24 maximum-routes 15000
switch(config-router-bgp)#
```

#### Route Reflection

Participating BGP routers within an AS communicate eBGP-learned routes to all of their peers; they do not re-advertise iBGP-learned routes within the AS to prevent routing loops. Although a fully meshed network topology ensures that all AS members share routing information, this topology can result in high volumes of iBGP messages when scaled. Alternatively, one or more routers are configured as route reflectors in larger networks.

A route reflector re-advertises routes learned through iBGP to a group of BGP neighbors within the AS, replacing the function of a fully meshed topology. The `neighbor route-reflector-client` command configures the switch to act as a route reflector and configures the specified neighbor as a client. The `bgp client-to-client reflection` command enables client-to-client reflection.

When using route reflectors, an AS is divided into clusters. A cluster contains at least one route reflector and a group of clients to which they re-advertise route information. A cluster may contain multiple route reflectors to provide redundancy protection. Each reflector has a cluster ID. When the cluster has a single route reflector, the cluster ID is its router ID. When a cluster has multiple

route reflectors, a 4-byte cluster ID is assigned to all route reflectors in the cluster, allowing them to recognize updates from other cluster reflectors. The `bgp cluster-id` command configures the cluster ID in a cluster with multiple route reflectors.

### Example

- These commands configure the switch as a route reflector and the neighbor at 172.72.14.5 as one of its clients, and set the cluster ID to 172.22.30.101.

```
switch(config-router-bgp) #neighbor 172.72.14.5 route-reflector-client
switch(config-router-bgp) #bgp cluster-id 172.22.30.101
switch(config-router-bgp) #
```

Usually the clients of a route reflector are not interconnected, and any routes learned by a client are mirrored to other clients and re-advertised within the AS by the route reflector. If the clients of a route reflector are fully meshed, routes received from a client do not need to be mirrored to other clients. In this case, client-to-client reflection should be disabled (`no bgp client-to-client reflection`).

### Route Preference

The primary function of external peers is to distribute routes they learn from their peers. Internal peers receive route updates without distributing them. External peers receive route updates, then distribute them to internal and external peers.

**Local preference** is a metric that iBGP sessions use to select an external route. Preferred routes have the highest local preference value. UPDATE packets include this metric in the LOCAL\_PREF field.

The `neighbor export-localpref` command specifies the LOCAL\_PREF that the switch sends to an internal peer. The command overrides previously assigned preferences and has no effect on external peers.

### Example

- This command configures the switch to enter 200 in the LOCAL\_PREF field of UPDATE packets it sends to the peer at 10.1.1.45.

```
switch(config-router-bgp) #neighbor 10.1.1.45 export-localpref 200
switch(config-router-bgp) #
```

The `neighbor import-localpref` command assigns a local preference to routes received through UPDATE packets from an external peer. This command has no effect when the neighbor is an internal peer.

### Example

- This command configures the switch to assign the local preference of 50 for routes advertised from the peer at 172.16.5.2.

```
switch(config-router-bgp) #neighbor 172.16.5.2 import-localpref 50
switch(config-router-bgp) #
```

The `show ip bgp` command displays the LOCAL\_PREF value for all listed routes.

### Example

- This command indicates the route to network 10.10.20.0/24 has a local preference of 400.

```
switch#show ip bgp
BGP routing table information for VRF default
```

```

Router identifier 192.168.100.23, local AS number 64512
Route status codes: s - suppressed, * - valid, > - active, # - not
  installed, E - ECMP head, e - ECMP S - Stale, c - Contributing to
  ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL
  Nexthop - Link Local Nexthop

      Network          Next Hop          Metric  LocPref Weight  Path
* >Ec 10.10.20.0/24    192.168.31.3     0       400     0
64521 i
switch#

```

## Graceful Restart

Graceful BGP restart allows a BGP speaker with separate control plane and data plane processing to continue forwarding traffic during a BGP restart. Its neighbors (receiving speakers) may retain routing information from the restarting speaker while a BGP session with it is being re-established, reducing route flapping.

Arista switches can act as helpers (receiving speakers) for graceful BGP restart with neighbors that advertise graceful restart capability.

Graceful restart helper mode is enabled by default, but can be turned off globally with the `no graceful-restart-helper` command. Per-peer configuration takes precedence over the global configuration.

## Examples

- This command disables graceful restart helper mode for all BGP peers.

```

switch(config-router-bgp) #no graceful-restart-helper
switch(config-router-bgp) #

```

- This command disables graceful restart helper mode for the neighbor at 192.168.32.5 regardless of global configuration.

```

switch(config-router-bgp) #no neighbor 192.168.32.5 graceful-restart-
  helper
switch(config-router-bgp) #

```

Peers with graceful restart capability advertise a restart time value as an estimate of the time it will take them to restart a BGP session. When a BGP session with a restarting speaker goes down, the switch (receiving speaker) marks routes from that peer as stale and starts the restart timer. If the session with the peer is not re-established before the restart time runs out, the switch deletes the stale routes from that peer. If the session is re-established within that time, the stale path timer is started. If the stale paths are not updated by the restarting speaker before the stale path time runs out, they are deleted. The maximum time these stale paths will be retained after the BGP session is re-established is 300 seconds by default, but can be configured using the `graceful-restart stalepath-time` command.

## Example

- This command configures BGP to discard stale paths from a restarting peer 500 seconds after the BGP session with that peer is re-established.

```

switch(config-router-bgp) #graceful-restart stalepath-time 500
switch(config-router-bgp) #

```

### 14.5.2.2.6 Filtering Routes

#### Filtering with Route Maps

Route maps are used in BGP to directly filter IPv4 unicast routes. The `neighbor route-map (BGP)` command applies a route map to inbound or outbound BGP routes. To display the route maps associated with a specific BGP neighbor, use the `show ip bgp neighbors` command.

#### Filtering with BGP Communities

Community values are assigned to a set of subnet prefixes through route map `set` commands. Route map `match` commands subsequently use community values to filter routes. The switch uses the following `ip community-list` commands to filter community routes into a BGP domain:

- `ip community-list` creates a community list by explicitly referencing one or more communities by name or number.
- `ip community-list regexp` creates a community list by referencing one or more communities by regular expression.
- `ip extcommunity-list` creates an extended community list to identify routes for VRFs or for link bandwidth (LBW) by explicitly referencing extended communities by prefix and number.
- `ip extcommunity-list regexp` creates an extended community list to identify routes for VRFs or for link bandwidth (LBW) by regular expression.

The BGP community attribute is a 32 bit value formatted as follows:

- an integer between 0 and 4294967040.
- AA:NN, where AA is 65535 and NN specifies the community number (0-65535) within the AS.

These four community attribute values, and the associated BGP speaker actions, are predefined:

- **no-export**: speaker does not advertise the routes beyond the BGP domain.
- **no-advertise**: speaker does not advertise the routes to any BGP peers.
- **local-as**: speaker does not advertise route to any external peers.
- **internet**: speaker advertises the route to the Internet community. By default, this includes all prefixes.

#### Example

- These commands assign two network subnets to a prefix list, assign a community number to the prefix list members, then utilize that community in an `ip community-list` command to permit the routes into the BGP domain.

1. Compose the IP prefix list.

```
switch(config)#ip prefix-list PL_1 permit 10.1.2.5/24
switch(config)#ip prefix-list PL_1 permit 10.2.5.1/28
switch(config)#
```

2. Create a route map that matches the IP prefix list and sets the community value.

```
switch(config)#route-map MAP_1 permit
switch(config-route-map-MAP_1)#match ip address prefix-list PL_1
switch(config-route-map-MAP_1)#set community 500
switch(config-route-map-MAP_1)#exit
switch(config)#
```

3. Create a community list that references the community.

```
switch(config)#ip community-list CL_1 permit 500
switch(config)#
```

---

BGP extended communities identify routes for VRFs or for link bandwidth (LBW). Extended community clauses utilize route target (rt) and site of origin options (soo):

- **route targets** identify sites that may receive appropriately tagged routes.
- **site of origin** identifies the site where the router learned the route.

### Filtering with AS Path Access Lists

An AS path access list is a named list of permit and deny statements which use regular expressions to filter BGP routes based on their AS path attribute. AS path access lists are created using the `ip as-path access-list` command, and are applied using a route map match clause with the name of the access list as a parameter.

#### Example

- These commands create an AS path access list identifying routes which pass through AS 3, create a route map which references the access list, assign the routes it filters to community 300, and apply the route map to the neighbor at 192.68.14.5 to assign a community value of 300 to inbound routes received from that neighbor.

1. Create the AS path access list.

```
switch(config)#ip as-path access-list as_list3 permit _3_
```

2. Create a route map that matches the AS path access list and sets the community value.

```
switch(config)#route-map MAP_3 permit
switch(config-route-map-MAP_3)#match as-path as_list3
switch(config-route-map-MAP_3)#set community 300
switch(config-route-map-MAP_3)#exit
```

3. Apply the route map to the neighbor.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.68.14.5 route-map MAP_3 in
switch(config-router-bgp)#
```

### 14.5.2.3 Configuring GTSM for BGP

The Generalized TTL Security Mechanism (GTSM) uses a packet's Time to Live (TTL) (IPv4) or Hop Limit (IPv6) to protect BGP peering sessions from denial-of-service (DoS) attacks based on forged protocol packets.

An IP packet received from a BGP peer is discarded when its current TTL value is less than (255-n) where n is the configured maximum number of hops to the peer. Use the `neighbor ttl maximum-hops` command to configure the maximum hop count.

**Note:** IP packets to GTSM enabled BGP peers are sent with the configured TTL value of 255.

### 14.5.2.4 Configuring Routes

#### 14.5.2.4.1 Advertising Routes

A BGP neighbor advertises routes it can reach through UPDATE packets. The `network (BGP)` command specifies a prefix that the switch advertises as a route originating from its AS.

The configuration clears the host portion of addresses entered in `network` commands. For example, 192.0.2.4/24 is stored as 192.0.2.0/24.

## Example

- This command configures the switch to advertise the 10.5.8.0/24 network.

```
switch(config-router-bgp) #network 10.5.8.0/24
switch(config-router-bgp) #
```

By default, BGP will advertise only those routes that are active in the switch's RIB. This can contribute to dropped traffic. If a preferred route is available through another protocol (like OSPF), the BGP route will become inactive and not be advertised; if the preferred route is lost, there is no available route to the affected peers. Advertising inactive BGP routes minimizes traffic loss by providing alternative routes.

The `bgp advertise-inactive` command causes BGP to advertise inactive routes to BGP neighbors. Inactive route advertisement is configured globally, but the global setting can be overridden on a per-VRF basis.

## Examples

- This command configures the switch to advertise routes learned through BGP even if they are not active on the switch.

```
switch(config-router-bgp) #bgp advertise-inactive
switch(config-router-bgp) #
```

- This command overrides inactive route advertisement for VRF "purple."

```
switch(config-router-bgp) #vrf purple
switch(config-router-bgp-vrf-purple) #no bgp advertise-inactive
switch(config-router-bgp-vrf-purple) #
```

### 14.5.2.4.2 Advertising ISIS Routes into BGP Network

The `redistribute isis route-map isis-to-bgp` command advertises the routes learned through IS-IS routes into the BGP network. It also allows the user to selectively advertise some routes and modify route attributes before advertising using route maps.

The command is available in both address-family mode and router BGP mode, but the command is rejected if configured in both address-family mode and router mode at the same time.

While redistributing IS-IS routes into BGP, the Level-1 or Level-2 keyword can be used to selectively redistribute Level-1 routes or Level-2 routes into BGP. The keyword is optional, and defaults to level-2 when not configured.

Use the `show ipv6 bgp detail` command to verify that routes are advertised with correct attributes.

**Note:** If the command is configured in router-af mode, it only redistributes routes with matching address family. If it is configured in router mode, it applies to all enabled address-families.

## Examples

- These commands redistribute IS-IS routes into BGP in address-family mode.

```
switch(config) #router bgp 1
switch(config-router-bgp) #address-family ipv4
switch(config-router-bgp-af) #redistribute isis level-1 route-map isis-
to-bgp-v4
switch(config-router-bgp-af) #
```

- These commands redistribute IS-IS routes into BGP in router BGP mode.

```
switch(config)#router bgp 1
switch(config-router-bgp)#redistribute isis level-1 route-map isis-to-
bgp
switch(config-router-bgp)#
```

#### 14.5.2.4.3 BGP Route Aggregation

Aggregation combines the characteristics of multiple routes into a single route for advertisement by the BGP speaker. Aggregation can reduce the amount of information that a BGP speaker is required to store and transmit when advertising routes to other BGP speakers. Aggregation options affect the attributes associated with the aggregated route, the advertisement of the contributor routes that comprise the aggregate, and which contributor routes are included.

Aggregate routes are created with the `aggregate-address` command, which takes an IP subnet as an argument; any routes configured on the switch that lie within that subnet then become contributors to the aggregate. Note that on Arista switches the BGP aggregate route will become active if there are any available contributor routes on the switch, regardless of the originating protocol. This includes routes configured statically.

BGP speakers display aggregate routes that they create as null routes (with one exception: if all the contributors to the aggregate have the same BGP path attributes, then the BGP aggregate copies those attributes and is no longer a null route). Aggregate routes are advertised into the BGP autonomous system and redistributed automatically, and their redistribution cannot be disabled. BGP neighbors display inbound aggregate routes as normal BGP routes. Null routes are displayed with the `show ip route` command; normal BGP routes (and null aggregate routes) are displayed with the `show ip bgp` and `show ip route` commands.

#### Aggregation Options

The `aggregate-address` command provides the following aggregate route options:

- **AS\_PATH attribute inclusion:** the `as-set` option controls the aggregate route's AS\_PATH and ATOMIC\_AGGREGATE attribute contents. AS\_PATH identifies the autonomous systems through which UPDATE message routing information passes. ATOMIC\_AGGREGATE indicates that the route is an aggregate or summary of more specific routes.

When the command includes `as-set`, the aggregate route's AS\_SET attribute contains the AS numbers of contributor routes. This can help BGP neighbors to prevent loops by rejecting aggregate routes that include their AS number in the AS\_SET.

When the command does not include `as-set`, the aggregate route's ATOMIC\_AGGREGATE attribute is set and the AS\_PATH attribute does not include AS numbers of contributing routes.

- **Attribute assignment:** the `attribute-map` option assigns attributes contained in set commands in a specified route map's lowest sequence with any set command to the aggregated route, overriding the automatic determination of the aggregate route's attributes by the switch.
- **Route suppression:** the `summary-only` option suppresses the advertisement of the contributor routes that comprise the aggregate.
- **Contributor filtering:** the `match-map` option uses a route map to filter out contributor routes that would otherwise be included in the aggregate.

#### Example

- These commands create an aggregate route (10.16.48.0/20) from four contributor routes (10.16.48.0/23, 10.16.50.0/23, 10.16.52.0/23, and 10.16.54.0/23). The aggregate route includes the AS\_PATH information from the contributor routes.

```
switch(config)#router bgp 1
```

```
switch(config-router-bgp) #aggregate-address 10.16.48.0/20 as-set
switch(config-router-bgp) #exit
switch(config) #
```

- These commands create an aggregate route and use a route map to add a local-preference attribute to the route.

```
switch(config) #route-map map1 permit 10
switch(config-route-map-map1) #set local-preference 40
switch(config-route-map-map1) #exit
switch(config) #router bgp 1
switch(config-router-bgp) #aggregate-address 10.16.48.0/20 attribute-map
map1
switch(config-router-bgp) #exit
switch(config) #
```

- These commands create an aggregate route and use a route map to allow only those contributors which match a specified prefix list to be included in the aggregate route.

```
switch(config) #route-map matchmap permit 10
switch(config-route-map-matchmap) #match ip address prefix-list agglst
switch(config-route-map-matchmap) #exit
switch(config) #router bgp 1
switch(config-router-bgp) #aggregate-address 1.1.0.0/16 match-map
matchmap
switch(config-router-bgp) #
```

#### 14.5.2.4.4 Customizing the BGP AS-Path Attribute

The BGP Replace AS-Path feature allows the user to customize the AS\_PATH attribute for prefixes that are either received from a BGP neighbor or advertised to a BGP neighbor. To configure the BGP Replace AS-Path feature, use the `set as-path match` and `set as-path prepend` commands.

To replace the AS\_PATH attribute of routes received from a BGP neighbor, configure a route map and attach the policy to the corresponding BGP neighbor statement in the inbound direction.

To replace the AS\_PATH attribute of routes that are advertised to a neighbor, configure a route map and attach the policy to the corresponding BGP neighbor statement in the outbound direction.

The Replace AS-Path feature works in conjunction with the AS-Path Prepend feature which is also used to modify the AS\_PATH attribute. However, if both features are configured within the same route map, then the replace AS-Path feature takes precedence over the AS-Path Prepend.

**Note:** The BGP Replace AS-Path feature supports both eBGP and iBGP neighbors. The locally configured AS number is always prefixed to the AS-Path of routes advertised to the eBGP neighbors. This RFC behavior is retained in Arista's implementation of the Replace AS-Path feature as well.

BGP Replace AS-Path has the following limitations:

- Replacing the AS-Path should be used cautiously since it may impact BGP loop prevention.
- A few duplicated routes may be advertised and installed on a router after the original AS-Path of those routes are replaced. To fix this issue, it is always suggested to filter out such routes by prefix with BGP Community.

#### Example

- This command replaces the AS-Path with the none option.

```
switch#show ip bgp neighbors 80.80.1.2 advertised-routes
BGP routing table information for VRF default
Router identifier 202.202.1.1, local AS number 200
```

```

Route status codes: s - suppressed, * - valid, > - active, # - not installed, E

Network          Next Hop          Metric  LocPref Weight Path
* > 101.101.1.0/24 80.80.1.1        -      -      -    200 200 i
* > 102.102.1.0/24 80.80.1.1        -      -      -    200 200 i
* > 103.103.1.0/24 80.80.1.1        -      -      -    200 200 i
* > 202.202.1.0/24 80.80.1.1        -      -      -    200 200 i
switch#

```

The AS-path of matching prefixes are replaced with the locally configured AS 200.

#### 14.5.2.4.5 AS-path Modifications for Split ASes

By default, BGP rejects routes that contain the local autonomous system number (ASN). Sometimes a single autonomous system is divided geographically or otherwise with one or more provider ASes in between. In these cases, a valid route can sometimes be dropped by a customer edge router because

the local ASN appears in the AS-path of route advertisements that have traveled through one or more provider networks. To ensure that these routes are not dropped, the provider edge router can be configured to replace the customer AS with its own, or the customer edge router can be configured to ignore its local AS number in received routes.

### Replacing Remote ASN in Outbound Route Announcements

To replace a remote ASN with the local ASN in BGP route announcements sent to a specified router, use the `neighbor as-path remote-as replace out` command.

#### Example

- These commands configure the switch to substitute its local ASN for the ASN of the BGP neighbor at 192.168.2.15 in BGP routes advertised to that neighbor.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.2.15 as-path remote-as
replace out
switch(config-router-bgp)#
```

### Ignoring Local ASN in Incoming Route Announcements

To accept BGP routes that include the local ASN in their AS-path attribute, use the `neighbor allowas-in` command.

#### Example

- These commands configure the switch to accept routes from the BGP neighbor at 192.168.1.30 which contain the switch's ASN in their AS paths as many as 3 times.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.1.30 allowas-in
switch(config-router-bgp)#
```

## 14.5.2.5 Configuring Address Families

The switch determines the network prefixes that peering sessions advertise and the BGP neighbor addresses that receive advertisements through address family activity configuration.

An address family is a data structure that defines route advertising status to BGP neighbor addresses. Each BGP neighbor address is assigned an activity level for each address family on the switch. The switch sends capability and network prefix advertisements to neighbor addresses that are active within specified address families:

- IPv4 address family: switch advertises IPv4 capability and network commands with IPv4 prefixes to neighbor addresses configured as **IPv4 address family active**.
- IPv6 address family: switch advertises IPv6 capability and network commands with IPv6 prefixes to neighbor addresses configured as **IPv6 address family active**.

### 14.5.2.5.1 Neighbor Address Family Configuration

Address family activity levels for neighbor addresses are configured through `bgp default` and `neighbor activate` commands.

- The `bgp default` command specifies the default activity level of BGP neighbor addresses for a specified address family.
- The `neighbor activate` command specifies deviations from default address family activity level for a specified BGP neighbor address.

---

## Default Neighbor Activation

The `bgp default` command configures the default address family activity level of all configured BGP neighbor addresses. The switch advertises the following to **address family active** addresses:

- IPv4 address family active: IPv4 capability and all network advertisements with IPv4 prefixes.
- IPv6 address family active: IPv6 capability and all network advertisements with IPv6 prefixes.

These commands configure default address family activity levels for configured BGP neighbor addresses:

- **bgp default ipv4-unicast**: all BGP neighbor addresses are IPv4 address family active (this is the switch default).
- **no bgp default ipv4-unicast**: no BGP neighbor addresses are IPv4 address family active.
- **bgp default ipv6-unicast**: all BGP neighbor addresses are IPv6 address family active.
- **no bgp default ipv6-unicast**: no BGP neighbor addresses are IPv6 address family active (this is the switch default).
- **bgp default ipv4-unicast transport ipv6**: all BGP neighbor addresses are IPv4 address family active and IPv6 neighbors can receive IPv4 NLRIs.

**Note:** If it is necessary to exchange IPv4 NLRIs over an IPv6 connection, the IPv4 address family must be activated on the IPv6 neighbor. To do this for all IPv6 neighbors, use the command `bgp default ipv4-unicast transport ipv6`. For an individual neighbor, use the `neighbor activate` command for the IPv6 neighbor in the IPv4 address-family configuration mode as described below.

## Activating Individual Neighbor Addresses

The `address-family` command places the switch in address family mode to configure the address family activity level of individual BGP neighbor addresses. The switch supports these address families:

- ipv4-unicast
- ipv6-unicast

**Running-config** displays `address family` commands in sub-blocks of the BGP configuration. The `neighbor activate` command is available in each address family configuration mode and defines the configuration mode address family activity level of a specified configured BGP neighbor address. Addresses are assigned one of the following states by the activate command:

- **neighbor activate** configures the address as active in the configuration mode address family.
- **no neighbor activate** configures the address as not active in the configuration mode address family.

The switch sends the following announcements to addresses that are active in an address family:

- **IPv4 address family**: IPv4 capability and all network routes with IPv4 prefixes.
- **IPv6 address family**: IPv6 capability and all network routes with IPv6 prefixes.

The `neighbor route-map (BGP)` command applies a route map to inbound or outbound BGP routes. In address-family mode, the route map is applied to routes corresponding to the configuration-mode address family. When a route map is applied to outbound routes, the switch advertises only routes matching at least one section of the route map. One outbound and one inbound route map can be applied to a neighbor for each address family. Applying a route map to a route replaces the previous corresponding route map assignment.

## Network Route Advertising in Address Families

The `network (BGP)` command specifies a network for advertisement through UPDATE packets to BGP peers. The command is available in Router-BGP and Router-BGP-Address-Family configuration modes; the mode in which the command is issued does not affect the command's execution.

- Commands with an IPv4 address are advertised to peers that are IPv4 address family-active.

- Commands with an IPv6 address are advertised to peers that are IPv6 address family-active.

## Examples

- These commands instantiate BGP, configure three neighbors, and configure two network routes.

The default activity level for IPv4 and IPv6 address families is set to the default; all neighbor addresses are IPv4 address family active and IPv6 address family not active. IPv4 capability and network routes with IPv4 prefixes are advertised to all neighbor IPv4 addresses.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 172.21.14.8 remote-as 15
switch(config-router-bgp)#neighbor 172.23.18.6 remote-as 16
switch(config-router-bgp)#neighbor 2001:0DB8:8c01::1 remote-as 16
switch(config-router-bgp)#network 172.18.23.9/24
switch(config-router-bgp)#network 2001:0DB8:de29::/64
switch(config-router-bgp)#
```

- These commands instantiate BGP on the switch, set IPv4 default activity level (**not active**), set IPv6 default activity level (**active**), and configure three neighbor addresses and two network route prefixes.

IPv6 capability and network routes with IPv6 prefixes are advertised to all neighbor addresses.

```
switch(config)#router bgp 10
switch(config-router-bgp)#bgp default ipv6-unicast
switch(config-router-bgp)#no bgp default ipv4-unicast
switch(config-router-bgp)#neighbor 172.21.14.8 remote-as 15
switch(config-router-bgp)#neighbor 172.23.18.6 remote-as 16
switch(config-router-bgp)#neighbor 2001:0DB8:8c01::1 remote-as 16
switch(config-router-bgp)#network 172.18.23.9/24
switch(config-router-bgp)#network 2001:0DB8:de29::/64
switch(config-router-bgp)#
```

- These commands configure three neighbors, two network routes, and the default activity level for each address family (**not active**), and specify neighbor addresses for each address family that is active.

```
switch(config)#router bgp 11
switch(config-router-bgp)#neighbor 172.21.14.8 remote-as 15
switch(config-router-bgp)#neighbor 172.23.18.6 remote-as 16
switch(config-router-bgp)#neighbor 2001:0DB8:8c01::1 remote-as 16
switch(config-router-bgp)#network 172.18.23.9/24
switch(config-router-bgp)#network 2001:0DB8:de29::/64
switch(config-router-bgp)#no bgp default ipv4-unicast
switch(config-router-bgp)#no bgp default ipv6-unicast
switch(config-router-bgp)#address-family ipv4
switch(config-router-bgp-af)#neighbor 172.21.14.8 activate
switch(config-router-bgp-af)#neighbor 172.23.18.6 activate
switch(config-router-bgp-af)#exit
switch(config-router-bgp)#address-family ipv6
switch(config-router-bgp-af)#neighbor 2001:0DB8:8c01::1 activate
switch(config-router-bgp-af)#exit
switch(config-router-bgp)#
```

- These commands permit IPv4 NLRI transport over all IPv6 connections by making the IPv4 address family active on IPv6 BGP neighbors.

```
switch(config)#router bgp 11
switch(config)#address-family ipv4
switch(config-router-bgp-af)#bgp default ipv4-unicast transport ipv6
```

```
switch(config-router-bgp-af) #exit
switch(config-router-bgp) #
```

### 14.5.2.6 Configuring Best-path Selection

The best-path selection algorithm (described under [Best-Path Selection](#)) determines which of multiple paths to the same destination received by BGP will be added to the IP routing table. To shape route preferences and influence best-path selection, use the following commands in router-BGP configuration mode.

- `bgp always-compare-med` configures the switch to always consider the multi-exit discriminator (MED) value when comparing paths (disabled by default).
- `bgp bestpath as-path ignore` configures the switch to ignore the length of the autonomous system (AS) path when comparing routes (disabled by default).
- `bgp bestpath as-path multipath-relax` used in equal-cost multi path (ECMP configuration) and enabled by default; the no form of the command configures the switch to consider paths unequal if their AS paths have different contents.
- `bgp bestpath ecmp-fast` the no form of this command causes the switch to ignore order of arrival in evaluating paths within an ECMP group.
- `bgp bestpath med confed` causes comparison of multi-exit discriminator (MED) values in routes originating within the same confederation as the switch and received from confederation peers (disabled by default).
- `bgp bestpath med missing-as-worst` configures the switch to treat a missing MED as having the highest (least preferred) value (disabled by default). This command overrides the missing-as-worst setting of the `bgp bestpath med confed` command.
- `bgp bestpath tie-break cluster-list-length` configures the switch to prefer the multipath route with the shortest CLUSTER\_LIST length in case of a tie in step 10 of the selection process (disabled by default).
- `bgp bestpath tie-break router-id` configures the switch to prefer the multipath route with the lowest ROUTER\_ID in case of a tie in step 10 (disabled by default).

#### 14.5.2.6.1 Displaying Reasons for Best-path Selection

To see the reasons why certain routes were excluded by the best-path selection process, use the detail option of the `show ip bgp` command. Enter the prefix to which BGP has selected a best path, and the output will display all learned paths. Paths which were not selected as best will display the reason they were not selected after the label **not best**.

The reason will be listed as one of the following:

- path weight
- local preference
- AS path length
- origin
- path MED
- eBGP path preferred
- IGP cost
- AS path details
- ECMP-Fast configured
- router ID
- originator ID
- router ID tie-break configured
- cluster list length
- cluster list length tie-break configured
- peer IP address

- path ID
- redistributed route exists
- unknown
- another route from the same AS is a better BGP route
- peer not ready
- unusable

### Example

- This command displays the reasons why three routes to 172.16.0.0/24 were rejected by the best-path algorithm. The reason for rejection is preceded by the label **Not best:**

```
switch#show ip bgp 172.16.0.0/24 detail
BGP routing table information for VRF default
Router identifier 192.168.100.18, local AS number 64524
Route status: [a.b.c.d] - Route is  queued for advertisement to peer.
BGP routing table entry for 204.1.47.220/30
  Paths: 4 available
    64512 64550 65100
      192.168.14.2 from 192.168.14.2 (192.168.100.21)
        Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29
        ago, valid,
        external, ECMP head, ECMP, best, ECMP contributor
        Rx SAFI: Unicast
    64512 64550 65100
      192.168.24.2 from 192.168.24.2 (192.168.100.22)
        Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29
        ago, valid,
        external, ECMP, ECMP contributor
        Rx SAFI: Unicast
        Not best: ECMP-Fast configured
    64512 64550 65100
      192.168.34.2 from 192.168.34.2 (192.168.100.23)
        Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29
        ago, valid,
        external, ECMP, ECMP contributor
        Rx SAFI: Unicast
        Not best: Redistributed route exists
    64512 64550 65100
      192.168.44.2 from 192.168.44.2 (192.168.100.24)
        Origin IGP, metric 0, localpref 100, weight 0, received 19:15:29
        ago, valid,
        external, ECMP, ECMP contributor
        Rx SAFI: Unicast
        Not best: eBGP path preferred
  Not advertised to any peer
switch#
```

### 14.5.2.7 Configuring BGP Convergence

To avoid hardware updates and route advertisement churn during switch reload or BGP instance start, BGP enters into the convergence state where it waits for all peers to join and receive all routes from all the peers.

**BGP Convergence** is bound by an upper value of convergence time (default value is 5 minutes) and BGP declares convergence on expiry of convergence timer. At the end of convergence, BGP updates the routes in FIB and advertises to all the peers.

To configure BGP convergence and the different timeout features, use the following commands in router-BGP configuration mode.

- `update wait-for-convergence` enables the BGP convergence feature.
- `bgp convergence slow-peer time` configures the BGP convergence idle peer timeout value. The default timeout value is 90 seconds.
- `bgp convergence time` configures the BGP convergence timeout value. The default timeout value is 300 seconds.

#### Different Cases for Convergence with Default Timeout Configuration

- **Convergence Time < 90 seconds after the first peer has joined:** this is the best case when all the configured peers have joined and EORs have been received from all peers in less than 90 seconds after the first peer has joined.
- **Convergence Time = 90 seconds after the first peer has joined:** this is the case when one or more BGP peers have joined within 90 seconds and EORs have been received from all peers within 90 seconds, but there are still some configured peers which have not joined yet. In this case, the convergence is declared after slow-peer timeout is reached.
- **Convergence Time > 90 seconds after the first peer has joined:** this is the case when one or more BGP peers have joined after 90 seconds, but EORs have not been received from all peers. As soon as EORs are received from all peers which have joined during the first 90 seconds, the convergence is declared.
- **Convergence Time = 300 seconds after the first peer has joined:** this is the case when EOR is not received till 300 seconds from some of the peers that have joined during 90 seconds after the first peer has joined.

#### 14.5.2.7.1 Displaying BGP Convergence Status

Use the `show bgp convergence` command to view information about the BGP convergence status, and to know if the convergence timer has started or not. The examples below show the command output at different points in the convergence process.

##### No Peers Have Joined

- This is the output when no peers have joined before convergence.

```
switch(config-router-bgp)#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event : None
Bgp convergence state : Not Initiated (Waiting for the first peer to
join)
Convergence timer is not running
Convergence timeout in use: 00:02:30
Convergence slow peer timeout in use: 00:00:55
First peer is not up yet
All the expected peers are up: no
All IGP protocols have converged: yes
Outstanding EORs: 0, Outstanding Keepalives: 0
Pending Peers: 2
Total Peers: 2
Established Peers: 0
Disabled Peers: 0
Peers that have not converged yet:
IPv4 peers:
201.1.1.1 (Session : Connect)
202.1.1.1 (Session : Connect)
IPv6 peers:
None
```

```
switch(config-router-bgp)#
```

### First Peer Has Joined

- This is the output when the first peer has joined before convergence.

```
switch#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:40 ago
Bgp convergence state : Pending (Waiting for EORs/Keepalives from
peer(s) and IGP
convergence)
Convergence timer running, will expire in 00:01:50
Convergence timeout in use: 00:02:30
Convergence slow peer timeout in use: 00:00:55
First peer came up 00:00:13 ago
All the expected peers are up: no
All IGP protocols have converged: yes
Outstanding EORs: 0, Outstanding Keepalives: 0
Pending Peers: 1
Total Peers: 2
Established Peers: 1
Disabled Peers: 0
Peers that have not converged yet:
IPv4 peers:
201.1.1.1 (Session : Active)
IPv6 peers:
None
switch#
```

### Convergence Timeout Reached

- This is the output when the convergence timeout value is reached.

```
switch(config-router-bgp)#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:02:44 ago
Bgp convergence state: Timeout reached
Time taken to converge 00:02:30
Pending Peers: 1
Total Peers: 2
Established Peers: 1
Disabled Peers: 0
Peers that did not converge before local bgp convergence:
IPv4 peers:
201.1.1.1 (Session : Active)
202.1.1.1 (Session : Established)
IPv6 peers:
None
switch(config-router-bgp)#
```

---

## Converged State

- This is the output during the converged state.

```
switch(config-router-bgp)#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:05:00
Configured convergence slow peer timeout: 00:01:30
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:05 ago
Bgp convergence state : Converged
Time taken to converge 00:00:02
First peer came up 00:00:05 ago
Pending Peers: 0
Total Peers: 3
Established Peers: 3
Disabled Peers: 0
Peers that did not converge before local bgp convergence:
IPv4 peers:
None
IPv6 peers:
None
switch(config-router-bgp)#
```

### 14.5.2.8 Configuring BGP Graceful Shutdown Community

#### 14.5.2.8.1 Creating a Route-Map Entry That Sets the Community for Graceful Shutdown

The `set community (route-map)` command specifies community attribute modifications to BGP routes.

##### Example

```
switch(config)#route-map map1
switch(config-route-map-map1)#set community GSHUT
switch(config)#exit
switch(config)#
```

#### 14.5.2.8.2 Creating a Route-Map Entry with Matching Preferences on Graceful Shutdown Community

The `ip community-list` command creates and configures a BGP access list that is based on BGP communities.

The `match (route-map)` command creates a route map clause entry that specifies one route filtering condition.

##### Example

```
switch(config)#ip community-list gshut_list permit GSHUT
switch(config)#route-map map1
switch(config-route-map-map1)#match community gshut_list
switch(config-route-map-map1)#exit
switch(config)#
```

#### 14.5.2.8.3 Validating the Route-Map

The `show route-map` command displays the contents of the specified route maps.

## Example

```
switch#show route-map map1
route-map map1 permit 10
Description:
Match clauses:
Set clauses:
set community GSHUT
switch#
```

### 14.5.2.9 Configuring BGP Selective Route Download

The `bgp route install-map` command is used in the BGP configuration mode to enable BGP Selective Route Download. BGP Selective Route Download can also be configured in an address family or VRF instance as shown in the following examples.

The following examples show how to configure a prefix list and route map, then apply BGP Selective Route Download to the map.

#### Examples

- These commands install BGP routes in the 10.0.0.0/24 and 20.0.0.0/24 ranges in the RIB (and thus in the hardware), but no other BGP routes.

```
switch(config)#ip prefix-list PFXL_ALLOW
switch(config-ip-pfx)#seq 1 permit 10.0.0.0/24 ge 24 le 32
switch(config-ip-pfx)#seq 2 permit 20.0.0.0/24 ge 24 le 32
switch(config-ip-pfx)#exit
switch(config-ip-pfx)#
```

- These commands configure the permit and deny rules for BGP routes.

```
switch(config)#route-map BGP_INSTALL_MAP permit 10
switch(config-route-map-BGP_INSTALL_MAP)#match ip address prefix-list
PFXL_ALLOW
switch(config-route-map-BGP_INSTALL_MAP)#exit
switch(config)#route-map BGP_INSTALL_MAP deny 20
switch(config)#
```

- These commands configure Selective Route Download for the map BGP\_INSTALL\_MAP.

```
switch(config)#router bgp 100
switch(config-router-bgp)#bgp route install-map BGP_INSTALL_MAP
switch(config-router-bgp)#
```

The following examples show how to configure prefix lists individually for the IPv4 and IPv6 address families, then apply BGP Selective Route Download for these address families.

#### Examples

- These commands configure the IPv4 address family prefix list.

```
switch(config)#ip prefix-list V4_ALLOW
switch(config-ip-pfx)#route-map BGP_V4_MAP permit 10
switch(config-route-map-BGP_V4_MAP)#match ip address prefix-list
V4_ALLOW
switch(config-route-map-BGP_V4_MAP)#route-map BGP_V4_MAP deny 20
switch(config-route-map-BGP_V4_MAP)#exit
switch(config-route-map-BGP_V4_MAP)#
```

- These commands configure the IPv6 address family prefix list.

```
switch(config)#ipv6 prefix-list V6_ALLOW
switch(config-ipv6-pfx)#route-map BGP_V6_MAP permit 10
switch(config-route-map-BGP_V6_MAP)#match ipv6 address prefix-list
V6_ALLOW
switch(config-route-map-BGP_V6_MAP)#route-map BGP_V6_MAP deny 20
switch(config-route-map-BGP_V6_MAP)#exit
switch(config-route-map-BGP_V6_MAP)#
```

- These commands configure Selective Route Download individually for the two address families.

```
switch(config)#router bgp 200
switch(config-router-bgp)#address-family ipv4
switch(config-router-bgp-af)#bgp route install-map BGP_V4_MAP
switch(config-router-bgp-af)#exit
switch(config-router-bgp)#address-family ipv6
switch(config-router-bgp-af)#bgp route install-map BGP_V6_MAP
switch(config-router-bgp-af)#
```

#### 14.5.2.9.1 Displaying BGP Selective Route Download Information

The `show ip bgp` command displays BGP RIB winning paths that are not installed in the RIB.

##### Example

- The following command displays BGP routing table information for VRF default, showing winning paths that are not installed in the RIB.

```
switch#show ip bgp
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not
installed, E
- ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL
Nexthop -
Link Local Nexthop

      Network                Next Hop                Metric  LocPref Weight Path
* >  6.0.0.0/24              1.0.0.1                  0       100     0     ?
* #   7.0.0.0/24              1.0.0.1                  0       100     0     ?

switch#
```

The `show ip bgp` command with a specified prefix displays detailed information and the reason for the BGP RIB winning paths to that prefix not being installed in the RIB.

##### Example

- The following command displays detailed information for the BGP routing table for VRF default.

```
switch#show ip bgp 7.0.0.0/24
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
BGP routing table entry for 7.0.0.0/24
```

```

Paths: 1 available
Local
  1.0.0.1 from 1.0.0.1 (1.0.0.1)
    Origin INCOMPLETE, metric 0, localpref 100, weight 0, valid,
    internal, not
installed (denied by install-map)
switch#

```

The `show ip bgp installed` command displays the list of installed routes in the BGP RIB.

### Example

- The following command displays the list of installed routes in BGP routing table for VRF defaults.

```

switch#show ip bgp installed
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not
installed, E
- ECMP head, e - ECMP
      S - Stale, c - Contributing to ECMP, b - backup
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL
Nexthop -
Link Local Nexthop

Path      Network          Next Hop          Metric  LocPref Weight
* >      6.0.0.0/24      1.0.0.1          0       100    0       ?
switch#

```

The `show ip bgp not-installed` displays the list of non-installed routes in the RIB.

### Example

- The following command displays the list of non-installed routes in the BGP routing table for VRF default.

```

switch#show ip bgp not-installed
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not
installed, E
- ECMP head, e - ECMP
      S - Stale, c - Contributing to ECMP, b - backup
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL
Nexthop -
Link Local Nexthop

Path      Network          Next Hop          Metric  LocPref Weight
* #      7.0.0.0/24      1.0.0.1          0       100    0       ?
switch#

```

#### 14.5.2.10 Configuring BGP Route Reflector

Use the `bgp route-reflector preserve-attributes` command to configure the switch as a BGP route reflector. The switch then keeps BGP attributes from being changed by outbound policies,

except for the policies configured in an outbound route map. BGP route reflection is disabled by default. Use the `always` option in the `bgp route-reflector preserve-attributes` command to prevent the BGP attributes from being changed by an outbound route map.

When the `bgp route-reflector preserve-attributes` command is used with the `always` option, the following outbound policies cannot change the next-hop, local preference, and metric BGP attributes of reflected routes:

- `neighbor next-hop-self`
- `neighbor export-local pref`
- `neighbor metric-out`

If the `always` option is not specified, the following route map policies can change the BGP attributes.

- `set ip[v6] next-hop`
- `set local-preference`
- `set metric`

## Examples

- The following commands display the switch configured with a route-reflector client (at 1.0.1.2) and a non-client (at 1.0.0.2). The switch reflects the prefix 1.0.6.0 from the neighbor at 1.0.1.2 to the router at 1.0.0.1. The prefix 1.0.4.0 is not a reflected route. The local preference is 100 by default for all routes.

```
switch(config)#router bgp 1
switch(config-router-bgp)#show active
router bgp 1
  no bgp default ipv6-unicast
  neighbor 1.0.0.2 remote-as 1
  neighbor 1.0.0.2 maximum-routes 12000
  neighbor 1.0.1.2 remote-as 1
  neighbor 1.0.1.2 route-reflector-client
  neighbor 1.0.1.2 maximum-routes 12000
  network 1.0.4.0/24
switch(config-router-bgp)#show ip bgp
BGP routing table information for VRF default
Router identifier 192.168.201.37, local AS number 1
Route status codes: s - suppressed, * - valid, > - active, E - ECMP
                    head, e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL
                    Nexthop - Link Local Nexthop

      Network          Next Hop          Metric  LocPref Weight Path
* >  1.0.4.0/24        -                  1        0      -      i
* >  1.0.6.0/24        1.0.1.2           0       100    0      i
switch(config-router-bgp)#show ip bgp neighbors 1.0.0.2 advertised-rou
utes
BGP routing table information for VRF default
Router identifier 192.168.201.37, local AS number 1
Route status codes: s - suppressed, * - valid, > - active, E - ECMP
                    head, e - ECMP, b - backup
                    S - Stale, c - Contributing to ECMP, q - Queued
for advertisement
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL
                    Nexthop - Link Local Nexthop

      Network          Next Hop          Metric  LocPref Weight
Path
* >  1.0.4.0/24        1.0.0.1           -       100    -      i
```

```
* > 1.0.6.0/24 1.0.1.2 - 100 - i
switch(config-router-bgp)#
```

- The following command changes the local preference to 201 for all routes advertised to the neighbor at 1.0.0.2.

```
switch(config-router-bgp)#neighbor 1.0.0.2 export-localpref 201
switch(config-router-bgp)#show ip bgp neighbors 1.0.0.2 advertised-
routes
BGP routing table information for VRF default
Router identifier 192.168.201.37, local AS number 1
Route status codes: s - suppressed, * - valid, > - active, E - ECMP
head, e - ECMP, b - backup
S - Stale, c - Contributing to ECMP, q - Queued
for advertisement
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL
Nextthop - Link Local Nextthop

Path      Network      Next Hop      Metric  LocPref Weight
* > 1.0.4.0/24 1.0.0.1      -       201     -       i
* > 1.0.6.0/24 1.0.1.2      -       201     -       i
switch(config-router-bgp)#
```

- The following command configures the switch to preserve the local preference of the reflected route 1.0.6.0.

```
switch(config-router-bgp)#bgp route-reflector preserve-attributes
switch(config-router-bgp)#show ip bgp neighbors 1.0.0.2 advertised-
routes
BGP routing table information for VRF default
Router identifier 192.168.201.37, local AS number 1
Route status codes: s - suppressed, * - valid, > - active, E - ECMP
head, e - ECMP, b - backup
S - Stale, c - Contributing to ECMP, q - Queued
for advertisement
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL
Nextthop - Link Local Nextthop

#### 14.5.2.10.1 Displaying Route Reflector Information

The `show bgp instance` command display the route reflector information.

**Note:** The value of the “Attributes of reflected routes” can be **preserved, always preserved, or not preserved.**

#### Example

- This command displays the global BGP status for the default VRF.

```

switch#show bgp instance
BGP instance information for VRF default
BGP Local AS: 64512, Router ID: 1.1.4.1
Total peers:          14
  Configured peers:   14
  UnConfigured peers: 0
  Disabled peers:     4
  Established peers:  9
Graceful restart helper mode enabled
Attributes of reflected routes are preserved
End of rib timer timeout: 00:05:00
BGP Convergence timer is inactive
BGP Convergence information:
  BGP has converged:  yes,   Time taken to converge: 00:05:44
  Outstanding EORs:   0,     Outstanding Keepalives: 0
Convergence timeout: 00:10:00
switch#

```

### 14.5.2.11 Configuring BGP Confederations

BGP confederations allow you to break an autonomous system (AS) into multiple sub-ASs, and then to group the sub-ASs as a confederation. The sub-ASs exchange iBGP routing information (next-hop, local-preference and MED), but communicate via eBGP.

To configure a BGP confederation, complete the following tasks on each BGP device in the confederation.

- **Configure the local AS number:** the local AS number is the membership number in a sub-AS. BGP devices with the same local AS number are identified as members of the same sub-AS. BGP devices always use the local AS number when communicating with other BGP4 devices in the confederation.
- **Configure the confederation ID:** the confederation ID is the AS number for those BGP devices that are outside of the confederation. A BGP device outside the confederation is not aware that BGP devices are in multiple sub-ASs. The confederation ID must differ from the sub-AS numbers.
- **Configure the list of sub-AS numbers that are confederation members:** devices in a sub-AS exchange information via iBGP, while devices in different sub-ASs use eBGP.

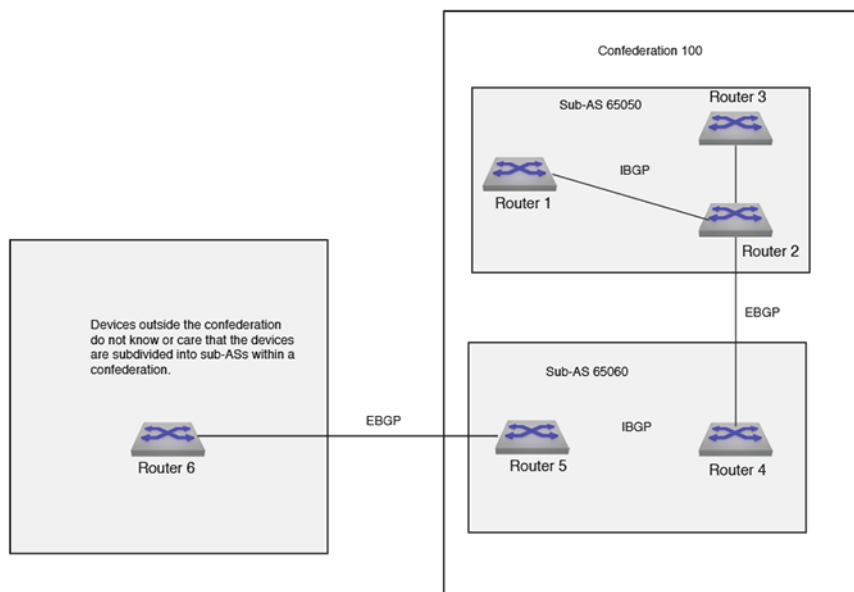

Figure 41: BGP Confederation Example

#### Example

- The `router bgp` command enables BGP and configures the router in sub-autonomous system 65050. The `bgp confederation identifier` command specifies that confederation 65050 belongs to autonomous system 100.

The neighbors from other autonomous systems within the confederation are treated as special eBGP peers when using the `bgp confederation peers` command.

```
switch(config)#router bgp 65050
switch(config-router-bgp)#bgp confederation identifier 100
switch(config-router-bgp)#bgp confederation peers 65060
switch(config-router-bgp)#
```

- The Arista EOS will group the maximum ranges together. In this example, peers 65032 and 65036 are not included in BGP confederation 100.

```
switch(config)#router bgp 65050
switch(config-router-bgp)#bgp confederation identifier 100
```

```
switch(config-router-bgp) #bgp confederation peers 65060
switch(config-router-bgp) #no bgp confederation peers 65032, 65036
switch(config-router-bgp) #
```

## 14.5.2.12 BGP Operational Commands

### 14.5.2.12.1 Shutdown

The `shutdown (BGP)` command disables BGP operations without disrupting the BGP configuration. The `no router bgp` command disables BGP and removes the BGP configuration.

The `no shutdown (BGP)` command resumes BGP activity.

#### Examples

- This command disables BGP activity on the switch.

```
switch(config-router-bgp) #shutdown
switch(config-router-bgp) #
```

- This command resumes BGP activity on the switch.

```
switch(config-router-bgp) #no shutdown
switch(config-router-bgp) #
```

### 14.5.2.12.2 Clearing the Routing Table and Resetting BGP Sessions

When entered without parameters, the `clear ip bgp` command clears all BGP learned routes from the routing table, reads routes from designated peers, and sends routes required by those peers. Routes that are read or sent are processed through any modified route map or AS-path access list.

Followed by an asterisk (\*), it clears the BGP sessions with all BGP peers. To reset the session with a specific peer, enter the peer's IP address at the end of the command.

#### Example

- This command removes all BGP learned routes from the routing table.

```
switch#clear ip bgp
switch#
```

## 14.5.3 BGP Examples

This section shows example configurations and topologies for iBGP ([Example 1](#)) and eBGP ([s](#)).

### 14.5.3.1 BGP Example 1

Example 1 features an internal BGP (iBGP) link that connects peers in AS 100.

#### 14.5.3.1.1 BGP Example 1 Diagram

[Figure 42: BGP Example 1](#) displays an iBGP connection, linking neighbors within AS 100. Each switch advertises two subnets. In UPDATE packets sent by Switch A, the LOCAL\_PREF field is 150. In UPDATE packets sent by Switch B, the LOCAL\_PREF field is 75.

Figure 42: BGP Example 1

#### 14.5.3.1.2 BGP Example 1 Code

This code configures the Example 1 BGP instance on both switches.

1. Configure the neighbor addresses.

- a. Specify the neighbor to Switch A.

```
switchA(config)#router bgp 100
switchA(config-router-bgp)#neighbor 10.100.100.2 remote-as 100
```

- b. Specify the neighbor to Switch B.

```
switchB(config)#router bgp 100
switchB(config-router-bgp)#neighbor 10.100.100.1 remote-as 100
```

2. Configure the routes to be advertised.

- a. Advertise Switch A's routes.

```
switchA(config-router-bgp)#network 10.10.1.0/24
switchA(config-router-bgp)#network 10.10.2.0/24
```

- b. Advertise Switch B's routes.

```
switchB(config-router-bgp)#network 10.10.3.0/24
switchB(config-router-bgp)#network 10.10.4.0/24
```

3. Configure the LOCAL\_PREF.

- a. Configure LOCAL\_PREF on Switch A.

```
switchA(config-router-bgp)#neighbor 10.100.100.2 export-localpref 150
```

- b. Configure LOCAL\_PREF on Switch B.

```
switchB(config-router-bgp)#neighbor 10.100.100.2 export-localpref 75
```

4. Modify the hold time and keepalive interval.

- a. Configure timers on Switch A.

```
switchA(config-router-bgp)#timer bgp 30 90
```

- b. Configure timers on Switch B.

```
switchB(config-router-bgp) #timer bgp 30 90
```

### 14.5.3.2 BGP Example 2

Example 2 creates an external BGP (eBGP) link that connects routers in AS 100 and AS 200.

#### 14.5.3.2.1 BGP Example 2 Diagram

Figure 43: BGP Example 2 displays an eBGP connection, linking Switch A in AS 100 to Switch B in AS 200. Each switch advertises two subnets.

Switch A assigns a local preference of 150 to networks advertised by Switch B. Switch B assigns a local preference of 75 to networks advertised by Switch A.

Figure 43: BGP Example 2

#### 14.5.3.2.2 BGP Example 2 Code

This code configures the Example 2 BGP instance on both switches.

1. Configure the neighbor addresses.

- a. Specify the neighbor to Switch A.

```
switchA(config) #router bgp 100  
switchA(config-router-bgp) #neighbor 10.100.100.2 remote-as 200
```

- b. Specify the neighbor to Switch B.

```
switchB(config) #router bgp 200  
switchB(config-router-bgp) #neighbor 10.100.100.1 remote-as 100
```

2. Configure the routes to be advertised.

- a. Advertise Switch A's routes.

```
switchA(config-router-bgp) #network 10.10.1.0/24  
switchA(config-router-bgp) #network 10.10.2.0/24
```

- b. Advertise Switch B's routes.

```
switchB(config-router-bgp) #network 10.10.3.0/24
```

```
switchB(config-router-bgp)#network 10.10.4.0/24
```

3. Configure the LOCAL\_PREF.

- a. Configure LOCAL\_PREF on Switch A.

```
switchA(config-router-bgp)#neighbor 10.100.100.2 import-localpref 150
```

- b. Configure LOCAL\_PREF on Switch B.

```
switchB(config-router-bgp)#neighbor 10.100.100.2 import-localpref 75
```

4. Modify the hold time and keepalive interval.

- a. Configure timers on Switch A.

```
switchA(config-router-bgp)#timer bgp 30 90
```

- b. Configure timers on Switch B.

```
switchB(config-router-bgp)#timer bgp 30 90
```

---

## 14.5.4 BGP Commands

### Global Configuration Commands

- `ip as-path access-list`
- `ip as-path regex-mode`
- `ip community-list`
- `ip community-list regexp`
- `ip extcommunity-list`
- `ip extcommunity-list regexp`
- `ip large-community-list regexp`
- `router bgp`

### Router-BGP Configuration Mode (Includes Address-Family Mode)

- `address-family`
- `aggregate-address`
- `bgp advertise-inactive`
- `bgp always-compare-med`
- `bgp bestpath as-path ignore`
- `bgp bestpath as-path multipath-relax`
- `bgp bestpath ecmp-fast`
- `bgp bestpath med confed`
- `bgp bestpath med missing-as-worst`
- `bgp bestpath tie-break cluster-list-length`
- `bgp bestpath tie-break router-id`
- `bgp client-to-client reflection`
- `bgp cluster-id`
- `bgp confederation identifier`
- `bgp confederation peers`
- `bgp convergence slow-peer time`
- `bgp convergence time`
- `bgp default`
- `bgp enforce-first-as`
- `bgp listen range`
- `bgp log-neighbor-changes`
- `bgp redistribute-internal (BGP)`
- `bgp route install-map`
- `bgp route-reflector preserve-attributes`
- `distance bgp`
- `dynamic peer max`
- `graceful-restart stalepath-time`
- `graceful-restart-helper`
- `match as-range`
- `maximum paths (BGP)`
- `neighbor activate`
- `no neighbor`
- `neighbor allowas-in`
- `neighbor auto-local-addr`
- `neighbor default-originate`

- neighbor description
- neighbor ebgp-multihop
- neighbor enforce-first-as

- `show ipv6 bgp peers regexp`
- `show ipv6 bgp regexp`
- `show ipv6 bgp summary`
- `show peer-filter`
- `show tunnel rib brief`

### 14.5.4.1 address-family

The **address-family** command places the switch in address-family configuration mode to configure the address family setting of addresses configured as BGP neighbors. Address-family configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The switch supports these address families:

- ipv4-unicast
- ipv6-unicast

**Running-config** displays **address-family** commands in sub-blocks of the BGP configuration. The following commands are available in address family configuration mode:

- **neighbor activate** configures the address as active in the configuration mode address family.
- **no neighbor activate** configures the address as not active in the configuration mode address family.
- **neighbor default-originate** advertises a default route to the specified BGP neighbor.
- **neighbor route-map (BGP)** applies a route map to the specified BGP route.
- **network (BGP)** specifies a network for advertisement through UPDATE packets to BGP peers.

The **no address-family** and **default address-family** commands delete the specified address family from **running-config** by removing all commands previously configured in the corresponding address-family mode.

The **exit** command returns the switch to router-BGP configuration mode.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
bgp ipv4|ipv6
```

```
no bgp ipv4|ipv6
```

```
default bgp ipv4|ipv6
```

#### Parameters

- ipv4 subsequent commands are applied to the IPv4 unicast address family.
- ipv6 subsequent commands are applied to the IPv6 unicast address family.

#### Example

- These commands enter address family mode for IPv6-unicast, insert a command, then exit the mode:

```
switch(config)#router bgp 1
switch(config-router-bgp)#address-family ipv6
switch(config-router-bgp-af)#neighbor 172.10.1.1 activate
switch(config-router-bgp-af)#exit
switch(config-router-bgp)#
```

---

## 14.5.4.2 aggregate-address

The **aggregate-address** command creates an aggregate route in the Border Gateway Protocol (BGP) database. Aggregate routes combine the characteristics of multiple routes into a single route that the switch advertises. Aggregation can reduce the amount of information that a BGP speaker is required to store and transmit when advertising routes to other BGP speakers. Aggregate routes are advertised only after they are redistributed.

The advertised address of the aggregate is entered as an IP subnet; any routes configured on the switch that lie within that subnet then become contributors to the aggregate. Note that on Arista switches the BGP aggregate route will become active if there are any available contributor routes on the switch, regardless of the originating protocol. This includes routes configured statically.

**Note:** Aggregate routes are redistributed automatically, and their redistribution cannot be disabled.

Command options affect the attributes associated with the aggregated route, the advertisement of the contributor routes that comprise the aggregate, and which contributor routes are included.

Command options affect the following aggregate routing attributes:

- **AS\_PATH attribute inclusion:** the `as-set` option controls the aggregate route's `AS_PATH` and `ATOMIC_AGGREGATE` attribute contents. `AS_PATH` identifies the autonomous systems through which UPDATE message routing information passes. `ATOMIC_AGGREGATE` indicates that the route is an aggregate or summary of more specific routes.

When the command includes `as-set`, the aggregate route's `AS_SET` attribute contains the AS numbers of contributor routes. This can help BGP neighbors to prevent loops by rejecting aggregate routes that include their AS number in the `AS_SET`.

When the command does not include `as-set`, the aggregate route's `ATOMIC_AGGREGATE` attribute is set and the aggregate route `AS_PATH` will include the longest leading `PATH_SEQ` of the `AS_PATH` which is common to all contributor routes. For example, for the aggregate 1.0.0.0/16 with two contributors present, the `AS_PATH` for the aggregate is "100 200" as shown.

### Aggregate

```
1.0.0.0/16 as-path ??
```

### Contributors

```
1.0.1.0/24 as-path "100 200 400 500"
```

```
1.0.2.0/24 as-path "100 200 300"
```

- **Attribute assignment:** the `attribute-map` option assigns attributes contained in set commands in a specified route map's lowest sequence with any set command to the aggregated route, overriding the automatic determination of the aggregate route's attributes by the switch.
- **Route suppression:** the `summary-only` option suppresses the advertisement of the contributor routes that comprise the aggregate.
- **Contributor filtering:** the `match-map` option uses a route map to filter out contributor routes that would otherwise be included in the aggregate.

The `no aggregate-address` and `default aggregate-address` commands remove the corresponding `aggregate-address` command from *running-config*.

### Command Mode

Router-BGP Configuration

### Command Syntax

```
aggregate-address AGGREGATE_NET [AS_SET][SUMMARY][ATTRIBUTE_MAP][MATCH_MAP]
```

```
no aggregate-address AGGREGATE_NET
```

```
default aggregate-address AGGREGATE_NET
```

### Parameters

- AGGREGATE\_NET aggregate route IP address. Options include:
  - *netv4\_addr* IPv4 subnet address (CIDR or address-mask notation).
  - *netv6\_addr* IPv6 subnet address (CIDR notation).
- AS\_SET controls AS\_PATH attribute values associated with aggregate route. Options include:
  - <no parameter> ATOMIC\_AGGREGATE attribute is set. Route contains no AS\_PATH data.
  - as-set route includes AS\_PATH information from contributor routes as AS\_SET attributes.
- SUMMARY controls advertisement of contributor routes. Options include:
  - <no parameter> contributor and aggregate routes are advertised.
  - summary-only contributor routes are not advertised.
- ATTRIBUTE\_MAP controls attribute assignments to the aggregate route. Options include:
  - <no parameter> attribute values are not assigned to route.
  - attribute-map *map\_name* assigns attribute values in set commands of the map's permit clauses. Deny clauses and match commands in permit clauses are ignored.
- MATCH\_MAP filters contributors to the aggregate route. Options include:
  - <no parameter> no contributors are filtered.
  - **match-map** *map\_name* filters contributor routes using the named match-map.

### Examples

- These commands create an aggregate route (10.16.48.0/20) from the contributor routes 10.16.48.0/23, 10.16.50.0/23, 10.16.52.0/23, and 10.16.54.0/23. The aggregate route includes the AS\_PATH information from the contributor routes.

```
switch(config)#router bgp 1
switch(config-router-bgp)#aggregate-address 10.16.48.0/20 as-set
switch(config-router-bgp)#exit
switch(config)#
```

- These commands create an aggregate route and use a route map to add a local-preference attribute to the route.

```
switch(config)#route-map map1 permit 10
switch(config-route-map-map1)#set community 45
switch(config-route-map-map1)#exit
switch(config)#router bgp 1
switch(config-router-bgp)#aggregate-address 10.16.48.0/20 attribute-map
map1
switch(config-router-bgp)#exit
switch(config)#
```

- These commands create an aggregate route and use a route map to allow only those contributors which match a specified prefix list to be included in the aggregate route.

```
switch(config)#route-map matchmap permit 10
switch(config-route-map-matchmap)#match ip address prefix-list agglist
switch(config-route-map-matchmap)#exit
switch(config)#router bgp 1
switch(config-router-bgp)#aggregate-address 1.1.0.0/16 match-map
matchmap
switch(config-router-bgp)#
```

---

### 14.5.4.3 **bgp advertise-inactive**

By default, BGP will advertise only those routes that are active in the switch's RIB. This can contribute to dropped traffic. If a preferred route is available through another protocol (like OSPF), the BGP route will become inactive and not be advertised; if the preferred route is lost, there is no available route to the affected peers. Advertising inactive BGP routes minimizes traffic loss by providing alternative routes.

The **bgp advertise-inactive** command configures BGP to advertise inactive routes to BGP neighbors. Inactive route advertisement is configured globally, but the global setting can be overridden on a per-VRF basis.

The **no bgp advertise-inactive** and **default bgp advertise-inactive** commands restore the default BGP behavior (advertising only active routes) by removing the corresponding **bgp advertise-inactive** command from *running-config*.

#### **Command Mode**

Router-BGP Configuration

#### **Command Syntax**

```
bgp advertise-inactive
no bgp advertise-inactive
default bgp advertise-inactive
```

#### **Example**

- These commands configure BGP to advertise inactive routes.

```
switch(config)#router bgp 64500
switch(config-router-bgp)#bgp advertise-inactive
switch(config-router-bgp)#
```

#### 14.5.4.4 `bgp always-compare-med`

The `bgp always-compare-med` command configures the switch to always consider multi-exit discriminator (MED) values (also known as “metric”) in best-path selection. By default, this function is disabled, and MED values are compared only if two paths have the same neighbor AS.

When there are two or more links between autonomous systems, MED values may be set by a router in the originating AS to give preferences to certain routes. In comparing MED values, the lower value is preferred.

The `no bgp always-compare-med` and `default bgp always-compare-med` commands restore the default behavior of comparing MED values only on paths with the same neighbor AS.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
bgp always-compare-med
no bgp always-compare-med
default bgp always-compare-med
```

##### Related Commands

- `bgp bestpath as-path ignore`
- `bgp bestpath as-path multipath-relax`
- `bgp bestpath ecmp-fast`
- `bgp bestpath med confed`
- `bgp bestpath med missing-as-worst`
- `bgp bestpath tie-break cluster-list-length`
- `bgp bestpath tie-break router-id`

##### Example

- These commands configure BGP to always consider MED values in best-path comparisons.

```
switch(config)#router bgp 64500
switch(config-router-bgp)#bgp always-compare-med
switch(config-router-bgp)#
```

---

#### 14.5.4.5 **bgp bestpath as-path ignore**

The `bgp bestpath as-path ignore` command configures BGP to ignore the length of the autonomous system (AS) path when comparing routes. This behavior is disabled by default. Normally, the switch compares AS paths as the third step in the best-path selection process (see [Best-Path Selection](#)), preferring the route with the shorter AS path.

The `no bgp bestpath as-path ignore` and `default bgp bestpath as-path ignore` commands restore the default behavior of considering AS path length in route comparisons.

##### **Command Mode**

Router-BGP Configuration

##### **Command Syntax**

```
bgp bestpath as-path ignore
no bgp bestpath as-path ignore
default bgp bestpath as-path ignore
```

##### **Related Commands**

- `bgp always-compare-med`
- `bgp bestpath as-path multipath-relax`
- `bgp bestpath ecmp-fast`
- `bgp bestpath med confed`
- `bgp bestpath med missing-as-worst`
- `bgp bestpath tie-break cluster-list-length`
- `bgp bestpath tie-break router-id`

##### **Example**

- These commands configure BGP to ignore AS path lengths when comparing routes.

```
switch(config)#router bgp 64500
switch(config-router-bgp)#bgp bestpath as-path ignore
switch(config-router-bgp)#
```

#### 14.5.4.6 bgp bestpath as-path multipath-relax

The **bgp bestpath as-path multipath-relax** command allows multiple eBGP routes to a destination to be considered equal in ECMP if their AS paths are the same length despite having different autonomous systems in those paths. The **no bgp bestpath as-path multipath-relax** command configures best-path selection to consider two paths *unequal* if their AS path contents are different, and prefers the first path received.

Multipath-relax is enabled by default. The **bgp bestpath as-path multipath-relax** and **default bgp bestpath as-path multipath-relax** commands restore the default behavior by removing the corresponding **no bgp bestpath as-path multipath-relax** command from *running-config*.

For BGP to support equal cost multipath (ECMP) routing, the `maximum paths (BGP)` command must be issued in router-BGP configuration mode.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
bgp bestpath as-path multipath-relax
no bgp bestpath as-path multipath-relax
default bgp bestpath as-path multipath-relax
```

##### Related Commands

- `bgp always-compare-med`
- `bgp bestpath as-path ignore`
- `bgp bestpath ecmp-fast`
- `bgp bestpath med confed`
- `bgp bestpath med missing-as-worst`
- `bgp bestpath tie-break cluster-list-length`
- `bgp bestpath tie-break router-id`

##### Example

- These commands configure BGP best-path selection to consider routes unequal if the contents of their AS paths differ.

```
switch(config)#router bgp 64500
switch(config-router-bgp)#no bgp bestpath as-path multipath-relax
switch(config-router-bgp)#
```

---

#### 14.5.4.7 bgp bestpath ecmp-fast

By default, within an ECMP group the BGP best-path selection process prefers the active path (the first path received by the switch) unless a relevant tie-breaker is enabled. The **no bgp bestpath ecmp-fast** command causes the best-path selection process to ignore order of arrival and continue evaluating paths on other criteria.

The **bgp bestpath ecmp-fast** and **default bgp bestpath ecmp-fast** commands restore the default behavior by removing the corresponding **no bgp bestpath ecmp-fast** command from *running-config*.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
bgp bestpath ecmp-fast
no bgp bestpath ecmp-fast
default bgp bestpath ecmp-fast
```

##### Related Commands

- [bgp always-compare-med](#)
- [bgp bestpath as-path ignore](#)
- [bgp bestpath as-path multipath-relax](#)
- [bgp bestpath med confed](#)
- [bgp bestpath med missing-as-worst](#)
- [bgp bestpath tie-break cluster-list-length](#)
- [bgp bestpath tie-break router-id](#)

##### Example

- These commands configure BGP to ignore order of arrival in best-path comparisons of paths within an ECMP group.

```
switch(config)#router bgp 64500
switch(config-router-bgp)#no bgp bestpath ecmp-fast
switch(config-router-bgp)#
```

### 14.5.4.8 bgp bestpath med confed

By default, paths originating within the same confederation as the switch and received from confederation peers do not have their multi-exit discriminator (MED) values compared as part of the best-path selection process. The `bgp bestpath med confed` command causes comparison of MED values in such routes. To ensure that MED values are considered in the best-path selection process for all routes received, use the `bgp always-compare-med` command.

The `no bgp bestpath med confed` and `default bgp bestpath med confed` commands restore the default behavior by removing the corresponding `bgp bestpath ecmp-fast` command from *running-config*.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
bgp bestpath med confed [missing-as-worst]
no bgp bestpath med confed [missing-as-worst]
default bgp bestpath med confed [missing-as-worst]
```

#### Related Commands

- `bgp always-compare-med`
- `bgp bestpath as-path ignore`
- `bgp bestpath as-path multipath-relax`
- `bgp bestpath ecmp-fast`
- `bgp bestpath med missing-as-worst`
- `bgp bestpath tie-break cluster-list-length`
- `bgp bestpath tie-break router-id`

#### Parameters

- `missing as worst` By default, best-path selection considers a missing MED value to be 0, so paths with missing MED values will be preferred. This option reverses the behavior in comparisons of routes originating within the same confederation as the switch, treating a missing MED as having the highest (least preferred) value.

**Note:** The `bgp bestpath med missing-as-worst` command controls how best-path selection treats missing MED values for all routes received, and, if configured, overrides the `missing-as-worst` option of this command.

#### Example

- These commands configure the BGP best-path selection process to consider MED values in comparisons between routes originating within the same confederation as the switch.

```
switch(config)#router bgp 64500
switch(config-router-bgp)#bgp bestpath med confed
switch(config-router-bgp)#
```

---

#### 14.5.4.9 bgp bestpath med missing-as-worst

By default, BGP best-path selection considers a missing MED value to be 0, so paths with missing MED values will be preferred. The `bgp bestpath med missing-as-worst` command reverses the behavior, treating a missing MED as having the highest (least preferred) value.

The `no bgp bestpath med missing-as-worst` and `default bgp bestpath med missing-as-worst` commands restore the default behavior (giving preference to missing MED values) by removing the corresponding `bgp bestpath med missing-as-worst` command from *running-config*.

**Note:** This command overrides the missing-as-worst setting of the `bgp bestpath med confed` command.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
bgp bestpath med missing-as-worst
no bgp bestpath med missing-as-worst
default bgp bestpath med missing-as-worst
```

##### Related Commands

- `bgp always-compare-med`
- `bgp bestpath as-path ignore`
- `bgp bestpath as-path multipath-relax`
- `bgp bestpath ecmp-fast`
- `bgp bestpath med confed`
- `bgp bestpath tie-break cluster-list-length`
- `bgp bestpath tie-break router-id`

##### Example

- These commands configure the BGP best-path selection process to consider a missing MED value to be considered highest (least preferred) in MED comparisons for all routes received.

```
switch(config)#router bgp 64500
switch(config-router-bgp)#bgp bestpath med missing-as-worst
switch(config-router-bgp)#
```

#### 14.5.4.10 bgp bestpath tie-break cluster-list-length

The **bgp bestpath tie-break cluster-list-length** command causes the best-path selection process to prefer the multipath route with the shortest CLUSTER\_LIST length in case of a tie in step 10. The cluster list length is assumed to be 0 if the route doesn't carry a CLUSTER\_LIST attribute.

The **no bgp bestpath tie-break cluster-list-length** and **default bgp bestpath tie-break cluster-list-length** commands restore the default behavior by removing the associated **bgp bestpath tie-break cluster-list-length** command from *running-config*.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
bgp bestpath tie-break cluster-list-length
no bgp bestpath tie-break cluster-list-length
default bgp bestpath tie-break cluster-list-length
```

##### Related Commands

- [bgp always-compare-med](#)
- [bgp bestpath as-path ignore](#)
- [bgp bestpath as-path multipath-relax](#)
- [bgp bestpath ecmp-fast](#)
- [bgp bestpath med confed](#)
- [bgp bestpath med missing-as-worst](#)
- [bgp bestpath tie-break router-id](#)

##### Example

- These commands configure the BGP selection process to prefer the multipath route with the shortest CLUSTER\_LIST length in case of a tie.

```
switch(config)#router bgp 64500
switch(config-router-bgp)#bgp bestpath tie-break cluster-list-length
switch(config-router-bgp)#
```

---

#### 14.5.4.11 bgp bestpath tie-break router-id

The **bgp bestpath tie-break router-id** command causes the best-path selection process to prefer the multipath route with the lowest ROUTER\_ID in case of a tie in step 10. If the route is a reflected route (i.e., if it contains route reflector attributes), the process will use the ORIGINATOR\_ID as the ROUTER\_ID for comparison. This behavior is disabled by default.

The **no bgp bestpath tie-break router-id** and **default bgp bestpath tie-break router-id** commands restore the default behavior by removing the associated **bgp bestpath tie-break router-id** command from *running-config*.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
bgp bestpath tie-break router-id
no bgp bestpath tie-break router-id
default bgp bestpath tie-break router-id
```

##### Related Commands

- [bgp always-compare-med](#)
- [bgp bestpath as-path ignore](#)
- [bgp bestpath as-path multipath-relax](#)
- [bgp bestpath ecmp-fast](#)
- [bgp bestpath med confed](#)
- [bgp bestpath med missing-as-worst](#)
- [bgp bestpath tie-break cluster-list-length](#)

##### Example

- These commands configure the best-path selection process to prefer the multipath route with the lowest ROUTER\_ID in case of a tie.

```
switch(config)#router bgp 64500
switch(config-router-bgp)#bgp bestpath tie-break router-id
switch(config-router-bgp)#
```

### 14.5.4.12 bgp client-to-client reflection

By default, routes received from a route reflector client and selected as best routes are propagated to all BGP peers, including other route reflector clients. If the clients are fully meshed, however, routes received from a client do not need to be mirrored to other clients. In this case, client-to-client reflection should be disabled.

The `no bgp client-to-client reflection` command disables client-to-client reflection.

The `bgp client-to-client reflection` and `default bgp client-to-client reflection` commands restore the default behavior by removing the `no bgp client-to-client reflection` command from *running-config*.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
bgp client-to-client reflection
no bgp client-to-client reflection
default bgp client-to-client reflection
```

#### Example

- These commands disable client-to-client reflection on the switch.

```
switch(config)#router bgp 1
switch(config-router-bgp)#no bgp client-to-client reflection
switch(config-router-bgp)#
```

---

### 14.5.4.13 bgp cluster-id

When using route reflectors, an AS is divided into clusters. A cluster consists of one or more route reflectors and a group of clients to which they re-advertise route information, and for redundancy a single cluster may contain multiple route reflectors. Each route reflector has a cluster ID. If the cluster has only one route reflector the cluster ID is its router ID, but if a cluster has multiple route reflectors a 4-byte cluster ID must be assigned to all route reflectors in the cluster. All must be configured with the same cluster ID to allow them to identify updates from the cluster's other route reflectors.

The **bgp cluster-id** command configures the cluster ID in a cluster with multiple route reflectors.

The **no bgp cluster-id** and **default bgp cluster-id** commands remove the cluster ID by removing the corresponding **bgp cluster-id** command from *running-config*. Do not remove the cluster ID if there are multiple route reflectors in the cluster.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
bgp cluster-id ID_NUM
no bgp cluster-id
default bgp cluster-id
```

#### Parameters

- ID\_NUM cluster ID shared by all route reflectors in the cluster (32-bit dotted-decimal notation). Options include:
  - **0.0.0.1 to 255.255.255.255** valid cluster ID number.
  - **0.0.0.0** removes the cluster-ID from the switch. Equivalent to **no bgp cluster-id** command.

#### Example

- This command sets the cluster ID for the switch to 172.22.30.101.

```
switch(config)#router bgp 1
switch(config-router-bgp)#bgp cluster-id 172.22.30.101
switch(config-router-bgp)#
```

#### 14.5.4.14 bgp confederation identifier

The **bgp confederation identifier** command configures the confederation identifier. Confederation can reduce the number of iBGP connections in a large AS domain. The AS domain is divided into several smaller sub-ASs, and each sub-AS remains fully connected. Devices in a sub-AS exchange information via iBGP, while devices in different sub-ASs use eBGP

The **no bgp confederation identifier** and **default bgp confederation identifier** commands remove the **bgp confederation identifier** command from *running-config*.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
bgp confederation identifier as_number
```

```
no bgp confederation identifier
```

```
default bgp confederation identifier
```

##### Parameters

- *as\_number* the ID of BGP AS confederation. Values range from 1 to 4294967295.

##### Example

- This command sets the BGP confederation identifier to 9.

```
switch(config)#router bgp 1  
switch(config-router-bgp)#bgp confederation identifier 9  
switch(config-router-bgp)#
```

---

#### 14.5.4.15 bgp confederation peers

The **bgp confederation peers** command configures a confederation consisting of sub-ASs.

Before this command is executed, the confederation ID should be configured using the **bgp confederation identifier** command. Otherwise this configuration is invalid. The configured ASs in this command are inside the confederation and each AS uses a fully meshed network. The confederation appears as a single AS to the devices outside it.

The **no bgp confederation peers** and **default bgp confederation peers** commands delete the specified sub-AS from the confederation by removing the corresponding **bgp confederation peers** command from *running-config*.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
bgp confederation peers as_range
```

```
no bgp confederation peers as_range
```

```
default bgp confederation peers as_range
```

##### Parameters

- *as\_range* the sub-AS number. Formats include number (from 1 to 4294967295), number range, or comma-delimited list of numbers and ranges.

##### Example

- This command configures the confederation that contains AS 1000 and AS 1002.

```
switch(config)#router bgp 1  
switch(config-router-bgp)#bgp confederation peers 1000 1002  
switch(config-router-bgp)#
```

#### 14.5.4.16 bgp convergence slow-peer time

The **bgp convergence slow-peer time** command configures the idle peer time to wait for the slow peers to establish a session in a BGP convergence state.

The **no bgp convergence slow-peer time** command disables the inheritance of the configuration from the global BGP configuration mode. The **default bgp convergence slow-peer time** command sets the timeout value to the default value.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
bgp convergence slow-peer time timeout
no bgp convergence slow-peer time
default bgp convergence slow-peer time
```

##### Parameters

- *timeout* the maximum time to wait for the slow peers to establish a session connection. Values range from 1 to 3600 seconds. The default value is 90 seconds.

##### Example

- This command configures an idle peer timeout of 40 seconds to wait before establishing a session.

```
switch(config)#router bgp 1
switch(config-router-bgp)#bgp convergence slow-peer time 40
switch(config-router-bgp)#
```

---

#### 14.5.4.17 bgp convergence time

The **bgp convergence time** command configures the time to wait before the BGP convergence starts in a session.

The **no bgp convergence time** command removes the configured convergence time to wait. The **default bgp convergence time** command sets the timeout value to the default value.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
bgp convergence time timeout_range
```

```
no bgp convergence time
```

```
default bgp convergence time
```

##### Parameters

- *timeout\_range* the maximum time to wait for the BGP convergence. Values range from 1 to 3600 seconds. The default value is 300 seconds.

##### Example

- This command configures a convergence time of 200 seconds to wait before establishing a session.

```
switch(config)#router bgp 1  
switch(config-router-bgp)#bgp convergence time 200  
switch(config-router-bgp)#
```

### 14.5.4.18 bgp default

The `bgp default` command configures the default address family activation level of all addresses configured as BGP neighbors. The switch sends the following announcements to addresses active in an address family:

- **IPv4 address family:** IPv4 capability and all network advertisements with IPv4 prefixes.
- **IPv6 address family:** IPv6 capability and all network advertisements with IPv6 prefixes.

The following commands configure default address family activation levels for addresses configured as BGP neighbors:

- `bgp default ipv4-unicast`: all addresses are IPv4 address family active.
- `no bgp default ipv4-unicast`: all addresses are *not* IPv4 address family active.
- `bgp default ipv6-unicast`: all addresses are IPv6 address family active.
- `no bgp default ipv6-unicast`: all addresses are *not* IPv6 address family active.
- `bgp default ipv4-unicast transport ipv6`: all BGP neighbor addresses are IPv4 address family active and IPv6 neighbors can receive IPv4 NLRIs.

**Note:** If it is necessary to exchange IPv4 NLRIs over an IPv6 connection, the IPv4 address family must be activated on the IPv6 neighbor. To do this for all IPv6 neighbors, use the command `bgp default ipv4-unicast transport ipv6`. For an individual neighbor, use the `neighbor activate` command for the IPv6 neighbor in the IPv4 address-family configuration mode as described below.

The activation state of an individual BGP neighbor address is configured by the `neighbor activate` command. The `neighbor activate` command overrides the address's default activation state for the address family configuration mode in which the command is issued:

- `neighbor activate`: the specified address is active.
- `no neighbor activate`: the specified address is *not* active.

The **default-default address family activation state** defines the address family activation level of all addresses configured as BGP neighbors when *running-config* does not contain any `bgp default` commands. The default state of the BGP default activation level varies by address family.

- **IPv4 address family:** all BGP addresses are IPv4 address family active.
- **IPv6 address family:** all BGP addresses are *not* IPv6 address family active.

The default `bgp default` command restores the default-default activation setting for BGP neighbor addresses in the specified address family:

- `default bgp ipv4-unicast` is equivalent to `bgp ipv4-unicast`
- `default bgp ipv6-unicast` is equivalent to `no bgp ipv6-unicast`

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
bgp default ADDRESS_FAMILY
```

```
no bgp default ADDRESS_FAMILY
```

```
default bgp default ADDRESS_FAMILY
```

#### Parameters

- ADDRESS\_FAMILY BGP address family. Options include:
  - `ipv4-unicast` IPv4-unicast peering sessions.
  - `ipv6-unicast` IPv6-unicast peering sessions.

#### Example

- 
- These commands configure the switch to configure all BGP neighbor addresses as IPv4 address-family active and IPv6 address-family active.

```
switch(config)#router bgp 1
switch(config-router-bgp)#bgp default ipv4-unicast
switch(config-router-bgp)#bgp default ipv6-unicast
switch(config-router-bgp)#show active
router bgp 65533
  bgp log-neighbor-changes
  distance bgp 20 200 200
  neighbor 172.23.254.2 remote-as 65533
  neighbor 172.41.254.78 remote-as 65534
  neighbor 2001:0DB8:52a4:fe01::2 remote-as 65533
  neighbor 2001:0DB8:52a4:fe4c::1 out-delay 10
switch(config-router-bgp)#
```

The **show active** command does not display the **bgp default ipv4-unicast** command because it is the default setting for IPv4 peering sessions.

#### 14.5.4.19 bgp enforce-first-as

The **bgp enforce-first-as** command causes a forced comparison of the first autonomous system (AS) in the AS path of eBGP routes received from BGP neighbors to the configured remote external peer autonomous system number (ASN). Updates from eBGP peers that do not include that ASN as the first item in the AS path (in the AS\_PATH attribute) are discarded.

This behavior is enabled by default upon BGP configuration, and disabled globally by the no form of this command. To configure first-AS enforcement for an individual neighbor or peer group, use the `neighbor enforce-first-as` command.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
bgp enforce-first-as
default bgp enforce-first-as
no bgp enforce-first-as
```

##### Example

- This command configures BGP to enforce the first AS globally.

```
switch(config-router-bgp) #bgp enforce-first-as
switch(config-router-bgp) #
```

---

#### 14.5.4.20 bgp listen range

The **bgp listen range** command identifies the BGP peering request from a range of IPv4 or IPv6 address, and names the dynamic peer group to which those peers belong to. To create a static peer group, use the **neighbor peer group (create)** command.

The request can be from a single AS number or from a range of AS numbers configured. To accept the peering request from single ASN use the **remote-as** option, and to accept request from multiple ASNs use the **peer-filter** option.

Members of a dynamic peer group are configured in groups and not as individuals. Once a new peer group is created with a group name, the group name is then used as an argument by the following **neighbor** commands:

- `neighbor ebgp-multihop`
- `neighbor import-localpref`
- `neighbor maximum-routes`
- `neighbor route-map (BGP)`
- `neighbor timers`
- `neighbor update-source.`

The **no bgp listen range** and **default bgp listen range** commands remove the dynamic peer group by deleting the corresponding command from **running-config**. To remove a static peer group, use the **no neighbor** command. All peering relationships with group members are terminated when the dynamic peer group is deleted.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
bgp listen range NET_ADDRESS peer-group group_name [remote-as as_number | peer-filter filter_name]
```

```
no bgp listen range NET_ADDRESS peer-group group_name
```

```
default bgp listen range NET_ADDRESS peer-group group_name
```

#### Parameters

- **NET\_ADDRESS** IP address range. Options include:
  - *IPv4\_subnet* IPv4 subnet (CIDR notation).
  - *IPv4\_address mask subnet* IPv4 subnet (dotted decimal notation).
  - *IPv6\_prefix* IPv6 subnet (dotted decimal notation).
- *group\_name* name of the peer group.
- *as\_number* the autonomous system number, ranges from 1 to 4294967295.
- *filter\_name* name of the peer filter.

#### Examples

- These commands create a dynamic peer group called “brazil” in AS 5 which accepts peering requests from the 192.168.6.0/24 subnet.

```
switch(config)#router bgp 1
switch(config-router-bgp)#bgp listen range 192.168.6.0/24 peer-group
brazil remote-as 5
switch(config-router-bgp)#
```

- These commands create a dynamic peer group called “brazil” in a range of AS numbers, which accepts peering requests from the 192.0.2.0/24 subnet. The range of AS numbers is defined by peer filter option.

```
switch(config)#router bgp 1  
switch(config-router-bgp)#bgp listen range 192.0.2.0/24 peer-group  
  brazil peer-filter group-1  
switch(config-router-bgp)#
```

---

#### 14.5.4.21 bgp log-neighbor-changes

The **bgp log-neighbor-changes** command configures the switch to generate a log message when a BGP peer enters or exits the **established** state. This is the default behavior.

The **no bgp log-neighbor-changes** command disables the generation of these log messages. The **default bgp log-neighbor-changes** command enables the generation of these log messages.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
bgp log-neighbor-changes
no bgp log-neighbor-changes
default bgp log-neighbor-changes
```

##### Example

- These commands configure the switch to generate a message when a BGP peer enters or exits the **established** state.

```
switch(config)#router bgp 1
switch(config-router-bgp)#bgp log-neighbor-changes
switch(config-router-bgp)#
```

#### 14.5.4.22 bgp redistribute-internal (BGP)

The **bgp redistribute-internal** command enables the redistribution of iBGP routes into an interior gateway protocol (IGP).

The **no bgp redistribute-internal** and **default bgp redistribute-internal** commands disable route redistribution from the specified domain by removing the corresponding **bgp redistribute-internal** command from *running-config*.

##### Command Mode

Router-BGP Configuration Router-BGP Address-Family Configuration

##### Command Syntax

```
bgp redistribute internal
no bgp redistribute internal
default bgp redistribute internal
```

##### Example

- This command redistributes internal BGP routes.

```
switch(config)#router bgp 9
switch(config-router-bgp)#bgp redistribute-internal
switch(config-router-bgp)#
```

---

### 14.5.4.23 bgp route install-map

The **bgp route install-map** command enables BGP Selective Route Download on the switch and allows the learning and advertising of the BGP routes without installing them in hardware.

The **no bgp route install-map** and **default bgp route install-map** commands delete the BGP Selective Route Download instance.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

BGP Configuration

#### Command Syntax

```
bgp route install-map map_name
```

#### Parameter

- *map\_name* The name of the route map configured.

#### Example

- These commands configure BGP Selective Route Download for test\_BGP map.

```
switch(config)#router bgp 100  
switch(config-router-bgp)#bgp route install-map test_BGP  
switch(config-router-bgp)#
```

#### 14.5.4.24 bgp route-reflector preserve-attributes

The **bgp route-reflector preserve-attributes** command configures the switch as a BGP route reflector. By default, BGP route reflector is disabled.

The **no bgp route-reflector preserve-attributes** and **default bgp route-reflector preserve-attributes** commands disable BGP route reflector on the switch.

The **exit** command returns the switch to global configuration mode.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
bgp route-reflector preserve-attributes [always]
```

```
no bgp route-reflector preserve-attributes [always]
```

```
default bgp route-reflector preserve-attributes [always]
```

##### Parameter

- **always** Always preserve route attributes, overwriting route map changes.

##### Example

- The following commands configure the switch as BGP route reflector.

```
switch(config)#router bgp 10
switch(config-router-bgp)#bgp route-reflector preserve-attributes
always
switch(config-router-bgp)#
```

---

#### 14.5.4.25 clear ip bgp counters

The `clear ip bgp counters` command resets general statistics of peers. These statistics primarily consist of message-related counts.

##### Command Mode

Privileged EXEC

##### Command Syntax

```
clear ip bgp [PEERS] counters [VRF_INSTANCES]
```

##### Parameters

- PEERS specifies targeted BGP peers. Options include:
  - <no parameters> all IPv4 and IPv6 peers.
  - \* all IPv4 and IPv6 peers.
  - *ipv4\_addr* the IPv4 peer with the specified IPv4 address.
  - *ipv6\_addr* the IPv6 peer with the specified IPv6 address.
  - *intra\_ipv6\_addr* the peer using the specified IPv6 link-local address.
  - *peer-group peer\_grp\_name* the peers using the specified BGP peer group.
- VRF\_INSTANCES specifies the VRF(s) examined for BGP peers. Options include:
  - <no parameters> resets matching peers in the context-active VRF.
  - *vrf\_name* resets matching peers in the specified VRF.
  - all resets matching peers in all VRFs.
  - default resets matching peers in the default VRF.

##### Related Commands

- `clear ip bgp`
- `clear ip bgp errors`
- `clear ip bgp neighbor *`

##### Example

- This command resets general statistics of all IPv4 and IPv6 peers in the context-active VRF.

```
switch#clear ip bgp counters
! Clearing all IPv4 and IPv6 peering sessions
switch#
```

### 14.5.4.26 clear ip bgp errors

The **clear ip bgp errors** command resets the error statistics and history of peers. Peer general statistics primarily consist of notification errors, socket errors, and update errors.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ip bgp [PEERS] errors [VRF_INSTANCES]
```

#### Parameters

- PEERS specifies targeted BGP peers. Options include:
  - <no parameters> all IPv4 and IPv6 peers.
  - \* all IPv4 and IPv6 peers.
  - *ipv4\_addr* the IPv4 peer with the specified IPv4 address.
  - *ipv6\_addr* the IPv6 peer with the specified IPv6 address.
  - *inrf\_ipv6\_addr* the peer using the specified IPv6 link-local address.
  - *peer-group peer\_grp\_name* the peers using the specified BGP peer group.
- VRF\_INSTANCES specifies the VRF(s) examined for BGP peers. Options include:
  - <no parameters> resets matching peers in the context-active VRF.
  - *vrf\_name* resets matching peers in the specified VRF.
  - all resets matching peers in all VRFs.
  - default resets matching peers in the default VRF.

#### Related Commands

- `clear ip bgp`
- `clear ip bgp counters`
- `clear ip bgp neighbor *`

#### Example

- This command resets the error statistics of all IPv4 and IPv6 peers in the context-active VRF.

```
switch#clear ip bgp errors
! Clearing all IPv4 and IPv6 peering sessions
switch#
```

---

#### 14.5.4.27 clear ip bgp neighbor \*

The `clear ip bgp neighbor *` command clears BGP neighbors belonging to the IPv4 transport address family. To clear BGP neighbors in the IPv6 transport address family, use the `clear ipv6 bgp neighbor *` command.

##### Command Mode

Privileged EXEC

##### Command Syntax

```
clear ip bgp neighbor * [VRF_INSTANCE]
```

##### Parameters

- VRF\_INSTANCE specifies VRF instance for which IPv4 transport address family BGP neighbors will be cleared. Options include:
  - <no parameter> clears IPv4 BGP neighbors in the context-active VRF.
  - vrf *vrf\_name* clears IPv4 BGP neighbors in the specified VRF.
  - vrf all clears IPv4 BGP neighbors in the all VRFs.
  - vrf default clears IPv4 BGP neighbors in the default VRF.

##### Related Commands

- `clear ip bgp`
- `clear ip bgp counters`
- `clear ip bgp errors`

##### Examples

- This command clears all IPv4 BGP neighbors in the context-active VRF.

```
switch#clear ip bgp neighbor *
switch#
```

- This command clears all IPv4 BGP neighbors in VRF “purple.”

```
switch#clear ip bgp neighbor * vrf purple
switch#
```

### 14.5.4.28 clear ip bgp

The `clear ip bgp` command removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required. This command can also clear the switch's BGP sessions with its peers.

Routes that are read or sent are processed through modified route maps or AS-path access lists.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ip bgp [PEERS] [RESET_TYPE] [DATA_FLOW] [VRF_INSTANCE]
```

#### Parameters

- PEERS specifies targeted BGP peers. Options include:
  - <no parameters> all IPv4 and IPv6 peers.
  - \* all IPv4 and IPv6 peers.
  - *ipv4\_addr* the IPv4 peer with the specified IPv4 address.
  - *ipv6\_addr* the IPv6 peer with the specified IPv6 address.
  - *intra\_ipv6\_addr* the peer using the specified IPv6 link-local address.
  - *peer-group peer\_grp\_name* the peers using the specified BGP peer group.
- RESET\_TYPE specifies the method used to reset routes. Options include:
  - <no parameters> performs a hard reset that terminates current BGP sessions and recreates the local routing information base.
  - *soft* performs a soft reset that maintains current BGP sessions and reconfigures the local routing information base using stored routes.
- DATA\_FLOW restricts soft reset to inbound or outbound routes. Hard reset is bidirectional. Options include:
  - <no parameters> resets inbound and outbound routes.
  - *in* resets inbound peer routes.
  - *out* resets outbound peer routes.
- VRF\_INSTANCES specifies the VRF(s) examined for BGP peers. Options include:
  - <no parameters> resets matching peers in the context-active VRF.
  - *vrf\_name* resets matching peers in the specified VRF.
  - *all* resets matching peers in all VRFs.
  - *default* resets matching peers in the default VRF.

#### Related Commands

- `clear ip bgp counters`
- `clear ip bgp errors`
- `clear ip bgp neighbor *`

#### Guidelines

Use the `clear ip bgp` command after changing any of the following BGP attributes:

- weights
- distribution lists
- timers
- administrative distance

#### Examples

- 
- This command performs a hard reset of all IPv4 and IPv6 peers in the context-active VRF.

```
switch#clear ip bgp
switch#
```

- This command has the same behavior as the above `clear ip bgp` command.

```
switch#clear ip bgp *
switch#
```

### 14.5.4.29 clear ipv6 bgp counters

The `clear ipv6 bgp counters` command resets general statistics of peers. These statistics primarily consist of message-related counts.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ipv6 bgp [PEERS] counters [VRF_INSTANCES]
```

#### Parameters

- PEERS specifies targeted BGP peers. Options include:
  - <no parameters> all IPv4 and IPv6 peers.
  - \* all IPv4 and IPv6 peers.
  - *ipv4\_addr* the IPv4 peer with the specified IPv4 address.
  - *ipv6\_addr* the IPv6 peer with the specified IPv6 address.
  - *inrf\_ipv6\_addr* the peer using the specified IPv6 link-local address.
  - *peer-group peer\_grp\_name* the peers using the specified BGP peer group.
- VRF\_INSTANCES specifies the VRF(s) examined for BGP peers. Options include:
  - <no parameters> resets matching peers in the context-active VRF.
  - *vrf\_name* resets matching peers in the specified VRF.
  - all resets matching peers in all VRFs.
  - default resets matching peers in the default VRF.

#### Related Commands

- `clear ipv6 bgp`
- `clear ipv6 bgp errors`
- `clear ipv6 bgp neighbor *`

#### Example

- This command resets general statistics of all IPv4 and IPv6 peers in the context-active VRF.

```
switch#clear ipv6 bgp counters
! Clearing all IPv4 and IPv6 peering sessions
switch#
```

---

### 14.5.4.30 clear ipv6 bgp errors

The `clear ipv6 bgp errors` command resets the error statistics and history of peers. Peer general statistics primarily consist of notification errors, socket errors, and update errors.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ipv6s bgp [PEERS] errors [VRF_INSTANCES]
```

#### Parameters

- PEERS specifies targeted BGP peers. Options include:
  - <no parameters> all IPv4 and IPv6 peers.
  - \* all IPv4 and IPv6 peers.
  - *ipv4\_addr* the IPv4 peer with the specified IPv4 address.
  - *ipv6\_addr* the IPv6 peer with the specified IPv6 address.
  - *inrf\_ipv6\_addr* the peer using the specified IPv6 link-local address.
  - *peer-group peer\_grp\_name* the peers using the specified BGP peer group.
- VRF\_INSTANCES specifies the VRF(s) examined for BGP peers. Options include:
  - <no parameters> resets matching peers in the context-active VRF.
  - *vrf\_name* resets matching peers in the specified VRF.
  - all resets matching peers in all VRFs.
  - default resets matching peers in the default VRF.

#### Related Commands

- `clear ipv6 bgp`
- `clear ipv6 bgp counters`
- `clear ipv6 bgp neighbor *`

#### Example

- This command resets the error statistics of all IPv4 and IPv6 peers in the context-active VRF.

```
switch#clear ipv6 bgp errors
! Clearing all IPv4 and IPv6 peering sessions
switch#
```

### 14.5.4.31 clear ipv6 bgp neighbor \*

The `clear ipv6 bgp neighbor *` command clears BGP neighbors belonging to the IPv4 transport address family. To clear BGP neighbors in the IPv4 transport address family, use the `clear ip bgp neighbor *` command.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ipv6 bgp neighbor * [VRF_INSTANCE]
```

#### Parameters

- VRF\_INSTANCE specifies VRF instance for which IPv6 transport address family BGP neighbors will be cleared. Options include:
  - <no parameter> clears IPv6 BGP neighbors in the context-active VRF.
  - vrf *vrf\_name* clears IPv6 BGP neighbors in the specified VRF.
  - vrf all clears IPv6 BGP neighbors in the all VRFs.
  - vrf default clears IPv6 BGP neighbors in the default VRF.

#### Related Commands

- `clear ipv6 bgp`
- `clear ipv6 bgp counters`
- `clear ipv6 bgp errors`

#### Examples

- This command clears all IPv4 BGP neighbors in the context-active VRF.

```
switch#clear ip bgp neighbor *  
switch#
```

- This command clears all IPv4 BGP neighbors in VRF “purple.”

```
switch#clear ip bgp neighbor * vrf purple  
switch#
```

---

### 14.5.4.32 clear ipv6 bgp

The `clear ipv6 bgp` command removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required. This command can also clear the switch's BGP sessions with its peers.

Routes that are read or sent are processed through modified route maps or AS-path access lists.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ipv6 bgp [PEERS] [RESET_TYPE] [DATA_FLOW] [VRF_INSTANCE]
```

#### Parameters

- PEERS specifies targeted BGP peers. Options include:
  - <no parameters> all IPv4 and IPv6 peers.
  - \* all IPv4 and IPv6 peers.
  - *ipv4\_addr* the IPv4 peer with the specified IPv4 address.
  - *ipv6\_addr* the IPv6 peer with the specified IPv6 address.
  - *inrf\_ipv6\_addr* the peer using the specified IPv6 link-local address.
  - *peer-group peer\_grp\_name* the peers using the specified BGP peer group.
- RESET\_TYPE specifies the method used to reset routes. Options include:
  - <no parameters> performs a hard reset that terminates current BGP sessions and recreates the local routing information base.
  - *soft* performs a soft reset that maintains current BGP sessions and reconfigures the local routing information base using stored routes.
- DATA\_FLOW restricts soft reset to inbound or outbound routes. Hard reset is bidirectional. Options include:
  - <no parameters> resets inbound and outbound routes.
  - *in* resets inbound peer routes.
  - *out* resets outbound peer routes.
- VRF\_INSTANCES specifies the VRF(s) examined for BGP peers. Options include:
  - <no parameters> resets matching peers in the context-active VRF.
  - *vrf\_name* resets matching peers in the specified VRF.
  - *all* resets matching peers in all VRFs.
  - *default* resets matching peers in the default VRF.

#### Related Commands

- `clear ipv6 bgp counters`
- `clear ipv6 bgp errors`
- `clear ipv6 bgp neighbor *`

#### Guidelines

Use the `clear ipv6 bgp` command after changing any of the following BGP attributes:

- weights
- distribution lists
- timers
- administrative distance

#### Examples

- This command performs a hard reset of all IPv4 and IPv6 peers in the context-active VRF.

```
switch#clear ipv6 bgp
switch#
```

- This command has the same behavior as the above `clear ip bgp` command.

```
switch#clear ipv6 bgp *
switch#
```

---

### 14.5.4.33 distance bgp

The **distance bgp** command assigns an administrative distance to routes that the switch learns through BGP. Routers use administrative distances to select a route when two protocols provide routing information to the same destination. Distance values range from 1 to 255; lower distance values correspond to higher reliability. BGP routing tables do not include routes with a distance of 255.

The distance command assigns distance values to external, internal, and local BGP routes:

- **external:** Best-path routes learned from a neighbor external to the autonomous system. Default distance is 200.
- **internal:** Internal routes are routes learned from a BGP entity within the same autonomous system. Default distance is 200.
- **local:** Local routes are networks listed with a network router configuration command for that router or for networks that are redistributed from another process. Default distance is 200.

The **no distance bgp** and **default distance bgp** commands restore the default administrative distances by removing the **distance bgp** command from *running-config*.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
distance bgp external_dist [INTERNAL_LOCAL]
```

```
no distance bgp
```

```
default distance bgp
```

#### Parameters

- *external\_dist* distance assigned to external routes. Values range from 1 to 255.
- INTERNAL\_LOCAL distance assigned to internal and local routes. Values for both routes range from 1 to 255. Options include:
  - <no parameter> the *external\_dist* value is also assigned to internal and local routes.
  - *internal\_dist local\_dist* values assigned to internal and local routes.

#### Example

- This command assigns an administrative distance of 150 to external routes, 200 to internal, and 150 to local routes.

```
switch(config)#router bgp 1  
switch(config-router-bgp)#distance bgp 150 200 150  
switch(config-router-bgp)#
```

#### 14.5.4.34 dynamic peer max

The `dynamic peer max` command limits the number of dynamic BGP peers allowed on the switch.

The `no dynamic peer max` and `default dynamic peer max` commands restore the default limit of dynamic BGP peers by removing the `dynamic peer max` command from *running-config*.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
dynamic peer max maximum
```

```
no dynamic peer max
```

```
default dynamic peer max
```

##### Parameters

- *maximum* the maximum number of dynamic BGP peers to be allowed on the switch. Values range from 1 to 1000; default value is 100.

##### Example

- This command sets the maximum number of dynamic BGP peers allowed on the switch to 200.

```
switch(config)#router bgp 1  
switch(config-router-bgp)#dynamic peer max 200  
switch(config-router-bgp)#
```

---

### 14.5.4.35 graceful-restart stalepath-time

The **graceful-restart stalepath-time** command specifies the maximum time that stale routes from a restarting BGP neighbor will be retained after a BGP session is re-established with that peer.

The **no graceful-restart stalepath-time** and **default graceful-restart stalepath-time** commands restore the default value of 300 seconds by deleting the **graceful-restart stalepath-time** statement from *running-config*.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
graceful-restart stalepath-time interval
no graceful-restart stalepath-time
default graceful-restart stalepath-time
```

#### Parameters

- *interval* Maximum period (in seconds) that stale routes from a restarting BGP neighbor will be retained after the BGP session is re-established. Values range from 1 to 3600 (60 minutes). Default is 300.

#### Example

- These commands configure the stale path retention interval to 15 minutes.

```
switch(config)#router bgp 1
switch(config-router-bgp)#graceful-restart stalepath-time 900
switch(config-router-bgp)#
```

### 14.5.4.36 graceful-restart-helper

The **graceful-restart helper** command enables BGP graceful restart helper mode on the switch for all BGP neighbors. When graceful restart helper mode is enabled, the switch will retain routes from neighbors which are capable of graceful restart while those neighbors are restarting BGP. Graceful restart is enabled by default. To configure graceful restart helper mode for a specific neighbor or peer group, use the **neighbor graceful-restart-helper** command. Individual neighbor configuration takes precedence over the global configuration.

The **no graceful-restart helper** command disables graceful restart helper mode on the switch. The **default graceful-restart helper** command enables graceful restart helper mode by removing the corresponding **no graceful-restart helper** command from *running-config*.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
graceful-restart helper
no graceful-restart helper
default graceful-restart helper
```

#### Example

- These commands disable graceful restart helper mode on the switch.

```
switch(config)#router bgp 1
switch(config-router-bgp)#no graceful-restart-helper
switch(config-router-bgp)#
```

---

### 14.5.4.37 ip as-path access-list

The `ip as-path access-list` command creates an access list to filter BGP route updates. If access list *list\_name* does not exist, this command creates it. If it already exists, this command appends statements to the list.

The `no ip as-path access-list` and `default ip as-path access-list` commands delete the named access list.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip as-path access-list list_name FILTER_TYPE regex ORIGIN
```

```
no ip as-path access-list list_name
```

```
default ip as-path access-list list_name
```

#### Parameters

- *list\_name* the name of the AS path access list.
- FILTER\_TYPE access resolution of the specified AS path. Options include:
  - permit access is permitted.
  - deny access is denied.
- *regex* a regular expression describing the AS path being filtered. Regular expressions are pattern-matching strings that are composed of text characters and operators.
- ORIGIN the origin of the path information. Values include:
  - <no parameter> sets the origin to **any**.
  - any any BGP origin.
  - egp EGP origin.
  - igp IGP origin.
  - incomplete incomplete origin.

#### Example

- These commands create an AS path access list named “list1” which allows all BGP routes except those originating in AS 3.

```
switch(config)#ip as-path access-list list1 deny _3$
switch(config)#ip as-path access-list list1 permit .*
switch(config)#
```

### 14.5.4.38 ip as-path regex-mode

The `ip as-path regex-mode` command specifies how the switch will evaluate regular expressions describing AS paths in ACLs. When the regex mode is set to `asn`, AS numbers in the ACL are interpreted as AS numbers; only complete AS number matches in the AS path return a match. When it is set to `string`, AS numbers in the ACL are interpreted as strings; both complete AS number matches and longer AS numbers that include the target string return a match. The default mode is `asn`.

For example, `asn` mode will return “false” and `string` mode will return “true” when searching for “10” in an AS path of “100 200.”

The `no ip as-path regex-mode` and `default ip as-path regex-mode` commands restore the regex mode to `asn` by removing the `ip as-path regex-mode` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip as-path regex-mode MODE_SETTING
no ip as-path regex-mode
default ip as-path regex-mode
```

#### Parameters

- `MODE_SETTING` Specifies how regular expressions describing AS paths in AS path ACLs will be evaluated. Options include:
  - `asn` AS numbers in the ACL are interpreted as AS numbers; only complete AS number matches in the AS path return a match.
  - `string` AS numbers in the ACL are interpreted as strings; both complete AS number matches and longer AS numbers that include the target string return a match.

#### Example

- This command sets the regex mode to `string`.

```
switch(config)#ip as-path regex-mode string
switch(config)#
```

### 14.5.4.39 ip community-list regexp

The `ip community-list regexp` command creates and configures a BGP access list based on BGP communities. A BGP community access list filters prefixes based on their BGP communities. The command uses regular expressions to identify the communities specified by the list. To create a community list by explicitly specifying one or more communities, use the `ip community-list` command.

The `no ip community-list regexp` and `default ip community-list regexp` commands delete the specified community list. To delete a specific community-list entry, specify the entry in the `no ip community-list regexp` command.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip community-list regexp list_name {deny | permit} reg_exp
no ip community-list regexp list_name {deny | permit} reg_exp
default ip community-list regexp list_name
```

#### Parameters

- *list\_name* name of the community list. Valid input is text.
- permit access is permitted for the specified community.
- deny access is denied for the specified community.
- *reg\_exp* list of communities, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.

**Note:** When using the no form of the command, a regular expression can be used to specify a single entry to be removed from the list, leaving the rest of the list intact. If no entry is specified, the no form of the command removes the entire list.

#### Related Commands

- `route-map`
- `match (route-map)`
- `show ip community-list`
- `show ip extcommunity-list`

#### Guideline

The `ip community-list regexp` command with the permit internet option permits access to only those routes that carry the community value of 0.

#### Examples

- This command creates a BGP community list that permits routes from networks 20-24 and 30-34 in autonomous system 10.

```
switch(config)#ip community-list regexp list_2 permit 10:[2-3][0-4]_
switch(config)#
```

- This command removes the above statement from the community list named “list\_2,” leaving any other statements in the list intact.

```
switch(config)#no ip community-list regexp list_2 permit 10:[2-3][0-4]_
switch(config)#
```

- This command deletes the community list named “list\_2” entirely.

```
switch(config)#no ip community-list regexp list_2
```

```
switch(config)#
```

- This command permits access to all routes associated with the BGP community list (CLIST1) that carry the community value 0.

```
switch(config)#ip community-list regexp CLIST1 permit internet  
switch(config)#
```

#### 14.5.4.40 ip community-list

The `ip community-list` command creates and configures a BGP access list based on BGP communities.

The `no ip community-list` and `default ip community-list` commands delete the specified community list by removing the corresponding `ip community-list` command from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

```
ip community-list list_name [permit | deny] [GSHUT | aa:nn | internet | local-as | no-advertise | no-export | number]
```

```
no ip community-list list_name
```

```
default ip community-list list_name
```

##### Parameters

- *list\_name* name of the community list. Valid input is text.
- permit permits access to the specified community.
- deny denies access to the specified community.
- GSHUT well-known graceful shutdown community.
- *aa:nn* AA is 65535 and NN specifies the community number (0-65535) within the AS.
- internet advertises route to the Internet community.
- local-as advertises route only to local peers.
- no-advertise does not advertise route to any peer.
- no-export advertises route only within BGP AS boundary.
- number community number. Values ranges from 0 to 4294967040.

##### Related Commands

- `route-map`
- `match (route-map)`
- `show ip community-list`
- `show ip extcommunity-list`

##### Guideline

EOS does not support disabling the process of graceful shutdown community.

**Note:** The `ip community-list` command with the permit internet option permits access to all routes associated with any community.

##### Examples

- This command creates a BGP community list (named “list\_9”) that does not match members of route maps configured with AS-network number 100:250.

```
switch(config)#ip community-list list_9 deny 100:250
switch(config)#
```

- These commands create a BGP community list that permits the graceful shutdown community, then use that list in a route map to permit routes with that community.

```
switch(config)#ip community-list gshut_list permit GSHUT
switch(config)#route-map map1
switch(config-route-map-map1)#match community gshut_list
switch(config-route-map-map1)#exit
switch(config)#show route-map map1
```

```
route-map map1 permit 10
  Description:
  Match clauses:
    match community gshut_list
  SubRouteMap:
  Set clauses:
switch(config)#
```

- This command permits access to all routes associated with the BGP community list (CLIST1).

```
switch(config)#ip community-list CLIST1 permit internet
switch(config)#
```

---

#### 14.5.4.41 ip extcommunity-list regexp

The `ip extcommunity-list regexp` command creates an extended community list to filter VRF routes or for link bandwidth (LBW) advertisement. The command uses regular expressions to define the extended communities specified by the list. To specify particular values, use the `ip extcommunity-list` command.

The following extcommunity-list types are supported:

- **Route Target (rt)** identifies sites that may receive appropriately tagged routes.
- **Site of Origin (soo)** identifies sites where the switch learned the route.
- **Link Bandwidth (lbw)** advertises BGP link bandwidth.

The `no ip extcommunity-list regexp` and `default ip extcommunity-list regexp` commands delete the specified extended community list by removing the corresponding `ip extcommunity-list regexp` statement from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

```
ip extcommunity-list regexp list_name {deny | permit} reg_exp
no ip extcommunity-list regexp list_name {deny | permit} reg_exp
default ip extcommunity-list regexp list_name
```

##### Parameters

- *list\_name* name of the extended community list. Valid input is text.
- permit access is permitted for the specified extended community list.
- deny access is denied for the specified extended community list.
- *reg\_exp* list of communities, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.
  - Expressions beginning with **RT:** match the **route target** extended community attribute option.
  - Expressions beginning with **SoO:** match the **site of origin** extended community attribute option.

##### Related Commands

- `route-map`
- `match (route-map)`
- `show ip community-list`
- `show ip extcommunity-list`

##### Example

- This command creates a BGP extended community list that denies routes from route target networks 20-24 and 30-34 in autonomous system 10.

```
switch(config)#ip extcommunity-list regexp list_1 deny RT:10:[2-3][0-4]_
switch(config)#
```

#### 14.5.4.42 ip extcommunity-list

The `ip extcommunity-list` command creates an extended community list to filter VRF routes or for link bandwidth (LBW) advertisement.

The following extcommunity-list types are supported:

- **Route Target (rt)** identifies sites that may receive appropriately tagged routes.
- **Site of Origin (soo)** identifies sites where the switch learned the route.
- **Link Bandwidth (lbw)** advertises BGP link bandwidth.

The `no ip extcommunity-list` and `default ip extcommunity-list` commands delete the specified extended community list by removing the corresponding `ip extcommunity-list` statement from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip extcommunity-list list_name {deny | permit} COMM_1 [COMM_2...COMM_n]
no ip extcommunity-list list_name
default ip extcommunity-list list_name
```

#### Parameters

- *list\_name* name of the extended community list.
- permit access is permitted for the specified community.
- deny access is denied for the specified community.
- COMM\_x extended community attribute. Options include:
  - rt *aa:nn* route target, as specified by autonomous system:network number.
  - rt *ip\_addr:nn* route target, as specified by ip address:network number.
  - soo *aa:nn* Site of Origin, as specified by autonomous system:network number.
  - soo *ip\_addr:nn* site of origin, as specified by ip address:network number.
  - lbw link bandwidth in bits per second.

#### Related Commands

- [route-map](#)
- [match \(route-map\)](#)
- [show ip community-list](#)
- [show ip extcommunity-list](#)

#### Example

- This command creates a BGP extended community list that denies routes from route target 100:250.

```
switch(config)#ip extcommunity-list list_9 deny rt 100:250
switch(config)#
```

#### 14.5.4.43 ip large-community-list regexp

The `ip large-community-list regexp` command creates and configures a BGP access list based on BGP large communities. A BGP large-community access list filters prefixes based on their BGP large community values. The command uses regular expressions to match large communities. Multiple large-community lists with the same name may be specified. To create a large-community list by explicitly specifying one or more communities, use the `ip large-community-list` command.

Large-communities are represented as follows: [ASN]:local-part1:local-part2.

The `no ip large-community-list regexp` and `default ip large-community-list regexp` commands delete the specified large community list. To delete a specific community-list entry, specify the entry in the `no ip large-community-list regexp` command.

##### Command Mode

Global Configuration

##### Command Syntax

```
ip large-community-list regexp list_name {deny | permit} reg_exp
no ip large-community-list regexp list_name {deny | permit} reg_exp
default ip large-community-list regexp list_name
```

##### Parameters

- *list\_name* name of the community list. Valid input is text.
- permit access is permitted for the specified community.
- deny access is denied for the specified community.
- *reg\_exp* list of communities, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.

**Note:** When using the no form of the command, a regular expression can be used to specify a single entry to be removed from the list, leaving the rest of the list intact. If no entry is specified, the no form of the command removes the entire list.

##### Related Commands

- [route-map](#)
- [match \(route-map\)](#)
- [show ip community-list](#)
- [show ip extcommunity-list](#)

##### Examples

- This command creates a BGP large community list that permits routes from autonomous system 10 with local-part1 value of 20-24 or 30-34.

```
switch(config)#ip large-community-list regexp list_2 permit 10:[2-3]
[0-4]:_
switch(config)#
```

- This command removes the above statement from the large community list named “list\_2,” leaving any other statements in the list intact.

```
switch(config)#no ip large-community-list regexp list_2 permit 10:
[2-3]:[0-4]_
switch(config)#
```

- This command deletes the large community list named “list\_2” entirely.

```
switch(config)#no ip large-community-list regexp list_2
```

```
switch(config)#
```

#### 14.5.4.44 match as-range

The **match as-range** command defines the match statement for the peer-filter, based on the match statement the peer-filter accept or reject the incoming peer request. The match statement includes a sequence number, AS number range and a match condition to accept or reject a peer by comparing its remote AS number to the specified range. A peer filter can consist of a single match statement or multiple match statements. The match statement for the peer filter is configured under peer-filter configuration mode.

The **no match as-range** or **default match as-range** command deletes the peer-filter condition for the group from *running-config*.

##### Command Mode

Peer-Filter Configuration

##### Command Syntax

```
[sequence_number] match as-range [as_number1] [- as_number2] result {accept | reject}
group_name
```

```
no [as_number1] [- as_number2] result {accept | reject} group_name
```

```
default [as_number1] [- as_number2] result {accept | reject} group_name
```

##### Parameters

- *sequence\_number* optional sequence number for the match statement; one is automatically created if not assigned. Values range from 0 to 65535.
- *group\_name* name of the peer filter group.
- *as\_number* the autonomous system number, values range from 1 to 4294967295.

##### Example

- These commands define a peer filter that accepts any AS number.

```
switch(config)#peer-filter group1
switch(config-peer-filter-group1)#10 match as-range 1-4294967295 result
accept
switch(config-peer-filter-group1)#
```

- These commands define a peer filter that accepts any AS number within 65000 and 65100 (inclusive) except 65008 and 65009.

```
switch(config)#peer-filter group2
switch(config-peer-filter-group2)#10 match as-range 65008-65009 result
reject
switch(config-peer-filter-group2)#20 match as-range 65000-651000 result
accept
switch(config-peer-filter-group2)#
```

- These commands define a peer filter that accepts 3 specific remote AS numbers.

```
switch(config)#peer-filter group3
eswitch(config-peer-filter-group3)#10 match as-range 65003 result
accept
switch(config-peer-filter-group3)#20 match as-range 65007 result accept
switch(config-peer-filter-group3)#30 match as-range 65009 result accept
switch(config-peer-filter-group3)#
```

#### 14.5.4.45 maximum paths (BGP)

The `maximum-paths` command controls the maximum number of parallel eBGP routes that the switch supports. The default maximum is one route. The command provides an ECMP (equal cost multiple paths) parameter that controls the number of equal-cost paths that the switch stores in the routing table for each route.

For paths to be considered equal, they must have the same weight, local preference, AS-path length, and origin. To require that they also have the same multi-exit discriminator (MED) value, use the `bgp always-compare-med` command. To require that their AS paths have the same contents, use the `no bgp bestpath as-path multipath-relax` command.

The `no maximum-paths` and `default maximum-paths` commands restore the default values of the maximum number of parallel routes and the maximum number of ECMP paths by removing the corresponding `maximum paths` command from *running-config*.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
maximum-paths paths [ecmp ecmp_paths]
```

```
no maximum-paths
```

```
default maximum-paths
```

##### Parameters

- *paths* maximum number of parallel routes. Default value is 1. Value must be less than or equal to the maximum number of ECMP paths.
- *ecmp\_paths* maximum number of ECMP paths for each route. Default is maximum value as defined belows.

Value for each parameter ranges from 1 to the number of interfaces available per ECMP group, which is platform dependent.

- **Arad:** Values range from 1 to 128. Default value is 128.
- **FM6000:** Values range from 1 to 32. Default value is 32.
- **PetraA:** Values range from 1 to 16. Default value is 16.
- **Trident:** Values range from 1 to 32. Default value is 32.
- **Trident II:** Values range from 1 to 128. Default value is 128.

##### Examples

- These commands configure the maximum number of BGP parallel paths to 12 without changing the default ECMP value.

```
switch(config)#router bgp 1
switch(config-router-bgp)#maximum-paths 12
switch(config-router-bgp)#
```

- These commands configure the maximum number of eBGP parallel routes to 2, with a maximum of 4 equal cost multipath (ECMP) paths for each route.

```
switch(config)#router bgp 1
switch(config-router-bgp)#maximum-paths 2 ecmp 4
switch(config-router-bgp)#
```

---

#### 14.5.4.46 neighbor activate

The **neighbor activate** command defines the configuration mode address family activation state of a specified address that is configured as a BGP neighbor. The switch sends the following announcements to addresses active in an address family:

- **IPv4 address family:** IPv4 capability and all network advertisements with IPv4 prefixes.
- **IPv6 address family:** IPv6 capability and all network advertisements with IPv6 prefixes.

The **bgp default** command configures the default address family activation state of addresses configured as BGP neighbors. The **neighbor activate** and **no neighbor activate** commands override the neighbor's default activation state within the configuration mode address family.

- **neighbor activate:** the specified address is active in the address family.
- **no neighbor activate:** the specified address is not active in the address family.

The **default neighbor activate** command removes the corresponding **neighbor activate** or **no neighbor activate** command from **running-config**, restoring the default address family activation state for the specified neighbor address.

#### Command Mode

Router-BGP Address-Family Configuration

#### Command Syntax

```
neighbor neighbor_ID activate
no neighbor neighbor_ID activate
default neighbor neighbor_ID activate
```

#### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.

#### Limitations

The switch supports the advertisement of networks with IPv6 prefixes to IPv4 transport neighbors. The switch does *not* support the advertisement of networks with IPv4 prefixes to IPv6 transport neighbors.

#### Example

- These commands activate the advertising of specified neighbors during IPv4 peering sessions, then display the result.

```
switch(config)#router bgp 1
switch(config-router-bgp)#no address-family ipv4
switch(config-router-bgp-af)#neighbor 172.41.18.15 activate
switch(config-router-bgp-af)#neighbor 172.49.22.6 activate
switch(config-router-bgp-af)#no neighbor 172.15.21.18 activate
switch(config-router-bgp-af)#show active
  address-family ipv4
    no neighbor 172.15.21.18 activate
    neighbor 172.49.22.6 activate
    neighbor 172.41.18.15 activate
switch(config-router-bgp-af)#exit
switch(config-router-bgp)#
```

#### 14.5.4.47 neighbor allowas-in

By default, BGP drops received routes if their autonomous system (AS) paths contain the AS number (ASN) of the switch. The `neighbor allowas-in` command configures the switch to accept routes from the specified BGP neighbor even if their AS paths contain the ASN of the switch itself. Optionally, the command can also configure the maximum number of times that the switch's ASN can appear in a route before it is dropped.

The `no neighbor allowas-in` command configures the default behavior (dropping BGP routes that contain the ASN of the switch).

The default `neighbor allowas-in` command applies the system default configuration for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the BGP neighbor at the specified address.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
neighbor neighbor_ID allowas-in [asn_quantity]
```

```
no neighbor neighbor_ID allowas-in
```

```
default neighbor neighbor_ID allowas-in
```

##### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- *asn\_quantity* number of repetitions of the switch's ASN allowed in the AS path of routes received from the specified BGP neighbor. Values range from 1 to 10. Default is 3.

##### Related Commands

This command is used on a customer edge router that is part of a split AS; to address the problem at the provider end, use the `neighbor as-path remote-as replace out` command.

##### Example

- These commands configure the switch to accept routes from the BGP neighbor at 192.168.1.30 which contain the switch's ASN in their AS paths as many as 3 times.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.1.30 allowas-in
switch(config-router-bgp)#
```

---

#### 14.5.4.48 neighbor as-path remote-as replace out

By default, BGP drops received routes if their autonomous system (AS) paths contain the AS number (ASN) of the switch. In a split AS sharing route advertisements through a provider network, this can result in valid routes being dropped. The **neighbor as-path remote-as replace out** command configures a provider edge switch to replace the customer's AS with its own in route advertisements sent to neighbors in that AS.

The **no neighbor as-path remote-as replace out** command configures the default behavior (leaving the customer's AS in the AS path attribute of routes advertised to the specified neighbor).

The **default neighbor as-path remote-as replace out** command applies the system default configuration for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the BGP neighbor at the specified address.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
neighbor neighbor_ID as-path remote-as replace out
no neighbor neighbor_ID as-path remote-as replace out
default neighbor neighbor_ID as-path remote-as replace out
```

##### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.

##### Related Commands

This command is used on a provider edge router forwarding BGP routes to a customer in a split AS; to address the problem at the customer end, use the **neighbor allowas-in** command.

##### Example

- These commands configure the switch to substitute its local ASN for the ASN of the BGP neighbor at 192.168.2.15 in BGP routes advertised to that neighbor.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.2.15 as-path remote-as
replace out
switch(config-router-bgp)#
```

#### 14.5.4.49 neighbor auto-local-addr

The **neighbor auto-local-addr** command configures the switch to automatically determine the local address to be used for the non-transport address family in NLRI sent to the specified neighbor or peer group. This allows IPv4 NLRI to be carried over IPv6 transport, or IPv6 NLRI to be carried over IPv4 transport.

The **no neighbor auto-local-addr** command applies the system default configuration.

The **default neighbor auto-local-addr** command applies the system default configuration for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

**Note:** While this feature works well in eBGP deployments in which the pairing routers are directly connected and have matching IP address configurations, multi-hop eBGP or iBGP deployments may require manual local address configuration.

To explicitly configure a local address for the non-transport address family for a specific neighbor or peer group, use the **neighbor local-v4-addr** command for IPv6 neighbors, or the **neighbor local-v6-addr** for IPv4 neighbors.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor neighbor_ID auto-local-addr
no neighbor neighbor_ID auto-local-addr
default neighbor neighbor_ID auto-local-addr
```

#### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.

#### Example

- For the IPv6 neighbor at 2001:0DB8:c2a4:1761::2, these commands configure the switch to automatically determine the IPv4 NLRI value to be sent during peering sessions.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 2001:0DB8:c2a4:1761::2 auto-local-addr
switch(config-router-bgp)#
```

---

#### 14.5.4.50 neighbor default-originate

The **neighbor default-originate** command advertises a default route to a BGP neighbor or peer group. This default route overrides the default route advertised by any other means to the specified neighbor or peer group. However, the update generated by **neighbor default-originate** is not processed by neighbor route map out policies.

If a route map is specified in this command, its set clauses are used to modify attributes of the exported default route, but its match clauses are not used to conditionally advertise the route. The default route is always advertised to the specified neighbor.

The **no neighbor default-originate** command applies the system default configuration.

The **default neighbor default-originate** command applies the system default configuration for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

#### Command Mode

Router-BGP Configuration Router-BGP Address-Family Configuration

#### Command Syntax

```
neighbor neighbor_ID default-originate [MAP]
no neighbor neighbor_ID default-originate
default neighbor neighbor_ID default-originate
```

#### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- MAP specifies route map that modifies attributes of the exported default route. Options include:
  - <no parameter> attributes are not modified by a route map.
  - route-map *map\_name* attributes set by specified route map are assigned to the exported default route.

#### Example

- These commands advertise a default route to the BGP neighbor at 192.168.14.5.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 192.168.14.5 default-originate
switch(config-router-bgp)#
```

#### 14.5.4.51 neighbor description

The **neighbor description** command associates descriptive text with the specified peer or peer group.

The **no neighbor description** command removes the text association from the specified peer or peer group.

The **default neighbor description** command removes the text association from the specified peer for individual neighbors, and applies the peer group's description to neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address or for the specified peer group.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
neighbor neighbor_ID description description_string
```

```
no neighbor neighbor_ID description
```

```
default neighbor neighbor_ID description
```

##### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- *description\_string* text string to be associated with the neighbor or peer group.

##### Example

- These commands associate the string "PEER\_1" with the peer located at 192.168.1.30.

```
switch(config)#router bgp 1  
switch(config-router-bgp)#neighbor 192.168.1.30 description PEER_1  
switch(config-router-bgp)#
```

---

#### 14.5.4.52 neighbor ebgp-multihop

The **neighbor ebgp-multihop** command programs the switch to accept and attempt BGP connections to the external peers residing on networks not directly connected to the switch. The command does not establish the multihop if the only route to the peer is the default route (0.0.0.0).

The **no neighbor ebgp-multihop** command applies the system default configuration.

The **default neighbor ebgp-multihop** command applies the system default configuration for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
neighbor neighbor_ID ebgp-multihop [hop_number]
```

```
no neighbor neighbor_ID ebgp-multihop
```

```
default neighbor neighbor_ID ebgp-multihop
```

##### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- *hop\_number* time-to-live (hops). Values range from 1 to 255. Default value is 255.

##### Example

- These commands configure the switch to accept and attempt BGP connections to the external peer located at 192.168.1.30, setting the hop limit to 32.

```
switch(config)#router bgp 1  
switch(config-router-bgp)#neighbor 192.168.1.30 ebgp-multihop 32  
switch(config-router-bgp)#
```

### 14.5.4.53 neighbor enforce-first-as

The **neighbor enforce-first-as** command causes a forced comparison of the first autonomous system (AS) in the AS path of eBGP routes received from a specified BGP peer or peer group to the configured remote external peer autonomous system number (ASN). Updates from the specified eBGP peers that do not include an ASN as first AS path (in the AS\_PATH attribute) are discarded.

This behavior is enabled globally by default upon BGP configuration, and disabled for the specified neighbor or peer group by the no form of the command. To configure first AS enforcement globally, use the `bgp enforce-first-as` command.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor neighbor_ID enforce-first-as  
no neighbor neighbor_ID enforce-first-as  
default neighbor neighbor_ID enforce-first-as
```

#### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.

#### Example

- This command disables enforcement of the first BGP AS for the neighbors in peer group "region-3."

```
switch(config-router-bgp) #no neighbor region-3 enforce-first-as  
switch(config-router-bgp) #
```

---

#### 14.5.4.54 neighbor export-localpref

The **neighbor export-localpref** command determines the LOCAL\_PREF value that is sent in BGP UPDATE packets to the specified peer or peer group. This command has no effect on external peers.

The **no neighbor export-localpref** command resets the LOCAL\_PREF value to the system default of 100 in packets sent to the specified peer or peer group.

The **default neighbor export-localpref** command resets the LOCAL\_PREF value to the system default of 100 for individual neighbors, and applies the peer groups's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address or the specified peer group.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
neighbor neighbor_ID export-localpref preference
```

```
no neighbor neighbor_ID export-localpref
```

```
default neighbor neighbor_ID export-localpref
```

##### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- *preference* preference value. Values range from 0 to 4294967295.

##### Example

- This command configures the switch to fill the LOCAL\_PREF field with 200 in UPDATE packets that it sends to the peer located at 10.1.1.45.

```
switch(config)#router bgp 1  
switch(config-router-bgp)#neighbor 10.1.1.45 export-localpref 200  
switch(config-router-bgp)#
```

#### 14.5.4.55 neighbor graceful-restart

The **neighbor graceful-restart** command enables the BGP graceful restart mode for a specified BGP neighbor or peer group. When graceful restart mode is enabled, the switch retains routes from neighbors that are capable of graceful restart. By default, graceful restart is enabled for all BGP neighbors. Individual neighbor configuration takes precedence over the global configuration.

The **no neighbor graceful-restart** and **default neighbor graceful-restart** commands disable graceful restart mode for the specified BGP neighbor or peer group by removing the corresponding **no neighbor graceful-restart** command from *running-config*.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
neighbor neighbor_ID graceful-restart  
no neighbor neighbor_ID graceful-restart  
default neighbor neighbor_ID graceful-restart
```

##### Parameters

- *neighbor\_ID* neighbors's IPv4 or IPv6 address or peer group name.

##### Example

- This command enables BGP graceful restart mode for the neighbor with the IP address 192.168.12.1.

```
switch(config)#router bgp 1  
switch(config-router-bgp)#neighbor 192.168.12.1 graceful-restart  
switch(config-router-bgp)#
```

---

#### 14.5.4.56 neighbor graceful-restart-helper

The **neighbor graceful-restart helper** command enables BGP graceful restart helper mode for the specified BGP neighbor or peer group. When graceful restart helper mode is enabled, the switch will retain routes from neighbors which are capable of graceful restart while those neighbors are restarting BGP. Graceful restart is enabled by default for all BGP neighbors. To configure graceful restart helper mode for all BGP neighbors, use the [graceful-restart-helper](#) command. Individual neighbor configuration takes precedence over the global configuration.

The **no neighbor graceful-restart helper** command disables graceful restart helper mode for the specified BGP neighbor or peer group. The **default neighbor graceful-restart helper** command enables graceful restart helper mode for the specified BGP neighbor or peer group by removing the corresponding **no neighbor graceful-restart helper** command from *running-config*.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
neighbor neighbor_ID graceful-restart helper
no neighbor neighbor_ID graceful-restart helper
default neighbor neighbor_ID graceful-restart helper
```

##### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.

##### Example

- These commands disable graceful restart helper mode for the neighbor at 192.168.12.1.

```
switch(config)#router bgp 1
switch(config-router-bgp)#no neighbor 192.168.12.1 graceful-restart-
helper
switch(config-router-bgp)#
```

### 14.5.4.57 neighbor import-localpref

The **neighbor import-localpref** command determines the local preference assigned to routes received from the specified external peer or peer group. This command has no effect on routes received from internal peers. **no neighbor import-localpref**

The command resets the local preference to the default of 100 for routes received from the specified peer or peer group.

The **default neighbor import-localpref** command resets the local preference to the default of 100 for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor neighbor_ID import-localpref preference
```

```
no neighbor neighbor_ID import-localpref
```

```
default neighbor neighbor_ID import-localpref
```

#### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- *preference* preference value. Values range from 0 to 4294967295.

#### Example

- These commands configure the switch to assign a local preference of 50 to routes received from the peer located at 192.168.1.30.

```
switch(config)#router bgp 1  
switch(config-router-bgp)#neighbor 192.168.1.30 import-localpref 50  
switch(config-router-bgp)#
```

---

#### 14.5.4.58 neighbor local-as

The **neighbor local-as** command enables AS\_PATH attribute modification for received eBGP routes, allowing the switch to appear as a member of a different AS to external peers. Arista switches do not prepend the local AS number to routes received from the eBGP neighbor; currently, we implement the command only as **neighbor local-as no-prepend replace-as**.

The **no neighbor local-as** command disables AS\_PATH modification for the specified peer or peer group. The **default neighbor local-as** command disables AS\_PATH modification for individual neighbors, and applies the peer groups setting for neighbors that are members of a peer group.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
neighbor neighbor_ID local-as as_id no-prepend replace-as  
no neighbor neighbor_ID local-as  
default neighbor neighbor_ID local-as
```

##### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- *as\_id* AS number that is sent in outbound routing updates in place of the actual AS of the switch. Values range from 1 to 4294967295.

This parameter cannot be set to the switch's AS number or to any AS number in the peer's network.

##### Example

- For the neighbor at 10.13.64.1, these commands remove AS 300 from outbound routing updates and replace it with AS 600.

```
switch(config)#router bgp 300  
switch(config-router-bgp)#neighbor 10.13.64.1 local-as 600 no-prepend  
replace-as  
switch(config-router-bgp)#
```

#### 14.5.4.59 neighbor local-v4-addr

The **neighbor local-v4-addr** command specifies the next-hop value that the switch sends as the IPv4 NLRI value to neighbors with whom IPv6 transport peering is established.

The **no neighbor local-v4-addr** command applies the system default configuration.

The **default neighbor local-v4-addr** command applies the system default configuration for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

To configure the switch to automatically determine the IPv4 address to be sent as the next-hop in IPv4 NLRI to an IPv6 neighbor, use the **neighbor auto-local-addr** command.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor neighbor_ID local-v4-addr ipv4_local
no neighbor neighbor_ID local-v4-addr
default neighbor neighbor_ID local-v4-addr
```

#### Parameters

- *neighbor\_ID* neighbor's IPv6 address or peer group name.
- *ipv4\_local* next hop address.

#### Example

- For the neighbor at 2001:0DB8:c2a4:1761::2, these commands specify an IPv4 NLRI value of 10.7.5.11 to be sent during IPv6 transport peering sessions.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 2001:0DB8:c2a4:1761::2 local-v4-
addr
10.7.5.11
switch(config-router-bgp)#
```

---

#### 14.5.4.60 neighbor local-v6-addr

The **neighbor local-v6-addr** command specifies the next-hop value that the switch sends as the IPv6 NLRI value to neighbors with which IPv4 transport peering is established.

In IPv6 peering sessions, the switch sends the global IPv6 address of the interface that is used to transmit BGP updates.

The **no neighbor local-v6-addr** command applies the system default configuration.

The **default neighbor local-v6-addr** command applies the system default configuration for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor neighbor_ID local-v6-addr ipv6_local
```

```
no neighbor neighbor_ID local-v6-addr
```

```
default neighbor neighbor_ID local-v6-addr
```

#### Parameters

- *neighbor\_ID* neighbor's IPv4 address or peer group name.
- *ipv6\_local* next hop address (A:B:C:D:E:F:G:H).

#### Example

- For the neighbor at 10.7.5.11, these commands specify an IPv6 NLRI value that is sent during IPv4 transport peering sessions.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 10.7.5.11 local-v6-addr
2001:0DB8:c2a4:1761::2
switch(config-router-bgp)#show active
router bgp 1
  bgp log-neighbor-changes
  bgp default ipv6-unicast
  neighbor 10.7.5.11 local-v6-addr 2001:0DB8:c2a4:1761::2
switch(config-router-bgp)#
```

### 14.5.4.61 neighbor maximum-routes

The **neighbor maximum-routes** command determines the number of BGP routes the switch accepts from a specified neighbor and defines an action when the limit is exceeded. The default value is 12,000. To remove the maximum routes limit, select a limit of zero.

When the number of routes received from a peer exceeds the limit, the switch generates an error message. This command can also configure the switch to disable peering with the neighbor. In this case, the neighbor state is reset only through a `clear ip bgp` command.

The **no neighbor maximum-routes** command applies the system default maximum-routes value of 12,000 for the specified peer.

The **default neighbor maximum-routes** command applies the system default value for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor neighbor_ID maximum-routes quantity [ACTION]
```

```
no neighbor neighbor_ID maximum-routes
```

```
default neighbor neighbor_ID maximum-routes
```

#### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- *quantity* maximum number of routes. Values include:
  - **0** the switch does not define a route limit.
  - **1 to 4294967294** maximum number of routes.
- ACTION switch action when the route limit is exceeded. Values include:
  - <no parameter> peering is disabled and an error message is generated.
  - warning-only peering is not disabled, but an error message is generated.

#### Example

- This command configures the switch to accept 15000 routes for the neighbor at 10.3.16.210. If the neighbor exceeds 15000 routes, the switch disables peering with the neighbor.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 110.3.16.210 maximum-routes 15000
switch(config-router-bgp)#
```

---

#### 14.5.4.62 neighbor next-hop-peer

The **neighbor next-hop-peer** command configures the switch to list the peer address as the next hop in routes that it receives from the specified peer BGP-speaking neighbor or members of the specified peer group. This command overrides the next hop for all routes received from this neighbor or peer group.

The **no neighbor next-hop-peer** command applies the system default (no next-hop override) for the specified peer.

The **default neighbor next-hop-peer** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address or the specified peer group.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
neighbor neighbor_ID next-hop-peer  
no neighbor neighbor_ID next-hop-peer  
default neighbor neighbor_ID next-hop-peer
```

##### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.

##### Example

- This command configures the peer address of 10.3.2.24 as the next hop for routes advertised to the switch from the peer BGP neighbor.

```
switch(config)#router bgp 9  
switch(config-router-bgp)#neighbor 10.3.2.24 next-hop-peer  
switch(config-router-bgp)#
```

### 14.5.4.63 neighbor next-hop-self

The **neighbor next-hop-self** command configures the switch to list its address as the next hop in routes that it advertises to the specified BGP-speaking neighbor or neighbors in the specified peer group. This is used in networks where BGP neighbors do not directly access all other neighbors on the same subnet.

The **no neighbor next-hop-self** command applies the system default (no next-hop override) for the specified peer.

The **default neighbor next-hop-self** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address or for the specified peer group.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor neighbor_ID next-hop-self  
no neighbor neighbor_ID next-hop-self  
default neighbor neighbor_ID next-hop-self
```

#### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.

#### Example

- This command configures the switch as the next hop for the peer at 10.4.1.30.

```
switch(config)#router bgp 1  
switch(config-router-bgp)#neighbor 10.4.1.30 next-hop-self  
switch(config-router-bgp)#
```

---

#### 14.5.4.64 neighbor out-delay

The **neighbor out-delay** command sets the period of time that a route update for the specified neighbor must be in the routing table before the switch exports it to BGP. The out delay interval is used for bundling routing updates.

The **no neighbor out-delay** command applies the system default (out-delay value of zero) for the specified peer.

The **default neighbor out-delay** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the specified neighbor.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
neighbor neighbor_ID out-delay delay_time  
no neighbor neighbor_ID out-delay delay_time  
default neighbor neighbor_ID out-delay delay_time
```

##### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- *delay\_time* the out delay period (seconds). Values range from 0 to 600. Default value is 0.

##### Example

- These commands set the out delay period to 5 seconds for the connection with the peer at 10.24.15.9.

```
switch(config)#router bgp 1  
switch(config-router-bgp)#neighbor 10.24.15.9 out-delay 5  
switch(config-router-bgp)#
```

### 14.5.4.65 neighbor passive

The **neighbor passive** command sets the TCP connection for the specified BGP neighbor or peer group to passive mode. When the peer's transport connection mode is set to passive, it accepts TCP connections for BGP but does not initiate them.

The **no neighbor passive** command sets the specified BGP neighbor or peer group to active connection mode. BGP peers in active mode can both accept and initiate TCP connections for BGP. This is the default behavior.

The **default neighbor passive** command restores the default connection mode. The default mode is **active** for individual BGP peers, or the mode inherited from the peer group for peer group members.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor neighbor_ID passive
no neighbor neighbor_ID passive
default neighbor neighbor_ID passive
```

#### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.

#### Example

- These commands configure the neighbor at IP address 10.2.2.14 to not initiate TCP connections for BGP peering.

```
switch(config)#router bgp 300
switch(config-router-bgp)#neighbor 10.2.2.14 passive
switch(config-router-bgp)#
```

---

#### 14.5.4.66 neighbor password

The **neighbor password** command enables authentication on a TCP connection with a BGP peer. The plain-text version of the password is a string, up to 8 bytes in length. Peers must use the same password to ensure proper communication.

**Running-config** displays the encrypted version of the password. The encryption scheme is not strong by cryptographic standards; encrypted passwords should be treated in the same manner as plain-text passwords.

The **no neighbor password** command applies the system default for the specified peer, removing the neighbor password from the configuration and disabling authentication with the specified peer.

The **default neighbor password** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor password** and **default neighbor password** commands remove the neighbor password from the configuration, disabling authentication with the specified peer.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor neighbor_ID password [ENCRYPT_LEVEL] key_text
```

```
no neighbor neighbor_ID password
```

```
default neighbor neighbor_ID password
```

#### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- ENCRYPT\_LEVEL the encryption level of the *key\_text* parameter. Values include:
  - <no parameter> the *key\_text* is in clear text.
  - 0 the *key\_text* is in clear text. Equivalent to the <no parameter> case.
  - 7 the *key\_text* is MD5-encrypted.
- *key\_text* the password.

#### Example

- This command specifies a password in clear text.

```
switch(config)#router bgp 1  
switch(config-router-bgp)#neighbor 10.25.25.13 password 0 code123  
switch(config-router-bgp)#
```

**Running-config** stores the password as an encrypted string.

#### 14.5.4.67 neighbor peer group (create)

Peer groups allow the user to apply settings to a group of BGP neighbors simultaneously. Once a peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Settings applied to an individual neighbor in the peer group override group settings.

The **neighbor peer group (create)** command is used to create static BGP peer groups. Static peer groups are peer groups whose members are added manually. To assign BGP neighbors to a static peer group, use the **neighbor peer-group (neighbor assignment)** command. To create a dynamic peer group, use the **bgp listen range** command.

The **no neighbor peer group (create)** and **default neighbor peer group (create)** commands remove the specified static peer group from *running-config*. When a static peer group is deleted, the neighbors that were members of that peer group lose any configuration that was inherited from the peer group. The no form of the **bgp listen range** command removes a dynamic peer group.

The **no neighbor** command removes all configuration commands for the specified neighbor.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor group_name peer group
no neighbor group_name peer group
default neighbor group_name peer group
```

#### Parameters

- *group\_name* peer group name.

#### Examples

- These commands create a BGP peer group called “bgpgroup1,” assign several neighbors to the group, apply a route map, and adjust the configuration for one group member.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor bgpgroup1 peer group
switch(config-router-bgp)#neighbor 10.1.1.1 peer group bgpgroup1
switch(config-router-bgp)#neighbor 10.2.2.2 peer group bgpgroup1
switch(config-router-bgp)#neighbor 10.3.3.3 peer group bgpgroup1
switch(config-router-bgp)#neighbor bgpgroup1 route-map corporate in
switch(config-router-bgp)#neighbor 10.3.3.3 maximum-routes 5000
switch(config-router-bgp)#show active
router bgp 9
bgp log-neighbor-changes
  neighbor bgpgroup1 peer-group
  neighbor bgpgroup1 route-map corporate in
  neighbor bgpgroup1 maximum-routes 12000
  neighbor 10.1.1.1 peer-group bgpgroup1
  neighbor 10.2.2.2 peer-group bgpgroup1
  neighbor 10.3.3.3 peer-group bgpgroup1
  neighbor 10.3.3.3 maximum-routes 5000
switch(config-router-bgp)#
```

- This command removes peer group “bgpgroup1” from *running-config*. The group members remain, but all settings that group members inherited from the peer group are removed.

```
switch(config-router-bgp)#no neighbor bgpgroup1 peer-group
switch(config-router-bgp)#show active
```

---

```
router bgp 9
  bgp log-neighbor-changes
  neighbor 10.1.1.1 maximum-routes 12000
  neighbor 10.2.2.2 maximum-routes 12000
  neighbor 10.3.3.3 maximum-routes 5000
switch(config-router-bgp)#
```

### 14.5.4.68 neighbor peer-group (neighbor assignment)

Peer groups allow the user to apply settings to a group of BGP neighbors simultaneously. Once a peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Settings applied to an individual neighbor in the peer group override group settings.

The **neighbor peer-group (neighbor assignment)** command is used to assign BGP neighbors to an existing static peer group. To create a static peer group, use the **neighbor peer-group (create)** command. A neighbor can only belong to one peer group, so issuing this command for a neighbor that is already a member of another group will remove it from that group.

The **no neighbor peer-group** and **default neighbor peer-group** commands remove the specified neighbor from all peer groups. When a neighbor is removed from a peer group, the neighbor retains the configuration inherited from the peer group.

The **no neighbor** command removes all configuration commands for the specified neighbor.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor NEIGHBOR_ADDR peer-group group_name
no neighbor NEIGHBOR_ADDR peer-group
default neighbor NEIGHBOR_ADDR peer-group
```

#### Parameters

- **NEIGHBOR\_ADDR** address of a neighbor being added to peer group. Values include:
  - *ipv4\_addr* neighbor's IPv4 address.
  - *ipv6\_addr* neighbor's IPv6 address.
- *group\_name* peer group name.

#### Examples

- These commands create a BGP peer group called "bgpgroup1," assign several neighbors to the group, and apply a route map.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor bgpgroup1 peer-group
switch(config-router-bgp)#neighbor 10.1.1.1 peer-group bgpgroup1
switch(config-router-bgp)#neighbor 10.2.2.2 peer-group bgpgroup1
switch(config-router-bgp)#neighbor 10.3.3.3 peer-group bgpgroup1
switch(config-router-bgp)#neighbor bgpgroup1 route-map corporate in
switch(config-router-bgp)#
```

- This command removes the neighbor at 1.1.1.1 from the peer group. All settings that neighbor 10.1.1.1 inherited from the peer group are maintained.

```
switch(config-router-bgp)#no neighbor 10.1.1.1 peer-group
switch(config-router-bgp)#
```

---

#### 14.5.4.69 neighbor remote-as

The **neighbor remote-as** command configures the expected AS number for a neighbor (peer). This configuration is required to establish a neighbor connection. Internal neighbors have the same AS number; external neighbors have different AS numbers.

**Note:** To establish a BGP session, there must be an IPv4 router ID configured in the same VRF or at least one L3 interface with an IPv4 address in the same VRF. If the VRF contains no L3 interfaces with IPv4 addresses (e.g., in an IPv6-only environment), configure an appropriate router ID using the **router-id (BGP)** command.

The **no neighbor remote-as** command applies the system default for the specified peer or peer group.

The **default neighbor remote-as** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor neighbor_ID remote-as as_id  
no neighbor neighbor_ID remote-as  
default neighbor neighbor_ID remote-as
```

#### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- *as\_id* autonomous system (AS) of the peer. Values range from 1 to 4294967295.

#### Example

- These commands establish a BGP connection with the router at 10.4.3.10 in AS 300.

```
switch(config)#router bgp 9  
switch(config-router-bgp)#neighbor 10.4.3.10 remote-as 300  
switch(config-router-bgp)#
```

### 14.5.4.70 neighbor remove-private-as

The **neighbor remove-private-as** command removes private autonomous system numbers from outbound routing updates for external BGP (eBGP) neighbors. When the autonomous system path includes only private autonomous system numbers, the **REMOVAL** parameter specifies how the private autonomous system number is removed.

The **no neighbor remove-private-as** command applies the system default (preserves private AS numbers) for the specified peer.

The **default neighbor remove-private-as** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor neighbor_ID remove-private-as [REMOVAL]
```

```
no neighbor neighbor_ID remove-private-as
```

```
default neighbor neighbor_ID remove-private-as
```

#### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- REMOVAL specifies removal of all private AS numbers when the AS path contains only private AS numbers. Values include:
  - all removes all private AS numbers from AS path in outbound updates.
  - all replace-as all private AS numbers in AS path are replaced with router's local AS number.

**Note:** This command does not support a mix of public and private AS numbers.

#### Example

- These commands program the switch to remove all private AS numbers from outbound routing updates for the eBGP neighbor at 10.5.2.11 only if the AS path does not contain any public AS number.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.5.2.11 remove-private-as
switch(config-router-bgp)#
```

- This command replaces all private AS numbers in the AS path with the switch's local AS number.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.5.2.11 remove-private-as all
replace-as
switch(config-router-bgp)#
```

---

#### 14.5.4.71 neighbor rib-in pre-policy retain

By default, inbound BGP routes that are filtered out by the import policy are still stored on the switch. Because all routes are retained, this allows policies to be changed without resetting BGP sessions. It also allows the switch to display all advertised routes when the `show ip bgp neighbor advertised-routes` command is issued.

The `no neighbor rib-in pre-policy retain` command configures the switch to discard information about routes received from the specified neighbor or group that fail the import policy.

The `neighbor rib-in pre-policy retain` command restores the system default behavior (retaining routes from the specified neighbor or group regardless of import policy).

The `default neighbor rib-in pre-policy retain` command applies the system default (retaining all routes) for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
neighbor neighbor_ID rib-in pre-policy retain inbound [SCOPE]
no neighbor neighbor_ID rib-in pre-policy retain inbound
default neighbor neighbor_ID rib-in pre-policy retain inbound
```

##### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- SCOPE determines how routes including the switch's AS number are handled. Values include:
  - <no parameter> routes including the switch's AS number are discarded.
  - all routes including the switch's AS number are retained.

##### Example

- These commands configure the switch to discard information about routes from the neighbor at 10.5.2.23 which are filtered out by the switch's import policies.

```
switch(config)#router bgp 9
switch(config-router-bgp)#no neighbor 10.5.2.23 rib-in pre-policy
retain inbound
switch(config-router-bgp)#
```

### 14.5.4.72 neighbor route-map (BGP)

The **neighbor route-map** command applies a route map to inbound or outbound BGP routes. When a route map is applied to outbound routes, the switch will advertise only routes matching at least one section of the route map. Only one outbound route map and one inbound route map can be applied to a given neighbor. A new route map applied to a neighbor will replace the previous route map.

The command is available in Router-BGP and Router-BGP-Address-Family configuration modes. The mode in which the command is executed determines the scope of the command:

- In Router-BGP mode, the route map is applied to the specified neighbor in all peering sessions where it is advertised.
- In Router-BGP-Address-Family mode, the route map is applied to the neighbors only in peering sessions corresponding to the configuration-mode address family.

The **no neighbor route-map** command discontinues the application of the specified route map for the specified neighbor and direction. Removing a route map from one direction does not remove it from the other if it has been applied to both.

The **default neighbor route-map** command applies the system default (no route map) for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

#### Command Mode

Router-BGP Configuration

Router-BGP Address-Family Configuration

#### Command Syntax

```
neighbor neighbor_ID route-map map_name DIRECTION
```

#### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- *map\_name* name of a route map.
- DIRECTION routes to which the route map is applied. Options include:
  - in route map is applied to inbound routes.
  - out route map is applied to outbound routes.

#### Example

- This command applies a route map named "inner-map" to a BGP inbound route from 10.5.2.11.

```
switch(config)#router bgp 9  
switch(config-router-bgp)#neighbor 10.5.2.11 route-map inner-map in  
switch(config-router-bgp)#
```

---

### 14.5.4.73 neighbor route-reflector-client

Participating BGP routers within an AS communicate eBGP-learned routes to all of their peers, but to prevent routing loops they must not re-advertise iBGP-learned routes within the AS. To ensure that all members of the AS share the same routing information, a fully meshed network topology (in which each member router of the AS is connected to every other member) can be used, but this topology can result in high volumes of iBGP messages when it is scaled. Instead, in larger networks one or more routers can be configured as route reflectors.

A route reflector is configured to re-advertise routes learned through iBGP to a group of BGP neighbors within the AS (its clients), eliminating the need for a fully meshed topology.

The **neighbor route-reflector-client** command configures the switch to act as a route reflector and configures the specified neighbor as one of its clients. Additional clients are specified by re-issuing the command.

The **no neighbor route-reflector-client** and **default neighbor route-reflector-client** commands disable route reflection by deleting the **neighbor route-reflector-client** command from *running-config*.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor neighbor_ID route-reflector-client  
no neighbor neighbor_ID route-reflector-client  
default neighbor neighbor_ID route-reflector-client
```

#### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.

#### Related Commands

- [bgp client-to-client reflection](#)

#### Example

- This command configures the switch as a route reflector and the neighbor at 10.5.2.1 as one of its clients.

```
switch(config)#router bgp 9  
switch(config-router-bgp)#neighbor 10.5.2.11 route-reflector-client  
switch(config-router-bgp)#
```

#### 14.5.4.74 neighbor route-to-peer

The **neighbor route-to-peer** command allows BGP to establish a connection to reach the specified peer using kernel routing table information. By default, route-to-peer configuration is enabled for a peer or a peer group.

The **no neighbor route-to-peer** command prevents BGP from using kernel routing table information to establish a BGP connection to reach a peer and the **default neighbor route-to-peer** command enables route-to-peer configuration for a peer or a peer group by removing the corresponding **no neighbor route-to-peer** command from the *running-config*.

If the peer is directly connected, BGP instead uses ARP table or neighbor table information to establish a BGP connection to reach the peer.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
neighbor neighbor_ID route-to-peer
no neighbor neighbor_ID route-to-peer
default neighbor neighbor_ID route-to-peer
```

##### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or the peer group name.

##### Example

- These commands establish a connection between the switch and the BGP peer located at IP address 172.16.1.1, and prevent BGP from using kernel routing table information to establish a route to that peer.

```
switch(config)#router bgp 64496
switch(config-router-bgp)#no neighbor 172.16.1.1 route-to-peer
switch(config-router-bgp)#neighbor 172.16.1.1 remote-as 100
switch(config-router-bgp)#
```

---

#### 14.5.4.75 neighbor send-community add / remove

The **neighbor send-community add / remove** command modifies the types of community path attributes included for routes in the UPDATE messages advertised to the specified BGP neighbor without having to issue the **no neighbor send-community** command.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
neighbor neighbor_ID send-community {add | remove} {extended | large | standard}
```

##### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- **add** appends the specified community path attribute type to the list of community path attribute types sent to the specified neighbor.
- **remove** removes the specified community path attribute type from the list of community path attribute types sent to the specified neighbor.
- **extended** enables (or disables) sending of the extended community path attribute to the specified neighbor.
- **large** enables (or disables) sending of the large community path attribute to the specified neighbor.
- **standard** enables (or disables) sending of the standard community path attribute to the specified neighbor.
- **link-bandwidth** see [neighbor send-community link-bandwidth](#) for a description of this parameter.

##### Guidelines

- If the **neighbor send-community** command has been issued for the neighbor without specifying any community types, that neighbor will receive all community attributes in the routes advertised to it. Using the **neighbor send-community add** command then to add an attribute will cause the switch to send *only* the specified community types in advertised routes. This will result in the other community path attributes no longer being advertised to that BGP peer.
- If all community types are removed using the **neighbor send-community remove** command, the switch will then send routes with all community types. (This behavior is maintained for backward compatibility.) To remove all community path attributes from routes sent to the specified neighbor, use the **no neighbor send-community** command.
- After using this command, issue the **show active** command in Router-BGP Configuration Mode to ensure that the intended attributes are being sent to the specified neighbor.

##### Examples

- These commands configure the switch to send large community attributes in the routes sent to the neighbor at address 10.5.2.24, then add extended community attributes as well.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.5.2.24 send-community large
switch(config-router-bgp)#neighbor 10.5.2.24 send-community add
extended
switch(config-router-bgp)#show active
switch(config-router-bgp)#neighbor 10.5.2.24 send-community add
extended
switch(config-router-bgp)#show active
router bgp 9
  neighbor 10.5.2.24 send-community extended large
  neighbor 10.5.2.24 maximum-routes 12000
switch(config-router-bgp)#
```

- These commands configure the switch to include extended and large community attributes in the routes sent to the neighbor at address 10.5.2.27, then remove the large attribute from the list of community types to be included.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.5.2.27 send-community extended
large
switch(config-router-bgp)#neighbor 10.5.2.27 send-community remove
large
switch(config-router-bgp)#show active
router bgp 600
  neighbor 10.5.2.27 send-community extended
  neighbor 10.5.2.27 maximum-routes 12000
switch(config-router-bgp)#
```

- These commands attempt to configure the switch to remove large community attributes from routes sent to the neighbor at address 10.5.2.28, but send all others. However, because the original command did not specify a list of attributes, the **remove** command has no effect, and all community path attributes are still included.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.5.2.28 send-community
switch(config-router-bgp)#neighbor 10.5.2.28 send-community remove
large
switch(config-router-bgp)#show active
router bgp 600
  neighbor 10.5.2.28 send-community
  neighbor 10.5.2.28 maximum-routes 12000
switch(config-router-bgp)#
```

- These commands configure the switch to send only large community attributes in routes sent to the neighbor at address 10.5.2.29, then attempt to remove the large attribute from sent routes. However, because this removes the last specified attribute, *all* community path attributes (including large) will now be included.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.5.2.29 send-community large
switch(config-router-bgp)#neighbor 10.5.2.28 send-community remove
large
switch(config-router-bgp)#show active
router bgp 600
  neighbor 10.5.2.29 send-community
  neighbor 10.5.2.29 maximum-routes 12000
switch(config-router-bgp)#
```

#### 14.5.4.76 neighbor send-community link-bandwidth

The **neighbor send-community link-bandwidth** command is used to locally regenerate the link-bandwidth value to be advertised to a specific BGP neighbor or peer group. When this command is configured the regenerated link-bandwidth value is included in the extended community path attribute in UPDATE messages.

This command is used specifically for local regeneration of the link-bandwidth value. To send an explicitly-configured link-bandwidth value, add an extended community to a route map instead. (see [set extcommunity \(route-map\)](#)) and include extended community attributes in UPDATE messages sent to that neighbor.

**Note:** The **neighbor send-community** command will override this command and vice-versa.

The **no neighbor send-community** command applies the system default (not sending community attributes in BGP UPDATE messages) for the specified peer.

The **default neighbor send-community** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor neighbor_ID send-community link-bandwidth {aggregate [reference_speed] | divide {equal | ratio}}
```

```
no neighbor neighbor_ID send-community
```

```
default neighbor neighbor_ID send-community
```

#### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- aggregate sends the sum of all link-bandwidth values for all paths toward a prefix to the specified neighbor or to each member of the specified peer group.
  - *reference\_speed* optional value to specify a reference link speed in bits/second. Values range from 0.0 to 4294967295.0; larger values can also be expressed using the multiplier K (\*10<sup>3</sup>), M (\*10<sup>6</sup>), or G (\*10<sup>9</sup>). The link speed of the connection to the peer is divided by this value, and the resulting ratio is used to scale down the link-bandwidth advertised to the peer. If the result is >1, the multiplier is ignored and the full aggregate value is advertised.
- divide divides the cumulative link-bandwidth value described above among the peers in an Adj-RIB-Out either equally or proportionally.
  - equal divides the cumulative total link-bandwidth value equally among all peers in the same Adj-RIB-Out.
  - ratio divides the cumulative total link-bandwidth value among peers proportionally according to the speed of the connection to each peer in the Adj-RIB-Out.

#### Examples

- These commands configure the switch to locally regenerate the link-bandwidth value, dividing the bandwidth proportionally and including it in UPDATE messages to all peers in the peer group "idaho."

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor idaho send-community link-bandwidth
divide ratio
switch(config-router-bgp)#
```

- These commands configure the switch to locally regenerate the link-bandwidth value, scale it down with a reference link speed of 20 gigabits/second, and include it in UPDATE messages to the neighbor at address 10.5.2.24.

```
switch(config)#router bgp 9  
switch(config-router-bgp)#neighbor 10.5.2.24 send-community link-  
bandwidth aggregate 20G  
switch(config-router-bgp)#
```

---

### 14.5.4.77 neighbor send-community

The **neighbor send-community** command configures the switch to include community path attributes for routes in the UPDATE messages advertised to the specified BGP neighbor. By default, the command enables the switch to send all community attributes: standard, extended, and large. To advertise *only a subset* of community attributes, use the keyword(s) for the community attribute(s) to be included. To add additional community attributes in a separate command, or to remove specific community attributes from advertised routes, use the **neighbor send-community add / remove** command.

**Note:** The **neighbor send-community link-bandwidth** command will override this command and vice-versa.

The **no neighbor send-community** command applies the system default (not sending community attributes in BGP UPDATE messages) for the specified peer.

The **default neighbor send-community** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor neighbor_ID send-community [extended] [large] [standard]
```

#### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- *extended* includes extended community attributes.
- *large* includes large community attributes.
- *standard* includes standard community attributes.

#### Examples

- These commands configure the switch to send all community attributes to the neighbor at address 10.5.2.23.

```
switch(config)#router bgp 9  
switch(config-router-bgp)#neighbor 10.5.2.23 send-community  
switch(config-router-bgp)#
```

- These commands configure the switch to include only large community attributes in the routes sent to the neighbor at address 10.5.2.24.

```
switch(config)#router bgp 9  
switch(config-router-bgp)#neighbor 10.5.2.24 send-community large  
switch(config-router-bgp)#
```

- These commands configure the switch to send only standard and large community attributes to the neighbor at address 10.5.2.25.

```
switch(config)#router bgp 9  
switch(config-router-bgp)#neighbor 10.5.2.25 send-community standard  
large  
switch(config-router-bgp)#
```

### 14.5.4.78 neighbor shutdown

The **neighbor shutdown** command disables the specified neighbor. Disabling a neighbor also terminates all of its active sessions and removes associated routing information.

The **no neighbor shutdown** command enables the specified peer.

The default neighbor shutdown command enables individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor neighbor_ID shutdown
```

#### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.

#### Example

- This command disables the neighbor at 10.5.2.23.

```
switch(config)#router bgp 9  
switch(config-router-bgp)#neighbor 10.5.2.23 shutdown  
switch(config-router-bgp)#
```

---

#### 14.5.4.79 neighbor timers

The `neighbor timers` command configures the BGP keepalive and hold times for a specified peer connection. The `timers bgp` command configures the times on all peer connections for which an individual command is not specified.

- **Keepalive time** is the period between the transmission of consecutive keepalive messages.
- **Hold time** is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering.

The hold time must be at least 3 seconds and should be three times longer than the keepalive setting.

The `no neighbor timers` command applies the system default for the specified peer or group (the timers specified by the `timers bgp` command).

The `default neighbor timers` command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
neighbor neighbor_ID timers keep_alive hold_time
```

```
no neighbor neighbor_ID timers
```

```
default neighbor neighbor_ID timers
```

##### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- *keep\_alive* keepalive period, in seconds. Values include
  - **0** keepalive messages are not sent.
  - **1 to 3600** keepalive time (seconds).
- *hold\_time* hold time. Values include:
  - **0** peering is not disabled by timeout expiry; keepalive packets are not sent.
  - **3 to 7200** hold time (seconds).

##### Example

- This command sets the keepalive time to 30 seconds and the hold time to 90 seconds for the connection with the peer at 10.24.15.9.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.24.15.9 timers 30 90
switch(config-router-bgp)#
```

#### 14.5.4.80 neighbor ttl maximum-hops

The `neighbor ttl maximum-hops` command configures the Generalized TTL Security Mechanism (GTSM) for the specified neighbor(s).

The `no neighbor ttl maximum-hops` command disables the GTSM configuration in the specified neighbor.

The `default neighbor ttl maximum-hops` command applies the system default configuration for individual neighbors; and applies the peer group's setting for neighbors that are members of a peer group.

**Command-Mode**

Router-BGP Configuration

**Command Syntax**`neighbor neighbor_ID ttl maximum-hops hop_number``no neighbor neighbor_ID ttl maximum-hops``default neighbor neighbor_ID ttl maximum-hops`**Parameters**

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- *hop\_number* maximum count of hops from a BGP peer. Values range from 0 to 254.

**Example**

- This command configures the TTL security for **10.20.20.30** with a maximum of four hops.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.20.20.30 ttl maximum-hops 4
switch(config-router-bgp)#
```

---

#### 14.5.4.81 neighbor update-source

The **neighbor update-source** command specifies the interface that BGP sessions use for TCP connections. By default, BGP sessions use the neighbor's closest interface (also known as the best local address).

The **no neighbor update-source** command applies the system default (using best local address for TCP connections) for the specified peer or group.

The default **neighbor update-source** command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
neighbor neighbor_ID update-source INTERFACE
```

```
no neighbor neighbor_ID update-source
```

```
default neighbor neighbor_ID update-source
```

##### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- INTERFACE interface type and number. Options include:
  - ethernet *e\_num* Ethernet interface specified by *e\_num*.
  - loopback *l\_num* loopback interface specified by *l\_num*.
  - management *m\_num* management interface specified by *m\_num*.
  - port-channel *p\_num* port-channel interface specified by *p\_num*.
  - vlan *v\_num* VLAN interface specified by *v\_num*.

##### Example

- This command configures the switch to use Ethernet interface 10 for TCP connections for the neighbor at 10.2.2.14.

```
switch(config)#router bgp 9  
switch(config-router-bgp)#neighbor 10.2.2.14 update-source ethernet 10  
switch(config-router-bgp)#
```

### 14.5.4.82 neighbor weight

The **neighbor weight** command assigns a weight attribute value to paths from the specified neighbor. Weight is the first parameter that the BGP best-path selection algorithm considers. When multiple paths to a destination prefix exist, the best-path selection algorithm prefers the path with the highest weight. Other attributes are used only when all paths to the prefix have the same weight.

Weight values range from 0 to 65535 and are not propagated to other switches through route updates. The default weight for paths that the router originates is 32768; the default weight for routes received through BGP is 0.

A path's BGP weight is also configurable through route maps. Weight values set through route-map commands have precedence over neighbor weight command values.

The **no neighbor weight** command applies the system default (32768 for router-originated paths, 0 for routes received through BGP) for the specified peer or group.

The **default neighbor weight** command applies the system default for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor neighbor_ID weight weight_value
```

```
no neighbor neighbor_ID weight
```

```
default neighbor neighbor_ID weight
```

#### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address or peer group name.
- *weight\_value* weight value. Values range from 1 to 65535.

#### Example

- This command specifies a weight of 4000 for all paths from the neighbor at 10.1.2.5.

```
switch(config)#router bgp 9  
eswitch(config-router-bgp)#neighbor 10.1.2.5 weight 4000  
switch(config-router-bgp)#
```

---

### 14.5.4.83 network (BGP)

The **network** command specifies a network for advertisement through UPDATE packets to BGP peers. The configuration zeros the host portion of the specified network address; for example, 192.0.2.4/24 is stored as 192.0.2.0/24. A route map option is available for assigning attributes to the network.

The command is available in Router-BGP and Router-BGP-Address-Family configuration modes. The mode in which the command is issued does not affect the command. The scope of the command depends on the specified network address:

- commands with an IPv4 address are advertised to peers activated in the IPv4 address family.
- commands with an IPv6 address are advertised to peers activated in the IPv6 address family.

The **no network** and **default network** commands remove the network from the routing table, preventing its advertisement.

#### Command Mode

Router-BGP Configuration

Router-BGP Address-Family Configuration

#### Command Syntax

```
network NET_ADDRESS [ROUTE_MAP]
```

```
no network NET_ADDRESS
```

```
default network NET_ADDRESS
```

#### Parameters

- NET\_ADDRESS IP address range. Entry options include:
  - *ipv4\_subnet* IPv4 subnet (CIDR notation).
  - *ipv4\_addr mask subnet* IPv4 subnet (address-mask notation).
  - *ipv6\_prefix* neighbor's IPv6 prefix (CIDR notation).
- ROUTE\_MAP specifies route map that assigns attribute values to the network. Options include:
  - <no parameter> attributes are not assigned through a route map.
  - route-map *map\_name* attributes listed by specified route map are assigned to the network.

#### Example

- This command enables BGP advertising for the network located at 10.1.2.5. The configuration stores the network as 10.1.2.5.

```
switch(config)#router bgp 9  
switch(config-router-bgp)#network 10.1.2.5/24  
switch(config-router-bgp)#
```

#### 14.5.4.84 no neighbor

The **no neighbor** command removes all neighbor configuration commands for the specified neighbor.

Neighbor settings can also be removed individually; refer to the command description page of the desired command for details. Neighbor settings for a peer group *must* be removed individually.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
no neighbor neighbor_ID
```

```
default neighbor neighbor_ID
```

##### Parameters

- *neighbor\_ID* neighbor's IPv4 or IPv6 address. This command does not accept a peer group name as an argument; peer group settings must be removed individually.

##### Example

- This command removes all neighbor configuration commands for the neighbor at 10.1.1.1.

```
switch(config)#router bgp 9  
switch(config-router-bgp)#no neighbor 10.1.1.1  
switch(config-router-bgp)#
```

---

#### 14.5.4.85 rd (Router-BGP VRF and VNI Configuration Modes)

The **rd** command adds a route distinguisher (RD) to VRF and VNI configuration modes. RDs internally identify routes belonging to a VRF or VNI to distinguish overlapping or duplicate IP address ranges. This allows the creation of distinct routes to the same IP address for different VPNs. The RD is a 64-bit number made up of an AS number or IPv4 address followed by a user-selected ID number.

If the switch is not running EVPN, an RD is not required for a VRF or VNI to function. Use **no** or **default** command forms to remove an RD from a VRF or VNI.

**Note:** Legacy RDs that were assigned in VRF Configuration Mode appear in **show vrf** outputs if an RD has not been configured using this command, but they no longer have an effect on the system. RDs assigned in the VNI Configuration Mode are displayed in the output of **show bgp evpn** command.

#### Command Modes

Router-BGP VRF Configuration

Router-BGP VNI Configuration

#### Command Syntax

```
rd admin_ID:local_assignment
```

```
no rd
```

```
default rd
```

#### Parameters

- *admin\_ID* an AS number or globally assigned IPv4 address identifying the entity assigning the RD. This should be an IANA-assigned identifying number.
- *local\_assignment* a locally assigned number distinguishing the VRF. Values range from 0-65535 if the *admin\_ID* is an IPv4 address, or from 0-4,294,967,295 if the *admin\_ID* is an AS number. If the *admin\_ID* is an AS number, the *local\_assignment* can also be entered in the form of an IPv4 address.

#### Examples

- These commands identify the administrator of the VRF called “purple” as AS 530 and assign 12 as its local number.

```
switch(config)#router bgp 50
switch(config-router-bgp)#vrf purple
switch(config-router-bgp-vrf-purple)#rd 530:12
switch(config-router-bgp-vrf-purple)#
```

- These commands identify the administrator of the MAC-VRF called “bundle1” as AS 530 and assign 12 as its local number.

```
cvx(config)#router bgp 100
cvx(config-router-bgp)#vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)#rd 530:12
cvx(config-macvrf-bundle1)#
```

### 14.5.4.86 redistribute (BGP)

The **redistribute** command enables the redistribution of specified routes to the BGP domain.

The **no redistribute** and **default redistribute** commands disable route redistribution from the specified domain by removing the corresponding **redistribute** command from *running-config*.

**Note:** Aggregate routes are redistributed automatically, and their redistribution cannot be disabled.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
redistribute ROUTE_TYPE [ROUTE_MAP]
```

```
no redistribute ROUTE_TYPE
```

```
default redistribute ROUTE_TYPE
```

#### Parameters

- ROUTE\_TYPE source from which routes are redistributed. Options include:
  - connected routes that are established when IP is enabled on an interface.
  - match nssa-external all OSPF NSSA external routes.
  - match nssa-external 1 type 1 OSPF NSSA external routes.
  - match nssa-external 2 type 2 OSPF NSSA external routes.
  - ospf routes from an OSPF domain.
  - ospf match external routes external to the AS, but imported from OSPF.
  - ospf match internal OSPF routes that are internal to the AS.
  - ospf match nssa-external all OSPF NSSA external routes.
  - ospf match nssa-external 1 type 1 OSPF NSSA external routes.
  - ospf match nssa-external 2 type 2 OSPF NSSA external routes.
  - ospf3 routes from an OSPFv3 domain.
  - ospf3 match external routes external to the AS, but imported from OSPFv3.
  - ospf3 match internal OSPFv3 routes that are internal to the AS.
  - rip routes from a RIP domain.
  - static IP static routes.
  - isis IS-IS routes. Sub-options include.
    - level-1 redistribute IS-IS level-1 routes.
    - level-1-2 redistribute IS-IS level-1 and level-2 routes.
    - level-2 redistribute IS-IS level-2 routes.
    - route-map route map reference.
- ROUTE\_MAP route map that determines the routes that are redistributed. Options include:
  - <no parameter> all routes are redistributed.
  - route-map *map\_name* only routes in the specified route map are redistributed.

**Note:** While redistributing IS-IS routes into BGP, the level-1 or level-2 keyword can be used to selectively redistribute level-1 routes or level-2 routes into BGP. The level-1 or level-2 keyword is optional, and the command defaults to level-2 when it is not configured.

#### Example

- These commands redistribute OSPF routes into the BGP domain.

```
switch(config)#router bgp 1
```

---

```
switch(config-router-bgp) #redistribute OSPF  
switch(config-router-bgp) #
```

- These commands redistribute ISIS routes into the BGP domain in address-family mode.

```
Switch(config) #router bgp 1  
switch(config-router-bgp) #address-family ipv4  
switch(config-router-bgp-af) #redistribute isis level-1 route-map isis-  
to-bgp-v4  
switch(config-router-bgp-af) #
```

- These commands redistribute ISIS routes into the BGP domain in router-bgp mode.

```
switch(config) #router bgp 1  
switch(config-router-bgp) #redistribute isis level-1 route-map isis-to-  
bgp  
switch(config) #
```

### 14.5.4.87 router bgp

The **router bgp** command places the switch in router-BGP configuration mode. If BGP was not previously instantiated, this command creates a BGP instance with the specified AS number. Router-BGP configuration mode is not a group-change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

When a BGP instance exists, the command must include the AS number of the existing BGP instance. Running this command with a different AS number generates an error message.

The **no router bgp** and **default router bgp** commands delete the BGP instance.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
router bgp as_id
```

```
no router bgp
```

```
default router bgp
```

#### Parameters

- *as\_id* autonomous system (AS) number. Values range from 1 to 4294967295.

#### Examples

- This command creates a BGP instance with AS number 64500.

```
switch(config)#router bgp 64500  
switch(config-router-bgp)#
```

- This command attempts to open a BGP instance with a different AS number from that of the existing instance. The switch displays an error and stays in global configuration mode.

```
switch(config)#router bgp 64501  
% BGP is already running with AS number 64500  
switch(config)#
```

- This command exits BGP configuration mode.

```
switch(config-router-bgp)#exit  
switch(config)#
```

- This command deletes the BGP instance.

```
switch(config)#no router bgp  
switch(config)#
```

---

#### 14.5.4.88 router-id (BGP)

The `router-id` command sets the local router BGP router ID.

When no ID has been specified, the local router ID is set to the following:

- the loopback IP address when a single loopback interface is configured.
- the loopback with the highest IP address when multiple loopback interfaces are configured.
- the highest IP address on a physical interface when no loopback interfaces are configured.

**Note:** The router ID must be specified if the switch has no IPv4 addresses configured.

The `no router-id` and `default router-id` commands remove the `router-id` command from *running-config*.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
router-id id_num
```

```
no router-id [id_num]
```

```
default router-id [id_num]
```

##### Parameters

- *id\_num* router ID number (32-bit dotted decimal notation).

##### Example

- This command configures the fixed router ID address of 10.10.4.11.

```
switch(config)#router bgp 9  
switch(config-router-bgp)#router-id 10.10.4.11  
switch(config-router-bgp)#
```

### 14.5.4.89 show bgp convergence

The **show bgp convergence** command displays information about the Border Gateway Protocol (BGP) convergence state and other statistics about the BGP instance in the specified VRF or in all VRFs.

#### Command Mode

EXEC

#### Command Syntax

```
show bgp convergence [VRF_INSTANCE]
```

#### Parameters

- VRF\_INSTANCE specifies VRF instances. Options include:
  - <no parameter> displays BGP information for the context-active VRF.
  - vrf *vrf\_name* displays BGP information for the specified VRF.
  - vrf all displays BGP information for all VRFs.
  - vrf default displays BGP information for the default VRF.

#### Examples

- This command displays the output when no peers have joined before convergence.

```
switch#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event : None
Bgp convergence state : Not Initiated (Waiting for the first peer to
join)
Convergence timer is not running
Convergence timeout in use: 00:02:30
Convergence slow peer timeout in use: 00:00:55
First peer is not up yet
All the expected peers are up: no
All IGP protocols have converged: yes
Outstanding EORs: 0, Outstanding Keepalives: 0
Pending Peers: 2
Total Peers: 2
Established Peers: 0
Disabled Peers: 0
Peers that have not converged yet:
IPv4 peers:
201.1.1.1 (Session : Connect)
202.1.1.1 (Session : Connect)
IPv6 peers:
None
switch#
```

- This command displays the output when the first peer has joined before convergence.

```
switch#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:40 ago
Bgp convergence state : Pending (Waiting for EORs/Keepalives from
peer(s) and IGP
convergence)
```

```
Convergence timer running, will expire in 00:01:50
Convergence timeout in use: 00:02:30
Convergence slow peer timeout in use: 00:00:55
First peer came up 00:00:13 ago
All the expected peers are up: no
All IGP protocols have converged: yes
Outstanding EORs: 0, Outstanding Keepalives: 0
Pending Peers: 1
Total Peers: 2
Established Peers: 1
Disabled Peers: 0
Peers that have not converged yet:
IPv4 peers:
201.1.1.1 (Session : Active)
IPv6 peers:
None
switch#
```

- This command displays the output when the convergence timeout value is reached.

```
switch#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:02:44 ago
Bgp convergence state : Timeout reached
Time taken to converge 00:02:30
Pending Peers: 1
Total Peers: 2
Established Peers: 1
Disabled Peers: 0
Peers that did not converge before local bgp convergence:
IPv4 peers:
201.1.1.1 (Session : Active)
202.1.1.1 (Session : Established)
IPv6 peers:
None
switch#
```

- This command displays the output during the converged state.

```
switch#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:05:00
Configured convergence slow peer timeout: 00:01:30
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:05 ago
Bgp convergence state : Converged
Time taken to converge 00:00:02
First peer came up 00:00:05 ago
Pending Peers: 0
Total Peers: 3
Established Peers: 3
Disabled Peers: 0
Peers that did not converge before local bgp convergence:
IPv4 peers:
None
IPv6 peers:
None
switch#
```

### 14.5.4.90 show bgp instance

The **show bgp instance** command displays summary Border Gateway Protocol (BGP) information about the BGP instance in the specified VRF or in all VRFs.

#### Command Mode

EXEC

#### Command Syntax

```
show bgp instance [VRF_INSTANCE]
```

#### Parameters

- VRF\_INSTANCE specifies VRF instances. Options include:
  - <no parameter> displays BGP information for the context-active VRF.
  - vrf *vrf\_name* displays BGP information for the specified VRF.
  - vrf all displays BGP information for all VRFs.
  - vrf default displays BGP information for the default VRF.

#### Examples

- This command displays information about the BGP instance in the context-active VRF.

```
switch#show bgp instance
BGP instance information for VRF purple
BGP Local AS: 64497, Router ID: 1.2.3.5
Total peers: 5
Configured peers: 3
  UnConfigured peers: 2
  Disabled peers: 0
  Established peers: 3
Graceful restart helper mode enabled
End of rib timer timeout: 00:05:00
BGP Convergence timer is inactive
BGP Convergence information:
  BGP has converged:no
  Outstanding EORs:0,Outstanding Keepalives: 0
  Convergence timeout: 00:10:00
switch#
```

- This command displays information about the BGP instance in the default VRF.

```
switch#show bgp instance vrf default
BGP instance information for VRF default
BGP Local AS: 64503, Router ID: 1.2.3.5
Total peers: 1
Configured peers: 1
  UnConfigured peers: 0
  Disabled peers: 0
  Established peers: 0
Graceful restart helper mode enabled
End of rib timer timeout: 00:05:00
BGP Convergence timer is inactive
BGP Convergence information:
  BGP has converged:no
  Outstanding EORs:0,Outstanding Keepalives: 0
  Convergence timeout: 00:10:00
switch#
```

#### 14.5.4.91 show bgp labeled-unicast tunnel

The `show bgp labeled-unicast tunnel` command displays the contents of the BGP labeled-unicast (LU) tunnel table. The user can optionally specify a tunnel index parameter to view the specific single tunnel information.

##### Command Mode

EXEC

##### Command Syntax

```
show bgp labeled-unicast tunnel tunnel_index
```

##### Parameters

- *tunnel\_index* index to view single tunnel information.

##### Example

- This command displays the BGP LU tunnel table.

```
switch#show bgp labeled-unicast tunnel
Index Endpoint Nexthop Interface Labels Contributing Metric Metric 2 Pref Pref 2
-----
5 2.0.0.0/24 10.1.1.2 'Ethernet3' [ 123 899 900 ] Yes 0 100 200 0
6 2.0.1.0/24 10.1.1.2 'Ethernet3' [ 400 500 600 ] Yes 0 100 200 0
7 2.0.2.0/24 10.1.1.2 'Ethernet3' [ 400 500 600 ] Yes 0 100 200 0
switch#
```

- This command displays the BGP LU tunnel table for tunnel index 4.

```
switch#show bgp labeled-unicast tunnel 4
Index Endpoint Nexthop/Tunnel Index Interface Labels Contributing Metric Metric 2 Pref Pref 2
-----
4 10.253.0.10/32 10.1.0.0 Port-Channel111 [ 3 ] Yes 0 0 200 0
switch#
```

#### 14.5.4.92 show ip as-path access-list

The **show ip as-path access-list** command displays BGP filters on the switch. Specifying an access list displays the statements from that access list. Entering the command without parameters displays the statements from all access lists on the switch.

##### Command Mode

EXEC

##### Command Syntax

```
show ip as-path access-list [list_name]
```

##### Parameters

- *list\_name* the name of an AS path access list.

##### Example

- This command displays the contents of the AS path access list named “list1.”

```
switch#show ip as-path access-list list1  
ip as-path access-list list1 deny _3$  
ip as-path access-list list1 permit .*  
switch#
```

---

### 14.5.4.93 show ip bgp community

The **show ip bgp community** command displays Border Gateway Protocol (BGP) routing table entries, filtered by community.

#### Command Mode

EXEC

#### Command Syntax

```
show ip bgp community COMM_1 [COMM_2... COMM_n] [MATCH_TYPE] [DATA_OPTION]
[VRF_INSTANCE]
```

#### Parameters

- COMM\_x community number or name, as specified in the route map that sets the community list number.
  - GSHUT well-known graceful shutdown community.
  - aa:nn AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - comm\_num community number. Values range from 1 to 4294967040.
  - internet advertises route to Internet community.
  - local-as advertises route only to local peers.
  - no-advertise does not advertise the route to any peer.
  - no-export advertises route only within BGP AS boundary.
- MATCH\_TYPE routes are filtered based on their communities. Options include:
  - <no parameter> routes must match at least one community in the list.
  - exact route must match all communities and include no other communities.
  - regex display routes matching the regular expression of communities.
- DATA\_OPTION type of information the command displays. Options include:
  - <no parameter> displays table of the routing entry line items.
  - detail displays data block for each routing table entry.
- VRF\_INSTANCE specifies VRF instances. Options include:
  - <no parameter> displays routing table for context-active VRF.
  - vrf vrf\_name displays routing table for the specified VRF.
  - vrf all displays routing table for all VRFs.
  - vrf default displays routing table for default VRF.

#### Guidelines

The interpretation of regular expressions is always based on string mode but not on the ACL configuration.

#### Example

- This command displays the BGP routing table entries with the community 64496:1000.

```
switch#show ip bgp community 64496:1000 detail
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
BGP routing table entry for 10.100.1.0/24
Paths: 1 available
 64496 64497 65536
 10.1.0.100 from 10.1.0.100 (10.0.0.100)
   Origin IGP, metric 0, localpref 100, IGP metric 1, weight 0,
   received 00:03:16 ago, valid, external, best
   Community: 655:23590 64496:1000
   Rx SAFI: Unicast
```

```
switch#
```

---

#### 14.5.4.94 show ip bgp installed

The `show ip bgp installed` command displays the list of installed routes in the RIB.

##### Command Mode

EXEC

##### Command Syntax

```
show ip bgp installed
```

##### Example

- This command displays the list of installed routes in the RIB.

```
switch#show ip bgp installed
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not
installed, E
- ECMP head, e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL
Nexthop -
Link Local Nexthop

  Path      Network          Next Hop          Metric  LocPref Weight
  * >      6.0.0.0/24       1.0.0.1           0       100      0       ?

switch#
```

#### 14.5.4.95 show ip bgp neighbors (route type)

The `show ip bgp neighbors (route type)` command displays information for next-hop routes to a specified IPv4 neighbor. The `show ip bgp neighbors (route-type) community` command displays the same information for routes filtered by communities.

The output format depends on the selected FILTER parameter:

- data-block format displays comprehensive information for each specified route.
- tabular format displays routing table entries in tabular format for the specified IP addresses.

Commands that do not include a route type revert to the `show ip bgp neighbors` command.

#### Command Mode

EXEC

#### Command Syntax

```
show ip bgp neighbors neighbor_addr HOPDIRECT [FILTER] [VRF_INSTANCE]
```

```
show ip bgp neighbors neighbor_addr [ROUTE_TYPE] HOPDIRECT [detail]
```

#### Related Commands

- `show ip bgp neighbors`
- `show ip bgp neighbors (route-type) community`

#### Parameters

- *neighbor\_addr* location of the neighbor.
- ROUTE\_TYPE filters route on route type. Options include:
  - ipv4 unicast displays IPv4 unicast routes.
  - ipv6 unicast displays IPv6 unicast routes.
- HOPDIRECT filters route on the basis of direction from neighbor. Options include:
  - advertised-routes displays routes advertised to the specified neighbor.
  - received-routes displays routes received from the specified neighbor (accepted and rejected).
  - routes displays routes received and accepted from specified neighbor.
- FILTER routing table entries that the command displays. Values include:
  - <no parameter> displays all routing table entries in tabular format.
  - detail displays all routing table entries in data-block format.
  - *ipv4\_addr* displays IPv4 host address in data-block format.
  - *ipv4\_prefix* displays the route information of specified IPv4 prefix in data-block format. Option includes:
    - longer-prefixes displays the route information of IPv4 prefix in data-block format.
- VRF\_INSTANCE specifies VRF instances. Options include:
  - <no parameter> displays routing table for context-active VRF.
  - *vrf vrf\_name* displays routing table for the specified VRF.
  - *vrf all* displays routing table for all VRFs.
  - *vrf default* displays routing table for default VRF.

#### Example

- This command displays information for routes advertised to the neighbor at 10.3.0.103.

```
switch#show ip bgp neighbors 10.3.0.103 advertised-routes
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP
head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
```

---

Origin codes: i - IGP, e - EGP, ? - incomplete

switch#

#### 14.5.4.96 show ip bgp neighbors (route-type) community

The `show ip bgp neighbors (route type) community` command displays information for next-hop routes to a specified neighbor. Routes are filtered by community.

The `show ip bgp neighbors (route type)` command displays the same information for routes filtered by IP addresses and subnets.

##### Command Mode

EXEC

##### Command Syntax

```
show ip bgp neighbors addr RTE community CM_1 [CM_2...CM_n] [MATCH] [INFO]
[VRF_INST]
```

##### Related Commands

- `show ip bgp neighbors`
- `show ip bgp neighbors (route type)`

##### Parameters

- *addr* location of the neighbor.
- RTE type of route that the command displays. Options include:
  - advertised-routes displays routes advertised to the specified neighbor.
  - received-routes displays routes received from the specified neighbor (accepted and rejected).
  - routes displays routes received and accepted from specified neighbor.
- CM\_x community number or name, as specified in the route map that sets the community list number. The command must list at least one of the following community identifiers:
  - GSHUT well-known graceful shutdown community.
  - *aa:nn* AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - *comm\_num* community number. Values range from 1 to 4294967040.
  - internet advertises route to Internet community.
  - local-as advertises route only to local peers.
  - no-advertise does not advertise route to any peer.
  - no-export advertises route only within BGP AS boundary.
- MATCH routes are filtered based on their communities.
  - <no parameter> routes must match at least one community in the list.
  - exact route must match all communities and include no other communities.
- INFO type of information the command displays. Values include:
  - <no parameter> displays table of routing entry line items.
  - detail displays data block for each routing table entry.
- VRF\_INST specifies VRF instances. Options include:
  - <no parameter> displays routing table for context-active VRF.
  - *vrf vrf\_name* displays routing table for the specified VRF.
  - *vrf all* displays routing table for all VRFs.
  - *vrf default* displays routing table for default VRF.

##### Example

- This command lists the routes advertised to the neighbor at 10.3.0.103 with community 655:23590.

```
switch#show ip bgp neighbors 10.3.0.103 advertised-routes community 655:23590
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
```

---

```
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP
head, e - ECMP
                S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local
Nexthop

* >      Network          Next Hop          Metric  LocPref Weight  Path
65536 i   10.100.1.0/24        10.1.0.100        -        100      -        64496 64497
switch#
```

### 14.5.4.97 show ip bgp neighbors regexp

The `show ip bgp neighbors regexp` command displays information for next-hop routes to a specified IPv4 neighbor that match the AS path attributes specified in the given regular expression.

#### Command Mode

EXEC

#### Command Syntax

```
show ip bgp neighbors addr RTE regexp as_paths [VRF_INST]
```

#### Related Commands

- `show ip bgp neighbors`
- `show ip bgp neighbors (route type)`

#### Parameters

- *addr* location of the neighbor.
- RTE type of route that the command displays. Options include:
  - `advertised-routes` displays routes advertised to the specified neighbor.
  - `received-routes` displays routes received from the specified neighbor (accepted and rejected).
  - `routes` displays routes received and accepted from specified neighbor.
- *as\_paths* list of AS paths, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.
- VRF\_INST specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

#### Example

- This command lists the routes advertised to the neighbor at 10.3.0.103 where the AS path is 64496.

```
switch#show ip bgp neighbors 10.3.0.103 advertised-routes regex ^64496$
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP
                    head, e - ECMP
                        S - Stale, c - Contributing to ECMP, b - backup, L = labeled-unicast
                        % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST -Cluster List, LL Nexthop - Link Local
                    Nexthop

Network          Next Hop          Metric  LocPref  Weight  Path
* > 10.100.0.0/24  10.1.0.100        200     100     -       64496 i
* > 10.100.2.0/24  10.1.0.100         42      100     -       64496 ?
switch#
```

#### 14.5.4.98 show ip bgp neighbors

The **show ip bgp neighbors** command displays Border Gateway Protocol (BGP) and TCP-session data for a specified IPv4 BGP neighbor, or for all IPv4 BGP neighbors if an address is not specified.

##### Command Mode

EXEC

##### Command Syntax

```
show ip bgp neighbors [NEIGHBOR_ADDR] [VRF_INSTANCE]
```

##### Parameters

- NEIGHBOR\_ADDR location of the neighbors. Options include:
  - <no parameter> command displays information for all IPv4 BGP neighbors.
  - *ipv4\_addr* command displays information for specified neighbor.
- VRF\_INSTANCE specifies VRF instances. Options include:
  - <no parameter> displays routing table for context-active VRF.
  - *vrf vrf\_name* displays routing table for the specified VRF.
  - *vrf all* displays routing table for all VRFs.
  - *vrf default* displays routing table for the default VRF.

##### Related Command

- [show ip bgp neighbors \(route type\)](#)
- [show ip bgp neighbors \(route-type\) community](#)

##### Example

- This command displays information of the neighbor at 10.1.0.100.

```
switch#show ip bgp neighbors 10.1.0.100
BGP neighbor is 10.1.0.100, remote AS 64496, external link

switch#
```

---

### 14.5.4.100 show ip bgp paths

The `show ip bgp paths` command displays all BGP AS paths in the database.

#### Command Mode

EXEC

#### Command Syntax

```
show ip bgp paths [VRF_INSTANCE]
```

#### Parameters

- VRF\_INSTANCE specifies VRF instances.
  - <no parameter> displays routing table for context-active VRF.
  - vrf *vrf\_name* displays routing table for the specified VRF.
  - vrf all displays routing table for all VRFs.
  - vrf default displays routing table for default VRF.

#### Display Values

- **Refcount:** number of routes using a listed path.
- **Metric:** the path's Multi Exit Discriminator (MED).
- **Path:** the route's AS path and its origin code.

The MED (the path's external metric) provides information to external neighbors about the preferred path into an AS that has multiple entry points. Lower MED values are preferred.

#### Example

- This command displays all BGP AS paths in the switch's database.

```
switch#show ip bgp paths
Refcount Metric      Path
6         0         64510 64505 64506 64507 i (HashID 9)
6         0         64510 ? (HashID 8)
12        0         65530 65531 65532 e (HashID 5)
12        0         i (HashID 6)
6         0         64100 64200 i (HashID 4)
28        0         i (HashID 1)
7         0         ? (HashID 2)
40        0         64510 i (HashID 10)
19        0         64510 i (HashID 7)
2         0         i (HashID 3)
switch#
```

### 14.5.4.101 show ip bgp peer-group

The **show ip bgp peer-group** command displays the BGP version, address family, and group members for all BGP peer groups defined on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ip bgp peer-group [GROUP] [VRF_INSTANCE]
```

#### Parameters

- GROUP peer group for which command displays information. Options include:
  - <no parameter> command displays information for all peer groups.
  - *group\_name* name of peer group for which command displays information.
- VRF\_INSTANCE specifies VRF instances.
  - <no parameter> displays routing table for context-active VRF.
  - *vrf vrf\_name* displays routing table for the specified VRF.
  - *vrf all* displays routing table for all VRFs.
  - *vrf default* displays routing table for default VRF.

#### Example

- This command displays BGP peer group information for all peer groups on the switch.

```
switch#show ip bgp peer-group
BGP peer-group is EXTERNAL
  BGP version 4
  Static peer-group members:
    VRF default:
      10.1.0.100, state: Connect
      Negotiated MP Capabilities:
        IPv4 Unicast: No
        IPv6 Unicast: No
        IPv4 SR-TE: No
        IPv6 SR-TE: No
      10.2.0.101, state: Connect
      Negotiated MP Capabilities:
        IPv4 Unicast: No
        IPv6 Unicast: No
        IPv4 SR-TE: No
        IPv6 SR-TE: No
  BGP peer-group is INTERNAL
  BGP version 4
  Listen-range subnets:
    VRF default:
      10.3.0.0/24, remote AS 64500
  Dynamic peer-group members:
    VRF default:
switch#
```

## 14.5.4.102 show ip bgp regexp

The **show ip bgp regexp** command displays Border Gateway Protocol (BGP) IPv4 routing-table entries that match the AS path attributes specified in the given regular expression.

### Command Mode

EXEC

### Command Syntax

```
show ip bgp regexp as_paths [VRF_INSTANCE]
```

### Parameters

- *as\_paths* list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
- VRF\_INSTANCE specifies the VRF instance of the BGP routing table to be displayed. Options include:
  - <no parameter> displays routing table for context-active VRF.
  - *vrf vrf\_name* displays routing table for the specified VRF.
  - *vrf all* displays routing table for all VRFs.
  - *vrf default* displays routing table for default VRF.

### Example

- This command displays information about the BGP IPv4 routes in the context-active VRF where the AS path is 64510.

```
switch#show ip bgp regexp ^64510$
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP
                    head, e - ECMP
                        S - Stale, c - Contributing to ECMP, b - backup, L = labeled-unicast
                        % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST -Cluster List, LL Nexthop - Link Local
                    Nexthop

      Network          Next Hop          Metric  LocPref Weight  Path
*       10.2.0.0/24      10.2.0.101         0       100     0       64510 i
* >     10.101.0.0/24    10.2.0.101         0       100     0       64510 i
* >     10.101.1.0/24    10.2.0.101         0       100     0       64510 i
* >     10.101.2.0/24    10.2.0.101         0       100     0       64510 i
switch#
```

### 14.5.4.103 show ip bgp summary

The **show ip bgp summary** command displays the summary of all IPv4 and IPv6 BGP neighbors based on exchanged Address Family Identifiers (AFI) and Subsequent Address Family Identifiers (SAFI) negotiations where AFI is “IP” and SAFI is “unicast” information.

#### Command Mode

EXEC

#### Command Syntax

```
show ip bgp summary [VRF_INSTANCE]
```

#### Parameters

- VRF\_INSTANCE specifies VRF instances. Options include:
  - <no parameter> displays routing table for context-active VRF.
  - vrf *vrf\_name* displays routing table for the specified VRF.
  - vrf all displays routing table for all VRFs.
  - vrf default displays routing table for default VRF.

#### Display Values

##### Header Row

- **BGP router identifier**: the router identifier loopback address or highest IP address.
- **Local AS Number**: AS number assigned to the switch.

##### Neighbor Table Columns

- **(First) Neighbor**: neighbor's IP address.
- **(Second) V**: BGP version number.
- **(Third) AS**: neighbor's AS number.
- **(Fourth) MsgRcvd**: messages received from the neighbor.
- **(Fifth) MsgSent**: messages sent to neighbor.
- **(Sixth) InQ**: messages queued from neighbor.
- **(Seventh) OutQ**: messages queued to send neighbor.
- **(Eighth) Up/Down**: period the BGP session has been Established, or its current status.
- **(Ninth) State**: State of the BGP session and the number of routes received from a neighbor.

After the maximum number of routes are received, the ninth field displays **PfxRcd**, and the connection becomes Idle. Maximum number of routes is set using the [maximum paths \(BGP\)](#) command.

#### Related Command

- [show ipv6 bgp summary](#)

#### Example

- This command displays the status of the switch's BGP connections.

```
switch#show ip bgp summary
BGP summary information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Neighbor Status Codes: m - Under maintenance
  Neighbor      V  AS      MsgRcvd  MsgSent  InQ  OutQ  Up/Down  State  PfxRcd
  PfxAcc
  10.1.0.100    4  64496    1075     1083    0    0 00:04:04 Connect
  10.2.0.101    4  64510    1079     1088    0    0 00:04:14 Connect
switch#
```

#### 14.5.4.104 show ip bgp

The **show ip bgp** command displays Border Gateway Protocol (BGP) IPv4 routing table entries. The output format depends on the command parameters:

- **data-block format** displays comprehensive information for each specified BGP routing-table entry.
- **tabular format** displays routing-table entries for the specified IPv4 addresses.

#### Command Mode

EXEC

#### Command Syntax

```
show ip bgp [FILTER] [VRF_INSTANCE]
```

#### Parameters

- FILTER routing-table entries to display. Options include:
  - <no parameter> displays all routing-table entries in tabular format.
  - detail displays all routing-table entries in data-block format.
  - *ipv4\_addr* displays IPv4 host address in data-block format.
  - PREFIX displays the route information of the specified IPv4 prefix in data block format. Options include:
    - detail *ipv4\_prefix* displays the detailed route information of specified IPv4 prefix in data block format.
    - longer-prefixes *ipv4\_prefix* displays the route information of IPv4 prefix in tabular block format.
    - longer-prefixes detail *ipv4\_prefix* displays the detailed route information of specified IPv4 prefix in data block format.
  - community-list *cmnty\_list\_name* displays BGP routes filtered by the specified community list.
  - installed displays the information of installed BGP routes.
  - labeled-unicast displays the information of labeled-unicast BGP routes only.
  - not-installed displays the information of BGP routes that are not installed.
- VRF\_INSTANCE specifies VRF instances. Options include:
  - <no parameter> displays routing table for context-active VRF.
  - vrf *vrf\_name* displays routing table for the specified VRF.
  - vrf all displays routing table for all VRFs.
  - vrf default displays routing table for default VRF.

#### Guidelines

You must provide the IPv4 prefix in CIDR notation.

#### Examples

- This command displays the BGP routing table with prefix “L” flag for all BGP LU route entries.

```
switch#show ip bgp
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E
- ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop -
Link Local Nexthop

      Network          Next Hop      Metric      LocPref      Weight      Path

```

### 14.5.4.105 show ip community-list

The **show ip community-list** command displays the BGP community lists configured on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ip community-list [COMMUNITY_LIST]
```

#### Parameters

- **COMMUNITY\_LIST** community list for which command displays information. Options include:
  - **<no parameter>** command displays information for all community lists.
  - *listname* name of the community list (text string).

#### Example

- This command displays the BGP paths in the switch's database.

```
switch#show ip community-list hs-comm-list
ip community-list hs-comm-list permit 0:10
switch#
```

---

#### 14.5.4.106 show ip extcommunity-list

The **show ip extcommunity-list** command displays the BGP extended community lists configured on the switch.

##### Command Mode

EXEC

##### Command Syntax

```
show ip extcommunity-list [COMMUNITY_LIST]
```

##### Parameters

- **COMMUNITY\_LIST** extended community list for which command displays information. Options include:
  - `<no parameter>` command displays information for all extended community lists.
  - `listname` command displays information for the specified extended community list.

##### Example

- This command displays information for all extended extcommunity lists on the switch.

```
switch#show ip extcommunity-list
ip extcommunity-list hs-extcomm-list permit rt 3050:20
ip extcommunity-list hs-extcomm-list permit soo 172.17.52.2:30
ip extcommunity-list hs-extcomm-list permit rt 3050:70000
switch#
```

### 14.5.4.107 show ipv6 bgp match community

The **show ipv6 bgp match community** command displays IPv6 Border Gateway Protocol (BGP) routing-table entries, filtered by community.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 bgp match community [COMM_1 ... COMM_n] [MATCH_TYPE] [INFO]
[VRF_INSTANCE]
```

#### Parameters

- COMM\_x community number or name, as specified in the route map that sets the community-list number. Options include:
  - aa:nn AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - comm\_num community number. Values range from 1 to 4294967040.
  - internet advertises route to Internet community.
  - local-as advertises route only to local peers.
  - no-advertise does not advertise route to any peer.
  - no-export advertises route only within BGP AS boundary.
- MATCH\_TYPE routes are filtered based on their communities. Options include:
  - <no parameter> routes must match at least one community in the list.
  - exact route must match all communities and include no other communities.
- INFO type of information the command displays. Options include:
  - <no parameter> displays table of the routing entry-line items.
  - detail displays data block for each routing-table entry.
- VRF\_INSTANCE specifies VRF instances. Options include:
  - <no parameter> displays routing-table for context-active VRF.
  - vrf vrf\_name displays routing table for the specified VRF.
  - vrf all displays routing table for all VRFs.
  - vrf default displays routing table for default VRF.

#### Example

- This command displays information in data-block format for each routing-table entry with community 655:23590.

```
switch(config)#show ipv6 bgp match community 655:23590 detail
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
BGP routing table entry for 2001:10:100:1::/64
  Paths: 1 available
        64496 64497 65536
        2001:10:1::100 from 2001:10:1::100 (10.0.0.100)
          Origin IGP, metric 0, localpref 100, IGP metric 1, weight 0,
          received 01:09:29 ago, valid, external, best
          Community: 655:23590 64496:1000
          Rx SAFI: Unicast
switch(config)#
```

---

#### 14.5.4.108 show ipv6 bgp peers (route type) community

The `show ipv6 bgp peers (route type) community` command displays information about the routes either advertised to or received from a specified IPv6 BGP neighbor. The routes are filtered by community.

The `show ipv6 bgp peers (route type)` command displays the same information for routes filtered by IP addresses and prefixes.

##### Command Mode

EXEC

##### Command Syntax

```
show ipv6 bgp peers addr RTE community CM_1 [CM_2...CM_n] [MATCH] [INFO] [VRF_INST]
```

##### Parameters

- *addr* neighbor location (IPv6 address).
- RTE type of route that the command displays. Options include:
  - advertised-routes displays routes advertised to the specified neighbor.
  - received-routes displays routes received from the specified neighbor (accepted and rejected).
  - routes displays routes received and accepted from specified neighbor.
- CM\_x community number or name, as specified in the route map that sets the community list number. The command must list at least one of the following community identifiers:
  - *GSHUT* well-known graceful shutdown community.
  - *aa:nn* AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - *comm\_num* community number. Values range from 1 to 4294967040.
  - internet advertises route to Internet community.
  - local-as advertises route only to local peers.
  - no-advertise does not advertise route to any peer.
  - no-export advertises route only within BGP AS boundary.
- MATCH routes are filtered based on their communities. Options include:
  - <no parameter> routes must match at least one community in the list
  - exact route must match all communities and include no other communities.
- INFO type of information the command displays. Values include:
  - <no parameter> displays table of the routing entry line items.
  - detail displays data block for each routing table entry.
- VRF\_INST specifies VRF instances. Options include:
  - <no parameter> displays routing table for context-active VRF.
  - vrf *vrf\_name* displays routing table for the specified VRF.
  - vrf all displays routing table for all VRFs.
  - vrf default displays routing table for default VRF.

##### Related Command

- `show ipv6 bgp peers`

##### Example

- This command lists the routes advertised to the neighbor at 2001:10:1:0::102 with the community 64496:1000.

```
switch#show ipv6 bgp peers 2001:10:1:0::102 advertised-routes community 64496:1000
BGP routing table information for VRF default
Router identifier 10.0.0.100, local AS number 64496
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP
head, e - ECMP
```

S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast  
 Origin codes: i - IGP, e - EGP, ? - incomplete  
 AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

|     | Network            | Next Hop       | Metric | LocPref | Weight | Path        |
|-----|--------------------|----------------|--------|---------|--------|-------------|
| * > | 2001:10:100:1::/64 | 2001:10:1::100 | -      | -       | -      | 64496 64497 |

65536 i  
 switch#

#### 14.5.4.109 show ipv6 bgp peers (route type)

The `show ipv6 bgp peers (route type)` command displays information about the routes either advertised to or received from a specified IPv6 BGP neighbor. The `show ipv6 bgp peers (route type) community` command displays the same information for routes filtered by communities. Commands that do not include a route type revert to the `show ipv6 bgp peers` command.

The output format depends on the selected FILTER parameter:

- data-block format displays comprehensive information for each specified route.
- tabular format displays routing table entries in tabular format for the specified IP addresses.

Output produced by the longer-prefixes option includes the specified route and all more specific routes.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 bgp peers neighbor_addr HOPDIRECT [FILTER] [VRF_INSTANCE]
```

```
show ipv6 bgp peers neighbor_addr [ROUTE_TYPE] HOPDIRECT [detail]
```

#### Parameters

- *neighbor\_addr* location of the neighbor.
- ROUTE\_TYPE filters route on route type. Options include:
  - ipv4 unicast displays IPv4 unicast routes.
  - ipv6 unicast displays IPv6 unicast routes.
- HOPDIRECT filters route on the basis of direction from neighbor. Options include:
  - advertised-routes displays routes advertised to the specified neighbor.
  - received-routes displays routes received from the specified neighbor (accepted and rejected).
  - routes displays routes received and accepted from specified neighbor.
- FILTER routing table entries that the command displays. Options include:
  - <no parameter> displays all routing table entries in tabular format.
  - detail displays all routing table entries in data-block format.
  - *ipv6\_addr* displays the IPv6 host address in data-block format.
  - *ipv6\_prefix* displays the route information of specified IPv6 prefix in data-block format. Additional option:
    - longer-prefixes displays the route information of IPv4 prefix in data-block format.
- VRF\_INSTANCE specifies VRF instances. Options include:
  - <no parameter> displays routing table for context-active VRF.
  - *vrf vrf\_name* displays routing table for the specified VRF.
  - *vrf all* displays routing table for all VRFs.
  - *vrf default* displays routing table for default VRF.

#### Related Commands

- `show ipv6 bgp peers (route type) community`

#### Example

- This command displays information of all routes advertised to the neighbor at 2001:10:1:0::100.

```
switch#show ipv6 bgp peers 2001:10:1:0::100 advertised-routes

#### 14.5.4.110 show ipv6 bgp peers regexp

The `show ipv6 bgp peers regexp` command displays information about routes (advertised or received) from a specified IPv6 neighbor that match the AS-path attributes specified in the given regular expression.

##### Command Mode

EXEC

##### Command Syntax

```
show ipv6 bgp peers addr ROUTE regexp as_paths [VRF_INST]
```

##### Parameters

- *addr* neighbor location (IPv6 address).
- ROUTE type of route that the command displays. Options include:
  - advertised-routes displays routes advertised to the specified neighbor.
  - received-routes displays routes received from the specified neighbor (accepted and rejected).
  - routes displays routes received and accepted from specified neighbor.
- *as\_paths* list of AS paths, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.
- VRF\_INST specifies VRF instances. Options include:
  - <no parameter> displays routing table for context-active VRF.
  - vrf *vrf\_name* displays routing table for the specified VRF.
  - vrf all displays routing table for all VRFs.
  - vrf default displays routing table for default VRF.

##### Related Commands

- [show ip bgp regexp](#)
- [show ipv6 bgp peers](#)

##### Examples

- This command displays information for routes received from the neighbor at 2001:10:1:0::100 which include AS number 64496 in their AS paths.

```
switch#show ipv6 bgp peers 2001:10:1:0::100 received-routes regex 64496
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP
head, e - ECMP

### 14.5.4.111 show ipv6 bgp peers

The **show ipv6 bgp peers** command displays IPv6 Border Gateway Protocol (BGP) and TCP session data for a specified neighbor. Command displays data for all neighbors if an address is not included.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 bgp peers [NEIGHBOR_ADDR] [VRF_INSTANCE]
```

#### Parameters

- NEIGHBOR\_ADDR location of the neighbors. Options include:
  - <no parameter> command displays information for all neighbors.
  - *ipv6\_addr* command displays information for the specified neighbor.
- VRF\_INSTANCE specifies VRF instances. Options include:
  - <no parameter> displays routing table for the context-active VRF.
  - *vrf vrf\_name* displays routing table for the specified VRF.
  - *vrf all* displays routing table for all VRFs.
  - *vrf default* displays routing table for the default VRF.

#### Related Command

- [show ip bgp peer-group](#)

#### Example

- This command displays information for the neighbor at 2001:10:1:0::100.

```
switch#show ipv6 bgp peers 2001:10:1:0::100
BGP neighbor is 2001:10:1:0::100, remote AS 64496, external link
  BGP version 4, remote router ID 10.0.0.100, VRF default
  Inherits configuration from and member of peer-group EXTERNAL
  Negotiated BGP version 4
  Member of update group 3
  Last read 00:00:01, last write 00:00:01
  Hold time is 180, keepalive interval is 60 seconds
  Configured hold time is 180, keepalive interval is 60 seconds
  Connect timer is inactive
  Idle-restart timer is inactive
  BGP state is Established, up for 00:12:01

### 14.5.4.112 show ipv6 bgp regexp

The `show ipv6 bgp regexp` command displays Border Gateway Protocol (BGP) IPv6 routing-table entries that match the AS-path attributes specified in the given regular expression.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 bgp regexp as_paths [VRF_INSTANCE]
```

#### Parameters

- *as\_paths* list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
- VRF\_INSTANCE specifies the VRF instance of the BGP routing table to be displayed. Options include:
  - <no parameter> displays routing table for context-active VRF.
  - *vrf vrf\_name* displays routing table for the specified VRF.
  - *vrf all* displays routing table for all VRFs.
  - *vrf default* displays routing table for default VRF.

#### Related Command

- [show ip bgp regexp](#)

#### Examples

- This command displays information about the BGP IPv6 routes in the context-active VRF that pass through AS 64496.

```
switch#show ipv6 bgp regex _64496_
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP
                    head, e - ECMP
                        S - Stale, c - Contributing to ECMP, b - backup, L = labeled-unicast
                        % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST -Cluster List, LL Nexthop - Link Local
                    Nexthop

* >    2001:10:100::/64       2001:10:1::100        200     100     0       64496 i
* >    2001:10:100:1::/64    2001:10:1::100         0       100     0       64496 64497 65536 i
* >    2001:10:100:2::/64    2001:10:1::100         42      100     0       64496 ?
switch#
```

### 14.5.4.113 show ipv6 bgp summary

The `show ipv6 bgp summary` command displays the summary of all IPv4 and IPv6 BGP neighbors based on Address Family Identifier (AFI) and Subsequent Address Family Identifier (SAFI) negotiations where AFI is “IPv6” and SAFI is “Unicast” information.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 bgp summary [VRF_INSTANCE]
```

#### Parameters

- VRF\_INSTANCE specifies VRF instances. Options include:
  - <no parameter> displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

#### Display Values

##### Header Row

- **BGP router identifier:** the router identifier; sloopback address or highest IP address.
- **Local AS number:** AS number assigned to switch.

##### Neighbor Table Columns

- **(First) Neighbor:** neighbor’s IP address.
- **(Second) V:** BGP version number.
- **(Third) AS:** neighbor’s AS number.
- **(Fourth) MsgRcvd:** messages received from the neighbor.
- **(Fifth) MsgSent:** messages sent to neighbor.
- **(Sixth) InQ:** messages queued from neighbor.
- **(Seventh) OutQ:** messages queued to send neighbor.
- **(Eighth) Up/Down:** period the BGP session has been Established, or its current status.
- **(Ninth) State:** state of the BGP session and the number of routes received from a neighbor.
- **(Tenth) PfxRcd:** the count of prefixes received by BGP per neighbor.
- **(Eleventh) PfxAcc:** the count of prefixes added to the BGP RIB among all received prefixes.

#### Related Command

- `show ip bgp summary`

#### Example

- This command displays the status of the switch’s BGP connections.

```
switch#show ipv6 bgp summary
BGP summary information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Neighbor Status Codes: m - Under maintenance
Neighbor      V  AS      MsgRcvd  MsgSent  InQ  OutQ  Up/Down  State  PfxRcd
PfxAcc
 2001:10:1::100  4  64496    37       36     0    0  00:29:33  Estab  4      4
 2001:10:2::101  4  64510    35       38     0    0  00:29:37  Estab  4      4
switch#
```

### 14.5.4.114 show ipv6 bgp

The **show ipv6 bgp** command displays IPv6 Border Gateway Protocol (BGP) routing-table entries. The output format depends on the command parameters:

- data-block format displays comprehensive information for each specified BGP routing-table entry.
- tabular format displays routing-table entries for specified IPv6 addresses.

#### Command Mode

EXEC

#### Command Syntax

```
show ipv6 bgp [FILTER] [VRF_INSTANCE]
```

#### Parameters

- FILTER routing table entries that the command displays. Options include:
  - <no parameter> displays all routing-table entries in tabular format.
  - detail displays all routing-table entries in data-block format.
  - *ipv6\_addr* displays IPv6 host address in data-block format.
  - *ipv6\_prefix* displays the route information of specified IPv6 prefix address in data-block format. Options include:
    - detail displays the detailed route information of specified IPv6 prefix address in data-block format.
    - longer-prefixes displays the route information of IPv6 prefix in data-block format.
    - longer-prefixes detail displays detailed route information of specified IPv6 prefix in data-block format.
  - community-list *cmnty\_list\_name* displays BGP routes filtered by the specified community list.
  - installed displays the information of installed BGP routes.
  - labeled-unicast displays the information of labeled-unicast BGP routes only.
  - not-installed displays the information of BGP routes that are not installed.
- VRF\_INSTANCE specifies VRF instances. Options include:
  - <no parameter> displays routing table for context-active VRF.
  - *vrf vrf\_name* displays routing table for the specified VRF.
  - *vrf all* displays routing table for all VRFs.
  - *vrf default* displays routing table for default VRF.

#### Guidelines

You must provide the IPv6 prefix in CIDR notation.

#### Related Command

- [show ip bgp](#)

#### Examples

- This command displays the route information of 2001:10:1:0::102/64 in data-block format.

```
switch#show ipv6 bgp 2001:10:1:0::102/64
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
BGP routing table entry for 2001:10:1::/64
  Paths: 2 available
    Local
      - from - (10.0.0.102)
        Origin IGP, metric 1, localpref 0, IGP metric -, weight -,
        received 00:16:27 ago, valid, local, best,
        redistributed (Connected)
```

---

```
    Rx SAFI: Unicast
64496
    2001:10:1::100 from 2001:10:1::100 (10.0.0.100)
        Origin INCOMPLETE, metric 42, localpref 100, IGP metric 1, weight
0, received 00:10:09 ago, valid,
external
    Rx SAFI: Unicast
switch#
```

### 14.5.4.115 show peer-filter

The **show peer-filter** command displays the definition of a peer filter.

#### Command Mode

EXEC

#### Command Syntax

```
show peer-filter filter_name
```

#### Parameters

- *filter\_name* name of the peer-filter group.

#### Example

- This command displays the peer-filter group information for “group3.”

```
switch#show peer-filter group3
peer-filter group3
  10 match as-range 65003 result accept
  20 match as-range 65007 result accept
  30 match as-range 65009 result accept
switch#
```

---

#### 14.5.4.116 show tunnel rib brief

The **show tunnel rib brief** command displays the preferred tunnels for various IP endpoints, optionally filtered by endpoint. Each tunnel RIB entry in the output displays the type of the tunnel (such as BGP LU) and a numerical index uniquely identifying that tunnel within the type-specific tunnel table.

##### Command Mode

EXEC

##### Command Syntax

```
show bgp tunnel rib brief
```

##### Example

- This command displays the tunnel type and the index value.

```
switch#show tunnel rib brief
Endpoint          Tunnel Type          Indexes
-----
10.1.1.0/32       BGP LU              2
11.1.1.0/32       BGP LU              1, 3
switch#
```

### 14.5.4.117 shutdown (BGP)

The **shutdown** command disables BGP on the switch without modifying the BGP configuration.

The **no shutdown** and **default shutdown** commands enable the BGP instance by removing the **shutdown** command from *running-config*.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

#### Examples

- These commands disable BGP on the switch.

```
switch(config)#router bgp 9  
switch(config-router-bgp)#shutdown  
switch(config-router-bgp)#
```

- These commands enable BGP on the switch.

```
switch(config)#router bgp 9  
switch(config-router-bgp)#no shutdown  
switch(config-router-bgp)#
```

---

#### 14.5.4.118 peer-filter

The **peer-filter** command creates a peer filter group and places the switch in peer-filter configuration mode for that group. The peer-filter group parameters are defined using the [match as-range](#) command.

The **no peer-filter** and **default peer-filter** commands remove the peer-filter group from *running-config*.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
peer-filter filter_name
```

```
no peer-filter filter_name
```

```
default peer-filter filter_name
```

##### Parameters

- *filter\_name* name of the peer filter.

##### Example

- This command creates a peer filter called “group1” and places the switch in peer-filter configuration mode for that filter.

```
switch(config-router-bgp) #peer-filter group1  
switch(config-peer-filter-group1) #
```

### 14.5.4.119 timers bgp

The `timers bgp` command configures the BGP keepalive and hold times. Timer settings apply to each peer connection. The `neighbor timers` command configures the times on a specified peer connection.

- **Keepalive time:** period between the transmission of consecutive keepalive messages.
- **Hold time:** period the switch waits for a keepalive or UPDATE message before it disables peering.

The hold time must be at least 3 seconds and should be three times longer than the keepalive setting.

The `no timers bgp` and `default timers bgp` commands return the time settings to their default values by removing the `timers bgp` command from *running-config*. The default values are:

- **keepalive:** 60 seconds.
- **hold time:** 180 seconds.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

#### Parameters

```
timers bgp keep_alive hold_time
```

```
no timers bgp
```

```
default timers bgp
```

- *keep\_alive* keepalive period, in seconds. Values include:
  - **0** keepalive messages are not sent.
  - **1 to 3600** keepalive time (seconds).
- *hold\_time* hold time. Values include:
  - **0** peering is not disabled by timeout expiry; keepalive packets are not sent.
  - **3 to 7200** hold time (seconds).

#### Example

- This command sets the keepalive time to 30 seconds and the hold time to 90 seconds.

```
switch(config)#router bgp 9  
switch(config-router-bgp)#timers bgp 30 90  
switch(config-router-bgp)#
```

---

#### 14.5.4.120 update wait-for-convergence

The **update wait-for-convergence** command disables FIB updates and route advertisement when the BGP instance is initiated until the BGP convergence state is reached.

The **no update wait-for-convergence** command allows FIB updates and route advertisement irrespective of the BGP convergence state.

##### Command Mode

Router-BGP Configuration

##### Command Syntax

```
update wait-for-convergence
no update wait-for-convergence
default update wait-for-convergence
```

##### Related Commands

- [clear ip bgp](#) removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required.
- [bgp convergence slow-peer time](#) configures the BGP convergence idle peer timeout value.
- [bgp convergence time](#) configures the BGP convergence timeout value.
- [show bgp convergence](#) displays information about the BGP convergence state; and other statistics about the BGP instance in either the specified VRF or all VRFs.

##### Guidelines

The initiation of BGP instance includes the following scenarios:

- the BGP instance starts for the first time after a switch is reloaded.
- the BGP instance restarts.
- all sessions are cleared by using the **clear ip bgp \*** command.

Configuration changes made by using this command are effective from the next initiation of a BGP instance.

##### Example

- This command disables FIB updates and route advertisement when the BGP instance is initiated until the BGP convergence state is reached.

```
switch(config)#router bgp 9
switch(config-router-bgp)#update wait-for-convergence
switch(config-router-bgp)#
```

### 14.5.4.121 vrf

The **vrf** command places the switch in BGP VRF configuration mode for the specified VRF. Commands issued in this mode will override global BGP configuration for the specified VRF.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
vrf vrf_instance
```

#### Parameters

- *vrf\_instance* VRF to be configured.

#### Example

- These commands place the switch in BGP VRF configuration mode for VRF “purple.”

```
switch(config)#router bgp 9  
switch(config-router-bgp)#vrf purple  
switch(config-router-bgp-vrf-purple)#
```

## 14.6 Maintenance Mode

This section describes configuration for performing maintenance of switch elements.

This section contains these topics:

- [Overview](#)
- [Maintenance Mode Elements](#)
- [Maintenance Mode Features](#)
- [Maintenance Mode Configuration](#)
- [Maintenance Mode Commands](#)

### 14.6.1 Overview

Using maintenance mode, you can perform several maintenance activities such as:

- EOS image upgrade
- Initial configuration or reconfiguration of a production system
- Replacement of hardware
- Changing linecards or transceiver modules
- Replace, reattach, and reroute cables

Maintenance mode uses BGP to divert traffic away from the switch on which the maintenance tasks need to be performed, minimizing traffic impact. You can set the traffic thresholds and time limits at which the switch, or parts of the switch, is considered to be available for maintenance tasks.

Maintenance mode can be activated on a switch at boot-up or during operation. The mode provides the following benefits:

- Rerouting of traffic when the mode is activated during operation and other routes are present
- Replacement of hardware in modular systems or systems with redundant hardware

The switch is placed into maintenance mode, serviced, and then returned to normal operation.

---

## 14.6.2 Maintenance Mode Elements

Maintenance mode elements include [Units](#), [Groups of Interfaces and BGP Peers](#), and [Profiles](#). Arista Network switches provide maintenance mode operations performed on a fundamental, configurable element, referred to as a Unit. Maintenance mode will quiesce a unit, which places the unit into maintenance mode by gracefully transitioning traffic away from it.

The most common maintenance mode operations such as removing from service an entire switch system or individual components of the switch, including a single linecard, interface, or BGP peer, can be achieved using minimal configuration.

### 14.6.2.1 Units

Units are configurable maintenance mode elements that comprise a collection of various groups. In addition, units contain policies which decide whether the member groups should be put into maintenance mode automatically upon boot. Built-in units are configured by default, such as the System unit representing the entire system. All maintenance mode operations are executed at the unit level.

An interface, interface range, and BGP peer (or peer-group) can be directly put under maintenance.

#### 14.6.2.1.1 Built-in Units

There are various built-in units such as **System** and **Linecard<n>**. Fixed systems contain only one built-in unit called **System**, which comprises the interface group containing all Ethernet interfaces and sub-interfaces; and BGP groups per VRF containing all the peers in the respective VRF.

Modular Systems have both **System** and **Linecard<n>** units. **Linecard<n>** units are present for each linecard which comprises the **Linecard<n>** groups containing all Ethernet interfaces and sub-interfaces of that linecard.

#### 14.6.2.1.2 User-configured Units

You can also configure customized units containing user-defined groups and policies as shown in the following example. A custom group called BG1 with a custom interface IG1 and a unit profile UP1 is created. The show command displays the details.

```
switch(config)#maintenance
switch(config-maintenance)#unit UNIT1
switch(config-unit-UNIT1)#group bgp BG1
switch(config-unit-UNIT1)#group interface IG1
switch(config-unit-UNIT1)#profile unit UP1
switch(config-unit-UNIT1)#exit
switch(config-maintenance)#show maintenance units
Unit Name: System
Origin: Built-in
Status: Not Under Maintenance
Unit Profile: Default
Time Since Last State Change: never
Bgp Groups:
AllBgpNeighborVrf-default
Interface Groups:
AllEthernetInterface
Unit Name: UNIT1
Origin: User Configured
Status: Under Maintenance
Unit Profile: UP1
Time Since Last State Change: 0:00:08 ago
Bgp Groups:
BG1
```

```
Interface Groups:
IG1
```

### 14.6.2.2 Groups of Interfaces and BGP Peers

Maintenance mode group types include the groups for interfaces and BGP peers. Groups are identified by a group name unique to a particular group type.

By default, several built-in groups are available on the device such as **linecard** groups containing physical interfaces.

#### 14.6.2.2.1 Built-in Groups

There are several built-in groups such as **AllEthernetInterface**, **Linecard1**, **Linecard2**, etc., **AllBgpNeighborVrf-<vrf\_name>**. **AllEthernetInterface** is the built-in interface group which contains all physical Ethernet interfaces and sub-interfaces on the switch, and is a part of **System** unit. Whereas on modulars **Linecard1**, **Linecard2**, etc., are the built-in groups which contain respective linecard interfaces and sub-interfaces; and are part of the **Linecard1** and **Linecard2** units respectively. **AllBgpNeighborVrf-<vrf\_name>** is the built-in BGP group which contains all the BGP peers in that particular VRF.

#### 14.6.2.2.2 User-defined Groups

The following set of commands sets up a custom group (IG1) of interfaces, which includes physical ports, port-channels and SVIs.

```
switch(config)#group interface IG1
switch(config-group-if-IG1)#interface Ethernet1
switch(config-group-if-IG1)#interface Port-Channel1,20
switch(config-group-if-IG1)#interface Vlan1-20
switch(config-group-if-IG1)#exit
switch(config)#
```

**Note:** User-defined interface groups do not contain sub-interfaces.

The following set of commands sets up a custom group (BG1) of BGP peers.

```
switch(config)#group bgp BG1
switch(config-group-bgp-BG1)#neighbor 10.0.0.1
switch(config-group-bgp-BG1)#neighbor BGP_PG1
switch(config-group-bgp-BG1)#vrf vrf1
switch(config-group-bgp-BG1)#exit
switch(config)#
```

**Note:** BGP groups are specific to VRF.

### 14.6.2.3 Profiles

Profiles are configurable maintenance mode elements that define policies for related software or hardware components to carry out maintenance mode operations.

#### 14.6.2.3.1 Default Profiles

Default profiles are the built-in policies which are applied to groups interface/BGP and unit.

The default profile is used in the absence of an explicit interface/BGP profile associated with the group, or explicit unit profile associated with the unit.

- **Interface Profile**

Default interface profile has rate-monitoring load-interval set to 60 seconds, threshold set to 100 kbps, and shutdown disabled as shown. The max-delay parameter is set to 300 seconds but is not enabled.

```
switch(config-maintenance)#show maintenance profile interface default
Interface Profile: Default
Rate Monitoring:
load-interval: 60 seconds
threshold (in/out): 100 kbps
shutdown:
enabled: no
max-delay: 300 seconds
```

- **BGP Profile**

Default BGP profile has route-map with set clauses set community GSHUT additive and set local-preference 0.

```
switch(config-maintenance)#show maintenance profile bgp default
Bgp Profile: Default
Initiator route-map: SystemGenerated
route-map SystemGenerated permit 10
Description:
description System generated initiator route-map
Match clauses:
SubRouteMap:
Set clauses:
set local-preference 0
set community GSHUT additive
```

- **Unit Profile**

Default unit profile has on-boot setting disabled.

```
switch(config-maintenance)#show maintenance profiles unit default
Unit Profile: Default
On-boot:
enabled: no
duration: 300 seconds
```

### 14.6.2.3.2 User-defined Profiles

You can define your own profiles which can be associated to groups or set as default profiles.

**Interface Profile:** The following set of commands sets up an Interface Profile(IP1) with load interval set to 10 seconds, rate-monitoring threshold set to 100kbps and the maximum delay for shutting down the interface set to 100 seconds. The interface will be shutdown with cause maint-down if traffic does not drain below the threshold even after the specified maximum delay period of 100 seconds.

```
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1
switch(config-profile-intf-IP1)#rate-monitoring load-interval 10
switch(config-profile-intf-IP1)#rate-monitoring threshold 100
switch(config-profile-intf-IP1)#shutdown max-delay 100
switch(config-profile-intf-IP1)#exit
switch(config-maintenance)#
```

An interface profile can be associated to only interface groups using the following set of commands.

```
switch(config)#group interface IG1
```

```
switch(config-group-if-IG1) #maintenance profile interface IP1
switch(config-group-if-IG1) #exit
switch(config) #
```

You can set the interface profile as the default interface profile using the following set of commands.

```
switch(config) #maintenance
switch(config-maintenance) #profile interface IP1 default
switch(config-maintenance) #exit
switch(config) #
```

**Bgp Profile:** The following set of commands sets up a BGP profile(BP1) with initiator route-map called RM which will be applied for both inbound and outbound directions.

```
switch(config) #maintenance
switch(config-maintenance) #profile bgp BP1
switch(config-profile-bgp-BP1) #initiator route-map RM inout
switch(config-profile-bgp-BP1) #exit
switch(config-maintenance) #
```

A BGP profile can be associated to both interface and bgp groups using the following commands.

```
switch(config) #group interface IG1
switch(config-group-if-IG1) #maintenance profile bgp BP1
switch(config-group-if-IG1) #exit
switch(config) #group bgp BG1
switch(config-group-bgp-BG1) #maintenance profile bgp BP1
switch(config-group-bgp-BG1) #exit
switch(config) #
```

You can set the bgp profile as the default bgp profile using the following set of commands.

```
switch(config) #maintenance
switch(config-maintenance) #profile bgp BP1 default
switch(config-maintenance) #exit
switch(config) #
```

**Unit Profile:** The following set of commands sets up a Unit profile(UP1) with on-boot duration of 300 seconds. The unit will enter into maintenance mode at boot-up and exit maintenance mode at the end of 5 minutes (300sec) after boot-up.

```
switch(config-maintenance) #profile unit UP1
switch(config-profile-unit-UP1) #on-boot duration 300
switch(config-profile-unit-UP1) #exit
switch(config-maintenance) #
```

A Unit profile can be associated to a Unit using the following commands.

```
switch(config) #maintenance
switch(config-maintenance) #unit UNIT1
switch(config-unit-UNIT1) #profile unit UP1
switch(config-unit-UNIT1) #exit
switch(config-maintenance) #
```

You can set the Unit profile as the default Unit profile using the following set of commands.

```
switch(config) #maintenance
switch(config-maintenance) #profile unit UP1 default
switch(config-maintenance) #exit
```

```
switch(config)#
```

### 14.6.3 Maintenance Mode Features

Arista Network switches provide maintenance mode features including rate monitoring, BGP maintenance route map, on-boot maintenance, and EventMgr integration.

#### 14.6.3.1 Rate Monitoring

Rate monitoring provides a mechanism to monitor traffic on interfaces identified for maintenance. You can set the traffic threshold and a time limit for the interface to be shutdown for maintenance tasks.

A shutdown parameter can be configured in the interface profile that signals the interface to be shutdown after it has entered maintenance mode.

The max-delay parameter specifies the maximum number of seconds to allow for traffic to dissipate from the interface before the interface is shutdown. The default interface profile settings are shown in the output of the `show maintenance profile interface default` command.

**Note:** The exclusive rate monitoring of sub-interfaces is not supported. Sub-interfaces inherit the interface profile from its parent interface. In case of multiple sub-interfaces configured for single parent interface, rate monitoring of parent interface include aggregate values of all respective sub-interfaces.

#### 14.6.3.2 BGP Maintenance Route Map

Route-maps are used within a BGP maintenance profile to tag the inbound and outbound routes in order to direct traffic away from the unit.

The default profile tags the inbound and outbound routes with the global shutdown community. Other methods can be configured under the route-map such as alternate communities, or by using AS\_PATH prepend operations.

#### 14.6.3.3 On-boot Maintenance

There are two ways of placing a unit in maintenance mode on switch boot-up:

- The unit is placed into maintenance mode prior to the switch reboot, and the running-config is saved prior to switch boot-up.
- The on-boot property in the unit maintenance profile specifies that the unit will be placed into maintenance mode as part of boot-up, and remains so for the specified duration.

**Note:** The duration value in the on-boot unit maintenance profile starts as soon as the unit is put into maintenance mode on boot-up.

### 14.6.4 Maintenance Mode Configuration

You can configure maintenance mode for the entire device, specific linecards, or any other Unit. You can set up configuration for maintenance mode for the device at boot-up or while it is running.

**Note:** Explicit maintenance of sub-interfaces is not supported. Sub-interfaces are put into maintenance implicitly in case of built-in unit maintenance and interface maintenance but not in case of user-configured units.

#### 14.6.4.1 Unit (System, Linecardn, etc.) Configuration

Arista Network switches provide the ability to place the switch in maintenance mode, and configuration options for groups, profiles, associating profiles with groups, units, and maintenance mode operations. **System** is a predefined (built-in) unit on all switches. Built-in groups include **AllEthernetInterface**,

**AllBgpNeighborVRF-`<vrf_name>`**, and **Linecardn**. **Linecardn** can also be a built-in unit and can be differentiated depending on the command being used as shown.

- `switch(config-maintenance) #unit Linecardn`
- `switch(config) #group interface Linecardn`

Built-in unit **System** comprises the following groups:

- **AllEthernetInterface** - a built-in interface group which contains all physical Ethernet interfaces on the switch on a fixed system
- **Linecardn** - a built-in interface group which contains all interfaces for the linecard numbered n for modular systems
- **AllBgpNeighborVRF-`<vrf_name>`** - a built-in BGP group which contains all the BGP peers in the named VRF.

For each Linecard n, there is a built-in unit which consists of all the **Linecardn** groups.

By default, the default interface and BGP profiles are applied to the built-in interface and BGP groups and the default built-in unit profile is applied to the built-in unit. You can also configure your own profiles and choose a default.

In the following example, traffic is flowing through multiple switches in the spine to and from one switch in maintenance mode. The traffic is then gracefully steered away from the Unit, provided other paths are available. Traffic will continue to flow through the Unit placed into maintenance mode, if no other path is available.

### Example

**Note:** The illustration shows an entire switch as the Unit. You can replace switch with Linecardn or another relevant Unit as appropriate.

Figure 44: Traffic flow pattern between TOR and Core Before Maintenance

**Figure 45: Traffic flow pattern between TOR and Core After unit on Spine-1 is put into Maintenance**

You can see the status of the Unit (System) using the `show maintenance units System` command for the example above before the system is placed into maintenance mode. If the device being placed into maintenance mode is modular and the Unit is a linecard, replace the argument **System** with **Linecardn** to see the status of the Unit (Linecardn).

```
switch(config)#show maintenance units System
Unit Name: System
  Origin: Built-in
  Status: Not Under Maintenance
  Unit Profile: Default
  Time Since Last State Change: never
  Bgp Groups:
    AllBgpNeighborVrf-default
  Interface Groups:
    AllEthernetInterface
```

You can then place the Unit (System) into maintenance mode and recheck the status using the sequence of commands shown.

```
switch(config-maintenance)#unit System
switch(config-builtin-unit-System)#quiesce
switch(config-builtin-unit-System)#exit
switch(config-maintenance)#show maintenance
Flags:
o - On-boot maintenance
v - Violating traffic threshold
```

```
Unit Name          Status          Time since last change
Flags
-----
-----
System             Under Maintenance    0:02:03 ago
switch(config-maintenance)# show ip bgp summary
BGP summary information for VRF default
Router identifier 1.1.1.1, local AS number 101
Neighbor Status Codes: m - Under maintenance
  Neighbor          V  AS          MsgRcvd  MsgSent  InQ  OutQ  Up/Down
  State
PfxRcd PfxAcc
m 1.1.1.2          4  100          24       17       0    0 00:00:40
  Estab 5          5
m 3.3.3.33         4  102          15       16       0    0 00:06:23
  Estab 1          1
```

**Note:** The 'o' flag is shown for on-boot maintenance in the **show maintenance** command and the 'm' neighbor status flag in the **show ip bgp summary** command indicates that the peer is in maintenance mode.

#### 14.6.4.2 On-boot Maintenance Mode Configuration

To configure on-boot maintenance, you can use one of two methods:

- Use **quiesce config** or
- Use on-boot profile

##### 14.6.4.2.1 Using quiesce config

You must perform the following tasks to place the Unit in maintenance mode on boot-up using the **quiesce** command.

1. Place the unit into maintenance mode prior to switch reboot using the following commands.

```
switch(config)#maintenance
switch(config-maintenance)#unit System
switch(config-unit-System)#quiesce
switch(config-unit-System)#exit
switch(config-maintenance)#show maintenance
```

Flags:

o - On-boot maintenance

v - Violating traffic threshold

Unit Name Status Time since last change Flags

```
-----
```

```
System Under Maintenance 00:01:10 ago
```

2. Save the running-config using the following command.

```
switch(config)#copy running-config startup-config
Copy completed successfully
switch(config)#
```

3. Reload the device.

```
switch(config)#reload
Proceed with reload? [Confirm] Yes
Connection to switch closed.
```

After the device comes up, you must execute the **no quiesce** command for the Unit to come out of maintenance mode. You can check the status of the device after it comes up using the **show maintenance** command.

```
switch#show maintenance
Flags:
o - On-boot maintenance
v - Violating traffic threshold
Unit Name Status Time since last change Flags
-----
-----
System Under Maintenance 00:03:10 ago
```

#### 14.6.4.2.2 Using on-boot profile

The on-boot property in the Unit maintenance profile specifies that the Unit will be placed into maintenance mode as part of boot-up for the specified duration. You must perform the following tasks to use this method.

1. Check to see if the on-boot maintenance mode is enabled using the **show maintenance profiles unit default**.

```
switch#show maintenance profiles unit default
Unit Profile: Default
On-boot:
enabled: no
duration: 300 seconds
```

2. Configure an on-boot profile with on-boot enabled and a duration specified. Make this the default Unit profile. The following code example shows the creation of an on-boot duration of 300 seconds in the profile unit UP1

```
switch(config)#maintenance
switch(config-maintenance)#profile unit UP1
switch(config-profile-unit-UP1)#on-boot duration 300
switch(config-profile-unit-UP1)#exit
switch(config-maintenance)#profile unit UP1 default
switch(config-maintenance)#show maintenance profiles unit default
Unit Profile: UP1
On-boot:
enabled: yes
duration: 300 seconds
switch(config-maintenance)#
```

3. Save the running-config and reload the device.

```
switch(config)#copy running-config startup-config
Copy completed successfully
switch(config)# reload
Connection to switch closed.
```

4. After the device comes up, execute the **show maintenance** and **show maintenance units System** commands.

```
switch(config)#show maintenance
Flags:
o - On-boot maintenance
v - Violating traffic threshold
Unit Name Status Time since last change Flags
-----
System Under Maintenance 00:00:08 ago o
switch(config)# show maintenance units System
Unit Name: System
Origin: Built-in
Status: Under Maintenance (on-boot)
Unit Profile: UP1
Time Since Last State Change: 0:00:16 ago
Will come out of on-boot Maintenance after 0:04:43
Interface Groups:
AllEthernetInterface
History:
2017-01-18 00:44:39 old state: 'maintenanceModeEnter' to new state:
'underMaintenance' 0:00:16 ago
2017-01-18 00:43:54 old state: 'active' to new state: 'maintenanceM
odeEnter'
```

0:01:01 ago

The `o` - flag shows that unit `System` is under maintenance due to on-boot profile. Also, `show maintenance units System` output shows the following - Will come out of on-boot Maintenance after 0:04:43, which is the time remaining of the specified duration of 5 minutes.

The Unit will come up in maintenance mode when the device boots up and will exit maintenance mode once the specified duration of 300 seconds in the default profile is completed. The BGP sessions will remain under maintenance for the duration and will resume after the specified duration is over.

#### 14.6.4.3 Interface-level Maintenance Mode Configuration

To configure the maintenance mode at interface-level, you must perform the following tasks:

1. Configure an interface-level profile (or use a pre-configured one). The following code example creates a user-defined interface profile `IP1` with a rate-monitoring load-interval of 100 seconds, a rate-monitoring threshold of 500 kbps and a maximum shutdown delay of 100 seconds.

```
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1
switch(config-maint-if-Et5)#rate-monitoring load-interval 100
switch(config-maint-if-Et5)#rate-monitoring threshold 500
switch(config-maint-if-Et5)#shutdown max-delay 100
```

2. Make the user-defined interface profile `IP1` as the default interface profile.

```
switch(config-maintenance)#profile interface IP1 default
```

3. Place the interface into maintenance mode.

```
switch(config)#maintenance
switch(config-maintenance)#interface Ethernet 1
switch(config-maint-if-Et1)#quiesce
```

4. Remove the interface from maintenance mode once the service has been performed.

```
switch(config-maintenance)#interface Ethernet 1
switch(config-maint-if-Et1)#no quiesce
```

**Note:** If interface `Et1` has sub-interfaces (`Et1.1`, `Et1.2`,...) with BGP peers on these sub-interfaces, then these sub-interfaces are also placed into maintenance mode. The `show maintenance interface <sub-interface> detail` command displays the maintenance state of sub-interfaces.

#### 14.6.4.4 Entering Maintenance Mode

Enter configuration commands `unit` and `quiesce` using the `maintenance profile bgp` mode command to place the switch into maintenance mode. The following code sequence places unit `foo`, the interface `3/3`, and BGP `1.1.1.1` in maintenance mode.

##### Example

```
switch(config)#maintenance
switch(config-maintenance)#unit foo
switch(config-unit-foo)#quiesce
switch(config-unit-foo)#exit
switch(config-maintenance)#interface ethernet 3/3
switch(config-maint-if-Et3/3)#quiesce
switch(config-unit-if-Et3/3)#exit
```

```
switch(config-maintenance) #bgp 1.1.1.1
switch(config-maint-bgp-1.1.1.1) #quiesce
switch(config-maint-bgp-1.1.1.1) #exit
switch(config-maintenance) #
```

#### 14.6.4.5 Exiting Maintenance Mode

Enter configuration commands **unit** and **no quiesce** using the **maintenance profile bgp** mode command for the switch to exit maintenance mode. The following code sequence causes unit foo, the interface 3/3, and BGP 1.1.1.1 to exit maintenance mode.

##### Example

```
switch(config) #maintenance
switch(config-maintenance) #unit foo
switch(config-unit-foo) #no quiesce
switch(config-unit-foo) #exit
switch(config-maintenance) #interface ethernet 3/3
switch(config-maint-if-Et3/3) #quiesce
switch(config-unit-if-Et3/3) #exit
switch(config-maintenance) #bgp 1.1.1.1
switch(config-maint-bgp-1.1.1.1) #no quiesce
switch(config-maint-bgp-1.1.1.1) #exit
switch(config-maintenance) #
```

#### 14.6.4.6 Configuring Event Handlers

Enter configuration options for the **show maintenance** command to fire at different stages while entering or exiting maintenance mode.

##### Example for Maintenance Mode Event Handler for all Stages

```
switch(config) #event-handler foo
switch(config-handler-foo) #trigger on-maintenance enter unit unit-foo all
switch(config-handler-foo) #action bash /mnt/flash/mm-event-handler-script
switch(config-handler-foo) #timeout 20
switch(config-handler-foo) #exit
switch(config) #
```

**Note:** The user is expected to configure the timeout value. This is time within which the script should complete execution and exit. If the script has not exited by the end of this period, then the following will occur:

1. Send the SIGUSR1 signal to the script.
2. Wait for a GRACE-PERIOD of 10 seconds for the script to exit.
3. If the script does not exit even after that GRACE-PERIOD, then send a SIGKILL to the script.
4. The maintenance operation progresses to the next stage.

GRACE-PERIOD is not configurable.

```
switch(config) #event-handler bar
switch(config-handler-bar) #trigger on-maintenance exit unit unit-foo
before
stage ratemon
switch(config-handler-bar) #action bash /mnt/flash/mm-event-handler-script
switch(config-handler-bar) #exit
```

```
switch(config) #
```

#### 14.6.4.7 Configuring Groups

Enter the maintenance mode configuration options for groups with the `maintenance` and `group bgp` commands.

##### Example for group interface IG1

```
switch(config) #group interface IG1
switch(config-group-if-IG1) #interface Ethernet1
switch(config-group-if-IG1) #interface Port-Channel1,20
switch(config-group-if-IG1) #interface Vlan1-20
switch(config-group-if-IG1) #exit
switch(config) #
```

##### Example for group bgp BG1

```
switch(config) #group bgp BG1
switch(config-group-bgp-BG1) #neighbor 10.0.0.1
switch(config-group-bgp-BG1) #neighbor BGP_PG1
switch(config-group-bgp-BG1) #vrf vrf1
switch(config-group-bgp-BG1) #exit
switch(config) #
```

**Note:** BGP groups are specific to VRF.

#### 14.6.4.8 Configuring Profiles

Enter the maintenance mode configuration options for profiles with the `profile interface`, `rate-monitoring threshold`, `profile bgp`, and `profile unit <profile_name>` commands.

These command examples assign a user configured profile as the **default** profile.

##### Example for profile interface IP1

```
switch(config) #maintenance
switch(config-maintenance) #profile interface IP1
switch(config-profile-intf-IP1) #rate-monitoring load-interval 10
switch(config-profile-intf-IP1) #rate-monitoring threshold 100
switch(config-profile-intf-IP1) #shutdown max-delay 100
switch(config-profile-intf-IP1) #profile interface IP1 default
switch(config-profile-intf-IP1) #exit
switch(config-maintenance) #
```

##### Example for profile bgp BP1

```
switch(config-maintenance) #profile bgp BP1
switch(config-profile-bgp-BP1) #initiator route-map rmap inout
switch(config-profile-bgp-BP1) #profile bgp BP1 default
switch(config-profile-bgp-BP1) #exit
switch(config-maintenance) #
```

### Example for profile unit UP1

```
switch(config-maintenance) #profile unit UP1
switch(config-profile-unit-UP1) #on-boot duration 300
switch(config-profile-unit-UP1) #profile unit UP1 default
switch(config-profile-unit-UP1) #exit
switch(config-maintenance) #
```

#### 14.6.4.9 Associating Profiles with Groups

Enter the maintenance mode configuration options for associating profiles with groups using the `maintenance` and `group bgp` command.

#### Example

```
switch(config) #group interface IG1
switch(config-group-if-IG1) #maintenance profile bgp BP1
switch(config-group-if-IG1) #maintenance profile interface IP1
switch(config-group-if-IG1) #
```

**Note:** An interface/BGP profile can be associated with the interface group, and a BGP profile can be associated with the BGP group.

#### 14.6.4.10 Configuring Units

Enter the maintenance mode configuration options for units using the `unit`, `group bgp`, and `maintenance` commands.

#### Example

```
switch(config) #maintenance
switch(config-maintenance) #unit foo
switch(config-unit-foo) #group bgp BG1
switch(config-unit-foo) #group interface IG1
switch(config-unit-foo) #profile unit UP1
```

#### 14.6.4.11 Show Commands

Maintenance mode show commands display general and detailed information associated with maintenance mode.

##### 14.6.4.11.1 show maintenance example

This example of the `show maintenance` command displays maintenance mode details.

#### Example

```
switch(config) #show maintenance
Flags:
o - On-boot maintenance
v - Violating traffic threshold
Unit Name Status Time since last change Flags
-----
-----
System Not Under Maintenance never
Foo Under Maintenance 0:00:14 ago ov
Interface Name Status Time since last change Flags
```

```

-----
-----
Ethernet4 Entering Maintenance 0:00:24 ago
Bgp Neighbor(vrf: defa Status Time since last change Flags
-----
-----
12.12.12.12 Under Maintenance 0:00:04 ago
Bgp Neighbor(vrf: red) Status Time since last change Flags
-----
-----
12.12.12.13 Under Maintenance 0:00:34 ago

switch(config)#

```

#### 14.6.4.11.2 show maintenance summary example

This example of the `show maintenance summary` command displays a summary of maintenance mode information.

##### Example

```

switch(config)#show maintenance summary
Number of Units configured: 3
Number of Units not under maintenance: 2
Number of Units entering maintenance: 1
Number of Units under maintenance: 0
Number of Units exiting maintenance: 0
Directly Put Under Maintenance:
    Number of interfaces entering maintenance: 0
    Number of interfaces under maintenance: 2
    Number of bgp peers entering maintenance: 0
    Number of bgp peers under maintenance: 3
Rate Monitoring:
    Number of interfaces entering maintenance: 0
    Number of interfaces under maintenance: 4
    Number of interfaces under maintenance with threshold violation:
0
    Number of interfaces shutdown for maintenance: 0

switch(config)#

```

#### 14.6.4.11.3 show maintenance units example

This example of the `show maintenance units` command displays maintenance mode units details.

##### Example

```

switch(config)#show maintenance units
Unit Name: Linecard3
Origin: User Configured
Status: Under Maintenance
Unit Profile: Default
Time Since Last State Change: 0:12:07 ago
Interface Groups:
IG1
Interface Traffic Threshold violations:
Current violations: 1
Etl
Total violations, during maintenance: 5
History:

```

```
2016-04-27 04:00:42 old state: 'maintenanceModeEnter' to new state:
'underMaintenance' 0:12:07 ago
2016-04-27 03:59:31 old state: 'active' to new state: 'maintenanceM
odeEnter'
0:13:18 ago
Unit Name: System
Origin: Built-in
Status: Not Under Maintenance
Unit Profile: Default
Time Since Last State Change: never
Interface Groups:
AllEthernetInterface

switch(config)#
```

#### 14.6.4.11.4 show maintenance bgp example

This example of the `show maintenance bgp` command displays maintenance mode BGP details for all IPs and VRFs.

##### Example

```
switch(config)#show maintenance bgp ip all vrf all
BGP peer maintenance information for VRF default
Router identifier 2.2.2.1, local AS number 1
Neighbor: 2.2.2.2
Maintenance State: Not Under Maintenance
BGP peer maintenance information for VRF red
Router identifier 6.6.6.1, local AS number 1
Neighbor: 1.1.1.2
Maintenance State: Not Under Maintenance
Router identifier 2.2.2.1, local AS number 1
Neighbor: 2.2.2.2
Maintenance State: Not Under Maintenance
Maintenance route-map: SystemGenerated
route-map SystemGenerated permit 10
Description:
Match clauses:
Set clauses:
set community GSHUT additive
set local-preference 0
Selected profile from BGP groups: Default

switch(config)#
```

#### 14.6.4.11.5 show maintenance interface example

This example of the `show maintenance interface status` command displays maintenance mode interface details.

##### Example

```
switch(config)#show maintenance interface
Flags:
v - Violating traffic threshold
s - Shutdown for maintenance
Rate (Mbps)
Interface Status In Out Flags
-----
-----
```

```

Ethernet1 Under Maintenance 0.4 0.0 v
Ethernet2 Under Maintenance 0.0 0.0
Ethernet3 Not Under Maintenance - -
Ethernet4 Under Maintenance 0.0 0.0
Ethernet5 Not Under Maintenance - -

switch(config)#

```

#### 14.6.4.11.6 show maintenance interface status quiesced

This example of the `show maintenance interface status quiesced` command displays maintenance mode interface status details for quiesced interfaces.

#### Example

```

switch(config)#show maintenance interface status quiesced
Flags:
v - Violating traffic threshold
s - Shutdown for maintenance
Rate (Mbps)
Interface Status In Out Flags
-----
-----
Ethernet1 Under Maintenance 0.3 0.0 v
Ethernet2 Under Maintenance 0.0 0.0
Ethernet4 Under Maintenance 0.0 0.0

switch(config)#

```

#### 14.6.4.11.7 show maintenance groups example

This example of the `show maintenance groups` command displays maintenance mode group details.

#### Example

```

switch(config)#show maintenance groups
Interface Group: IG1
Interfaces:
Et4-6
Profiles:
Interface Profile: IP1
Units: newEt
Bgp Group: BG
Neighbors:
IPv4 Peers: 4.4.4.2, 1.1.1.2, 3.3.3.2
IPv6 Peers: 3::3
Bgp Profile: prepend
Units: newBG

switch(config)#

```

#### 14.6.4.11.8 show maintenance profiles example

This example of the `show maintenance profiles` command displays maintenance mode profile details.

---

## Example

```
switch(config)#show maintenance profiles
Interface Profile: INTFPROFILE
Rate Monitoring:
load-interval: 444 seconds
threshold (in/out): 4000 Kbps
shutdown:
enabled: yes
max-delay: 399 seconds
Bgp Profile: BGPPROFILE
Initiator route-map:
name: rm
Unit Profile: UNITPROFILE
On-boot:
enabled: yes
duration: 340 seconds

switch(config)#
```

### 14.6.4.11.9 show interface status

This example of the `show interface <intf_name> status` command displays maintenance mode information for interfaces.

## Example

```
switch(config)#show interface status
Port Name Status Vlan Duplex Speed TypeFlags
Et1 connected 1 full 10G EbraTestPhyP mv
Et2 connected 1 full 10G EbraTestPhyP m
Et3 maint-down 1 full 10G EbraTestPhyP m
Et4 maint-down 1 full 10G EbraTestPhyP m
Et5 connected 1 full 10G EbraTestPhyP
Et6 connected 1 full 10G EbraTestPhyP
switch(config)#
```

### 14.6.4.11.10 show interface ethernet

This example of the `show interface ethernet` command displays maintenance mode information for an ethernet interface.

## Example

```
switch(config)#show interface ethernet 4
Ethernet4 is down, line protocol is down (maint-down)
Hardware is Ethernet, address is 0000.0101.0004 (bia 0000.0101.0004)
Ethernet MTU 9214 bytes , BW 10000000 kbit
Full-duplex, 10Gb/s, auto negotiation: off, uni-link: unknown
Down 18 minutes, 39 seconds
Under maintenance for 18 minutes, 42 seconds
2 link status changes since last clear
Last clearing of "show interface" counters never
5 minutes input rate 0 bps (0.0% with framing overhead), 0 packets/sec
5 minutes output rate 0 bps (0.0% with framing overhead), 0 packets/sec
0 packets input, 0 bytes
Received 0 broadcasts, 0 multicast
0 runts, 0 giants
0 input errors, 0 CRC, 0 alignment, 0 symbol, 0 input discards
```

```

0 PAUSE input
94 packets output, 11562 bytes
Sent 0 broadcasts, 94 multicast
0 output errors, 0 collisions
0 late collision, 0 deferred, 0 output discards
0 PAUSE output

switch(config)#

```

#### 14.6.4.11.1 show ip bgp neighbors

This example of the **show ip bgp neighbors** command displays IP BGP neighbors maintenance mode details.

##### Example

```

switch(config)#show ip bgp neighbors 1.1.1.2
BGP neighbor is 1.1.1.2, remote AS 1, external link
...
Prefix statistics:
Sent Rcvd
IPv4 prefixes: 0 0
IPv6 prefixes: 0 0
Inbound route map is foo
Outbound route map is foo
Session is under maintenance
Maintenance-mode:
Inbound and Outbound policy
Route map is SystemGenerated

switch(config)#

```

#### 14.6.4.11.2 show ip bgp summary

This example of the **show ip bgp summary** command displays maintenance mode information for IP BGP.

##### Example

```

switch(config)#show ip bgp summary
BGP summary information for VRF default
Router identifier 192.168.201.13, local AS number 100
Neighbor Status Codes: m - Under maintenance
Neighbor V AS MsgRcvd MsgSent InQ OutQ Up/Down State PfxRcd
PfxAcc
m 1.0.0.1 4 300 983 988 0 0 16:16:03 Estab 1 1
1.0.1.1 4 300 983 983 0 0 16:15:58 Estab 1 1

switch(config)#

```

#### 14.6.4.11.3 show maintenance stages example

These examples of the **show maintenance stages** command display maintenance mode stages details.

##### Example

```

switch(config)#show maintenance stages

```

```

Maintenance Enter Stage Sequence
No. Stage Description
-----
1 bgp BGP Maintenance processing
2 ratemon Interface Rate Monitoring

Maintenance Exit Stage Sequence
No. Stage Description
-----
1 ratemon Interface Rate Monitoring
2 bgp BGP Maintenance processing

switch(config)#

```

### Example

```

switch(config)#show maintenance bgp receiver route-map
route-map SystemGenerated permit 10
  Description:
    description System generated receiver route-map
  Match clauses:
    match community GSHUT-LIST
  SubRouteMap:
  Set clauses:
route-map SystemGenerated permit 50
  Description:
    description System generated receiver route-map
  Match clauses:
  SubRouteMap:
  Set clauses:
tg232(s1)(config)#show maintenance profiles interface
tg232(s1)(config)#show maintenance profiles bgp
tg232(s1)(config)#show maintenance profiles unit
tg232(s1)(config)#show maintenance profiles unit default
Unit Profile: Default
  On-boot:
    enabled: no
    duration: 300 seconds
switch(config)#

```

### Example

```

switch(config)#show maintenance profiles interface default
Interface Profile: Default
  Rate Monitoring:
    load-interval: 60 seconds
    threshold (in/out): 100 Kbps
  shutdown:
    enabled: no
    max-delay: 300 seconds

switch(config)#

```

### Example

```

switch(config)#show maintenance profiles bgp default
Bgp Profile: Default
  Initiator route-map: SystemGenerated
  route-map SystemGenerated permit 10
  Description:

```

```

description System generated initiator route-map
Match clauses:
SubRouteMap:
Set clauses:
  set local-preference 0
  set community GSHUT additive

switch(config)#

```

### Example

```

switch(config)#show maintenance profiles unit default
Unit Profile: Default
  On-boot:
    enabled: no
    duration: 300 seconds

switch(config)#

```

#### 14.6.4.12 Syslog Messages

Maintenance mode syslog messages are as follows:

- MaintenanceMode: %MMODE-4-MAINT\_OP\_WARNING: Unit config is deleted for unit foo. The unit is still undergoing maintenance operation.
- MaintenanceMode: %MMODE-5-MAINT\_UNIT\_STATE\_CHANGE: Maintenance unit state changed for unit <Dynamic Unit><SPINE-V6><vrf-default>. Old State maintenanceModeEnter, New State underMaintenance.
- MaintenanceMode: %ETH-6-MAINTENANCE\_DOWN: Interface Et1 has been shutdown for maintenance.
- MaintenanceMode: %MMODE-5-INTF\_PROFILE\_CHANGE: For interface Et1 interface profile changed to IP1.
- Rib: %BGP-6-MAINTENANCE-MODE: peer 1.1.1.1 is placed under maintenance.
- Rib: %BGP-6-MAINTENANCE-MODE: peer 1.1.1.1 is taken out of maintenance.

---

## 14.6.5 Maintenance Mode Commands

### Global Configuration Commands

- `group bgp`
- `group interface`
- `maintenance`

### Group Configuration Commands

- `interface`
- `maintenance profile bgp`
- `maintenance profile interface`
- `neighbor`
- `vrf`

### Maintenance Configuration Commands

- `bgp <peer> [vrf <vrf_name>]`
- `interface`
- `profile bgp`
- `profile unit <profile_name> default`
- `profile interface`
- `profile interface <profile_name> default`
- `profile unit`
- `profile unit <profile_name> default`
- `unit`

### Unit Configuration Commands

- `group bgp <group_name>`
- `group interface <group_name>`
- `profile unit`
- `quiesce`

### Interface Profile Configuration Commands

- `rate-monitoring load-interval`
- `rate-monitoring threshold`
- `shutdown max-delay`

### BGP Profile Configuration Commands

- `initiator route-map <route-map-name> inout`

### Unit Profile Configuration Commands

- `on-boot duration`

### EventMgr Configuration Commands

- `trigger on-maintenance`

**Display Commands**

- `show maintenance`
- `show maintenance bgp`
- `show maintenance bgp receiver route-map`
- `show maintenance debug`
- `show maintenance groups`
- `show maintenance interface`
- `show maintenance interface status`
- `show maintenance profiles`
- `show maintenance stages`
- `show maintenance summary`
- `show maintenance units`

**Enhanced Commands to show Maintenance Status**

- `show interface`
- `show interface <intf_name> status`
- `show ip | ipv6 bgp`
- `show ip | ipv6 bgp summary [ vrf <vrf_name>]`

### 14.6.5.1 `bgp <peer> [vrf <vrf_name>]`

The `bgp <peer> [vrf <vrf_name>]` command places the switch in maintenance dynamic BGP unit configuration mode. If no VRF is specified, the BGP peer is considered to be in the DEFAULT VRF, otherwise, in the specified VRF.

The command creates the dynamic BGP unit if the specified dynamic BGP unit does not exist prior to issuing the command.

The `no bgp <peer> [vrf <vrf_name>]` and `default bgp <peer> [vrf <vrf_name>]` removes the dynamic BGP unit from *running-config*.

#### Command Mode

Maintenance Configuration

#### Command Syntax

```
bgp ipv4_addr [vrf <vrf_name>]
```

```
bgp ipv6_addr [vrf <vrf_name>]
```

```
bgp peer_group_name [vrf <vrf_name>]
```

```
<no | default> bgp ipv4_addr|ipv6_addr|peer_group_name [vrf <vrf_name>]
```

#### Parameters

- `ipv4_addr` BGP neighbor IPv4 address
- `ipv6_addr` BGP neighbor IPv6 address
- `peer_group_name` BGP peer group name
- `vrf_name` name of the VRF to which the BGP peer belongs

#### Commands available in maintenance dynamic interface unit configuration mode:

- `quiesce`

#### Example

- This command creates dynamic BGP unit for IPv4 addr 1.0.1.1, IPv6 addr 1::1 with `quiesce` and `peer-group PG` in VRF VRF1 under maintenance configuration.

```
switch(config)#maintenance
switch(config-maintenance)#bgp 1.0.1.1
switch(config-maint-bgp-1.0.1.1)#exit
switch(config-maintenance)#bgp 1::1
switch(config-maint-bgp-1::1)#quiesce
switch(config-maint-bgp-1::1)#exit
switch(config-maintenance)#bgp PG vrf VRF1
switch(config-maint-bgp-PG)#exit
switch(config-maint-bgp-PG)#show active
maintenance
    bgp 1.0.1.1
    !
    bgp 1::1
        quiesce
    !
    bgp PG vrf VRF1
switch(config-maintenance)#
```

### 14.6.5.2 `group bgp <group_name>`

The `group bgp <group_name>` command adds a BGP group to a unit.

The `no group bgp <group_name>` and `default group bgp <group_name>` removes the BGP group from a unit.

#### Command Mode

Maintenance Unit Configuration

#### Command Syntax

```
group bgp group_name
```

```
no group bgp group_name
```

```
default group bgp group_name
```

#### Parameters

- `group_name` name of the BGP group

#### Example

- This command adds a BGP group BG1 to unit UNIT1.

```
switch(config)#maintenance
switch(config-maintenance)#unit UNIT1
switch(config-unit-UNIT1)#group bgp BG1
switch(config-unit-UNIT1)#show active
maintenance
    unit UNIT1
    group bgp BG1
switch(config-unit-UNIT1)
```

### 14.6.5.3 group bgp

The `group bgp <group_name>` command places the switch in group-BGP configuration mode for configuring the members of a BGP group in a particular VRF and associating a BGP maintenance profile for these members.

The command creates the group if the specified group does not exist prior to issuing the command.

The `no group bgp <group_name>` and `default group bgp <group_name>` removes the BGP group.

#### Command Mode

Global Configuration

#### Command Syntax

```
group bgp group_name
```

```
no group bgp group_name
```

```
default group bgp group_name
```

#### Parameters

- `group_name` name of the BGP group

#### Commands available in group-BGP configuration mode:

- `neighbor (ipv4 address | ipv6 address | peer-group)`
- `vrf (vrf-name)`
- `maintenance profile bgp`

**Note:** Built-in BGP groups like `AllBgpNeighborVrf-default` and `AllBgpNeighborVrf-<vrf_name>` do not allow neighbor configuration. Only BGP maintenance profile can be associated to them.

#### Example

- This command creates a BGP group BG1 and enters into group BGP BG1 configuration mode.

```
switch(config)#group bgp BG1
switch(config-group-bgp-BG1)#show active
group bgp BG1
exit
switch(config-group-bgp-BG1)#
```

- This command enters into BGP built-in configuration mode for `AllBgpNeighborVrf-default`.

```
switch(config)#group bgp AllBgpNeighborVrf-default
switch(config-builtin-group-bgp-AllBgpNeighborVrf-default)#show active
group bgp AllBgpNeighborVrf-default
exit
switch(config-builtin-group-bgp-AllBgpNeighborVrf-default)#exit
switch(config)#show maintenance groups bgp AllBgpNeighborVrf-default
BGP Group: AllBgpNeighborVrf-default
Origin: Built-in
Neighbors:
Ipv4 Peers: 1.0.0.1, 1.0.1.2
Bgp Profile: Default
Vrf: default
Units: System
switch(config)#
```

#### 14.6.5.4 `group interface <group_name>`

The `group interface <group_name>` command adds an interface to a unit.

The `no group interface <group_name>` and `default group interface <group_name>` removes the interface group from a unit.

##### Command Mode

Maintenance Unit Configuration

##### Command Syntax

```
group interface group_name
```

```
no group interface group_name
```

```
default group interface group_name
```

##### Parameters

- `group_name` name of the interface group

##### Example

- This command adds an interface group IG1 to unit UNIT1.

```
switch(config) #maintenance
switch(config-maintenance) #unit UNIT1
switch(config-unit-UNIT1) #group interface IG1
switch(config-unit-UNIT1) # show active
maintenance
    unit UNIT1
    group interface IG1
switch(config-unit-UNIT1)
```

### 14.6.5.5 group interface

The **group interface** command places the switch in group-intf configuration mode for configuring the members of interface group and associating a BGP/interface maintenance profile for these members.

The command creates the group if the specified group does not exist prior to issuing the command.

The **no group interface <group\_name>** and **default group interface <group\_name>** removes the interface group.

#### Command Mode

Global Configuration

#### Command Syntax

```
group interface group_name
no group interface group_name
default group interface group_name
```

#### Parameters

- *group\_name* name of the interface group

#### Commands available in group-BGP configuration mode:

- **interface**
- **maintenance profile bgp**
- **maintenance profile interface**

**Note:** Built-in Interface groups like **AllEthernetInterface**, **Linecard3**, **Linecard4**, etc. do not allow interface configurations. Only BGP/interface maintenance profiles can be associated to them.

#### Example

- This command creates an interface group IG1 and enters into group interface IG1 configuration mode.

```
switch(config)#group interface IG1
switch(config-group-if-IG1)#show active
group interface IG1
exit
switch(config-group-if-IG1)#
```

- This command enters into built-in interface group AllEthernetInterface.

```
switch(config)#group interface AllEthernetIntetrface
switch(config-builtin-group-if-AllEthernetInterface)#show active
group interface AllEthernetInterface
exit
switch(config-builtin-group-if-AllEthernetInterface)#exit
switch(config)# show maintenance groups interface AllEthernetInterface
Interface Group: AllEthernetInterface
Origin: Built-in
Interfaces:
Et1, Et2, Et3, Et4, Et5/1, Et34, Et35, Et36
Profiles:
Interface Profile: Default
Bgp Profile: Default
Units: System#
```

### 14.6.5.6 initiator route-map <route-map-name> inout

The `initiator route-map <route-map-name> inout` command is a maintenance BGP profile configuration option for assigning the initiator route-map, which will be applied to inout (inbound and outbound).

The `no initiator route-map <route-map-name> inout` and `default initiator route-map <route-map-name> inout` removes this configuration from the BGP profile.

#### Command Mode

Maintenance-Profile-BGP Configuration

#### Command Syntax

```
initiator route-map route-map-name inout
```

```
no initiator route-map
```

```
default initiator route-map
```

#### Parameters

- *route-map-name* initiator route-map name

#### Example

- This command configures initiator route-map **RM1** within a BGP profile **BP1**.

```
switch(config)#maintenance
switch(config-maintenance)#profile bgp BP1
switch(config-profile-bgp-BP1)#initiator route-map RM1 inout
switch(config-profile-bgp-BP1)#show active
maintenance
  profile bgp BP1
    initiator route-map RM1 inout

switch(config-profile-bgp-BP1)#
```

---

### 14.6.5.7 interface intf-name

The **interface <intf-name>** command places the switch in maintenance dynamic interface unit configuration mode.

The command creates the dynamic interface unit if the specified dynamic interface unit does not exist prior to issuing the command.

The **no interface <intf-name>** and **default interface <intf-name>** removes the dynamic interface unit from *running-config*.

#### Command Mode

Maintenance Configuration

#### Command Syntax

```
interface interface-name
```

```
no interface interface-name
```

```
default interface interface-name
```

#### Parameters

- *interface-name* name of the interface
- ethernet *e\_range* Ethernet interfaces specified by *e\_range*
- port-channel *p\_range* port channel interfaces specified by *p\_range*
- vlan *v\_range* vlans specified by *v\_range*.

Valid *e\_range*, *p\_range* and *v\_range* formats include number, range, or comma-delimited list of numbers and ranges.

**Note:** Different dynamic interface units are created for each interface in the range.

#### Commands available in maintenance dynamic interface unit configuration mode:

- quiesce

#### Example

- This command creates two dynamic interface units for interfaces Ethernet1-2 under maintenance configuration.

```
switch(config)#maintenance
switch(config-maintenance)#interface Ethernet1-2
switch(config-maint-if-Et1-2)#exit
switch(config-maintenance)#show active
maintenance
    interface Ethernet1
    !
    interface Ethernet2
switch(config-maintenance)#
```

### 14.6.5.8 interface

The **interface** command adds interfaces to interface group.

The **interface <intf-name>** and **default interface <intf-name>** removes the interface from the group.

#### Command Mode

Group-Interface Configuration

#### Command Syntax

**interface** *interface-name*

**no interface** *interface-name*

**default interface** *interface-name*

#### Parameters

- *interface-name* name of the interface
- ethernet *e\_range* Ethernet interfaces specified by *e\_range*
- port-channel *p\_range* port channel interfaces specified by *p\_range*
- vlan *v\_range* vlans specified by *v\_range*.

Valid *e\_range*, *p\_range* and *v\_range* formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.

#### Example

- This command adds Ethernet8, Ethernet9, and port-channel10 to the interface group IG1.

```
switch(config)#group interface IG1
switch(config-group-if-IG1)#interface Ethernet8-9
switch(config-group-if-IG1)#interface port-channel10
switch(config-group-if-IG1)#show active
group interface IG1
interface Et8-9
interface Po10
switch(config-group-if-IG1)#exit
switch(config)#
```

---

### 14.6.5.9 maintenance profile bgp

The **maintenance profile bgp <profile-name>** command associates a BGP maintenance profile to an interface/BGP group. A BGP profile can be associated to both the interface and BGP group.

The **no maintenance profile bgp <profile-name>** and **default maintenance profile bgp <profile-name>** removes the profile from the interface/BGP group.

#### Command Mode

Group-Interface Configuration

Group-BGP Configuration

Built-in-Group-Interface Configuration

Built-in-Group-BGP Configuration

#### Command Syntax

```
maintenance profile bgp profile-name
```

```
no maintenance profile bgp profile-name
```

```
default maintenance profile bgp profile-name
```

#### Parameters

- *profile name* name of the BGP profile

#### Example

- This command adds BGP profile BP1 to a BGP group BG1.

```
switch(config)#group bgp BG1
switch(config-group-bgp-BG1)#neighbor 1.0.1.1
switch(config-group-bgp-BG1)#neighbor 1::1
switch(config-group-bgp-BG1)#neighbor PG
switch(config-group-bgp-BG1)#maintenance profile bgp BP1
switch(config-group-bgp-BG1)#show active
group bgp BG1
  neighbor 1.0.1.1
  neighbor 1::1
  neighbor PG
  maintenance profile bgp BP1
switch(config-group-bgp-BG1)#exit
switch(config)#
```

- This command adds BGP profile BP1 to interface group IG1.

```
switch(config)#group interface IG1
switch(config-group-if-IG1)#interface Ethernet8-9
switch(config-group-if-IG1)#maintenance profile bgp BP1
switch(config-group-if-IG1)#show active
group interface IG1
  interface Et8-9
  maintenance profile bgp BP1
switch(config-group-if-IG1)#exit
switch(config)#
```

- This command adds BGP profile BP1 to built-in interface group AllEthernetInterface.

```
switch(config)#group interface AllEthernetInterface
switch(config-builtin-group-if-AllEtherentInterface)#maintenance
profile bgp BP1
switch(config-builtin-group-if-AllEtherentInterface)#show active
```

```
group interface AllEthernetInterface
  maintenance profile bgp BP1

switch(config-builtin-group-if-AllEtherentInterface) #
```

---

### 14.6.5.10 maintenance profile interface

The **maintenance profile interface** <profile-name> command associates interface profile to interface group.

The **no maintenance profile interface** <profile-name> and **default maintenance profile interface** <profile-name> removes the interface profile from interface group.

#### Command Mode

Group-Interface Configuration

Built-in-Group-Interface Configuration

#### Command Syntax

```
maintenance profile interface profile-name
```

```
no maintenance profile interface profile-name
```

```
default maintenance profile interface profile-name
```

#### Parameters

- *profile-name* name of the interface profile

#### Example

- This command adds interface profile IP1 to interface group IG1.

```
switch(config)#group interface IG1
switch(config-group-if-IG1)#interface Ethernet8-9
switch(config-group-if-IG1)#maintenance profile interface IP1
switch(config-group-if-IG1)#show active
group interface IG1
    interface Et8-9
        maintenance profile interface IP1

switch(config-group-if-IG1)#
```

- This command adds interface profile IP1 to built-in interface group AllEthernetInterface.

```
switch(config)#group interface AllEthernetInterface
switch(config-builtin-group-if-AllEtherentInterface)#maintenance
profile
interface IP1
switch(config-builtin-group-if-AllEtherentInterface)#show active
group interface AllEthernetInterface
    maintenance profile interface IP1

switch(config-builtin-group-if-AllEtherentInterface)#
```

### 14.6.5.11 maintenance

The **maintenance** command allows you to enter maintenance configuration mode and specify maintenance configuration options.

The **no maintenance** and **default maintenance** command removes the maintenance configuration from the *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

**maintenance**

**no maintenance**

**default maintenance**

#### Commands available in maintenance configuration mode:

- **unit**
- **bgp**
- **interface**
- **profile bgp**
- **profile interface**
- **profile unit**
- **profile interface <profile-name> default**
- **profile bgp <profile-name> default**
- **profile unit <profile-name> default**

#### Examples

- This example shows the commands to enter maintenance configuration mode and configure maintenance related parameters.

```
switch(config)#maintenance
switch(config-maintenance)#profile unit foo
switch(config-profile-unit-foo)#on-boot duration 300
switch(config-profile-unit-foo)#exit
switch(config-maintenance)#unit U1
switch(config-unit-U1)#group interface IG1
switch(config-unit-U1)#group bgp BG1
switch(config-unit-U1)#profile unit foo
switch(config-unit-U1)#exit
switch(config-maintenance)#show active
maintenance
  profile unit foo
    on-boot duration 300
  unit U1
    group interface IG1
    group bgp BG1
    profile unit foo
switch(config-maintenance)#
```

---

### 14.6.5.12 neighbor

The **neighbor** command adds BGP peer(s) to a BGP group. The neighbors can be IPv4, IPv6 or a peer-group. The **no neighbor <peer>** and **default neighbor <peer>** removes the BGP peer from the group.

#### Command Mode

Group-BGP Configuration

#### Command Syntax

**neighbor** *ipv4\_addr*

**no neighbor** *ipv4\_addr*

**default neighbor** *ipv4\_addr*

**neighbor** *ipv6\_addr*

**no neighbor** *ipv6\_addr*

**default neighbor** *ipv6\_addr*

**neighbor** *peer-group-name*

**no neighbor** *peer-group-name*

**default neighbor** *peer-group-name*

#### Parameters

- *ipv4\_addr* BGP neighbor ipv4 address
- *ipv6\_addr* BGP neighbor ipv6 address
- *peer-group-name* BGP peer group name

#### Example

- This command adds ipv4 peer 1.0.1.1, ipv6 peer 1::1 and peer-group PG to the BGP group BG1.

```
switch(config)#group bgp BG1
switch(config-group-bgp-BG1)#neighbor 1.0.1.1
switch(config-group-bgp-BG1)#neighbor 1::1
switch(config-group-bgp-BG1)#neighbor PG
switch(config-group-bgp-BG1)#group bgp BG1
switch(config-group-bgp-BG1)#neighbor 1.0.1.1
switch(config-group-bgp-BG1)#neighbor 1::1
switch(config-group-bgp-BG1)#neighbor PG
switch(config-group-bgp-BG1)#exit
switch(config)#
```

### 14.6.5.13 on-boot duration

The `on-boot duration` command is a maintenance unit profile configuration option for specifying the duration after which the associated unit will be brought out of maintenance after reboot. The `on-boot` property in the maintenance unit profile specifies that the unit will be placed into maintenance mode as part of boot-up, and remain so for the specified duration.

The `no on-boot` and `default on-boot` removes this configuration from the unit profile.

#### Command Mode

Maintenance-Profile-Unit Configuration

#### Command Syntax

```
on-boot duration duration
```

```
no on-boot
```

```
default on-boot
```

#### Parameters

- *duration* number of seconds for which unit will remain under maintenance after reboot (from 300 to 3600 seconds)

#### Example

- This command configures on-boot duration of 1000 seconds in profile unit UP1.

```
switch(config)#maintenance
switch(config-maintenance)#profile unit UP1
switch(config-profile-unit-UP1)#on-boot duration 1000
switch(config-profile-unit-UP1)#show active
maintenance
    profile unit UP1
        on-boot duration 1000

switch(config-profile-unit-UP1)#
```

---

#### 14.6.5.14 profile bgp <profile\_name> default

The `profile bgp <profile_name> default` command configures a user-configured BGP profile as default BGP profile.

The `no profile bgp <profile_name> default` and `default profile bgp <profile_name> default` removes the user-configured BGP profile as default BGP profile.

##### Command Mode

Maintenance Configuration

##### Command Syntax

```
profile bgp profile_name default
```

```
no profile bgp profile_name default
```

```
default profile bgp profile_name default
```

##### Parameters

- *profile\_name* name of the BGP profile

##### Example

- This command configures user configured BGP profile BP1 as default BGP profile.

```
switch(config)#maintenance
switch(config-maintenance)#profile bgp BP1
switch(config-profile-bgp-BP1)#initiator route-map RM1 inout
switch(config-profile-bgp-BP1)#exit
switch(config-maintenance)#
switch(config-maintenance)#show maintenance profile bgp default
Bgp Profile: Default
  Initiator route-map: SystemGenerated
  route-map SystemGenerated permit 10
  Description:
    description System generated initiator route-map
  Match clauses:
  Set clauses:
    set community GSHUT additive
    set local-preference 0

switch(config-maintenance)#
switch(config-maintenance)#profile bgp BP1 default
switch(config-maintenance)#show maintenance profile bgp default
Bgp Profile: BP1
  Initiator route-map: RM1
switch(config-maintenance)#
switch(config-maintenance)#show active
maintenance
  profile bgp BP1
    initiator route-map RM1 inout
  profile bgp BP1 default

switch(config-maintenance)#
```

### 14.6.5.15 profile bgp

The **profile bgp** command places the switch in maintenance profile BGP configuration mode for configuring initiator route-map.

The command creates the profile if the specified BGP profile does not exist prior to issuing the command.

The **no profile bgp <profile-name>** and **default profile bgp <profile-name>** removes the profile from *running-config*.

#### Command Mode

Maintenance Configuration

#### Command Syntax

```
profile bgp profile-name
```

```
no profile bgp profile-name
```

```
default profile bgp profile-name
```

#### Parameters

- *profile-name* name of the BGP profile

#### Commands available in maintenance profile BGP configuration mode:

- **initiator route-map (route-map name) inout**

#### Example

- This command creates BGP profile BP1.

```
switch(config)#maintenance
switch(config-maintenance)#profile bgp BP1
switch(config-profile-bgp-BP1)#show active
maintenance
    profile bgp BP1

switch(config-profile-bgp-BP1)#
```

---

### 14.6.5.16 profile interface <profile\_name> default

The **profile interface <profile\_name> default** command configures a user-configured interface profile as default interface profile.

The **no profile interface <profile\_name> default** and **default profile interface <profile\_name> default** removes the user-configured interface profile as default interface profile.

#### Command Mode

Maintenance Configuration

#### Command Syntax

```
profile interface profile_name default
```

```
no profile interface profile_name default
```

```
default profile interface profile_name default
```

#### Parameters

- *profile\_name* name of the interface profile

#### Example

- This command configures user configured interface profile IP1 as default interface profile.

```
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1
switch(config-profile-intf-IP1)#rate-monitoring load-interval 100
switch(config-profile-intf-IP1)#rate-monitoring threshold 500
switch(config-profile-intf-IP1)#shutdown max-delay 100
switch(config-profile-intf-IP1)#exit
switch(config-maintenance)#
switch(config-maintenance)#show maintenance profile interface default
Interface Profile: Default
  Rate Monitoring:
    load-interval: 60 seconds
    threshold (in/out): 100 kbps
  shutdown:
    enabled: no
    max-delay: 300 seconds

switch(config-maintenance)#
switch(config-maintenance)#profile interface IP1 default
switch(config-maintenance)#show maintenance profile interface default
Interface Profile: IP1
  Rate Monitoring:
    load-interval: 100 seconds
    threshold (in/out): 500 kbps
  shutdown:
    enabled: yes
    max-delay: 100 seconds
switch(config-maintenance)#
switch(config-maintenance)#show active
maintenance
  profile interface IP1 default
  profile interface IP1
    rate-monitoring load-interval 100
    rate-monitoring threshold 500
    shutdown max-delay 100

switch(config-maintenance)#
```

### 14.6.5.17 profile interface

The **profile interface** command places the switch in maintenance profile interface configuration mode for configuring rate-monitoring threshold, load-interval, and shutdown max-delay.

The command creates the profile if the specified interface profile does not exist prior to issuing the command.

The **no profile interface <profile-name>** and **default profile interface <profile-name>** removes the profile from *running-config*.

#### Command Mode

Maintenance Configuration

#### Command Syntax

```
profile interface profile-name
```

```
no profile interface profile-name
```

```
default profile interface profile-name
```

#### Parameters

- *profile-name* name of the interface profile

#### Commands available in maintenance profile interface configuration mode:

- **rate-monitoring load-interval**
- **rate-monitoring threshold**
- **shutdown max-delay**

#### Example

- This command creates interface profile IP1.

```
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1
switch(config-profile-intf-IP1)#show active
maintenance
    profile interface IP1

switch(config-profile-intf-IP1)#
```

---

### 14.6.5.18 profile unit <profile\_name> default

The `profile unit <profile_name> default` command configures a user-configured unit profile as default unit profile.

The `no profile unit <profile_name> default` and `default profile unit <profile_name> default` removes the user-configured unit profile as default unit profile.

#### Command Mode

Maintenance Configuration

#### Command Syntax

```
profile unit profile_name default
```

```
no profile unit profile_name default
```

```
default profile unit profile_name default
```

#### Parameters

- *profile\_name* name of the interface profile

#### Example

- This command configures user-configured unit profile UP1 as the default unit profile.

```
switch(config)#maintenance
switch(config-maintenance)#profile unit UP1
switch(config-profile-unit-UP1)#on-boot duration 1000
switch(config-profile-unit-UP1)#exit
switch(config-maintenance)#
switch(config-maintenance)#show maintenance profiles unit default
Unit Profile: Default
  On-boot:
    enabled: no
    duration: 300 seconds

switch(config-maintenance)#profile unit UP1 default
switch(config-maintenance)#show maintenance profile unit default
Unit Profile: UP1
  On-boot:
    enabled: yes
    duration: 1000 seconds
switch(config-maintenance)#
switch(config-maintenance)#show active
maintenance
  profile unit UP1 default
  profile unit UP1
    on-boot duration 1000

switch(config-maintenance)#
```

### 14.6.5.19 profile unit <profile\_name>

The **profile unit <profile\_name>** command associates unit profile to a particular unit.

The **no profile unit <profile\_name>** and **default profile unit <profile\_name>** removes the unit profile from a unit.

#### Command Mode

Maintenance-Unit Configuration

Maintenance-Built-in-Unit Configuration

#### Command Syntax

**profile unit** *profile-name*

**no profile unit** *profile-name*

**default profile unit** *profile-name*

#### Parameters

- *profile-name* name of the unit profile

#### Examples

- This command adds unit profile UP1 to UNIT1.

```
switch(config)#maintenance
switch(config-maintenance)#unit UNIT1
switch(config-unit-UNIT1)#group interface IG1
switch(config-unit-UNIT1)#exit
switch(config-maintenance)#show maintenance units UNIT1
Unit Name: UNIT1
  Origin: User Configured
  Status: Not Under Maintenance
  Unit Profile: Default
  Time Since Last State Change: never
  Interface Groups:
    IG1

switch(config-maintenance)#unit UNIT1
switch(config-unit-UNIT1)#profile unit UP1
switch(config-unit-UNIT1)#show maintenance units UNIT1
Unit Name: UNIT1
  Origin: User Configured
  Status: Not Under Maintenance
  Unit Profile: UP1
  Time Since Last State Change: never
  Interface Groups:
    IG1
switch(config-unit-UNIT1)#show active
maintenance
  unit UNIT1
    group interface IG1
    profile unit UP1

switch(config-unit-UNIT1)#
```

- This command adds unit profile UP2 to built-in unit System.

```
switch(config)#maintenance
switch(config-maintenance)#profile unit UP2
switch(config-profile-unit-UP2)#on-boot duration 600
switch(config-profile-unit-UP2)#exit
switch(config-maintenance)#
switch(config-maintenance)#unit System
switch(config-builtin-unit-System)#show active
maintenance
  unit System
switch(config-builtin-unit-System)#exit
switch(config-maintenance)#show maintenance units System
Unit Name: System
  Origin: Built-in
  Status: Not Under Maintenance
```

---

```
Unit Profile: Default
Time Since Last State Change: never
Interface Groups:
  AllEthernetInterface

switch(config-maintenance)#
switch(config-maintenance)#unit System
switch(config-builtin-unit-System)#profile unit UP2
switch(config-builtin-unit-System)#show active
maintenance
  unit System
    profile unit UP2
switch(config-builtin-unit-System)#exit
switch(config-maintenance)#show maintenance units System
Unit Name: System
  Origin: Built-in
  Status: Not Under Maintenance
  Unit Profile: UP2
  Time Since Last State Change: never
  Interface Groups:
    AllEthernetInterface

switch(config-maintenance)#
```

### 14.6.5.20 profile unit

The **profile unit** command places the switch in maintenance profile unit configuration mode for configuring on-boot duration.

The command creates the profile if the specified BGP profile does not exist prior to issuing the command.

The **no profile unit <profile-name>** and **default profile unit <profile-name>** removes the profile from *running-config*.

#### Command Mode

Maintenance Configuration

#### Command Syntax

```
profile unit profile-name
```

```
no profile unit profile-name
```

```
default profile unit profile-name
```

#### Parameters

- *profile-name* name of the unit profile

#### Commands available in maintenance profile unit configuration mode:

- **on-boot duration**

#### Example

- This command creates unit profile UP1.

```
switch(config)#maintenance
switch(config-maintenance)#profile unit UP1
switch(config-profile-unit-UP1)#show active
maintenance
    profile unit UP1

switch(config-profile-unit-UP1)#
```

## 14.6.5.21 quiesce

The **quiesce** command places a unit or dynamic interface/BGP unit into maintenance mode, gracefully transitioning traffic away from it.

The **no quiesce** and **default quiesce** exits the unit from maintenance.

### Command Mode

Maintenance-Unit Configuration

Maintenance-Built-in-Unit Configuration

Maintenance Dynamic-Interface Unit Configuration

Maintenance Dynamic-Bgp Unit Configuration

### Command Syntax

**quiesce**

**no quiesce**

**default quiesce**

### Examples

- This command places unit UNIT1, interface Et1, BGP peer 1.0.1.1 in VRF default, BGP peer 1::1 in VRF VRF1 into maintenance.

```
switch(config)#group interface IG1
switch(config-group-if-IG1)#interface Ethernet3-6
switch(config-group-if-IG1)#maintenance profile interface IP1
switch(config-group-if-IG1)#exit
switch(config)#maintenance
switch(config-maintenance)#unit UNIT1
switch(config-unit-UNIT1)#group interface IG1
switch(config-unit-UNIT1)#quiesce
switch(config-unit-UNIT1)#exit
switch(config-maintenance)#interface Ethernet1
switch(config-maint-if-Et1)#quiesce
switch(config-maint-if-Et1)#exit
switch(config-maintenance)#bgp 1.0.1.1
switch(config-maint-bgp-1.0.1.1)#quiesce
switch(config-maint-bgp-1.0.1.1)#exit
switch(config-maintenance)#bgp 1::1 vrf VRF1
switch(config-maint-bgp-1::1)#quiesce
switch(config-maint-bgp-1::1)#exit
switch(config-maintenance)#show active
maintenance
  bgp 1.0.1.1
    quiesce
  !
  bgp 1::1 vrf VRF1
    quiesce
  interface Et1
    quiesce
  unit UNIT1
    quiesce

switch(config-maintenance)#show maintenance
Flags:
o - On-boot maintenance
v - Violating traffic threshold

Unit Name          Status              Time since last change  Flags
-----
System
UNIT1              Under Maintenance    0:00:06 ago
Interface Name     Status              Time since last change  Flags
-----
Ethernet1         Entering Maintenance 0:00:06 ago
Bgp Neighbor(vrf: defa Status              Time since last change  Flags
-----
1.0.1.1           Under Maintenance    0:00:06 ago
Bgp Neighbor(vrf: VRF1 Status              Time since last change  Flags
-----
1::1              Under Maintenance    0:00:06 ago
switch(config-maintenance)#
```

### 14.6.5.22 rate-monitoring load-interval

The **rate-monitoring load-interval** command is a maintenance interface profile configuration option for configuring the interfaces rate monitoring load interval with a load interval value between 5 and 600 seconds.

#### Command Mode

Maintenance-Profile-Interface Configuration

#### Command Syntax

```
rate-monitoring load-interval load_interval
```

```
no rate-monitoring load-interval load_interval
```

```
default rate-monitoring load-interval load_interval
```

#### Parameters

- *load\_interval* load interval value between 5 and 600 seconds

#### Example

- This command configures the rate monitoring load interval for the profile interface IP1 to a load interval of 10 seconds.

```
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1
switch(config-profile-intf-IP1)#rate-monitoring load-interval 10
switch(config-profile-intf-IP1)#show active
maintenance
  profile interface IP1
    rate-monitoring load-interval 10

switch(config-profile-intf-IP1)#
```

---

### 14.6.5.23 rate-monitoring threshold

The **rate-monitoring threshold** command is a maintenance interface profile configuration option for configuring the interfaces rate monitoring threshold with a threshold value between 1 and 4294967295 kilobytes.

The **no rate-monitoring threshold** and **default rate-monitoring threshold** removes this configuration from the interface profile.

#### Command Mode

Maintenance-Profile-Interface Configuration

#### Command Syntax

```
rate-monitoring threshold threshold_in_kbps
```

```
no rate-monitoring threshold threshold_in_kbps
```

```
default rate-monitoring threshold threshold_in_kbps
```

#### Parameters

- *threshold\_in\_kbps* threshold in kilobytes per second (kbps) between 1 and 4294967295 kilobytes

#### Example

- This command configures the rate monitoring threshold for the profile interface IP1 to a threshold of 1000 kilobytes per second (kbps).

```
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1
switch(config-profile-intf-IP1)#rate-monitoring threshold 1000
switch(config-profile-intf-IP1)# show active
maintenance
    profile interface IP1
        rate-monitoring threshold 1000

switch(config-profile-intf-IP1)#
```

#### 14.6.5.24 show interface <intf\_name> status

The `show interface <intf_name> status` command displays an m flag if the interface is undergoing maintenance operation.

##### Command Mode

EXEC

##### Command Syntax

```
show interface [intf_name] status
```

##### Parameters

- *intf\_name* name of the interface
  - ethernet *e\_range* Ethernet interfaces specified by *e\_range*
  - port-channel *p\_range* port channel interfaces specified by *p\_range*
  - vlan *v\_range* vlans specified by *v\_range*

##### Note:

Valid *e\_range*, *p\_range* and *v\_range* formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.

##### Example

- This command display tabular output and shows 'm' flag for Ethernet16/1 status.

```
switch#show interface Ethernet16/1 status
Port Name Status Vlan Duplex Speed Type Flags
Et1 disabled 1 auto auto 1000BASE-T
...
Et14/1 connected 2 full 40G 40GBASE-CR4
Et15/1 connected 2 full 40G 40GBASE-CR4
Et16/1 connected routed full 40G 40GBASE-CR4 m
Et17/1 notconnect 1 full 10G Not Present
...
switch#
```

---

### 14.6.5.25 show interface

The **show interface** command displays detailed information about the interface. It displays an extra line that reads: Under maintenance for time in hours and minutes.

#### Command Mode

EXEC

#### Command Syntax

**show interface** *intf\_name*

#### Parameters

- *intf\_name* name of the interface
  - ethernet *e\_range* Ethernet interfaces specified by *e\_range*
  - port-channel *p\_range* port channel interfaces specified by *p\_range*
  - vlan *v\_range* vlans specified by *v\_range*

#### Note:

Valid *e\_range*, *p\_range* and *v\_range* formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.

#### Example

- This command displays detailed information about Ethernet 16/1 interface.

```
switch#show interface ethernet 16/1
Ethernet16/1 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.7373.efc7
  Internet address is 1.0.1.1/24
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  IP MTU 1500 bytes, BW 40000000 kbit
  Full-duplex, 40Gb/s, auto negotiation: off, uni-link: n/a
  Up 4 hours, 44 minutes, 36 seconds
  Under maintenance for 4 hours, 22 minutes, 26 seconds
  Loopback Mode : None
  2 link status changes since last clear
  Last clearing of "show interface" counters 4:45:12 ago
  5 minutes input rate 20 bps (0.0% with framing overhead), 0 packets/sec
  5 minutes output rate 20 bps (0.0% with framing overhead), 0 packets/sec
    580 packets input, 46286 bytes
    Received 1 broadcasts, 0 multicast
    0 runts, 0 giants
    0 input errors, 0 CRC, 0 alignment, 0 symbol, 0 input discards
    0 PAUSE input
    601 packets output, 48954 bytes
    Sent 7 broadcasts, 15 multicast
    0 output errors, 0 collisions
    0 late collision, 0 deferred, 0 output discards
    0 PAUSE output
switch#
```

### 14.6.5.26 show ip | ipv6 bgp summary [ vrf <vrf\_name>]

The `show ip | ipv6 bgp summary [ vrf <vrf_name>]` command displays the m flag if the BGP IPv4 or IPv6 peer is undergoing maintenance operation.

#### Command Mode

EXEC

#### Command Syntax

```
show ip bgp summary [ vrf <vrf_name> ]
```

```
show ipv6 bgp summary [ vrf <vrf_name> ]
```

#### Parameters

- *vrf\_name* name of the VRF

#### Example

- This command displays the 'm' flag in `show ip bgp summary` output for peer 1.0.1.2 which is in maintenance mode.

```
switch#show ip bgp summary
BGP summary information for VRF default
Router identifier 0.0.1.1, local AS number 200
Neighbor Status Codes: m - Under maintenance
Neighbor V  AS MsgRcvd MsgSent InQ OutQ Up/Down State PfxRcd
PfxAcc
 1.0.0.1 4 100 292 296 0 0 04:47:44 Estab 1 1
m 1.0.1.2 4 300 292 296 0 0 04:47:44 Estab 1 1
switch#
```

## 14.6.5.27 show ip | ipv6 bgp

The `show ip | ipv6 bgp` command displays maintenance related information when relevant.

### Command Mode

EXEC

### Command Syntax

```
show ip bgp neighbors <peer_addr> [vrf <vrf_name>]
```

```
show ipv6 bgp peers <peer_addr> [vrf <vrf_name>]
```

### Parameters

- `peer_addr` name of the peer
  - `ipv4_addr` BGP neighbor IPv4 address
  - `ipv6_addr` BGP neighbor IPv6 address
  - `peer-group-name` BGP peer group name
- `vrf_name` name of the VRF

### Example

- This command displays the `m` flag in `show ip bgp summary` output for peer 1.0.1.2 which is in maintenance mode.

```
switch#show ip bgp neighbors 1.0.1.2
BGP neighbor is 1.0.1.2, remote AS 300, external link
  BGP version 4, remote router ID 0.0.2.1, VRF default
  Negotiated BGP version 4
  Last read 00:00:09, last write 00:00:11
  Hold time is 180, keepalive interval is 60 seconds
  Configured hold time is 180, keepalive interval is 60 seconds
  Connect timer is inactive

### 14.6.5.28 show maintenance bgp receiver route-map

The `show maintenance bgp receiver route-map` command displays receiver route-map which is applied during maintenance operation.

#### Command Mode

EXEC

#### Command Syntax

```
show maintenance bgp receiver route-map
```

#### Example

- This command displays receiver route-map contents.

```
switch#show maintenance bgp receiver route-map
route-map SystemGenerated permit 10
  Description:
    description System generated receiver route-map
  Match clauses:
    match community GSHUT-LIST
  SubRouteMap:
  Set clauses:
route-map SystemGenerated permit 50
  Description:
    description System generated receiver route-map
  Match clauses:
  SubRouteMap:
  Set clauses:switch#
```

### 14.6.5.29 show maintenance bgp

The **show maintenance bgp** command displays detailed maintenance information about BGP peers.

#### Command Mode

EXEC

#### Command Syntax

```
show maintenance bgp <ipv4_addr> [vrf <vrf_name>] | <ipv6_addr> [vrf <vrf_name>] |
<peer_group> [vrf <vrf_name>] | ip all [vrf <vrf_name> | vrf all] | ipv6 all [vrf <vrf_name> |
vrf all]
```

#### Parameters

- *ipv4\_addr* BGP neighbor ipv4 address
- *ipv6\_addr* BGP neighbor ipv6 address
- *peer\_group* BGP peer group name
- *vrf\_name* name of the VRF to which peer belongs
- **ip all vrf vrf\_name** all ipv4 peers in specified VRF
- **ipv6 all vrf vrf\_name** all ipv6 peers in specified VRF
- **ip all vrf all** all ipv4 peers in all the VRFs
- **ipv6 all vrf all** all ipv6 peers in all the VRFs

#### Example

- This command displays maintenance information about BGP peers 1.0.0.1 and 1.0.1.1 and maintenance route-map applied.

```
switch#show maintenance bgp ip all vrf all
BGP peer maintenance information for VRF default
Router identifier 0.0.1.1, local AS number 200
  Neighbor: 1.0.0.1
    Maintenance state: Under Maintenance
    Maintenance route-map: SystemGenerated
  Neighbor: 1.0.1.2
    Maintenance state: Under Maintenance
    Maintenance route-map: SystemGenerated

switch#
```

### 14.6.5.30 show maintenance debug

The `show maintenance debug` command displays the history of various maintenance operations on a unit/interface/BGP peer.

#### Command Mode

EXEC

#### Command Syntax

```
show maintenance debug bgp [peer_name] | interface [intf_name] | units  
[unit_name]
```

#### Parameters

- *bgp* display history of all dynamic BGP units which have undergone maintenance operation
  - *interface* display history of all dynamic interface units which have undergone maintenance operation
  - *units* display history of all units which have undergone maintenance operation
  - *peer\_name* name of the peer
    - *ipv4\_addr* BGP neighbor IPv4 address
    - *ipv6\_addr* BGP neighbor IPv6 address
    - *peer-group-name* BGP peer group name
  - *intf\_name* name of the interface
    - *ethernet e\_range* Ethernet interfaces specified by *e\_range*
    - *port-channel p\_range* port channel interfaces specified by *p\_range*
    - *vlan v\_range* vlans specified by *v\_range*
-  **Note:** Valid *e\_range*, *p\_range* and *v\_range* formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.
- *unit\_name* name of the unit

#### Example

- This command displays history of maintenance operation on Ethernet 16/1.

```
switch#show maintenance debug interface Ethernet 16/1-4  
Interface Ethernet16/1  
History:  
Maintenance Enter Stage Progression started 4:07:07 ago @ 2016-08-29 22:38:54  
0.000000 maintEnter stages started  
0.000091 stage begin started  
0.000151 event begin:EventMgr started  
0.004222 event begin:EventMgr completed  
0.004256 stage begin is complete

### 14.6.5.31 show maintenance groups

The `show maintenance groups` command displays all the interface/BGP groups along with their members and associated profiles.

#### Command Mode

EXEC

#### Command Syntax

```
show maintenance groups interface | bgp <group_name>
```

#### Parameters

- *interface* display only interface groups
- *bgp* display only BGP groups
- *group\_name* name of the group

#### Example

- This command displays group details for built-in interface group **AllEthernetInterface** and built-in BGP group **AllBgpNeighborVrf-default** and user-configured interface group IG1.

```
switch#show maintenance groups
Interface Group: AllEthernetInterface
Origin: Built-in
Interfaces:
  Et1, Et2, Et3, Et4, Et5/1, Et5/2, Et5/3, Et5/4, Et6/1, Et6/2, Et6/3, Et6/4,
  Et7/1, Et7/2, Et7/3, Et7/4, Et8/1, Et8/2, Et8/3, Et8/4, Et9/1, Et9/2, Et9/3,
  Et9/4, Et10/1, Et10/2, Et10/3, Et10/4, Et11/1, Et11/2, Et11/3, Et11/4, Et12/1,
  Et12/2, Et12/3, Et12/4, Et13/1, Et13/2, Et13/3, Et13/4, Et14/1, Et14/2, Et14/3,
  Et14/4, Et15/1, Et15/2, Et15/3, Et15/4, Et16/1, Et16/2, Et16/3, Et16/4, Et17/1,
  Et17/2, Et17/3, Et17/4, Et18/1, Et18/2, Et18/3, Et18/4, Et19/1, Et19/2, Et19/3,
  Et19/4, Et20/1, Et20/2, Et20/3, Et20/4, Et21/1, Et21/2, Et21/3, Et21/4, Et22/1,
  Et22/2, Et22/3, Et22/4, Et23/1, Et23/2, Et23/3, Et23/4, Et24/1, Et24/2, Et24/3,
  Et24/4, Et25/1, Et25/2, Et25/3, Et25/4, Et26/1, Et26/2, Et26/3, Et26/4, Et27/1,
  Et27/2, Et27/3, Et27/4, Et28/1, Et28/2, Et28/3, Et28/4, Et29, Et30, Et31, Et32,
  Et33, Et34, Et35, Et36
Profiles:
  Interface Profile: low-load-interval-profile
  Bgp Profile: Default
Units: System
Interface Group: IG1
Origin: User Configured
Interfaces:

Profiles:
  Interface Profile: IP1
  Bgp Profile: BP1
Units: UNIT1
Bgp Group: AllBgpNeighborVrf-default
Origin: Built-in
Neighbors:
  Ipv4 Peers: 1.0.0.1, 1.0.1.2
  Bgp Profile: Default
  Vrf: default
Units: System

switch#
```

### 14.6.5.32 show maintenance interface status

The **show maintenance interface status** command displays maintenance status and rates for interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show maintenance interface status active | entering | exiting | quiesced
```

#### Parameters

- *active* interfaces which are active
- *entering* interface which are entering maintenance
- *exiting* interface which are exiting maintenance
- *quiesced* interface which are under maintenance

#### Example

- This command displays interface status and traffic rates of interfaces which are quiesced.

```
switch#show maintenance interface status quiesced
Flags:
v - Violating traffic threshold
s - Shutdown for maintenance
Rate (Mbps)
Interface  Status  In Out  Flags
-----
-----
Ethernet1  Not Under Maintenance - -
Ethernet2  Not Under Maintenance - -
Ethernet3  Not Under Maintenance - -
Ethernet4  Not Under Maintenance - -
Ethernet16/1 Under Maintenance 0.0 0.0
Port-Channel10 Under Maintenance 100.5 50.5v
Port-Channel11 Entering Maintenance 15.5 10.5
Port-Channel10 Under Maintenance - -

switch#
```

### 14.6.5.33 show maintenance interface

The **show maintenance interface** command displays detailed information about interfaces and their maintenance status with traffic rates.

#### Command Mode

EXEC

#### Command Syntax

```
show maintenance interface [intf_name [detail] | detail]
```

#### Parameters

- *intf\_name* name of the interface or sub-interface. Options include:
  - ethernet *e\_range* Ethernet interfaces specified by *e\_range*
  - port-channel *p\_range* port channel interfaces specified by *p\_range*
  - vlan *v\_range* vlans specified by *v\_range*
- **detail** provides the detailed rate-monitoring information

#### Guidelines

Valid *e\_range*, *p\_range* and *v\_range* formats include number, range, or comma-delimited list of numbers and ranges.

#### Example

- This command displays interface status and traffic rates.

```
switch#show maintenance interface
Flags:
v - Violating traffic threshold
s - Shutdown for maintenance
Rate (Mbps)
Interface  Status  In Out  Flags
-----
Ethernet1  Not Under Maintenance - -
Ethernet2  Not Under Maintenance - -
Ethernet3  Under Maintenance 0.0 0.0
Ethernet4  Not Under Maintenance - -
...
Ethernet35 Entering Maintenance 8.7 2.9
Ethernet36 Not Under Maintenance - -
switch#
```

- This command displays detailed information about the interface Ethernet16/1.

```
switch#show maintenance interface Ethernet16/1 detail
Ethernet16/1 is Under Maintenance
Groups: AllEthernetInterface
Selected profiles from Interface groups:
Interface Maintenance profile: low-load-interval-profile
Bgp Maintenance profile: Default
Bgp:
Maintenance State: Under Maintenance
Vrf: default
Neighbor: 1.0.1.2
Maintenance routemap: SystemGenerated
Rate Monitoring:
Passive monitoring since 0:42:25 ago
Total samples taken: 236
Before Maintenance:
Below threshold: 1
Above threshold: 0
After Maintenance:
Below threshold: 235
Above threshold: 0
Last sample information:
Sample taken 0:00:04 ago
In: 0.0 Mbps
Out: 0.0 Mbps
switch#
```

### 14.6.5.34 show maintenance profiles

The **show maintenance profiles** command displays all the interface/BGP/unit profiles configuration.

#### Command Mode

EXEC

#### Command Syntax

```
show maintenance profiles interface | bgp | unit <profile_name>
```

#### Parameters

- *interface* display only interface profiles
- *bgp* display only BGP profiles
- *unit* display only unit profiles
- *profile\_name* name of the profile

#### Example

- This command displays profile configuration details for interface profile IP1, unit profile UP1 and BGP profile BP1.

```
switch#show maintenance profiles
Interface Profile: IP1
  Rate Monitoring:
    load-interval: 444 seconds
    threshold (in/out): 4000 Kbps
  shutdown:
    enabled: yes
    max-delay: 399 seconds
Bgp Profile: BP1
  Initiator route-map:
    name: RM1
Unit Profile: UP1
  On-boot:
    enabled: yes
    duration: 340 seconds

switch #
```

---

### 14.6.5.35 show maintenance stages

The **show maintenance stages** command displays stages of maintenance operation while entering/exiting maintenance.

#### Command Mode

EXEC

#### Command Syntax

```
show maintenance stages [enter | exit]
```

#### Parameters

- *enter* display maintenance stages during maintenance enter operation
- *exit* display maintenance stages during maintenance exit operation

#### Example

- This command displays maintenance mode stages details.

```
switch #show maintenance stages
No. Stage Description
-----
1 bgp BGP Maintenance processing
2 ratemon Interface Rate Monitoring
Maintenance Exit Stage Sequence
No. Stage Description
-----
1 ratemon Interface Rate Monitoring
2 bgp BGP Maintenance processing
switch #
```

- This command displays maintenance mode stage details during entry.

```
switch #show maintenance stages enter
No. Stage Description
-----
1 bgp BGP Maintenance processing
2 ratemon Interface Rate Monitoring
switch#
```

### 14.6.5.36 show maintenance summary

The **show maintenance summary** command displays summarized information about the maintenance mode operations such as number of units configured, number of units Entering/Exiting maintenance etc.

#### Command Mode

EXEC

#### Command Syntax

```
show maintenance summary
```

#### Example

- This command displays summary of maintenance mode operations.

```
switch#show maintenance summary
Number of Units Configured: 0
Number of Units Exiting Maintenance: 0
Number of Units Entering Maintenance: 0
Number of Units Not Under Maintenance: 1
Number of Units Under Maintenance: 0
Directly Put Under Maintenance:
  Number of interfaces Entering Maintenance: 0
  Number of interfaces Under Maintenance: 1
  Number of bgp peers Entering Maintenance: 0
  Number of bgp peers Under Maintenance: 1
Rate Monitoring:
  Number of interfaces Entering Maintenance: 0
  Number of interfaces Under Maintenance: 1
  Number of interfaces Under Maintenance with threshold violation: 0
  Number of interfaces shutdown for maintenance: 0

switch#
```

---

### 14.6.5.37 show maintenance units

The `show maintenance units` command displays detailed information about the particular unit.

#### Command Mode

EXEC

#### Command Syntax

```
show maintenance units [unit_name]
```

#### Parameters

- *unit\_name* name of unit

#### Example

- This command displays maintenance units details.

```
switch#show maintenance units
Unit Name: System
Origin: Built-in
Status: Not Under Maintenance
Unit Profile: Default
Time Since Last State Change: never
Bgp Groups:
AllBgpNeighborVrf-default
Interface Groups:
AllEthernetInterface

Unit Name: UNIT1
Origin: User Configured
Status: Under Maintenance
Unit Profile: UP1
Time Since Last State Change: 0:00:08 ago
Bgp Groups:
BG1
Interface Groups:
IG1
History:
2016-08-29 23:05:30 old state: 'maintenanceModeEnter' to new state:
'underMaintenance' 0:00:08 ago
2016-08-29 23:05:30 old state: 'active' to new state: 'maintenanceModeEnter'
0:00:08 ago

switch#
```

### 14.6.5.38 show maintenance

The **show maintenance** command provides brief information about all units/dynamic interface unit/dynamic bgp unit and status.

'o' - flag displays that unit is undergoing or has undergone a maintenance operation because of on-boot.

'v' - flag displays that one/some of the interfaces are violating traffic, i.e. traffic for those interfaces is above threshold.

#### Command Mode

EXEC

#### Command Syntax

**show maintenance**

#### Examples

- This command displays maintenance mode details.

```
switch#show maintenance
Flags:
o - On-boot maintenance
v - Violating traffic threshold
Unit Name Status Time since last change Flags
-----
System Not Under Maintenance never
Foo Under Maintenance 0:00:40 ago o

Interface Name Status Time since last change Flags
-----
Ethernet16/1 Entering Maintenance 0:00:02 ago v

Bgp Neighbor(vrf: defa Status Time since last change Flags
-----
1.0.0.2 Not Under Maintenance never

Bgp Neighbor(vrf: red) Status Time since last change Flags
-----
2.0.1.2 Under Maintenance 0:00:16 ago

switch#
```

---

### 14.6.5.39 shutdown max-delay

The **shutdown max-delay** command is a maintenance interface profile configuration option for configuring the maximum duration after which the interface is shutdown with a value between 1 and 4294967295 seconds.

The **no shutdown** and **default shutdown** removes this configuration from the interface profile.

#### Command Mode

Maintenance-Profile-Interface Configuration

#### Command Syntax

**shutdown max-delay** *delay*

**no shutdown max-delay** *delay*

**default shutdown max-delay** *delay*

#### Parameters

- *delay* maximum shutdown delay between 1 and 4294967295 seconds

#### Example

- This command configures the shutdown max-delay for the profile interface IP1 to 500 seconds or one hour.

```
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1
switch(config-profile-intf-IP1)#shutdown max-delay 500
switch(config-profile-intf-IP1)#show active
maintenance
    profile interface IP1
        shutdown max-delay 500

switch(config-profile-intf-IP1)#
```

### 14.6.5.40 trigger on-maintenance

The **trigger on-maintenance** command is an event handler configuration for triggering actions during the maintenance operation of a unit, interface and BGP peer at specified stages.

The event-handler configuration takes effect only after exiting the event-handler configuration mode.

#### Command Mode

Event-handler Configuration

#### Command Syntax

```
trigger on-maintenance <enter | exit> <unit <unit_name> | bgp <ipv4_addr | ipv6_addr | peer_group> [vrf <vrf_name>] | interface <intf_name>> <begin | end | all | <before | after> stage <stage_name>>
```

#### Parameters

- *enter* trigger on-maintenance event-handler on maintenance enter operation
- *exit* trigger on-maintenance event-handler on maintenance exit operation
- *bgp* trigger event-handler on dynamic BGP unit maintenance operation
  - *pv4\_addr* BGP neighbor ipv4 address
  - *pv6\_addr* BGP neighbor ipv6 address
  - *peer\_group* BGP peer group name
- *vrf vrf\_name* name of the VRF to which BGP peer belongs
- *interface* trigger event-handler on dynamic interface unit maintenance operation
  - *intf\_name* name of the interface
    - *ethernet* trigger event-handler on specified Ethernet interface
    - *port-channel* trigger event-handler on specified port channel interface
    - *vlan* trigger event-handler on specified vlan

 **Note:** Comma-delimited list, ranges are not supported.

- *unit* trigger event-handler on maintenance operation of unit
- *begin* action is triggered in the beginning of maintenance operation
- *end* action is triggered at the end of maintenance operation
- *stage\_name* action is triggered at specified stage
  - *bgp* and *ratemon* are the two stages
- *all* action is triggered at all the stages
- *before* action is triggered before the specified stage
- *after* action is triggered after the specified stage

#### Examples

- This command configures event-handler E1, which triggers on maintenance an enter operation of unit UNIT1 at all the stages.

```
switch(config)#event-handler E1
switch(config-handler-E1)#trigger on-maintenance enter unit UNIT1 all
switch(config-handler-E1)#action bash FastCli -c "show maintenance"
switch(config-handler-E1)# exit
switch(config)# show event-handler E1
Event-handler E1
Trigger: Asynchronous on-maintenance enter unit UNIT1 all delay 0
seconds
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: FastCli -c "show maintenance"
Action expected to finish in less than 10 seconds
```

```
Last Trigger Detection Time: Never
Total Trigger Detections: 0
Last Trigger Activation Time: Never
Total Trigger Activations: 0
Last Action Time: Never
Total Actions: 0
```

```
switch(config)#
```

- This command configures event-handler E2, which triggers on maintenance an exit operation of dynamic interface unit Ethernet1 before stage bgp.

```
switch(config)#event-handler E2
switch(config-handler-E2)#trigger on-maintenance exit interface
Ethernet1 before
stage bgp
switch(config-handler-E2)#action bash FastCli -c "show maintenance
summary"
switch(config-handler-E2)# exit
switch(config)# show event-handler E2
Event-handler E2
Trigger: Asynchronous on-maintenance exit interface Ethernet1 before
stage bgp
delay 0 seconds
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: FastCli -c "show maintenance summary"
Action expected to finish in less than 10 seconds
Last Trigger Detection Time: Never
Total Trigger Detections: 0
Last Trigger Activation Time: Never
Total Trigger Activations: 0
Last Action Time: Never
Total Actions: 0

switch(config)#
```

- This command configures event-handler E3, which triggers on maintenance an enter operation of dynamic BGP unit 1::1 in VRF VRF1 at the last stage end.

```
switch(config)#event-handler E3
switch(config-handler-E3)#trigger on-maintenance enter bgp 1::1 vrf
VRF1 end
switch(config-handler-E3)#action bash FastCli -c "show maintenance bgp
ip all vrf
all"
switch(config-handler-E3)# exit
switch(config)# show event-handler E3
Event-handler E3
Trigger: Asynchronous on-maintenance enter bgp 1::1 vrf VRF1 end delay
0 seconds
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: FastCli -c "show maintenance bgp ip all vrf all"
Action expected to finish in less than 10 seconds
Last Trigger Detection Time: Never
Total Trigger Detections: 0
Last Trigger Activation Time: Never
Total Trigger Activations: 0
Last Action Time: Never
Total Actions: 0

switch(config)#
```

### 14.6.5.41 unit

The `unit <unit_name>` command places the switch in maintenance unit configuration mode for configuring BGP/interface groups in the unit.

The command creates the unit if the specified unit profile does not exist prior to issuing the command.

The `no unit <unit-name>` and `default unit <unit-name>` removes the unit from *running-config*.

#### Command Mode

Maintenance Configuration

#### Command Syntax

```
unit linecard l_range | unit_name
no unit linecard l_range | unit_name
default unit linecard l_range | unit_name
```

#### Parameters

- *Linecard l\_range* name of the Linecard built-in unit
- *0 l\_range* linecards available on the switch
- *unit\_name* name of the user-configured unit

#### Commands available in maintenance unit configuration mode:

- `group interface`
- `group bgp`
- `profile unit`
- `quiesce`

 **Note:** Built-in units like System, Linecard3, Linecard4, etc. do not allow group configuration but unit profile can be associated to these units.

#### Examples

- This command creates maintenance unit UNIT1.

```
switch(config)#maintenance
switch(config-maintenance)#unit UNIT1
switch(config-unit-UNIT1)#show active
maintenance
unit UNIT1
switch(config-unit-UNIT1)#
```

- This command enters the built-in Linecard1 unit configuration mode.

```
switch(config)#maintenance
switch(config-maintenance)#unit Linecard1
switch(config-builtin-unit-Linecard1)#show active
maintenance
unit Linecard1
switch(config-builtin-unit-Linecard1)#
```

---

#### 14.6.5.42 vrf

The **vrf** command specifies the VRF for BGP group. All the neighbors configured in the BGP group are considered to be members of the BGP group in the particular VRF context.

The **no vrf <vrf-name>** and **default vrf <vrf-name>** removes the VRF configuration from the BGP group and sets the VRF context to default.

##### Command Mode

Group-BGP Configuration

##### Command Syntax

**vrf** *vrf\_name*

**no vrf** *vrf\_name*

**default vrf** *vrf\_name*

##### Parameters

- *vrf\_name* name of the VRF in a group belonging to neighbors in that group

##### Example

- This command specifies VRF VRF1 for the neighbors in the BGP group BGP1.

```
switch(config)#group bgp BG1
switch(config-group-bgp-BG1)#neighbor 1.0.1.1
switch(config-group-bgp-BG1)#neighbor 1::1
switch(config-group-bgp-BG1)#neighbor PG
switch(config-group-bgp-BG1)#vrf VRF1
switch(config-group-bgp-BG1)#show active
group bgp BG1
  neighbor 1.0.1.1
  neighbor 1::1
  neighbor PG
  vrf VRF1
switch(config-group-bgp-BG1)#exit
switch(config)#
```

## 14.7 Bidirectional Forwarding Detection

This section describes Bidirectional Forwarding Detection (BFD) and how it is configured in relation to various protocols. Topics in this section include:

- [Introduction](#)
- [BFD Configuration](#)
- [BFD Commands](#)

### 14.7.1 Introduction

In networks without data link signaling, connection failures are usually detected by the hello mechanisms of routing protocols. Detection can take over a second, and reducing detection time by increasing the rate at which hello packets are exchanged can create an excessive burden on the participating CPUs.

BFD is a low-overhead, protocol-independent mechanism which adjacent systems can use instead for faster detection of faults in the path between them. BFD is strictly a failure-detection mechanism, and does not discover neighbors or reroute traffic.

BFD is a simple mechanism which detects the liveness of a connection between adjacent systems, allowing it to quickly detect failure of any element in the connection. It does not operate independently, but only as an adjunct to routing protocols. The routing protocols are responsible for neighbor detection, and create BFD sessions with neighbors by requesting failure monitoring from BFD.

Once a BFD session is established with a neighbor, BFD exchanges control packets to verify connectivity and informs the requesting protocol of failure if a specified number of successive packets are not received. The requesting protocol is then responsible for responding to the loss of connectivity.

Routing protocols using BFD for failure detection continue to operate normally when BFD is enabled, including the exchange of hello packets.

The basic behavior of BFD is defined in RFC 5880.

### 14.7.1.1 BFD Modes

BFD functions in asynchronous or demand mode, and also offers an echo function. EOS supports asynchronous mode and the echo function.

- [Asynchronous Mode](#)
- [Demand Mode](#)

#### 14.7.1.1.1 Asynchronous Mode

In asynchronous mode, BFD control packets are exchanged by neighboring systems at regular intervals. If a specified number of sequential packets are not received, BFD declares the session to be down.

#### 14.7.1.1.2 Demand Mode

In demand mode, once the BFD session is established, the participating systems can request that BFD packets not be sent, then request an exchange of packets only when needed to verify connectivity. EOS does not support demand mode.

### 14.7.1.2 Echo Function

When the echo function is in use, echo packets are looped back through the hardware forwarding path of the neighbor system without involving the CPU. Failure is detected by an interruption in the stream of echoed packets. The minimum reception rate for BFD control packets from the neighbor is also changed automatically when the echo function is operational, because liveness detection is supplied by the echo packets.

While BFD control messages are transmitted to port 3784, BFD echo messages use UDP port 3785 for both source and destination.

### 14.7.1.3 BFD on Port Channels

On port channels, the BFD per-link feature can be used to add resiliency to the port channel's BFD sessions. When BFD per-link is enabled, BFD considers the port channel "up" as long as any link in the port channel is functioning properly.

BFD per-link can be configured in full compliance with RFC 7130, causing member ports to be removed from the port channel when their BFD micro sessions are down, or in legacy mode, which relies on the LAG itself to detect and remove unresponsive member ports. By default, BFD per-link operates in legacy mode, which allows the switch to inter-operate more effectively with older equipment, but which may drop traffic if downed links are not detected by other means. RFC7130 mode allows for faster detection and removal of downed links within the port channel and can be used in situations where LACP is not supported. For the BFD session to come up, both peers must be configured in the same way.

---

## 14.7.2 BFD Configuration

To use BFD as the failure detection mechanism for a routing protocol, it must be enabled for each participating protocol.

These sections describe BFD configuration tasks:

- [Configuring BFD on an Interface](#)
- [Configuring BFD on a Port Channel](#)
- [Configuring the Echo Function](#)
- [Configuring BFD for PIM](#)
- [Configuring BFD for BGP](#)
- [Configuring BFD for VRRP](#)
- [Configuring BFD for OSPF](#)
- [Configure BFD for IS-IS](#)
- [Displaying BFD Neighbor Information](#)

### 14.7.2.1 Configuring BFD on an Interface

The transmission rate for BFD control packets, the minimum rate at which control packets are expected from the peer, and the multiplier (the number of packets that must be missed in succession before BFD declares the session to be down) can all be configured per interface. The values configured apply to all BFD sessions that pass through the interface.

The default values for these parameters are:

- `transmission rate` 300 milliseconds
- `minimum receive rate` 300 milliseconds
- `multiplier` 3

To configure different values for these parameters on an interface, use the `bfd interval` command.

For BFD to function as a failure detection mechanism, it must be enabled for each participating protocol.

#### Example

- These commands set the transmit and receive intervals to 200 milliseconds and the multiplier to 2 for all BFD sessions passing through Ethernet interface 3/20.

```
switch(config)#interface ethernet 3/20
switch(config-if-Et3/20)#bfd interval 200 min_rx 200 multiplier 2
switch(config-if-Et3/20)#
```

### 14.7.2.2 Configuring BFD on a Port Channel

Basic BFD parameters are configured on a port channel as described in [Configuring BFD on an Interface](#) above.

Additionally, BFD can be configured in per-link mode on a port channel so that the port channel will be considered up as long as any link in the channel is up. BFD per-link can be configured in compliance with RFC 7130 (causing member ports to be removed from the port channel when their BFD micro session is down), or in legacy mode for interoperability with older equipment. For the BFD session to come up, both peers must be configured in the same way (either RFC-7130 or legacy mode).

**Note:** In RFC 7130 mode, if multiple IP addresses are configured for a member of a port channel (e.g., one IPv4 address and one IPv6 address), the member will be removed from the port channel if the micro session associated with either IP address goes down.

### 14.7.2.2.1 Enabling BFD Per-link

To enable BFD per-link on a port channel, use the `bfd per-link` command.

#### Example

- These commands enabled BFD per-link on port channel 5.

```
switch(config)#interface port-channel 5
switch(config-if-Po5)#bfd per-link
switch(config-if-Po5)#
```

### 14.7.2.2.2 Configuring BFD Per-link in RFC 7130 Mode

By default, BFD per-link operates in legacy mode. To enable RFC 7130 mode (in which a member port is removed from the port channel when its BFD micro session is down), configure the switch as follows.

1. If you are configuring an L2 interface, specify a local L3 BFD address for the switch using the `bfd local-address` command. This is not necessary when configuring an L3 interface with an IP address configured on the port channel.
2. Enable BFD per-link on the port channel using the `bfd per-link` command.
3. Specify the L3 address of the port channel's BFD neighbor using the `bfd neighbor` command. For an L2 port channel, the address is the globally configured BFD local address on the peer switch. For an L3 port channel, the address is the IP address configured on the peer port channel.

#### Examples

- These commands configure BFD per-link in RFC 7130 mode over an L2 port channel.

Switch 1 configuration:

```
switch1(config)#bfd local-address 10.0.0.5
switch1(config)#interface port-channel 5
switch1(config-if-Po5)#bfd per-link rfc-7130
switch1(config-if-Po5)#bfd neighbor 10.0.0.4
switch1(config-if-Po5)#
```

Switch 2 configuration:

```
switch2(config)#bfd local-address 10.0.0.4
switch2(config)#interface port-channel 5
switch2(config-if-Po5)#bfd per-link rfc-7130
switch2(config-if-Po5)#bfd neighbor 10.0.0.5
switch2(config-if-Po5)#
```

- These commands configure BFD per-link in RFC 7130 mode over an L3 port channel.

Switch 1 configuration:

```
switch1(config)#interface port-channel 5
switch1(config-if-Po5)#no switchport
switch1(config-if-Po5)#bfd per-link rfc-7130
switch1(config-if-Po5)#ip address 10.0.0.5/24
switch1(config-if-Po5)#bfd neighbor10.0.0.4
switch1(config-if-Po5)#
```

Switch 2 configuration:

```
switch2(config)#interface port-channel 5
switch2(config-if-Po5)#no switchport
```

```
switch2(config-if-Po5) #bfd per-link rfc-7130
switch2(config-if-Po5) #ip address 10.0.0.4/24
switch2(config-if-Po5) #bfd neighbor 10.0.0.5
```

### 14.7.2.3 Configuring the Echo Function

The echo function is disabled by default, and is enabled on an interface using the **bfd echo** command.

When the BFD echo function is enabled, a "slow-timer" value replaces the minimum receive interval value in BFD packets sent from the switch. The default value is 2000 milliseconds. To configure a different value for the slow-timer, use the **bfd slow-timer** command.

#### Examples

- These commands enable the BFD echo function on Ethernet interface 5. If a slow-timer value has been configured on the switch, the minimum receive rate expected from the BFD neighbor will be reset to that value; otherwise, the minimum receive rate will be set to 2000 milliseconds.

```
switch(config) #interface ethernet 5
switch(config-if-Et5) #bfd echo
switch(config-if-Et5) #
```

- This command configures BFD to expect control packets from the peer every 10000 milliseconds when the BFD echo function is enabled.

```
switch(config) #bfd slow-timer 10000
switch(config) #
```

### 14.7.2.4 Configuring BFD for PIM

The **bfd (Router-PIM Sparse-mode)** command enables or disables Bidirectional Forwarding Detection (BFD) globally for all protocol-independent multicast (PIM) neighbors.

To enable or disable PIM BFD on a specific interface, use the **pim ipv4 bfd** command. The interface-level configuration supersedes the global setting.

#### Example

- These commands enable PIM BFD globally on the switch in the default VRF, enabling it on all PIM-SM interfaces where it is not explicitly disabled.

```
switch(config) #router pim sparse-mode
switch(config-router-pim-sparse) #ipv4
switch(config-router-pim-sparse-ipv4) #bfd
switch(config-router-pim-sparse-ipv4) #
```

- These commands configure VLAN interface 200 to use BFD for PIM-SM connection failure detection regardless of the global PIM BFD configuration.

```
switch(config) #interface vlan 200
switch(config-if-VL200) #pim ipv4 bfd
switch(config-if-VL200) #
```

### 14.7.2.5 Configuring BFD for BGP

To enable or disable Bidirectional Forwarding Detection (BFD) for border gateway protocol (BGP) connections with a BGP neighbor or peer group, use the **neighbor bfd** command.

**Example**

- These commands enable BFD failure detection for BGP connections with the neighbor at 10.13.64.1.

```
switch(config)#router bgp 300
switch(config-router-bgp)#neighbor 10.13.64.1 bfd
switch(config-router-bgp)#
```

**14.7.2.6 Configuring BFD for VRRP**

To enable or disable Bidirectional Forwarding Detection (BFD) for virtual router redundancy protocol (VRRP), use the **vrrp bfd ip** command.

When enabled, BFD provides failure detection for a 2-router VRRP system. When the master is configured with the physical IP address of the backup router, and the backup is configured with the address of the master, a BFD session is established between them. If the BFD session goes down, the backup router immediately assumes the master role.

VRRP master advertisement packets are still sent even when the BFD session is established to accommodate VRRP systems involving more than two routers.

**Example**

- These commands enable BFD on Ethernet interface 3/20 for VRRP ID 15 with a connection to a router at IP address 192.168.2.1.

```
switch(config)#interface ethernet 3/20
switch(config-if-Et3/20)#vrrp 15 bfd ip 192.168.2.1
switch(config-if-Et3/20)#
```

**14.7.2.7 Configuring BFD for OSPF**

To enable or disable BFD globally for all OSPF neighbors, use the **bfd default (OSPF)** command in OSPF configuration mode.

To enable or disable BFD for OSPF on a specific interface, use the **ip ospf neighbor bfd** command. The interface-level configuration supersedes the global setting.

**Example**

- These commands enable BFD in OSPF instance 100 for all OSPF neighbors on BFD-enabled interfaces except those connected to interfaces on which OSPF BFD has been explicitly disabled.

```
switch(config)#router ospf 100
switch(config-router-ospf)#bfd default
switch(config-router-ospf)#
```

- This command enables OSPF BFD on Ethernet interface 3/21.

```
switch(config)#interface ethernet 3/21
switch(config-if-Et3/21)#ip ospf neighbor bfd
switch(config-if-Et3/21)#
```

**14.7.2.8 Configure BFD for IS-IS**

The **isis bfd** and command configure Bidirectional Forwarding Detection (BFD), a low overhead protocol designed to provide rapid detection of failures at any protocol layer in the path between adjacent forwarding engines over any media. BFD is supported for IS-IS IPv4 routes.

---

## Examples

- These commands enable BFD for all the interfaces on which IS-IS is enabled. By default BFD is disabled on all the interfaces.

```
switch(config)#router isis 1
switch(config-router-isis)#address-family ipv4
switch(config-router-af)#bfd default
switch(config-router-af)#
```

- These commands enable BFD on IS-IS interfaces.

```
switch(config)#interface Ethernet 5/6
switch(config-if-Et5/6)#isis bfd
switch(config-if-Et5/6)#
```

### 14.7.2.9 Displaying BFD Neighbor Information

Use the [show bfd peers](#) command to display information about Bidirectional Forwarding Detection (BFD) neighbors.

#### Example

- This command displays general information about BFD neighbors.

```
switch>show bfd peers
DstAddrMyDiscYoDiscIfLUpLDownLdiagState

10.168.1.561613et52_1(81)17151450 0NoDiagnosticUp
10.168.1.581714et52_2(65)17151883 0NoDiagnosticUp
10.168.1.241815et51_1(73)17152175 0NoDiagnosticUp
```

- This command displays detailed information about BFD neighbors.

```
switch>show bfd peers detail
Peer Addr 10.168.1.56, Intf Ethernet52/1, State Up
VRF default, LAddr 10.168.1.57, LD/RD 16/13
Last Up 17151450
Last Down 0
Last Diag: No Diagnostic
TxInt: 300, RxInt: 300, Multiplier: 3
Received RxInt: 300, Received Multiplier: 3
Rx Count: 433987, Tx Count: 433829
Detect Time: 900
Registered protocols: bgp

Peer Addr 10.168.1.58, Intf Ethernet52/2, State Up
VRF default, LAddr 10.168.1.59, LD/RD 17/14
Last Up 17151883
Last Down 0
Last Diag: No Diagnostic
TxInt: 300, RxInt: 300, Multiplier: 3
Received RxInt: 300, Received Multiplier: 3
Rx Count: 434235, Tx Count: 434050
Detect Time: 900
Registered protocols: bgp
```

## 14.7.3 BFD Commands

### BFD Configuration Command

- `bfd echo`
- `bfd interval`
- `bfd local-address`
- `bfd neighbor`
- `bfd per-link`
- `bfd slow-timer`

### BFD Display Commands

- `show bfd peers`

### PIM-BFD Configuration Commands

- `bfd (Router-PIM Sparse-mode)`
- `pim ipv4 bfd`

### BGP-BFD Configuration Commands

- `neighbor bfd`

### VRRP-BFD Configuration Commands

- `vrrp bfd ip`

### OSPF-BFD Configuration Commands

- `bfd default (OSPF)`
- `ip ospf neighbor bfd`

### ISIS-BFD Configuration Commands

- `isis bfd`
- `bfd default (ISIS)`

---

### 14.7.3.1 bfd (Router-PIM Sparse-mode)

The **bfd (Router-PIM Sparse-mode)** command enables Bidirectional Forwarding Detection (BFD) globally for use as a failure-detection mechanism for Protocol-Independent Multicast Sparse-Mode (PIM-SM) on the switch. To override the global configuration for a specific interface, use the [pim ipv4 bfd](#) command. All PIM-SM interfaces will use the global setting if they are not individually configured.

When PIM BFD is enabled, a BFD session is created for each PIM-SM neighbor and used to detect a loss of connectivity with the neighbor. PIM hello packets are still exchanged with PIM-SM neighbors when BFD is enabled.

The **no bfd** and **default bfd** commands disable PIM BFD globally by deleting the **bfd** statement from **running-config**. When this is done, only interfaces with PIM BFD explicitly enabled will use PIM BFD.

#### Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

#### Command Syntax

```
bfd
```

```
no bfd
```

```
default bfd
```

#### Example

- These commands enable PIM BFD globally on the switch in the default VRF, enabling it on all PIM-SM interfaces where it is not explicitly disabled.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#bfd
switch(config-router-pim-sparse-ipv4)#
```

### 14.7.3.2 bfd default (ISIS)

The **bfd default** command places the switch in address-family configuration mode.

The **bfd default** and **isis bfd** commands configure Bidirectional Forwarding Detection (BFD), a low overhead protocol designed to provide rapid detection of failures at any protocol layer in the path between adjacent forwarding engines over any media. BFD is supported for IS-IS IPv4 routes.

#### Command Mode

Router-Address-Family Configuration

#### Command Syntax

#### **bfd default** Example

- These commands enable BFD for all the interfaces on which IS-IS is enabled. By default BFD is disabled on all the interfaces.

```
switch(config)#router isis 1
switch(config-router-isis)#address-family ipv4
switch(config-router-af)#bfd default
switch(config-router-af)#
```

---

### 14.7.3.3 bfd default (OSPF)

The `bfd default` command globally configures OSPF to use Bidirectional Forwarding Detection (BFD). When this command is issued, BFD sessions will be established with all OSPF neighbors connected to BFD-enabled interfaces unless OSPF BFD has been disabled on a participating interface using the `ip ospf neighbor bfd` command. BFD is globally disabled in OSPF by default.

For OSPF BFD to function on an interface, BFD must also be enabled and configured on that interface using the `bfd interval` command.

The `no bfd default` and `default bfd default` commands disable OSPF BFD on all interfaces except those where it has been explicitly enabled using the `ip ospf neighbor bfd` command.

#### Command Mode

Router-OSPF Configuration

#### Command Syntax

`bfd default`

`no bfd default`

`default bfd default` **Examples**

These commands enable BFD for OSPF instance 100 on all interfaces except those on which OSPF BFD has been explicitly disabled.

```
switch(config)#router ospf 100
switch(config-router-ospf)#bfd default
switch(config-router-ospf)#
```

### 14.7.3.4 bfd echo

The **bfd echo** command enables the BFD echo function on the configuration mode interface.

The **no bfd echo** and **default bfd echo** commands disable the BFD echo function by removing the corresponding **bfd echo** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration Interface-Loopback Configuration Interface-Management Configuration Interface-Port-channel Configuration Interface-VLAN Configuration

#### Command Syntax

```
bfd echo
```

```
no bfd echo
```

```
default bfd echo
```

#### Example

- These commands enable the BFD echo function on Ethernet interface 5. If a slow-timer value has been configured on the switch, the minimum receive rate expected from the BFD neighbor will be reset to that value; otherwise, the minimum receive rate will be set to 2000 milliseconds.

```
switch(config)#interface ethernet 5  
switch(config-if-Et5)#bfd echo  
switch(config-if-Et5)#
```

---

### 14.7.3.5 bfd interval

The **bfd interval** command configures the BFD control packet transmission rate, minimum control packet receive rate, and the number of missed packets that will signal that the session is down. These parameters can be configured globally for the switch or for the configuration mode interface. If a parameter is configured both globally and on the interface, the value configured on the interface takes precedence.

**Note:** For a BFD session to be established, BFD must be enabled for any routing protocol using BFD for failure detection.

The **no bfd interval** and **default bfd interval** commands return the BFD parameters on the configuration mode interface to default values by removing the corresponding **bfd interval** command from **running-config**.

#### Command Mode

Global Configuration Interface-Ethernet Configuration Interface-Loopback Configuration Interface-Management Configuration Interface-Port-channel Configuration Interface-VLAN Configuration

#### Command Syntax

```
bfd interval transmit_rate min_rx receive_minimum multiplier factor
```

```
no bfd interval
```

```
default bfd interval
```

#### Parameters

- *transmit\_rate* rate in milliseconds at which control packets will be sent. Values range from 50 to 60000; the default value is 300.
- *receive\_minimum* rate in milliseconds at which control packets will be expected. Values range from 50 to 60000.
- *factor* number of consecutive missed BFD control packets after which BFD will declare the session as down. Values range from 3 to 50.

#### Examples

- These commands configure BFD on Ethernet interface 5 to expect packets from the peer every 200 milliseconds and declare the session down after failing to receive 5 consecutive packets. This configuration overrides any values configured globally.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#bfd interval 200 min_rx 200 multiplier 5
switch(config-if-Et5)#
```

### 14.7.3.6 bfd local-address

The **bfd local-address** command specifies the local L3 address for use in Bidirectional Forwarding Detection (BFD). When configuring an L2 interface, specification of a local L3 address is required in order to run BFD per-link in RFC 7130 mode. (This is not necessary when configuring an L3 interface with an IP address configured on the port channel.)

The **no bfd local-address** and **default bfd local-address** commands remove the local L3 address by removing the corresponding **bfd local-address** command from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
bfd local-address address
```

```
no bfd local-address [ address]
```

```
default bfd local-address [ address]
```

#### Parameters

*address* local IPv4 or IPv6 address for BFD.

#### Example

- This command specifies the local L3 address for BFD.

```
switch(config)#bfd local-address 10.0.0.4
switch(config)#
```

---

### 14.7.3.7 bfd neighbor

The **bfd neighbor** command specifies the L3 address of the BFD neighbor of the port channel being configured. This is required to run BFD per-link in RFC 7130 mode. For an L2 port channel, this address should be the BFD per-link "local address" globally configured on the peer switch. For an L3 port channel, this address should be the IP address configured on the peer port channel.

The **no bfd neighbor** and **default bfd neighbor** commands remove the BFD neighbor address by removing the corresponding **bfd neighbor** command from **running-config**.

#### Command Mode

Interface-Port-channel Configuration

#### Command Syntax

**bfd neighbor** *address*

**no bfd neighbor** [*address*]

**default bfd neighbor** [*address*]

**Parameters** *address* IPv4 or IPv6 address of the port channel's BFD neighbor.

#### Example

- These commands specify the L3 address of the port channel's BFD neighbor.

```
switch(config)#interface port-channel 5
switch(config-if-Po5)#bfd neighbor 10.0.0.5
switch(config-if-Po5)#
```

### 14.7.3.8 bfd per-link

The **bfd per-link** command enables the BFD per-link function on the port channel being configured. When BFD per-link is enabled, BFD sub-sessions are run on each link of the port channel; BFD considers the port-channel to be up as long as any one of the links is live.

BFD per-link runs by default in legacy mode, which allows downed links to remain members of the port channel and relies on LACP or other means to prune the dead links. Legacy mode is provided for interoperability with older switches.

RFC 7130 mode runs BFD per-link in full compliance with RFC 7130, and automatically removes links in down state from the port-channel, then adds them back again when they come up. Use the **rfc-7130** keyword to enable per-link in RFC 7130 mode. You must also configure an L3 BFD neighbor address for each port-channel running RFC 7130 per-link using the **bfd neighbor** command. When configuring an L2 interface, you must also globally configure a local L3 BFD address on the switch using the **bfd local-address** command.

For the BFD session to come up, both peers must be configured in the same way (either RFC-7130 or legacy mode).

The **no bfd per-link** and **default bfd per-link** commands disable the BFD per-link function by removing the corresponding **bfd per-link** command from **running-config**.

#### Command Mode

Interface-Port-channel Configuration

#### Command Syntax

```
bfd per-link [rfc-7130]
no bfd per-link [rfc-7130]
default bfd per-link [rfc-7130]
```

#### Example

- These commands enable the BFD per-link function in legacy mode on port channel 5.

```
switch(config)#interface port-channel 5
switch(config-if-Po5)#bfd per-link
switch(config-if-Po5)#
```

- These commands globally specify a local L3 BFD address for the switch, enable the BFD per-link function in RFC 7130 mode on port channel 5, and specify the L3 address of the port channel's BFD neighbor.

```
switch(config)#bfd local-address 10.0.0.5
switch(config)#interface port-channel 5
switch(config-if-Po5)#bfd per-link rfc-7130
switch(config-if-Po5)#bfd neighbor 10.0.0.4
switch(config-if-Po5)#
```

---

### 14.7.3.9 bfd slow-timer

The `bfd slow-timer` command configures the minimum reception rate for BFD control packets which will be used if the BFD echo function is enabled. The default value is 2000 milliseconds.

**Note:** For a BFD session to be established, BFD must be enabled for any routing protocol using BFD for failure detection.

The `no bfd slow-timer` and `default bfd slow-timer` commands return the BFD slow-timer to the default value of 2000 milliseconds by removing the corresponding `bfd interval` command from `running-config`.

#### Command Mode

Global Configuration

#### Command Syntax

```
bfd slow-timer receive_minimum
```

```
no bfd slow-timer
```

```
default bfd slow-timer
```

#### Parameters

- *receive\_minimum* rate in milliseconds at which control packets will be expected when the BFD echo function is enabled. Values range from 2000 to 60000; default value is 2000.

#### Examples

- This command configures BFD to expect control packets from the peer every 10000 milliseconds when the BFD echo function is enabled.

```
switch(config)#bfd slow-timer 10000  
switch(config)#
```

### 14.7.3.10 ip ospf neighbor bfd

The `ip ospf neighbor bfd` command enables Bidirectional Forwarding Detection (BFD) for the open shortest path first protocol (OSPF) on the configuration mode interface regardless of the global settings for the OSPF instance. All OSPF neighbors associated with the interface become BFD peers, and OSPF uses BFD for failure detection.

For OSPF BFD to function on an interface, BFD must also be enabled and configured on that interface using the `bfd interval` command.

The `no ip ospf neighbor bfd` command disables OSPF BFD on the interface and terminates all BFD sessions with the interface's OSPF peers. The `default ip ospf neighbor bfd` command causes the interface to follow global OSPF BFD settings configured by the `bfd default (OSPF)` command.

#### Command Mode

Interface-Ethernet Configuration Interface-Port-Channel Configuration Interface-VLAN Configuration

#### Command Syntax

```
ip ospf neighbor bfd
```

```
no ip ospf neighbor bfd
```

```
default ip ospf neighbor bfd
```

#### Example

- These commands enable BFD on Ethernet interface 3/20.

```
switch(config)#interface ethernet 3/20
switch(config-if-Et3/20)#ip ospf neighbor bfd
switch(config-if-Et3/20)#
```

- These commands cause Ethernet interface 3/20 to follow the global OSPF BFD configuration.

```
switch(config)#interface ethernet 3/20
switch(config-if-Et3/20)#default ip ospf neighbor bfd
switch(config-if-Et3/20)#
```

---

### 14.7.3.11 isis bfd

The **isis bfd** command activates the corresponding IS-IS routing instance on the configuration mode interface. By default, the IS-IS routing instance is not enabled on an interface.

The **no isis enable** and **default isis enable** commands disable IS-IS on the configuration mode interface by removing the corresponding **isis enable** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
isis bfd
```

```
no isis bfd
```

```
default isis bfd
```

#### Examples

- These commands enable BFD on IS-IS interfaces.

```
switch(config)#interface Ethernet 5/6  
switch(config-if-Et5/6)#isis bfd  
switch(config-if-Et5/6)#
```

### 14.7.3.12 neighbor bfd

The **neighbor bfd** command enables Bidirectional Forwarding Detection (BFD) for use as a failure detection mechanism for border gateway protocol (BGP) connections to the specified BGP neighbor or peer group.

Once a BFD session is established with a BGP neighbor, if the BFD session goes down the status of the BGP session is changed to `down` as well.

The **no neighbor bfd** and **default neighbor bfd** commands disable BFD for BGP connections to the specified neighbor or peer group by removing the corresponding **neighbor bfd** command from **running-config**.

#### Command Mode

Router-BGP Configuration

#### Command Syntax

```
neighbor NEIGHBOR_ID bfd
```

```
no neighbor NEIGHBOR_ID bfd
```

```
default neighbor NEIGHBOR_ID bfd
```

#### Parameters

- NEIGHBOR\_ID IP address or peer group name. Values include:
  - *ipv4\_addr neighbor* IPv4 address.
  - *ipv6\_addr neighbor* IPv6 address.
  - *group\_name* peer group name.

#### Example

- These commands enable BFD failure detection for BGP connections with the neighbor at 10.13.64.1.

```
switch(config)#router bgp 300
switch(config-router-bgp)#neighbor 10.13.64.1 bfd
switch(config-router-bgp)#
```

---

### 14.7.3.13 pim ipv4 bfd

The `pim ipv4 bfd` command enables Bidirectional Forwarding Detection (BFD) on the configuration mode interface as a failure detection mechanism for Protocol-Independent Multicast Sparse-Mode (PIM-SM). To enable PIM BFD globally on the switch, use the [bfd \(Router-PIM Sparse-mode\)](#) command. Interface-level settings override the global setting.

When PIM BFD is enabled, a BFD session is created for each PIM-SM neighbor and used to detect a loss of connectivity with the neighbor. PIM-SM hello packets are still exchanged with PIM-SM neighbors when BFD is enabled.

The `no pim ipv4 bfd` disables PIM BFD on the configuration mode interface regardless of global settings. The `default pim ipv4 bfd` command causes the configuration mode interface to follow the global setting for PIM BFD by removing the corresponding `pim ipv4 bfd` statement from `running-config`.

#### Command Mode

Interface-Ethernet Configuration Interface-Port-Channel Configuration Interface-VLAN Configuration

#### Command Syntax

```
pim ipv4 bfd
```

```
no pim ipv4 bfd
```

```
default pim ipv4 bfd
```

#### Example

- These commands configure VLAN interface 200 to use BFD for PIM-SM connection failure detection regardless of the global PIM BFD configuration.

```
switch(config)#interface vlan 200
switch(config-if-VL200)#pim ipv4 bfd
switch(config-if-VL200)#
```

### 14.7.3.14 show bfd peers

The **show bfd peers** command displays information about the neighbors with which the switch currently has a Bidirectional Forwarding Detection (BFD) session.

#### Command Mode

EXEC

#### Command Syntax

```
show bfd peers [INFO_LEVEL]
```

#### Parameters

- **INFO\_LEVEL** amount of information that is displayed. Options include:
  - <no parameter> command displays data block for each specified interface.
  - detail command displays table that summarizes interface data.
- **Display Values**
  - **DstAddr** IP address of the BFD neighbor.
  - **MyDisc** Local discriminator value of the BFD session.
  - **YoDisc** Neighbor's discriminator value for the BFD session.
  - **If** Interface to which the neighbor is connected.
  - **LUp** Last up.
  - **LDown** Last down.
  - **Ldiag** Diagnostic for the last change in session state.
  - **State** State of the BFD session.
  - **TxInt** Transmit interval of the local interface.
  - **RxInt** Minimum receive interval set on the local interface.
  - **Multiplier** Local multiplier (number of packets that must be missed to declare session down).
  - **Received RxInt** Minimum receive interval set on the neighbor interface.
  - **Received Multiplier** Neighbor's multiplier (number of packets that must be missed to declare session down).
  - **Rx Count** BFD control packets transmitted.
  - **Tx Count** BFD control packets received.
  - **Detect** Time Total time in milliseconds it takes for BFD to detect connection failure.
  - **Registered Protocols** Protocols using BFD with this neighbor.
- **Examples**
  - This command displays general information about BFD neighbors.

### 14.7.3.15 vrrp bfd ip

The **vrrp bfd ip** command enables and configures Bidirectional Forwarding Detection (BFD) for virtual router redundancy protocol (VRRP) on the configuration mode interface.

When enabled, BFD provides failure detection for a 2-router VRRP system. When the master is configured with the physical IP address of the backup router, and the backup is configured with the address of the master, a BFD session is established between them. If the BFD session goes down, the backup router immediately assumes the master role.

VRRP master advertisement packets are still sent even when the BFD session is established to accommodate VRRP systems involving more than two routers.

The **no vrrp bfd ip** and **default vrrp bfd ip** commands disable BFD for VRRP on the configuration mode interface by removing the corresponding **vrrp bfd ip** statement from **running-config**. The **no vrrp** command also removes the **vrrp bfd ip** command for the specified virtual router.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
vrrp group bfd ip ipv4_address
```

```
no vrrp group bfd ip
```

```
default vrrp group bfd ip
```

#### Parameters

- *group* virtual router identifier (VRID). Values range from 1 to 255.
- *ipv4\_address* IPv4 address of the other VRRP router. On the master router, enter the physical IP address of the backup; on the backup, enter the physical IP address of the master.

#### Example

- These commands enable BFD on Ethernet interface 3/20 for VRRP ID 15 with a connection to a router at IP address 192.168.2.1.

```
switch(config)#interface ethernet 3/20
switch(config-if-Et3/20)#vrrp 15 bfd ip 192.168.2.1
switch(config-if-Et3/20)#
```

## Multicast

---

IP multicast is the transmission of data packets to multiple hosts through a common IP address. Sections covered in this chapter include:

- [Multicast Architecture](#)
- [IGMP and IGMP Snooping](#)
- [Protocol Independent Multicast](#)
- [Multicast Source Discovery Protocol \(MSDP\)](#)
- [Audio Video Bridging \(AVB\)](#)

### 15.1 Multicast Architecture

IP multicast is the transmission of data packets to multiple hosts through a common IP address. Arista switches support multicast transmissions through IGMP, IGMP Snooping, and PIM-SM. These topics describe the Arista multicast architecture.

- [Overview](#)
- [Multicast Architecture Description](#)
- [Multicast Listener Discovery \(MLD\)](#)
- [Static IP Mroute](#)
- [Multicast Architecture](#)
- [Multicast Commands](#)

#### 15.1.1 Overview

Arista switches provide layer 2 multicast filtering and layer 3 routing features for applications requiring IP multicast services. The switches support over a thousand separate routed multicast sessions at wire speed without compromising other layer 2/3 switching features. Arista switches support IGMP, IGMP snooping, PIM-SM, and MSDP to simplify and scale data center multicast deployments.

##### Supported Features

Feature support varies by platform; please consult the release notes for multicast support information by platform.

Multicast and unicast use the same routing table. Unicast routes use TCAM resources, which may also impact the maximum number of multicast routes.

##### Features Not Supported

The multicast functions not supported by Arista switches include (\*,\*,G) forwarding or boundary routers, multicast MIBs, and router applications joining multicast groups.

#### 15.1.2 Multicast Architecture Description

IP multicast is data transmission to a subset of all hosts through a single multicast group address. Multicast packets are delivered using best-effort reliability, similar to unicast packets. Senders use the multicast address as the destination address. Any host, regardless of group membership, can send to a group. However, only group members receive messages sent to a group address.

IP multicast addresses range from 224.0.0.0 to 239.255.255.255. Multicast routing protocol control traffic reserves the address range 224.0.0.0 to 224.0.0.255. The address 224.0.0.0 is never assigned to any group.

Multicast group membership is dynamic; a group's activity level and membership can vary over time. A host can also simultaneously belong to multiple multicast groups.

**Multicast Architecture** depicts the components that comprise the multicast architecture. The remainder of this section describes the multicast components depicted in the figure.

**Figure 46: Multicast Architecture**

### 15.1.2.1 Multicast Control Plane

The multicast control plane builds and maintains multicast distribution trees. It communicates changes in the multicast routing table to the MFIB for multicast forwarding.

- Protocol Independent Multicast (PIM) builds and maintains multicast routing trees using reverse path forwarding (RPF) on a unicast routing table.
- Internet Group Management Protocol (IGMP) identifies multicast group members on subnets directly connected to the switch. Hosts manage multicast group membership with IGMP messages.
- The switch maintains an mroute (multicast routing) table when running PIM to provide forwarding tables used to deliver multicast packets.

The mroute table stores the states of inbound and outbound interfaces for each source/group pair (S,G). The switch discards and forwards packets on the basis of this state information. Each table entry, referred to as an mroute, corresponds to a unique (S,G) and contains:

- the multicast group address
- the multicast source address (or \* for all sources)
- the inbound interface
- a list of outbound interfaces

### 15.1.2.2 Multicast Routing Information Base (MRIB)

The MRIB is the channel between multicast control plane clients and the multicast forwarding plane. The `show ip mroute` command displays MRIB entries as (\*, G), (S, G), and (\*, G/m) multicast entries.

MRIB entries are based on source, group, and group masks. The entries are associated with a list of interfaces whose forwarding state is described with flags. MRIB communication is based on the state

change of entry and interface flags. Flags are significant to MRIB clients but are not interpreted by the MRIB.

### 15.1.2.3 Multicast Forwarding Plane

The multicast forwarding plane consists of the multicast forwarding information base (MFIB), a forwarding engine that is independent of multicast routing protocols.

MFIB formats PIM and IGMP multicast routes for protocol-independent hardware packet forwarding and adds them to the hardware multicast expansion table (MET) and the hardware FIB.

MFIB uses a core forwarding engine for interrupt-level (fast switching) and process-level (process switching) forwarding. MFIB fast-switches inbound multicast packets that match an MFIB forwarding entry and process-switches packets requiring a forwarding entry if a matching entry does not exist.

### 15.1.2.4 Hardware Dependent Forwarding and Fast Drop

In IP multicast protocols, each (S,G) and (\*,G) route corresponds to an inbound reverse path forwarding (RPF) interface. Packets arriving on non-RPF interfaces may require PIM processing, as performed by the CPU subsystem software.

By default, hardware sends all packets arriving on non-RPF interfaces to the CPU subsystem software. However, the CPU can be overwhelmed by non-RPF packets that do not require software processing. The CPU subsystem software prevents CPU overload by creating a fast-drop entry in hardware for inbound non-RPF packets not requiring PIM processing. Packets matching a fast-drop entry are bridged in the ingress VLAN but not sent to the software, avoiding CPU subsystem software overload. Fast-drop entry usage is critical in topologies with persistent RPF failures.

Protocol events, such as links going down or unicast routing table changes, can change the set of packets that can be fast dropped. Packets that were correctly fast dropped before a topology change may require forwarding to the CPU subsystem software after the change. The CPU subsystem software handles fast-drop entries that respond to protocol events so that PIM can process all necessary non-RPF packets.

## 15.1.3 Multicast Listener Discovery (MLD)

Networks use Multicast Listener Discovery (MLD) to control the flow of layer 3 IPv6 multicast traffic. Hosts request and maintain multicast group membership through MLD messages. Multicast routers use MLD to maintain a membership list of active multicast groups for each attached network.

With respect to each of its attached networks, a multicast router is either a querier or non-querier. Each physical network contains only one querier. A network with more than one multicast router designates the router with the lowest IP address as its querier.

In an MLD Report or Done message, the multicast address field holds a specific IPv6 multicast address to which the message sender is listening or is ceasing to listen, respectively.

### 15.1.3.1 Platform Compatibility

- 7280R
- 7500R

### 15.1.3.2 Configuring Multicast Listener Discovery

#### 15.1.3.2.1 Enabling MLD

Use `mld` command to enable MLD on an interface. When the switch fills the multicast routing table, it only adds interfaces when the interface receives join messages from downstream devices or when

---

the interface is directly connected to a member of the MLD group. By default, MLD is disabled on an interface.

### Examples

- This command enables MLD on the Ethernet interface 1.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#mld
```

- This command disables MLD on the Ethernet interface 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#no mld
```

### 15.1.3.2.2 Configuring MLD

An interface that runs MLD uses default protocol settings unless otherwise configured. The switch provides commands that alter startup query, last member query, and normal query settings.

#### MLD

The switch supports MLD versions 1 through 2. The `mld` command configures multicast routers on the configuration mode interface. Version 2 is the default MLD version.

#### Example

- This command enables MLD on the Ethernet interface 1.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#mld
```

#### Startup Query

Membership queries are sent at an increased frequency immediately after an interface starts up to quickly establish the group state. Query count and query interval commands adjust the period between membership queries for a specified number of messages.

The `mld startup-query-interval` command specifies the interval between membership queries that an interface sends immediately after it starts up. The `mld startup-query-count` command specifies the number of queries that the switches sends from the interface at the startup interval rate.

#### Examples

- This command configures the startup query count of 4 on an Ethernet interface 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld startup-query-count 4
```

- This command configures the startup query interval of 100 seconds on an Ethernet interface 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld startup-query-interval 100
```

#### Membership Queries

The router with the lowest IP address on a subnet sends membership queries as the MLD querier. When a membership query is received from a source with a lower IP address, the router resets its

query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The `mld query-interval` command configures the frequency at which the active interface, as an MLD querier, sends membership query messages.

The `mld query-response-interval` command configures the time that a host has to respond to a membership query.

### Examples

- This command configures the query interval of 30 seconds on an Ethernet interface 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld query-interval 30
```

- This command configures the query response interval of 30 seconds on an Ethernet interface 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld query-response-interval 30
```

### Last Member Query

When the querier receives an MLD leave message, it verifies the group has no remaining hosts by sending a set of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The `mld last-listener-query-count` command specifies the number of query messages the router sends in response to a group-specific or group-source-specific leave message.

The `mld last-listener-query-interval` command configures the transmission interval for sending group-specific or group-source-specific query messages to the active interface.

### Examples

- This command configures the last listener query count to 3 on an Ethernet interface 1.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#mld last-listener-query-count 3
```

- This command configures the last listener query interval to 2 seconds on an Ethernet interface 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld last-listener-query-interval 2
```

### Static Groups

The `mld static-group` command configures the configuration mode interface as a static member of the multicast group at the specified address. The router forwards multicast group packets through the interface without otherwise appearing or acting as a group member. No interface is a static member of a multicast group by default.

### Example

- This command configures static groups on an interface Ethernet 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld static-group ff30::1 a::1
```

---

## 15.1.4 Static IP Mroute

The Static IP Multicast route (or Static Mroute) interface overrides the interface that is ordinarily selected from the matching route in the unicast routing table, providing a means for breaking dependency on the unicast topology for the multicast topology. Let us assume that, PIM routers in a multicast network sends PIM joins towards a source to receive traffic from that source. The interface on which to send a PIM join is determined by looking up the unicast routing table for the source address. This interface is the upstream or RPF interface for that source. When traffic is received from that source, it is ensured it is received on the RPF interface for that source. This mechanism causes multicast traffic to take the same path through a network as unicast traffic would. In some cases, it is desirable to have the multicast traffic take a different path than the unicast traffic. For example, to avoid a slow firewall required for unicast traffic but not for multicast traffic or to receive multicast across a low latency, low bandwidth microwave link while unicast traverses a higher latency, higher bandwidth fiber path.

To overcome this situation, a static IP multicast route (or static mroute) command `ip mroute` command is introduced. The `ip mroute` command specifies a candidate for the RPF interface of any (S,G) multicast route where the source falls within the given source/mask. This interface potentially overrides the interface that would ordinarily have been selected from the matching route in the unicast routing table. This command, therefore, provides a means of breaking the dependence of the multicast topology on the unicast topology. The method of selecting the RPF interface for an (S,G) route is described next.

### Example

- This command configures a Static IP mroute for a source 1.1.1.1/32 with an administrative distance 20 on a Ethernet interface 2/1.

```
switch(config)#ip mroute 1.1.1.1/32 ethernet 2/1 20
```

### 15.1.4.1 Selecting Static Mroute

The Static Mroute is selected based the following parameters:

- Longest Match
- Administrative Distance
- Interface Status

#### Longest Match

When a given source matches multiple static Mroutes in the MRIB, the longest match will be selected. The order in which the static Mroutes were configured will not be a factor.

### Example

- If the following static mroutes were configured in order:

```
ip mroute 0.0.0.0/0 Ethernet1
ip mroute 192.168.0.0/16 Ethernet2
ip mroute 192.168.1.0/24 Ethernet3
```

For an (S,G) route where S = 192.168.1.1, the third static mroute listed above would be selected since it is the most specific route to the source. The RPF interface would therefore be Ethernet 3. The table below shows the selected RPF interface for 3 different sources based on the configuration above:

| Source      | RPF Interface |
|-------------|---------------|
| 192.168.1.1 | Ethernet 3    |
| 192.168.1.2 | Ethernet 3    |
| 192.168.2.1 | Ethernet 2    |
| 10.0.0.1    | Ethernet 1    |

### Administrative Distance

User is allowed to specify an administrative distance with each static Mroute. While selecting a Static Mroute for a source, if multiple Static Mroute exist in the MRIB with the same source/mask, then, the one with the lowest Admin distance is selected. The default administrative distance for a Static Mroute is 1.

### Interface Status

For a Static Mroute to be considered for selection, the specified interface must be UP and PIM must be enabled on it.

#### 15.1.4.2 Selecting RPF interface

Static Mroutes are BGP IP Multicast (SAFI 2) learned routes. These routes are stored in the multicast routing information base (MRIB), a separate routing table. The RPF interface is selected for a source as follows:

Initially, a source route is looked up in the MRIB. If the MRIB lookup yields a route, that route is used for selecting the RPF interface. Therefore, any configured Static Mroutes matching the source wins the selection process over a 'Connected' route to the source. For a static mroute to be considered for selection, the specified interface must be up and PIM must be enabled on it. By default, Static Mroute have an Admin distance of 1. If multiple Static Mroutes exist with equal longest prefix match, the mroute with the lowest Admin distance will win. Admin distance is not be used to compare selection between unicast RIB and MRIB routes. Successful Static Mroute looked up in the MRIB are always chosen over unicast RIB lookups.

If MRIB lookup does not yield a route, then the unicast RIB is looked up for a route to select the RPF interface. If the selected route has ECMP, one of the corresponding paths is selected as RPF neighbor.

 **Note:** The path to choose RPF neighbor is selected based on the hashing scheme; and protocols specified for valid paths, multi-path configuration, directly connected sources, and assert winners.

### Example

- Let us assume that the Static Mroute is configured, and for this example let us consider that the default Admin distance for connected routes is 0, 1 for static routes, and 110 for OSPF routes.

```
ip mroute 172.16.0.0/16 Ethernet1
ip mroute 192.168.0.0/16 Ethernet2
ip mroute 192.168.1.0/24 Ethernet3
ip mroute 192.168.1.0/24 Ethernet4 255
ip mroute 192.168.1.3/32 Ethernet5 255
ip mroute 200.10.0.0/16 Ethernet5
ip mroute 200.11.0.32/16 Ethernet5
```

- So the MRIB table contains the following:

| Prefix         | Interface  | Admin Distance |
|----------------|------------|----------------|
| 172.16.0.0/16  | Ethernet 1 | 1              |
| 192.168.0.0/16 | Ethernet 2 | 1              |
| 192.168.1.0/24 | Ethernet 3 | 1              |
| 192.168.1.0/24 | Ethernet 4 | 255            |
| 192.168.1.3/32 | Ethernet 5 | 255            |
| 200.10.0.0/16  | Ethernet 5 | 1              |
| 200.11.0.1/32  | Ethernet 5 | 1              |

- And let us assume the unicast RIB table contains the following:

| Prefix         | Interface   | Protocol  | Admin Distance |
|----------------|-------------|-----------|----------------|
| 10.0.0.0/24    | Ethernet 6  | OSPF      | 110            |
| 172.16.1.0/24  | Ethernet 7  | OSPF      | 110            |
| 192.168.0.0/16 | Ethernet 8  | OSPF      | 110            |
| 192.168.1.0/24 | Ethernet 9  | Static    | 1              |
| 192.168.1.3/32 | Ethernet 10 | OSPF      | 110            |
| 200.10.0.0/16  | Ethernet 11 | Connected | 0              |

- The table below shows the RPF interface selections for a set of sources along with which Static Mroute was chosen, which unicast RIB route was chosen, which was the eventual winner, and the reasoning behind the selection.

| Source      | Static Mroute | Unicast Route | Winner        | RPF Interface | Reasoning                                                                                                                                                                                                                          |
|-------------|---------------|---------------|---------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10.0.0.1    | -             | 1             | Unicast Route | Ethernet 6    | <ul style="list-style-type: none"> <li>• Only the unicast Rib yields a route to the source so it wins</li> </ul>                                                                                                                   |
| 200.11.0.1  | 7             | -             | Static Mroute | Ethernet 5    | <ul style="list-style-type: none"> <li>• Only the MRIB yields a route to the source so it wins</li> </ul>                                                                                                                          |
| 192.168.1.3 | 5             | 5             | Unicast Route | Ethernet 10   | <ul style="list-style-type: none"> <li>• In the MRIB (5) is the longest match</li> <li>• While comparing the static mroute and the unicast route, the unicast route is the winner because it has a lower Admin distance</li> </ul> |

| Source      | Static Mroute | Unicast Route | Winner        | RPF Interface | Reasoning                                                                                                                                                                                                                                                                           |
|-------------|---------------|---------------|---------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 192.168.2.1 | 2             | 3             | Static Mroute | Ethernet 2    | <ul style="list-style-type: none"> <li>In the MRIB (2) is the longest match</li> <li>While comparing the static mroute and the unicast route, the static Mroute is the winner because it has a lower Admin distance</li> </ul>                                                      |
| 192.168.1.1 | 3             | 4             | Static Mroute | Ethernet 3    | <ul style="list-style-type: none"> <li>In the MRIB both (3) and (4) are the longest match but (3) has the lower Admin distance</li> <li>While comparing the static mroute and the unicast route, the static mroute is the winner even though both have the same distance</li> </ul> |

## 15.1.5 Configuring Multicast

This section describes the following configuration tasks:

- [Enabling IPv4 Multicast Routing](#)
- [Enabling IPv6 Multicast Routing](#)
- [Multicast-Routing Configuration Example](#)
- [Multicast Boundary Configuration](#)

### 15.1.5.1 Configuring Multicast

This section describes the following configuration tasks:

- [Enabling IPv4 Multicast Routing](#)
- [Enabling IPv6 Multicast Routing](#)
- [Multicast-Routing Configuration Example](#)
- [Multicast Boundary Configuration](#)

#### 15.1.5.1.1 Enabling IPv4 Multicast Routing

Enabling IPv4 multicast routing allows the switch to forward multicast packets. The `routing` command enables multicast routing. When multicast routing is enabled, *running-config* contains a `routing` statement.

##### Example

- These commands enable IPv4 multicast routing on the switch.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#routing
```

#### 15.1.5.1.2 Enabling IPv6 Multicast Routing

Enabling IPv6 Multicast routing allows the switch to distribute IPv6 datagrams to one or more recipients. IPv6 PIM builds and maintains Multicast routing using reverse path forwarding (RPF) based on unicast routing table. IPv6 PIM is protocol-independent and can use routing tables consisting of OSPFv3, IPv6 BGP or static routes, for RPF lookup. MLD is used to discover Multicast hosts

---

and maintain group membership on directly attached link. This feature is supported on 7280R and 7500R. Source-specific multicast (SSM) is currently supported on L3 routed port.

### PIM Sparse Mode

In PIM-SM, each host (sender and/or receiver) is associated with a designated router (DR) which acts for all directly connected hosts in PIM-SM transactions. Upon receiving of MLD report from host or PIM join from downstream PIM neighbor, (S,G) route is created or programmed and router sends a PIM join to upstream PIM neighbor with shortest path to the source.

### Configuring IPv6 Multicast Routing

The following steps are to configure IPv6 multicast routing on the switch.

#### 1. Enabling IPv6 multicast-routing

By default, multicast-routing is disabled on switch. The following commands are used to enable IPv6 multicast-routing.

##### Example

```
switch(config)#router multicast
switch(config-router-multicast)#ipv6
switch(config-router-multicast-ipv6)#routing
```

#### 2. Enabling IPv6 PIM Sparse Mode

By default, IPv6 PIM is disabled on an interface. The `pim ipv6 sparse-mode` command enables an interface to participate in IPv6 multicast-routing domain.

##### Example

```
switch(config)#interface ethernet 15/1
switch(config-if-Et15/1)#pim ipv6 sparse-mode
```

 **Note:** SVI is not supported.

#### 3. Enabling MLD

By default, MLD is disabled on an interface. Enabling MLD is needed only on the interface that is connected to the MLD host which would like to receive IPv6 multicast traffic.

##### Example

```
switch(config)#interface ethernet 15/1
switch(config-if-Et15/1)#mlld
```

### 15.1.5.1.3 Multicast-Routing Configuration Example

```
router multicast
  ipv6
    Routing
interface Ethernet15/1
  no switchport
  ipv6 enable
  ipv6 address 40:1::3/64
  mld
  pim ipv6 sparse-mode
```

## Displaying IPv6 Multicast Routing Information

- The `show mld membership` command displays the MLD group membership table as shown.

```
switch#show mld membership
Interface                Group                Source
Filter Mode
-----
Ethernet2/1.1            ff33::1:0:0:1       101:1::2
include
Ethernet2/1.1            ff33::1:0:0:2       101:1::2
include
Ethernet2/1.1            ff33::1:0:0:3       101:1::2
include
Ethernet2/1.1            ff33::1:0:0:4       101:1::2

```

#### 15.1.5.1.4 Multicast Boundary Configuration

The multicast boundary specifies subnets where source traffic entering an interface is filtered to prevent the creation of mroute states on the interface. The interface is not included in the outgoing

interface list (OIL). Multicast PIM, IGMP and other multicast data cannot cross the boundary, facilitating the use of a multicast group address in multiple administrative domains.

The `ip multicast boundary` command configures the multicast boundary. The multicast boundary can be specified through multiple IPv4 subnets or one standard IPv4 ACL.

In an ACL method, the multicast subnets are allowed only from the permit entries of the ACL and rest is either denied or filtered. Whereas, in a non-ACL method the statements configure subnets that are only denied or filtered.

### Examples

- These commands configure the multicast address of 229.43.23.0/24 as a multicast boundary where source traffic is restricted from VLAN interface 300.

```
switch(config)#interface vlan 300
switch(config-if-vl300)#ip multicast boundary 229.43.23.0/24
switch(config-if-vl300)#
```

- These commands create a standard ACL, then implement the ACL in an `ip multicast boundary` command to allow multicast for subnet (224.0.0.0/4) and create a multicast boundary for all remaining subnets by denying them.

```
switch(config)#ip access-list standard mbacl
switch(config-std-acl-mbacl)#10 deny 225.123.0.0/16
switch(config-std-acl-mbacl)#20 deny 239.120.10.0/24
switch(config-std-acl-mbacl)#30 permit 224.0.0.0/4
switch(config-std-acl-mbacl)#exit
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip multicast boundary mbacl
switch(config-if-Vl200)#exit
switch(config)#
```

### 15.1.5.2 Configuring MFIB

MFIB formats PIM and IGMP multicast routes for protocol-independent hardware packet forwarding and adds them to the hardware multicast expansion table (MET) and the hardware FIB.

#### MFIB Polling Interval

The switch records activity levels for multicast routes in the MFIB after polling the corresponding hardware activity bits. The `activity polling-interval` command specifies the frequency at which the switch polls the hardware activity bits for the multicast routes.

#### Example

- These commands set the MFIB activity polling period to 15 seconds.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#activity polling-interval 15
switch(config-router-multicast-ipv4)#
```

#### MFIB Fast Drops

In IP multicast protocols, every (S,G) or (\*,G) route is associated with an inbound RPF (reverse path forwarding) interface. Packets arriving on an interface not associated with the route may need CPU-dependent PIM processing, so packets received by non-RPF interfaces are sent to the CPU by default, causing heavy CPU processing loads.

---

Multicast routing protocols often do not require non-RPF packets; these packets do not require software processing. The CPU therefore updates the hardware MFIB with a fast-drop entry when it receives a non-RPF interface packet that PIM does not require. Additional packets that match the fast-drop entry are not sent to the system software.

Fast drop is enabled on all interfaces by default. The `no ip mfib fastdrop` command disables MFIB fast drop for the configuration mode interface.

### Example

- This command disables MFIB fast drop for the VLAN interface 120.

```
switch(config)#interface vlan 120
switch(config-if-Vl120)#no ip mfib fastdrop
switch(config-if-Vl120)#
```

The `ip mfib max-fastdrops` command limits the number of fast-drop routes that the switches MFIB table can contain. The default fast-drop route limit is 1024.

### Example

- This command sets the maximum number of fast-drop routes to 2000.

```
switch(config)#ip mfib max-fastdrops 2000
switch(config)#
```

The `clear ip mfib fastdrop` command, in global configuration mode, removes all MFIB fast-drop entries on all interfaces.

### Example

- This command removes all fast-drop entries from the MFIB table.

```
switch#clear ip mfib fastdrop
switch#
```

The `show multicast fib ipv4` command displays information about the routes and interfaces in the IPv4 MFIB.

- `show multicast fib ipv4` displays MFIB information for hardware-forwarded routes.
- `show multicast fib ipv4 software` displays MFIB information for software-forwarded routes.

### Example

- This command displays MFIB information for hardware-forwarded routes.

```
switch#show multicast fib ipv4
Activity poll time: 60 seconds
239.255.255.250 172.17.26.25
  Vlan26 (iif)
  Vlan2028
  Cpu
  Activity 0:02:11 ago
239.255.255.250 172.17.26.156
  Vlan26 (iif)
  Vlan2028
  Cpu
  Activity 0:02:11 ago
239.255.255.250 172.17.26.178
```

```
Vlan26 (iif)
Vlan2028
Cpu
  Activity 0:03:37 ago
switch#
```

### MFIB Unresolved Cache-entries Max

The `unresolved cache-entries max` command configures the maximum number of unresolved (S,G) routes that the switch can cache packets. All packets belonging to (S,G) routes exceeding the limit are dropped. The default buffer size is 4000 routes. See `ip multicast boundary` to limit the number of cached packets per S,G.

#### Example

- This command sets the maximum MFIB unresolved cache-entry buffer size to 6000 routes in the default VRF.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#unresolved cache-entries max 6000
switch(config-router-multicast-ipv4)#
```

### MFIB Unresolved Packet-buffers Max

The `ip multicast boundary` command specifies the number of packets per unresolved route that are queued while the route is being resolved by the switch. The limit for `ip multicast boundary` is for an individual route, packets that exceed this limit are dropped. By default, the switch processes 3 unresolved packets for an individual route. See `unresolved cache-entries max` to limit the number of unresolved routes that are cached.

#### Example

- This command configures the switch in the default VRF to cache up to thirty multicast packets from any route before that route is resolved.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#unresolved packet-buffers max 30
switch(config-router-multicast-ipv4)#
```

### 15.1.5.3 Displaying and Clearing the Mroute Table

The mroute table stores the states of inbound and outbound interfaces for each source/group pair (S,G). The switch discards and forwards packets on the basis of this state information. Each table entry, referred to as an mroute, corresponds to a unique (S,G) and contains:

- the multicast group address
- the multicast source address (or \* for all sources)
- the inbound interface
- a list of outbound interfaces

#### Clearing mroute Entries

The `clear ip mroute` command removes route entries from the mroute table:

- `clear ip mroute *` all entries from the mroute table.
- `clear ip mroute gp_ipv4` all entries for the specified multicast group.
- `clear ip mroute gp_ipv4 src_ipv4` all entries for the specified source sending to a specified group.

---

## Examples

- This command removes all route entries from the mroute table.

```
switch#clear ip mroute *
switch#
```

- This command removes entries for source 228.3.10.1 sending to multicast group 224.2.205.42.

```
switch#clear ip mroute 224.2.205.42 228.3.10.1
switch#
```

## Displaying the mroute Table

The `show ip mroute count` command displays IP multicast routing table statistics.

### Example

- This command displays IP multicast routing table statistics.

```
switch#show ip mroute count
IP Multicast Statistics
1 groups and 1 sources
Multicast routes: 1 (*,G), 1 (S,G)
Average of 1.00 sources per group
Maximum of 1 sources per group:
228.24.12.1
switch>
```

The `show ip mroute` command displays information from the IP multicast routing table.

- `show ip mroute` displays information for all routes in the table.
- `show ip mroute gp_addr` displays information for the specified multicast group.

### Example

- This command displays the IP multicast routing table for the multicast group 225.1.1.1.

```
switch#show ip mroute 225.1.1.1
PIM Sparse Mode Multicast Routing Table
Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
R - RPT bit is set, S - SPT bit is set
W - Wildcard entry, X - External component interest
I - SG Include Join alert rcvd, P - Ex-Prune alert rcvd
H - Joining SPT due to policy, D - Joining SPT due to protocol
Z - Entry marked for deletion
A - Learned via Anycast RP Router
225.1.1.1
172.28.1.100, 5d04h, flags: S
Incoming interface: Vlan281
Outgoing interface list:
Port-Channel999
switch>
```

## 15.1.6 Multicast Commands

### Multicast Configuration Commands (Global)

- `activity polling-interval`
- `ip mfib max-fastdrops`
- `ip mroute`
- `ip multicast boundary`
- `ip multicast static`
- `multipath deterministic`
- `multipath none`
- `route`
- `router multicast`
- `routing`
- `unresolved cache-entries max`

### Multicast Configuration Commands (Interface)

- `ip mfib fastdrop`
- `ip multicast boundary`

### Multicast Clear Commands

- `clear ip mfib fastdrop`
- `clear ip mroute`

### Multicast Display Commands

- `show ip mroute`
- `show ip mroute count`
- `show ip multicast boundary`
- `show mld membership`
- `show mld querier`
- `show mld statistics`
- `show mld summary`
- `show multicast fib ipv4`
- `show multicast fib ipv4 software`
- `show multicast fib ipv6`
- `show pim ipv6 sparse-mode route`
- `show platform fap mroute ipv6`

---

### 15.1.6.1 activity polling-interval

The switch records activity levels for multicast routes in the mfib after polling the corresponding hardware activity bits. The **activity polling-interval** command specifies the frequency at which the switch polls the hardware activity bits for the multicast routes.

The **no activity polling-interval** and **default activity polling-interval** commands restore the default interval of 60 seconds by removing the **activity polling-interval** command from *running-config*.

#### Command Mode

Router Multicast IPv4 Configuration

#### Command Syntax

```
activity polling-interval period
```

```
no activity polling-interval
```

```
default activity polling-interval
```

#### Parameters

- *period* interval (seconds) between polls. Values range from 1 to 60. Default is 60.

#### Example

- These commands set the MFIB activity polling period to 15 seconds.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#activity polling-interval 15
switch(config-router-multicast-ipv4)#
```

### 15.1.6.2 clear ip mfib fastdrop

The `clear ip mfib fastdrop` command removes all fast-drop entries from the MFIB table.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ip mfib fastdrop
```

#### Example

- This command removes all fast-drop entries from the MFIB table.

```
switch#clear ip mfib fastdrop  
switch#
```

---

### 15.1.6.3 clear ip mroute

The **clear ip mroute** command removes route entries from the mroute table, as follows:

- **clear ip mroute \*** removes all entries from the mroute table.
- **clear ip mroute gp\_ipv4** removes all entries for the specified multicast group.
- **clear ip mroute gp\_ipv4src\_ipv4** removes all entries for the specified source sending to the specified group.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ip mroute ENTRY_LIST
```

#### Parameters

- ENTRY\_LIST entries that the command removes from the mroute table. Options include:
  - \* all route entries
  - gp\_ipv4 all entries for multicast group gp\_ipv4 (dotted decimal notation)
  - gp\_ipv4 src\_ipv4 all entries for source (src\_ipv4) sending to group (gp\_ipv4)

#### Examples

- This command removes all route entries from the mroute table.

```
switch#clear ip mroute *
switch#
```

- This command removes entries for the source 228.3.10.1 sending to multicast group 224.2.205.42.

```
switch#clear ip mroute 224.2.205.42 228.3.10.1
switch#
```

#### 15.1.6.4 ip mfib fastdrop

In IP multicast protocols, every (S,G) or (\*,G) route is associated with an inbound RPF (reverse path forwarding) interface. Packets arriving on an interface not associated with the route may need CPU-dependent PIM processing, so packets received by non-RPF interfaces are sent to the CPU by default, causing heavy CPU processing loads.

Multicast routing protocols often do not require non-RPF packets; these packets do not require software processing. The CPU therefore updates the hardware MFIB with a fast-drop entry when it receives a non-RPF interface packet that PIM does not require. Additional packets that match the fast-drop entry are not sent to the system software.

Fast drop is enabled on all interfaces by default. The `no ip mfib fastdrop` command disables MFIB fast drop for the configuration mode interface.

The `ip mfib fastdrop` and `default ip mfib fastdrop` commands enable MFIB fast drop for the configuration mode interface by removing the corresponding `no ip mfib fastdrop` command from *running-config*.

The `clear ip mfib fastdrop` command, in global configuration mode, removes all MFIB fast-drop entries on all interfaces.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
ip mfib fastdrop
```

```
no ip mfib fastdrop
```

```
default ip mfib fastdrop
```

##### Examples

- This command disables MFIB fast drop for VLAN interface 120.

```
switch(config)#interface vlan 120
switch(config-if-Vl120)#no ip mfib fastdrop
switch(config-if-Vl120)#
```

---

### 15.1.6.5 ip mfib max-fastdrops

The `ip mfib max-fastdrops` command limits the number of fast-drop routes that the switch's MFIB table can contain.

The `no ip mfib max-fastdrops` and `default ip mfib max-fastdrops` commands restore the default fast-drop route limit of 1024 by removing the `ip mfib max-fastdrops` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip mfib max-fastdrops quantity
```

```
no ip mfib max-fastdrops
```

```
default ip mfib max-fastdrops
```

#### Parameters

- *quantity* maximum number of fast-drop routes. Value ranges from 0 to 1000000 (one million). Default is 1024.

#### Example

- This command sets the maximum number of fast-drop routes to 2000.

```
switch(config)#ip mfib max-fastdrops 2000
switch(config)#
```

### 15.1.6.6 ip mroute

The `ip mroute` command configures the Static Mroute on the switch.

The `no ip mroute` and `default ip mroute` commands remove the specified static mroute from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip mroute [<source-prefix>|<source-address> <mask>] [<rpf-interface>|<rpf-neighbor>] [admin distance]
```

#### Example

- This command configures a Static IP mroute for a source 1.1.1.1/32 with an administrative distance 20 on a Ethernet interface 2/1.

```
switch(config)#ip mroute 1.1.1.1/32 ethernet 2/1 20
```

---

### 15.1.6.7 ip multicast boundary

The **ip multicast boundary** command specifies subnets where source traffic entering the configuration mode interface is dropped, preventing the creation of mroute states on the interface. The interface is not included in the outgoing interface list (OIL). The multicast boundary can be specified through multiple IPv4 subnets or one standard IPv4 ACL.

In an ACL method, the multicast subnets are allowed only from the permit entries of the ACL and rest is either denied or filtered. Whereas, in a non-ACL method the statements configure subnets that are only denied or filtered.

Multicast PIM, IGMP and other multicast data cannot cross the boundary, facilitating the use of a multicast group address in multiple administrative domains.

The **no ip multicast boundary** and **default ip multicast boundary** commands delete the specified subnet restriction by removing the corresponding **ip multicast boundary** command from **running-config**. When these commands do not specify a subnet address, all **ip multicast boundary** statements for the configuration mode interface are removed.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip multicast boundary SUBNET [TCAM]
```

```
no ip multicast boundary [SUBNET]
```

```
default ip multicast boundary [SUBNET]
```

#### Parameters

- SUBNET the subnet address configured as the multicast boundary. Options include:
  - *net\_addr* multicast subnet address (CIDR or address mask).
  - *acl\_name* standard access control list (ACL) that specifies the multicast group addresses.
- TCAM specifies address inclusion in the routing table. Options include:
  - *<no parameter>* boundaries ((S,G) entries) are added to routing table.
  - **out** boundaries are not added to routing table.

#### Guidelines

When **out** is selected, the first inbound data packet corresponding to the **SUBNET** may be sent to the CPU. In response, the packet is dropped and the boundary prefix is added to the hardware table. In this scenario, the mroute entry is added only when data traffic is received.

#### Restrictions

Only one command that specifies an ACL can be assigned to an interface. Commands that specify an ACL and a subnet cannot be simultaneously assigned to an interface.

#### Examples

- This command configures the multicast address of 229.43.23.0/24 as a multicast boundary where source traffic is restricted from VLAN interface 300.

```
switch(config)#interface vlan 300
switch(config-if-vl300)#ip multicast boundary 229.43.23.0/24
switch(config-if-vl300)#
```

- These commands create a standard ACL, then implement the ACL in an ip multicast boundary command to allow multicast for subnet (224.0.0.0/4) and create a multicast boundary for all remaining subnets by denying them.

```
switch(config)#ip access-list standard mbacl
switch(config-std-acl-mbacl)#10 deny 225.123.0.0/16
switch(config-std-acl-mbacl)#20 deny 239.120.10.0/24
switch(config-std-acl-mbacl)#30 permit 224.0.0.0/4
switch(config-std-acl-mbacl)#exit
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip multicast boundary mbacl
switch(config-if-Vl200)#exit
switch(config)#
```

---

### 15.1.6.8 ip multicast static

The `ip multicast static` command enables static multicast routing on the switch.

The `exit` command returns the switch to global configuration mode.

#### Command Mode

Interface Ethernet Configuration

#### Command Syntax

```
ip multicast static
```

#### Example

- The following commands configure the static multicast routing on the switch.

```
switch(config)#interface ethernet 1/2
switch(config-if-Et1/2)#no switchport
switch(config-if-Et1/2)#ip address 1.1.1.1/24
switch(config-if-Et1/2)#ip multicast static
```

### 15.1.6.9 ip route multicast

The **ip route multicast** command places the switch in VRF mode, when a static multicast route is being configured within a specific VRF. In this mode the switch allows to configure various route attributes such as VLAN, port-channel, Ethernet interface, Null0, Register0.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

Router Multicast Configuration

#### Command Syntax

```
ip route multicast group [source] iif interface-name [oif interface-name1,interface-name2...] [cpu] [priority]
```

#### Parameters

- *group* Specifies the group address.
- *source* Specifies the source address.
- **iif** Incoming interface.
- **oif** Outgoing interface.
- *interface-name* Ethernet port number. Value ranges from 1 to 32.
- **cpu** Copy to CPU.
- **priority** Route priority. Value ranges from 1 to 255.

#### Example

- The following commands places the switch in IP route multicast VRF mode and a VLAN 20 is configured in this example.

```
switch(config)#router multicast  
switch(config-router-multicast)#vrf test  
switch(config-router-multicast-vrf-test)#ip route multicast 1.1.1.1  
10.1.1.1 iif  
vlan 20 cpu priority 30
```

---

### 15.1.6.10 mld last-listener-query-count

The `mld last-listener-query-count` command specifies the number of query messages the switch sends in response to a group-specific or group-source-specific leave message.

After receiving a message from a host leaving a group, the switch sends query messages at intervals specified by `mld last-listener-query-interval`. If the switch does not receive a response to the queries after sending the number of messages specified by this parameter, it stops forwarding messages to the host.

The `no mld last-listener-query-count` and `default mld last-listener-query-count` commands reset the last-listener-query-count to the default value by removing the corresponding `mld last-listener-query-count` command from the *running-config*. Default value is 2.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
mld last-listener-query-count number
```

```
no mld last-listener-query-count
```

```
default mld last-listener-query-count
```

#### Parameters

- *number* the last listener query count. Values range from 0 to 100. Default value is 2.

#### Example

- This command configures the last listener query count to 3 on an Ethernet interface 1.

```
switch(config)#interface Ethernet 1  
switch(config-if-Et1)#mld last-listener-query-count 3
```

### 15.1.6.11 mld last-listener-query-interval

The `mld last-listener-query-interval` command configures the switch's transmission interval for sending group-specific or group-source-specific query messages from the configuration mode interface.

When a switch receives a message from a host that is leaving a group, it sends query messages at intervals set by this command. The `mld last-listener-query-count` specifies the number of messages that are sent before the switch stops forwarding packets to the host.

If the switch does not receive a response after this period, it stops forwarding traffic to the host on behalf of the group, source, or channel.

The `no mld last-listener-query-interval` and `default mld last-listener-query-interval` commands reset the last-listener-query-interval to the default value by removing the corresponding `mld last-listener-query-interval` command from the *running-config*. Default value is one second.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
mld last-listener-query-interval period
no mld last-listener-query-interval
default mld last-listener-query-interval
```

#### Parameters

- *period* the last listener query interval in seconds. Values range from 1 to 3175.

#### Example

- This command configures the last listener query interval to 2 seconds on an Ethernet interface 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld last-listener-query-interval 2
```

---

### 15.1.6.12 mld query-interval

The **mld query-interval** command configures the frequency at which the configuration mode interface, as an MLD querier, sends host-query messages.

An MLD querier sends host-query messages to discover the multicast groups that have members on networks attached to the interface. The switch implements a default query interval of 125 seconds.

The **no mld query-interval** and **default mld query-interval** commands reset the query interval to the default value by removing the corresponding **mld query-interval** command from the *running-config*.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
mld query-interval period
```

```
no mld query-interval
```

```
default mld query-interval
```

#### Parameters

- *period* the interval between query messages in seconds. Values range from 1 to 3175.

#### Example

- This command configures the query interval of 30 seconds on an Ethernet interface 1.

```
switch(config)#interface Ethernet1  
switch(config-if-Et1)#mld query-interval 30
```

### 15.1.6.13 mld query-response-interval

The **mld query-response-interval** command configures the maximum response time that the recipient can wait before responding with a membership report on receipt of a general query.

The **no mld query-response-interval** and **default mld query-response-interval** commands reset the query interval to the default value by removing the corresponding **mld query-response-interval** command from the *running-config*.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
mld query-interval period
```

```
no mld query-interval
```

```
default mld query-interval
```

#### Parameters

- *period* the query response interval in seconds. Values range from 1 to 3175.

#### Example

- This command configures the query response interval of 30 seconds on an Ethernet interface 1.

```
switch(config)#interface Ethernet1  
switch(config-if-Et1)#mld query-response-interval 30
```

---

#### 15.1.6.14 mld robustness

The **mld robustness** command configures the number of general queries to be sent before the router assumes there are no more listeners.

The **no mld robustness** and **default mld robustness** commands reset the robustness to the default value by removing the corresponding **mld robustness** command from the *running-config*.

##### Command Mode

Interface-Ethernet Configuration

##### Command Syntax

```
mld robustness robust_value
```

```
no mld robustness
```

```
default mld robustness
```

##### Parameters

- *robust\_value* the robustness count. Values range from 1 to 100.

##### Example

- This command configures the robustness value to 2 on an Ethernet interface 1.

```
switch(config) #interface Ethernet1  
switch(config-if-Et1) #mld robustness 2
```

### 15.1.6.15 mld startup-query-count

The `mld startup-query-count` command specifies the number of query messages that an interface sends during the startup query interval.

When an interface starts running MLD, it can establish the group state more quickly by sending query messages at a higher frequency. The `mld startup-query-interval` and `mld startup-query-count` commands define the startup period and the query message transmission frequency during that period.

The `no mld startup-query-count` and `default mld startup-query-count` commands restore the default startup-query-count value by removing the corresponding `mld startup-query-count` command from the *running-config*.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
mld startup-query-count number
```

```
no mld startup-query-count
```

```
default mld startup-query-count
```

#### Parameters

- *number* the startup query count. Values range from 1 to 100.

#### Example

- This command configures the startup query count of 4 on an Ethernet interface 1.

```
switch(config) #interface Ethernet1  
switch(config-if-Et1) #mld startup-query-count 4
```

---

### 15.1.6.16 mld startup-query-interval

The `mld startup-query-interval` command specifies the interval between the general queries sent by a querier on startup.

When an interface starts running MLD, it can establish the group state quicker by sending query messages at a higher frequency. The `mld startup-query-interval` and `mld startup-query-count` commands define the startup period and the query message transmission frequency during that period.

The `no mld startup-query-count` and `default mld startup-query-interval` commands restore the default startup-query-interval value by removing the corresponding `mld startup-query-interval` command from the *running-config*.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
mld startup-query-interval period
```

```
no mld startup-query-interval
```

```
default mld startup-query-interval
```

#### Parameters

- *period* the startup query interval in seconds. Values range from 1 to 3175.

#### Example

- This command configures the startup query interval of 100 seconds on an Ethernet interface 1.

```
switch(config) #interface Ethernet1  
switch(config-if-Et1) #mld startup-query-interval 100
```

### 15.1.6.17 mld static-group

The **mld static-group** command configures the configuration mode interface as a static member of a specified multicast group. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, static group memberships are not configured on any interfaces.

If the command includes a source address, only multicast group messages received from the specified host address are fast-switched. Otherwise, all multicast traffic of the specified group is fast-switched.

The **no mld static-group** and **default mld static-group** commands remove the configuration mode interfaces group membership by removing the corresponding **mld startup-group** command from the *running-config*.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
mld static-group source_address [group_address | access-list acl_name]
no mld static-group source_address [group_address | access-list acl_name]
default mld static-group source_address [group_address | access-list
acl_name]
```

#### Parameters

- *source\_address* IP address of the host that originates multicast data packets.
- *group\_address* IPv6 address of a multicast group.
- *access-list* IPv6 access list to use as a static group list.
- *acl\_name* specifies access-list name

#### Examples

- This command configures static groups on an interface Ethernet 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld static-group ff30::1 a::1
```

- This command configures multiple static groups using an access list on an interface Ethernet 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld static-group access-list testAccessList
```

---

### 15.1.6.18 mld

The **mld** command enables multicast listener discovery on an interface which controls the flow of layer 3 IPv6 multicast traffic. Hosts request and maintain multicast group membership through MLD messages. Multicast routers use MLD to maintain a membership list of active multicast groups for each attached network.

The **no mld** and **default mld** commands restore the default behavior by removing the corresponding **mld** command from the *running-config*.

**Note:** It is possible to change the values of the querier parameters used by MLD.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
mld [last-listener-query-count | last-listener-query-interval | query-interval | query-response-interval | robustness | startup-query-count | startup-query-interval | static-group]
```

```
no mld
```

```
default mld
```

#### Parameters

- **last-listener-query-count** the number of group-specific or group-source-specific queries to send before the router assumes there are no more listeners.
- **last-listener-query-interval** the interval between the last listener queries.
- **query-interval** the interval between the general queries regularly sent by a querier.
- **query-response-interval** the interval that the host has to respond to a general query.
- **robustness** the number of general queries to send before the router assumes there are no more listeners.
- **startup-query-count** the number of queries a router sends at startup.
- **startup-query-interval** the interval between the general queries sent by a querier at startup.
- **static-group** the number of static groups or sources of MLD messages.

#### Examples

- This command enables MLD on the Ethernet interface 1.

```
switch(config)#interface Ethernet1  
switch(config-if-Et1)#mld
```

### 15.1.6.19 multipath deterministic

By default, multicast traffic is load balanced by distributing packets over all ECMP links. The `no multipath deterministic` command routes multicast ECMP traffic to the neighbor with the highest IPv4 address.

The `multipath deterministic` and `default multipath deterministic` commands restore the default behavior of randomly distributing multicast traffic over all ECMP links.

#### Command Mode

Router Multicast IPv4 Configuration

#### Command Syntax

```
multipath deterministic
```

```
no multipath deterministic
```

```
default multipath deterministic
```

#### Related Commands

- `multipath none` performs the same function as `no multipath deterministic`

#### Example

- These commands configure the switch to route multicast traffic through the ECMP link to the neighbor with the highest IP address.

```
switch(config)#router multicast  
switch(config-router-multicast)#ipv4  
switch(config-router-multicast-ipv4)#no multipath deterministic  
switch(config-router-multicast-ipv4)#
```

- These commands configure the switch to load balance multicast traffic by distributing packets over all ECMP links.

```
switch(config)#router multicast  
switch(config-router-multicast)#ipv4  
switch(config-router-multicast-ipv4)#multipath deterministic  
switch(config-router-multicast-ipv4)#
```

---

### 15.1.6.20 multipath none

By default, multicast traffic is load balanced by distributing packets over all ECMP links. The `multipath none` command routes multicast ECMP traffic to the neighbor with the highest IPv4 address.

The `no multipath none` and `default multipath none` commands restore the default behavior of randomly distributing multicast traffic over all ECMP links by removing the `multipath none` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
multipath none
```

```
no multipath none
```

```
default multipath none
```

#### Related Commands

- `multipath deterministic` performs the same function as `no multipath none`

#### Example

- These commands configure the switch to route multicast traffic through the ECMP link to the neighbor with the highest IP address.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#multipath none
switch(config-router-multicast-ipv4)#
```

- These commands configure the switch to load balance multicast traffic by distributing packets over all ECMP links.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#no multipath none
switch(config-router-multicast-ipv4)#
```

### 15.1.6.21 route

The **route** command configures a static multicast route for the specified source, destination group, and incoming interface on the router.

The **no route** and **default route** commands remove the specified static multicast route by removing the corresponding **route** command from *running-config*.

#### Command Mode

Router Multicast IPv4 Configuration

Router Multicast VRF IPv4 Configuration

#### Command Syntax

```
route group_address [source_address] iif interface [oif interface] [cpu] [iifFrr interface]
[priority priority_num]
```

```
no route group_address
```

```
default route group_address
```

#### Parameters

- *group\_address* the multicast group address
- *source\_address* the optional source address for the multicast route
- **iif interface** specifies an incoming interface for the static route
- **cpu** optionally mirrors multicast packets to the CPU
- **oif interface** specifies an optional outgoing interface to be included among those on which the multicast traffic is forwarded
- **iifFrr interface** specifies an optional interface for multicast-only fast reroute
- *interface* options include:
  - **Ethernet ethernet\_port** Ethernet interface
  - **Null0** drops all traffic
  - **Port-Channel lag\_no** port-channel interface or sub-interface; values range from 1-2000 or 1-2000.1-4094
  - **Register0** drops all incoming traffic
  - **Vlan vlan\_no** VLAN interface
- **priority priority\_num** specifies an optional priority for the multicast route. If the same route is present in several multicast routing tables, the priority number is used to select the best available route. Values range from 0 to 255; PIM routes by default have a priority of 0, while static multicast routes by default have a priority of 255.

#### Examples

- These commands create a static multicast route in the default VRF. The static route has a group address of 225.3.3.3 and source address of 1.1.1.1. It uses VLAN 100 as its incoming interface, VLANs 200 and 300 as its outgoing interfaces, and Ethernet interface 2 as its multicast-only fast reroute interface.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#route 225.3.3.3 1.1.1.1 iif
Vlan100 oif
Vlan200 Vlan300 iifFrr Ethernet2
switch(config-router-multicast-ipv4)#
```

---

### 15.1.6.22 router multicast

The `router multicast` command places the switch in router-multicast configuration mode to configure IPv4 and IPv6 router multicast traffic.

#### Command Mode

Global Configuration

#### Command Syntax

```
router multicast
```

#### Example

- The following command places the switch in router-multicast configuration mode.

```
switch(config)#router multicast  
switch(config-router-multicast)#ipv6  
switch(config-router-multicast-ipv6)#routing
```

### 15.1.6.23 routing

The **routing** command allows the switch to forward multicast packets. Multicast routing is disabled by default.

The **no routing** and **default routing** commands disable multicast routing by removing the **routing** command from *running-config*.

#### Command Mode

Router Multicast IPv4 Configuration

Router Multicast VRF IPv4 Configuration

#### Command Syntax

**routing**

**no routing**

**default routing**

#### Example

- These commands enable multicast routing on the switch.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#routing
switch(config-router-multicast-ipv4)#
```

### 15.1.6.24 rpf route

The **rpf route** command specifies a candidate for the multicast reverse path forwarding (RPF) interface of any (S,G) multicast route (mroute), where the source falls within the given network prefix. Static mroutes are stored in a separate routing table, the multicast routing information base (MRIB).

#### Command Mode

Router Multicast IPv4 Configuration

Router Multicast VRF IPv4 Configuration

#### Command Syntax

```
rpf route {<source_prefix>|<source_address> <mask>} {<rpf_interface>|<rpf_neighbor>}  
[admin_distance]
```

```
no rpf route {<source_prefix>|<source_address> <mask>} {<rpf_interface>|<rpf_neighbor>}
```

```
default rpf route {<source_prefix>|<source_address> <mask>} {<rpf_interface>|<rpf_neighbor>}
```

#### Parameters

- source\_prefix specifies the source prefix.
- source\_address specifies the source address.
- mask specifies the address mask.
- rpf\_interface specifies the multicast RPF interface.
- rpf\_neighbor specifies the multicast RPF neighbor.
- admin\_distance specifies the administrative distance (optional). Values range from 1 to 255.

#### Examples

- These commands select the longest match when a source matches multiple static mroutes in the MRIB.

```
switch(config)#router multicast  
switch(config-router-multicast)#ipv4  
switch(config-router-multicast-ipv4)#rpf route 10.0.0.0/16 Ethernet 4  
switch(config-router-multicast-ipv4)#rpf route 11.10.1.0/24 Ethernet 5  
switch(config-router-multicast-ipv4)#rpf route 11.10.1.2/32 Ethernet 6  
switch(config-router-multicast-ipv4)##
```

- These commands include an administrative distance of 255 on Ethernet interface 5 with static mroute.

```
switch(config)#router multicast  
switch(config-router-multicast)#ipv4  
switch(config-router-multicast-ipv4)#rpf route 10.0.0.0/16 Ethernet 4  
switch(config-router-multicast-ipv4)#rpf route 11.10.1.0/24 Ethernet 5  
255  
switch(config-router-multicast-ipv4)#rpf route 11.10.1.2/32 Ethernet 6  
switch(config-router-multicast-ipv4)#
```

### 15.1.6.25 show ip mroute count

The `show ip mroute count` command displays IP multicast routing table statistics.

The `show ip mroute` command displays information from the IP multicast routing table.

#### Command Mode

EXEC

#### Command Syntax

```
show ip mroute count
```

#### Example

- This command displays IP multicast routing table statistics.

```
switch#show ip mroute count
IP Multicast Statistics
1 groups and 1 sources
Multicast routes: 1 (*,G), 1 (S,G)
Average of 1.00 sources per group
Maximum of 1 sources per group:
228.24.12.1
switch#
```

---

### 15.1.6.26 show ip mroute

The `show ip mroute` command displays information from the IP multicast routing table.

- `show ip mroute` displays information for all routes in the table.
- `show ip mroute gp_addr` displays information for the specified multicast group.

#### Command Mode

EXEC

#### Command Syntax

`show ip mroute`

`show ip mroute gp_addr`

#### Parameters

- `gp_addr` group IP address (dotted decimal notation).

#### Example

- This command displays the IP multicast routing table entry for the multicast group 225.1.1.11

```
switch#show ip mroute 225.1.1.1
PIM Sparse Mode Multicast Routing Table
Flags: E - Entry forwarding on the RPT, J -Joining to the SPT
R - RPT bit is set, S - SPT bit is set
W - Wildcard entry, X - External component interest
I - SG Include Join alert rcvd, P - Ex-Prune alert rcvd
H - Joining SPT due to policy, D - Joining SPT due to protocol
Z - Entry marked for deletion
A - Learned via Anycast RP Router
225.1.1.1
172.28.1.100, 5d04h, flags: S
Incoming interface: Vlan281
Outgoing interface list:
Port-Channel999
switch#
```

### 15.1.6.27 show ip multicast boundary

The **show ip multicast boundary** command displays the summary of all IP multicast boundaries across all interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show ip multicast boundary [group_prefix | group_prefix/length [out] | interface
{ethernet e_num | loopback l_num | management m_num | port-channel p_num | vlan
v_num} | out]
```

#### Parameters

- <no parameters> displays the summary of all IP multicast boundaries across all interfaces
- *group\_prefix* displays the list of IP multicast boundaries matching the specified group address with subnet mask.
- *group\_prefix/length* displays the list of IP multicast boundaries matching the specified group address with CIDR notation. Option includes:
  - **out** displays the specified group addresss IP multicast boundaries whose control plane filtering is enabled
- **interface** displays IP multicast boundary of the specified interface. Options include:
  - **ethernet** *e\_num* displays IP multicast boundaries of the specified Ethernet interface
  - **loopback** *l\_num* displays IP multicast boundaries of the specified Loopback interface
  - **management** *m\_num* displays IP multicast boundaries of the specified management interface
  - **port-channel** *p\_num* displays IP multicast boundaries of the specified port channel interface
  - **vlan** *v\_num* displays IP multicast boundaries of the specified VLAN interface
- **out** displays all IP multicast boundaries whose only control plane filtering is enabled

#### Examples

- This command displays the summary of all IP multicast boundaries across all interfaces.

```
switch(config-if-Et24)#show ip multicast boundary
Interface Denied Prefix Data Plane Filtered
Ethernet1 224.5.5.0/24 Yes
Ethernet1 224.6.6.0/24 Yes
Ethernet2 224.4.4.0/24 Yes
Ethernet3 224.5.5.0/24 No
```

- This command displays all IP multicast boundaries matching 224.5.5.0 255.255.255.255.

```
switch(config-if-Et24)#show ip multicast boundary 224.5.5.0
255.255.255.255
Interface Denied Prefix Data Plane Filtered
Ethernet1 224.5.5.0 255.255.255.255
Ethernet3 224.5.5.0 255.255.255.255 No
```

- This command displays all IP multicast boundaries matching 224.5.5.0/24.

```
switch(config-if-Et24)#show ip multicast boundary 224.5.5.0/24
Interface Denied Prefix Data Plane Filtered
Ethernet1 224.5.5.0/24
Ethernet3 224.5.5.0/24 No
```

- This command displays all IP multicast boundaries of the Ethernet1 interface.

```
switch(config-if-Et24)#show ip multicast boundary interface Ethernet1
```

---

```
Interface Denied Prefix Data Plane Filtered
Ethernet1 224.5.5.0/24
Ethernet1 224.6.6.0/24 No
```

- This command displays the list of IP multicast boundaries whose only control plane filtering is enabled.

```
switch(config-if-Et24)#show ip multicast boundary out
Interface Denied Prefix Data Plane Filtered
Ethernet1 224.5.5.0/24 No
Ethernet3 224.5.5.0/24 No
```

### 15.1.6.28 show mld membership

The `show mld membership` command displays MLD group and source membership information on a specific interface.

#### Command Mode

EXEC

#### Command Syntax

```
show mld membership [dynamic | group | interface | static]
```

#### Parameters

- *dynamic* displays MLD information for a dynamic group.
- *group* displays MLD information for a specified multicast group address.
- *interface* displays MLD information for the specified interface.
- *static* displays MLD information for statically configured group.

#### Example

- This command displays MLD group and source information on the Ethernet interface 3 and 6.

```
switch#show mld membership
Interface          Group          Source
  Filter Mode
-----
-----
Ethernet3          ff30::1       a::2
  include
Ethernet3          ff30::1       a::1
  include
Ethernet6          ff30::2       a::2
  include
```

### 15.1.6.29 show mld querier

The **show mld querier** command displays information about the MLD querier and querier parameters.

#### Command Mode

EXEC

#### Command Syntax

```
show mld querier [interface | parameters]
```

#### Parameters

- *interface* displays MLD querier information.
- *parameters* displays MLD querier parameters.

#### Example

- This command displays MLD querier on the Ethernet interface Et3 and Et6.

```
Switch#show mld querier
Interface Querier          General  Other
      Version
Querier
-----
Et3      fe80::1:ff:fe01:0      0:01:14  N/A
      2
Et6      fe80::1:ff:fe01:0      0:01:14  N/A
      2
```

- This command displays MLD querier parameters on the Ethernet interface Et3 and Et6.

```
Switch#show mld querier parameters
Interface Robustness Query  Query  Startup  Startup
Last      Last
Listener  Listener
Query     Query
Interval  Count
-----
Et3      2      125    10      31.25    2      1
      2
Et6      2      125    10      31.25    2      1
      2
```

### 15.1.6.30 show mld statistics

The **show mld statistics** command displays total statistics information of incoming and outgoing MLD messages on a specific interface.

#### Command Mode

EXEC

#### Command Syntax

```
show mld statistics version value
```

#### Parameters

- *version* specifies MLD version.
- *value* specifies the MLD version number. Accepted version values are 1 and 2.

#### Example

- This command displays total MLD statistics on the Ethernet interface Et3 and Et6.

```
switch#show mld statistics
                                MLD Total (Version1 + Version2) Statistics
                                Received
  Sent
Interface   Queries   Reports   Dones     Others     Errors
  Queries
-----
Et3         0           12        0         0         0
  12
Et6         0           11        0         0         0
  12
```

---

### 15.1.6.31 show mld summary

The `show mld summary` command displays MLD summary information.

#### Command Mode

EXEC

#### Command Syntax

```
show mld summary
```

#### Parameters

- *interface* displays MLD summary on a specified interface.

#### Example

- This command displays MLD summary on the Ethernet interface 3 and 6.

```
Arista#show mld summary
Interface          IPv6 link-local address      Group
Count    Querier State
-----
Ethernet3          fe80::1:ff:fe01:0            2
  querier
Ethernet6          fe80::1:ff:fe01:0            2
  querier

Number of MLD interfaces: 2
Number of total groups joined across all MLD interfaces: 4
```

### 15.1.6.32 show multicast fib ipv4 software

The **show multicast fib ipv4 software** command displays information about the interfaces and the software-forwarded routes included in the IPv4 multicast forwarding information base (MFIB). Use the **show multicast fib ipv4** command for hardware-forwarded routes.

Parameter options are available to filter output by group address or group and source address.

#### Command Mode

EXEC

#### Command Syntax

```
show multicast fib ipv4 software [INFO_LEVEL] [ROUTE]
```

#### Parameters

- INFO\_LEVEL specifies the type of information displayed. Options include
  - <no parameter> displays packet reception counters.
  - **detail** displays packet reception counters and packet queued/dropped counters.
- ROUTE routes displayed, filtered by multicast group and source IP addresses:
  - <no parameter> shows information for all software-forwarded routes in the MFIB.
  - *group\_addr* shows information only for the specified multicast group.
  - *group\_addr source address* shows information only for the specified group and source.

#### Example

- This command displays MFIB information for all software-forwarded routes in the MFIB.

```
switch#show multicast fib ipv4 software
239.255.255.250 172.17.41.150
    Vlan3040 (iif)
    Packets Received: 18
    Bytes Received   : 9147
    RPF Failures     : 0
239.255.255.250 172.17.41.120
    Vlan3040 (iif)
    Packets Received: 6
    Bytes Received   : 966
    RPF Failures     : 0
switch#
```

- This command displays detailed MFIB information for all software-forwarded routes in the MFIB.

```
switch#show multicast fib ipv4 software detail
239.255.255.250 172.17.41.150
Vlan3040 (iif)
Packets Received: 18
Bytes Received: 9147
RPF Failures: 0
Packets Queued/Dropped : 0 / 0
239.255.255.250 172.17.41.120
Vlan3040 (iif)
Packets Received: 6
Bytes Received: 966
RPF Failures: 0
Packets Queued/Dropped : 0 / 0
switch#
```

### 15.1.6.33 show multicast fib ipv4

The **show multicast fib ipv4** command displays information about interfaces and the hardware-forwarded routes included in the IPv4 Multicast Forwarding Information Base (MFIB).

#### Command Mode

EXEC

#### Command Syntax

```
show multicast fib ipv4 [group_address [source_address] | bidirectional |
count | counter | df | rpa | software | sparse-mode | static | summary |
vrf]
```

#### Parameters

- <no parameters> displays information for all hardware-forwarded routes in the MFIB
- *group\_address* displays the information of the specified multicast group address. Options include:
  - *source\_address* displays the information of the specified multicast group and source addresses
  - **count** displays the multicast routes count of the specified group address
  - **counters** displays the multicast route traffic count of the specified group address
- **bidirectional** displays the information of bidirectional routes
- **count** displays the count of multicast routes
- **counter** displays the count of multicast route traffic in either bytes or packets
- **df** displays the bidirectional Protocol Independent Multicast (PIM) Designated Forwarder (DF) bitmap
- **rpa** displays the bidirectional PIM Rendezvous Point Address (RPA) index
- **software** displays the software multicast FIB
- **sparse-mode** displays the sparse-mode information
- **static** displays the static multicast information
- **summary** displays the multicast FIB summary
- **vrf** *vrf\_name* displays information of the corresponding VRF

#### Guidelines

The counter is not available (N/A) if a multicast route does not have an associated counter. If the counter value for any source in a group address is N/A, then the sum of counters for the group address is N/A. However, the counter values for other sources are still displayed.

#### Examples

- This command displays the bidirectional PIM RPA index.

```
switch#show multicast fib ipv4 rpa
Prefix                               Rpa Index
225.0.0.0/8                          1
226.0.0.0/8                          1
```

- This command displays the static multicast route information.

```
switch#show multicast fib ipv4 static count
(S,G) routes: 34
(*,G) routes: 31
Fastdrop routes: 0
Prefix routes: 12
```

- This command displays the multicast routes count of the specified group and source addresses.

```
switch#show multicast fib ipv4 229.0.0.0 10.1.5.101 count
Activity poll time: 60 seconds
```

```
(S,G) routes: 1
Fastdrop routes: 0
```

- This command displays the multicast route traffic count of the specified group and source addresses.

```
switch#show multicast fib ipv4 229.0.0.0 10.1.5.101 counters
Activity poll time: 60 seconds
229.0.0.0 10.1.5.101
  Byte: 46128
  Packet: 93
  Port-Channel100 (iif)
    Activity 0:53:52 ago
```

- This command displays the multicast FIB summary.

```
switch#show multicast fib ipv4 summary
Number of multicast routes: 12
Number of fastdrop routes : 45
```

---

### 15.1.6.34 show multicast fib ipv6

The `show multicast fib ipv6` command displays the Multicast Forwarding Information Base (MFIB) table.

#### Command Mode

EXEC

#### Command Syntax

```
show multicast fib ipv6
```

#### Example

- The command output displays the Multicast Forwarding Information Base (MFIB) table as shown.

```
switch#show multicast fib ipv6
Activity poll time: 60 seconds
ff33::1:0:0:1 101:1::2
  Ethernet11/1 (iif)
  Ethernet9/1.1
  Ethernet2/1.1
  Ethernet3/1.1
  Ethernet6/1.1
  Ethernet5/1.1
  Ethernet8/1.1
  Ethernet7/1.1
  Ethernet4/1.1
Activity 0:00:35 ago
```

### 15.1.6.35 show pim ipv6 sparse-mode route

The `show pim ipv6 sparse-mode route` command displays the PIM Sparse Mode Multicast Routing table.

#### Command Mode

EXEC

#### Command Syntax

```
show pim ipv6 sparse-mode route
```

#### Example

- The command output displays the PIM Sparse Mode Multicast Routing table as shown.

```
switch#show pim ipv6 sparse-mode route
PIM Sparse Mode Multicast Routing Table
Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
       R - RPT bit is set, S - SPT bit is set, L - Source is attached
       W - Wildcard entry, X - External component interest
       I - SG Include Join alert rcvd, P - (*,G) Programmed in hardware
       H - Joining SPT due to policy, D - Joining SPT due to protocol
       Z - Entry marked for deletion, C - Learned from a DR via a register
       A - Learned via Anycast RP Router, M - Learned via MSDP
       N - May notify MSDP, K - Keepalive timer not running
       T - Switching Incoming Interface, B - Learned via Border Router
RPF route: U - From unicast routing table
           M - From multicast routing table
ff33::1:0:0:1
 101:1::2, 2:03:00, flags: S
  Incoming interface: Ethernet11/1
  RPF route: [U] 101:1::/64 [110/1] via fe80::464c:a8ff:feb7:39e9
  Outgoing interface list:
    Ethernet6/1.1
    Ethernet4/1.1
    Ethernet7/1.1
    Ethernet9/1.1
    Ethernet8/1.1
    Ethernet2/1.1
    Ethernet5/1.1
    Ethernet3/1.1
```

### 15.1.6.36 show platform fap mroute ipv6

The `show platform fap mroute ipv6` command displays the Platform Hardware Forwarding table.

#### Command Mode

EXEC

#### Command Syntax

```
show platform fap mroute ipv6
```

#### Example

- The command output displays the Platform Hardware Forwarding table as shown

```
switch#show platform fap mroute ipv6
Jericho0 Multicast Routes:
-----
  Location      GroupId      Group
  Source
  IIF           McId         OIF
  FLP/TT       FLP/TT      TT
  FLP
  FLP           FLP         FLP
-----
  4096/2048     1/1         ff33::1:0:0:23/128
  101:1::2/128
  Vlan1357 21504     Vlan1044(Et7/1) Vlan1123(Et9/1)

  Vlan1200(Et8/1) Vlan1223(Et2/1)

  Vlan1226(Et5/1) Vlan1232(Et3/1)
```

### 15.1.6.37 unresolved cache-entries max

The **unresolved cache-entries max** command configures the maximum number of unresolved (S,G) routes that the switch can cache packets. The default buffer size is 4000 (S,G) routes.

The **no unresolved cache-entries max** and **default unresolved cache-entries max** commands restore the default unresolved cache-entries buffer size of 4000 (S,G) routes by removing the **unresolved cache-entries max** command from *running-config*. See [ip multicast boundary](#) to limit the number of cached packets per S,G.

#### Command Mode

Router Multicast IPv4 Configuration

Router Multicast VRF IPv4 Configuration

#### Command Syntax

```
unresolved cache-entries max quantity_entries
```

```
no unresolved cache-entries max
```

```
default unresolved cache-entries max
```

#### Parameters

- *quantity\_entries* maximum buffer size (routes). Value ranges from 10 to 10000000. Default is 4000.

#### Example

- This command sets the maximum MFIB unresolved cache-entry buffer size to 6000 routes in the default VRF.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#unresolved cache-entries max 6000
switch(config-router-multicast-ipv4)#
```

### 15.1.6.38 unresolved packet-buffers max

The **unresolved packet-buffers max** command specifies the number of (S,G) multicast packets for an individual route that the switch can process before the (S,G) entry is entered into cache. Packets that are received in excess of this limit before the route is programmed into the cache are dropped. By default, the switch processes 3 unresolved packets for an individual route.

The **no unresolved packet-buffers max** and **default unresolved packet-buffers max** commands restore the number of unresolved packets that the switch processes to the default value of 3 packets by removing the **unresolved packet-buffers max** command from **running-config**. See [unresolved cache-entries max](#) to limit the number of unresolved routes that are cached.

#### Command Mode

Router Multicast IPv4 Configuration

Router Multicast VRF IPv4 Configuration

#### Command Syntax

```
unresolved packet-buffers max quantity_packets
```

```
no unresolved packet-buffers max
```

```
default unresolved packet-buffers max
```

#### Parameters

- *quantity\_packets* packets per unresolved route that the switch processes. Values range from 3 to 10000000. Default is 3.

#### Example

- This command programs the switch in the default VRF to process thirty multicast packets from any route regardless of its entries presence in the multicast routing cache.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#unresolved packet-buffers max 30
switch(config-router-multicast-ipv4)#
```

## 15.2 IGMP and IGMP Snooping

- [IGMP Snooping](#)
- [IGMP Host Proxy Description](#)
- [Supported Features](#)
- [IGMP Protocols](#)
- [Configuring IGMP](#)
- [Configuring IGMP Snooping](#)
- [IGMP Host Proxy](#)
- [IGMP and IGMP Snooping Commands](#)

### 15.2.1 IGMP Snooping

IGMP snooping is a layer 2 switch process that extracts lists of hosts receiving multicast group traffic by monitoring IGMP network packets. The switch uses these lists to avoid flooding hosts with extraneous multicast traffic by sending group packets only to group members. Besides preventing local hosts from receiving traffic for groups they did not join, snooping prunes multicast traffic from links that do not contain IGMP clients.

When snooping is enabled, a switch examines IGMP packets sent between hosts connected to network switches and multicast routers (mrouter). When a switch finds an IGMP report from a multicast group recipient, it adds the recipient's port to the group multicast list. When the switch receives an IGMP leave, it removes the recipient's port from the list. Groups are removed upon the group timer expiry. When the switch finds an IGMP query packet or PIM hello packet from a multicast router, it adds the router's port to the port list for all multicast groups.

### Snooping Querier

Snooping requires an IGMP querier in the network to create multicast group tables. An IGMP snooping querier performs the multicast router (mrouter) role when the network does not have a router. When the snooping querier is enabled on a VLAN, the switch periodically broadcasts IGMP queries and listens for IGMP Reports that indicate host group memberships.

Networks that contain multiple snooping queriers elect one as the querier, based on IP address. When IGMP snooping querier is enabled on a VLAN, the switch performs as a querier only when it is elected or it is the only snooping querier on the network.

### L2 Report Flooding

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can degrade performance. L2 report flooding addresses this by facilitating report message forwarding through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

### IGMP Snooping Proxy

IGMP snooping proxy is an enhancement over IGMP snooping. When snooping proxy is enabled, the switch starts sending proxy queries periodically to the downstream hosts and collects the IGMP reports and updates the local state. Later, when the switch receives an IGMP query from an upstream router, the switch immediately responds with a report based on its local state.

When IGMP snooping proxy is disabled, the IGMP queries in VLAN, and the reports from hosts are flooded. Enabling IGMP snooping proxy prevents a sudden burst in IGMP report traffic in response to every query. It also reduces the number of reports that the IGMP Querier needs to process in the VLAN. However, it introduces a latency in the propagation of the IGMP state through the VLAN.

## 15.2.2 IGMP Host Proxy Description

The figure displays a typical IGMP host-proxy implementation. The customer network connects to the sender network through the edge switch's Ethernet 1 interface, which is configured as an IGMP host proxy. PIM is enabled within the sender and customer networks but not on the connection between the networks.

**Figure 47: IP IGMP Host Proxy Implementation**

---

The IGMP proxy agent sends unsolicited IGMP joins when a (S,G) or (\*,G) entry arrives in the multicast routing table (mroute table). Subsequently, IGMP reports are sent when queries or group-specific queries arrive on the host proxy interface. When the customer network is void of active listeners, the connection eventually expires and the senders stop transmitting to the network.

IGMP host proxy requires the following:

- PIM multicast border router (MBR) must be enabled on the interface.
- IP IGMP and IP multicast must be enabled.
- The switch must be an RP or in each host's RP path.
- Fast-drop entries are required when there are no interested listeners for the group.

IGMP host proxy is configurable to filter for specific multicast groups and sources.

### 15.2.3 Supported Features

For a list of the IGMP features that each Arista switch platform supports, refer to the supported features table here: <https://www.arista.com/en/support/product-documentation/supported-features>.

### 15.2.4 IGMP Protocols

- [IGMP](#)
- [IGMP Snooping](#)

#### 15.2.4.1 IGMP

Networks use Internet Group Management Protocol (IGMP) to control the flow of layer 3 multicast traffic. Hosts request and maintain multicast group membership through IGMP messages. Multicast routers use IGMP to maintain a membership list of active multicast groups for each attached network.

- IGMP version 1 is defined in RFC 1112. Hosts can join multicast groups without a method to leave a group. Routers use a timeout-based process to determine when hosts lose interest in a group.
- IGMP version 2 is defined in RFC 2236. Version 2 adds leave messages that hosts use to terminate group membership.
- IGMP version 3 is defined in RFC 4604. Version 3 allows hosts to specify IP addresses within a group from where they receive traffic. Traffic from all other group addresses is blocked from the host.

With respect to each of its attached networks, a multicast router is either a querier or non-querier. Each physical network contains only one querier. A network with more than one multicast router designates the router with the lowest IP address as its querier.

Queriers solicit group membership information by periodically sending General Query messages. Queriers also receive unsolicited messages from hosts joining or leaving a multicast group. When a querier receives a message from a host, it updates its membership list for the group referenced in the message and the network where the message originated.

Queriers forward multicasts from remote sources only to networks as specified by its membership list. If a querier does not receive a report from a network host for a specific group, it removes the corresponding entry from the table and discontinues forwarding multicasts for that group on the network. Queriers also send group-specific queries after receiving a leave request from a host to determine if the network still contains active multicast group members. If it does not receive a membership report during the period defined by the last member query response interval, the querier removes the group-network entry from the membership list.

When a host receives a General Query, it responds with Membership Report messages for each of its multicast groups within the interval specified by the Max Response Time field in the query. IGMP suppresses multiple messages from different hosts on a network for the same group. Hosts send unsolicited Membership reports to join a multicast group and send leave messages to exit a group.

### 15.2.4.2 IGMP Snooping

IGMP snooping is a layer 2 switch process that extracts lists of hosts receiving multicast group traffic by monitoring IGMP network packets. The switch uses these lists to avoid flooding hosts with extraneous multicast traffic by sending group packets only to group members. Besides preventing local hosts from receiving traffic for groups they did not join, snooping prunes multicast traffic from links that do not contain IGMP clients.

When snooping is enabled, a switch examines IGMP packets sent between hosts connected to network switches and multicast routers (mrouters). When a switch finds an IGMP report from a multicast group recipient, it adds the recipient's port to the group multicast list. When the switch receives an IGMP leave, it removes the recipient's port from the list. Groups are removed upon the group timer expiry. When the switch finds an IGMP query packet or PIM hello packet from a multicast router, it adds the router's port to the port list for all multicast groups.

#### Snooping Querier

Snooping requires an IGMP querier in the network to create multicast group tables. An IGMP snooping querier performs the multicast router (mrouter) role when the network does not have a router. When the snooping querier is enabled on a VLAN, the switch periodically broadcasts IGMP queries and listens for IGMP Reports that indicate host group memberships.

Networks that contain multiple snooping queriers elect one as the querier, based on IP address. When IGMP snooping querier is enabled on a VLAN, the switch performs as a querier only when it is elected or it is the only snooping querier on the network.

#### L2 Report Flooding

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can degrade performance. L2 report flooding addresses this by facilitating report message forwarding through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

#### IGMP Snooping Proxy

IGMP snooping proxy is an enhancement over IGMP snooping. When snooping proxy is enabled, the switch starts sending proxy queries periodically to the downstream hosts and collects the IGMP reports and updates the local state. Later, when the switch receives an IGMP query from an upstream router, the switch immediately responds with a report based on its local state.

When IGMP snooping proxy is disabled, the IGMP queries in VLAN, and the reports from hosts are flooded. Enabling IGMP snooping proxy prevents a sudden burst in IGMP report traffic in response to every query. It also reduces the number of reports that the IGMP Querier needs to process in the VLAN. However, it introduces a latency in the propagation of the IGMP state through the VLAN.

## 15.2.5 Configuring IGMP

This section describes the following configuration tasks:

- [Enabling IGMP](#)
- [Configuring IGMP Settings](#)

### 15.2.5.1 Enabling IGMP

Enabling PIM also enables IGMP on that interface. When the switch fills the multicast routing table, it only adds interfaces when the interface receives join messages from downstream devices or when the interface is directly connected to a member of the IGMP group.

---

By default, PIM and IGMP are disabled on an interface. Use the [pim ipv4 sparse-mode](#) or [pim ipv4 bidirectional](#) command to enable PIM and IGMP on the configuration mode interface.

### Example

- This command enables PIM and IGMP on VLAN interface 8.

```
switch(config)#interface vlan 8
switch(config-if-Vl8)#pim ipv4 sparse-mode
switch(config-if-Vl8)#
```

In the unlikely event that the IGMP agent needs to run on an interface without PIM being enabled, use the [ip igmp](#) command.

### Example

- This command enables IGMP on VLAN interface 8 without enabling PIM.

```
switch(config)#interface vlan 8
switch(config-if-Vl8)#ip igmp
switch(config-if-Vl8)#
```

## 15.2.5.2 Configuring IGMP Settings

An interface that runs IGMP uses default protocol settings unless otherwise configured. The switch provides commands that alter startup query, last member query, and normal query settings.

### IGMP Version

The switch supports IGMP versions 1 through 3. The [ip igmp version](#) command configures the IGMP version on the configuration mode interface. Version 3 is the default IGMP version.

### Example

- This command configures IGMP version 3 on VLAN interface 4

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp version 3
switch(config-if-Vl4)#
```

### Startup Query

Membership queries are sent at an increased frequency immediately after an interface starts up to quickly establish the group state. Query count and query interval commands adjust the period between membership queries for a specified number of messages.

The [ip igmp startup-query-interval](#) command specifies the interval between membership queries that an interface sends immediately after it starts up. The [ip igmp startup-query-count](#) command specifies the number of queries that the switches sends from the interface at the startup interval rate.

### Example

- These commands define a startup interval of 15 seconds for the first 10 membership queries sent from VLAN interface 12.

```
switch(config)#interface vlan 12
switch(config-if-Vl12)#ip igmp startup-query-interval 150
switch(config-if-Vl12)#ip igmp startup-query-count 10
```

```
switch(config-if-Vl12) #
```

### Membership Queries

The router with the lowest IP address on a subnet sends membership queries as the IGMP querier. When a membership query is received from a source with a lower IP address, the router resets its query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The `ip igmp query-interval` command configures the frequency at which the active interface, as an IGMP querier, sends membership query messages.

The `igmp query-max-response-time` command configures the time that a host has to respond to a membership query.

### Example

- These commands define a membership query interval of 75 seconds and a query response timer reset value of 45 seconds for queries sent from VLAN interface 15.

```
switch(config)#interface vlan 15
switch(config-if-Vl15)#ip igmp query-interval 75
switch(config-if-Vl15)#igmp query-max-response-time 450
switch(config-if-Vl15) #
```

### Last Member Query

When the querier receives an IGMP leave message, it verifies the group has no remaining hosts by sending a set of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The `ip igmp last-member-query-count` (LMQC) command specifies the number of query messages the router sends in response to a group-specific or group-source-specific leave message.

The `ip igmp last-member-query-interval` command configures the transmission interval for sending group-specific or group-source-specific query messages to the active interface.

### Example

- These commands program the switch to send 3 query messages, one every 25 seconds, when VLAN interface 15 receives an IGMP leave message.

```
switch(config)#interface vlan 15
switch(config-if-Vl15)#ip igmp last-member-query-interval 250
switch(config-if-Vl15)#ip igmp last-member-query-count 3
switch(config-if-Vl15) #
```

### Static Groups

The `ip igmp static-group` command configures the configuration mode interface as a static member of the multicast group at the specified address. The router forwards multicast group packets through the interface without otherwise appearing or acting as a group member. No interface is a static member of a multicast group by default.

**Note:** To become a static member of a multicast group, the switch must be the PIM designated router (DR) for the network. If it is not, you can use the `pim ipv4 dr-priority` command to make it the DR by configuring its PIM DR value to be the highest on the network.

## Example

- These commands configure VLAN interface 15 as the PIM designated router, then configure it as a static member of the multicast group at address 231.1.1.15 for multicast data packets that originate at 10.1.1.1.

```
switch(config)#interface vlan 15
switch(config-if-Vl15)#pim ipv4 dr-priority 5000
switch(config-if-Vl15)#ip igmp static-group 231.1.1.45 10.1.1.1
switch(config-if-Vl15)#
```

## 15.2.6 Configuring IGMP Snooping

This section describes the following configuration tasks:

- [Enabling Snooping](#)
- [Configuring Snooping Parameters](#)
- [Snooping Querier](#)
- [IGMP Snooping L2 Report Flooding](#)
- [IGMP Snooping Filters](#)
- [Configuring IGMP Snooping Proxy](#)

### 15.2.6.1 Enabling Snooping

The switch provides two control settings for snooping IGMP packets:

- Global settings control the availability of IGMP snooping on the switch. Snooping is globally enabled by default.
- Per-VLAN settings control IGMP on individual VLANs. If snooping is enabled on the VLAN, it follows the global snooping state.

The [ip igmp snooping](#) command controls the global snooping setting. The [ip igmp snooping vlan](#) command configures snooping on individual VLANs.

### Examples

- This command globally enables snooping on the switch.

```
switch(config)#ip igmp snooping
switch(config)#
```

- This command disables snooping on VLANs 2 through 4.

```
switch(config)#no ip igmp snooping vlan 2-4
switch(config)#
```

### 15.2.6.2 Configuring Snooping Parameters

#### Specifying a Static Multicast Router Connection

The [ip igmp snooping vlan multicast-router](#) command statically configures a port that connects to a multicast router to join all multicast groups. The port to the router must be in the specified VLAN range.

Snooping may not always be able to locate the IGMP querier. This command is for IGMP queriers that are known to connect through the network to a port on the switch.

**Example**

- This command configures the static connection to a multicast router through Ethernet port 3.

```
switch(config)#ip igmp snooping vlan 2 mrouter interface ethernet 3
switch(config)#
```

**Adding a Port to a Multicast Group**

The `ip igmp snooping vlan member` command adds an a port to a multicast group. The IP address must be an unreserved IPv4 multicast address. The interface to the port must be in the specified VLAN range.

**Example**

- This command configures the static connection to a multicast group at 237.2.1.4 through Ethernet port 3.

```
switch(config)#ip igmp snooping vlan 7 static 237.2.1.4 interface
ethernet 3
switch(config)#
```

**Robustness Variable**

The robustness variable specifies the number of unacknowledged snooping queries that a switch sends before removing the recipient from the group list.

The `ip igmp snooping robustness-variable` command configures the robustness variable for all snooping packets sent from the switch. The default value is 2.

**Example**

- This command sets the robustness-variable value to 3.

```
switch(config)#ip igmp snooping robustness-variable 3
switch(config)#
```

**Configuring Interface Startup Initial Query Times**

The `ip igmp snooping interface-restart-query` command configures the interface startup initial query times in milliseconds. If nothing is configured, a default value of 2000 milliseconds is used. Issuing the command replaces any values already configured. Multiple values may be input in a single command; this makes the mechanism more resilient in the case of dropped packets.

**Examples**

- This command configures interfaces to send IGMP queries at 1000, 2000, and 4000 milliseconds (i.e., 1 second, 2 seconds, and 4 seconds) after an interface restart or spanning tree change.

```
switch(config)#ip igmp snooping interface-restart-query 1000 2000 4000
switch(config)#
```

**Example**

- This command configures interfaces to send a single IGMP query of 5000 milliseconds (5 seconds) after an interface restart or spanning tree change.

```
switch(config)#ip igmp snooping interface-restart-query 5000
```

```
switch(config)#
```

### 15.2.6.3 Snooping Querier

The IGMP snooping querier supports snooping by sending Layer 2 membership queries to hosts attached to the switch. Note that if IGMP snooping is enabled, QoS will not apply to IGMP packets.

#### 15.2.6.3.1 Enabling the Snooping Querier

Enabling the snooping querier on an interface requires the explicit configuration of a global querier address or a local querier address for the interface. See [Configuring Snooping Querier Parameters](#).

The switch provides two control settings for controlling the snooping querier:

- The global setting controls the querier on VLANs for which there is no snooping querier command.
- VLAN querier settings take precedence over the global querier setting.

The [ip igmp snooping querier](#) command controls the global querier setting. When enabled globally, the querier is controlled on individual VLANs through the [ip igmp snooping vlan querier](#) command.

The [ip igmp snooping vlan querier](#) command controls the querier for the specified VLANs. VLANs follow the global querier setting unless overridden by one of these commands:

- **ip igmp snooping vlan querier** enables the querier on specified VLANs.
- **no ip igmp snooping vlan querier** disables the querier on specified VLANs.

#### Example

- These commands globally enables the snooping querier on the switch, explicitly disables snooping on VLANs 1-4, and explicitly enables snooping on VLANs 5-8.

```
switch(config)#ip igmp snooping querier
switch(config)#no ip igmp snooping vlan 1-4 querier
switch(config)#ip igmp snooping vlan 5-8 querier
switch(config)#
```

- This command removes the querier setting for VLANs 3-6:

```
switch(config)#default ip igmp snooping vlan 3-6 querier
switch(config)#
```

#### Globally Set the Snooping Querier Version

The [ip igmp snooping querier version](#) command configures the IGMP snooping querier version. Version 2 is the default IGMP snooping version.

#### Example

- This command globally configures IGMP snooping querier version 2.

```
switch(config)#ip igmp snooping querier version 2
switch(config)#
```

The [ip igmp snooping vlan querier version](#) command configures IGMP globally on the VLAN. Version 2 is the default IGMP snooping version.

**Example**

- This command configures IGMP snooping vlan querier version VLAN 5.

```
switch(config)#ip igmp snooping vlan 5 querier version 2
switch(config)#
```

**15.2.6.3.2 Configuring Snooping Querier Parameters****Querier Address**

The switch provides two IP addresses for setting the querier source:

- The global address is used by VLANs for which there is no querier address command.
- VLAN querier address settings take precedence over the global querier address.

The snooping querier address specifies the source IP address for IGMP snooping query packets that the switch transmits. The source address is also used to elect a snooping querier when the subnet contains multiple snooping queriers.

The default global querier address is not defined. When the configuration includes a snooping querier, a querier address must be defined globally or for each interface that enables a querier.

The [ip igmp snooping querier address](#) command sets the global querier source IP address for the switch. VLANs use the global address unless overwritten with the [ip igmp snooping vlan querier address](#) command. The default global address is not defined.

The [ip igmp snooping vlan querier address](#) command sets the source IP address for query packets transmitted from the specified VLAN. This command overrides the [ip igmp snooping querier address](#) for the specified VLAN.

**Examples**

- This command sets the source IP address for query packets that the switch transmits to 10.1.1.41

```
switch(config)#ip igmp snooping querier address 10.1.1.41
switch(config)#
```

- This command sets the source IP address for query packets that VLAN 2 transmits to 10.14.1.1.

```
switch(config)#ip igmp snooping vlan 2 querier address 10.14.1.1
switch(config)#
```

**Membership Query Interval**

The query interval is the period (seconds), between IGMP Membership Query message transmissions. The interval ranges from 5 to 3600 seconds.

The [ip igmp snooping querier query-interval](#) command specifies the global query interval for packets the switch sends as a snooper querier. The default global setting is 125 seconds.

The [ip igmp snooping vlan querier query-interval](#) command specifies the query interval for packets sent from the snooping querier to the specified VLAN, overriding the global setting. VLANs that do not specify a query interval use the global setting.

**Examples**

- This command sets a query interval of 150 seconds for queries transmitted from VLANs for which a query interval is not configured.

```
switch(config)#ip igmp snooping querier query-interval 150
```

```
switch(config)#
```

- This command sets the query interval of 240 seconds for queries transmitted from VLAN 2.

```
switch(config)#ip igmp snooping vlan 2 querier query-interval 240
switch(config)#
```

### Membership Query Response Interval

The Max Response Time field, in Membership Query messages, specifies the longest time a host can wait before responding with a Membership Report message. In all other messages, the sender sets the field to zero and the receiver ignores it. The switch provides two values for setting this field:

- The global value is used by VLANs for which there is no Max Response Time command.
- VLAN values take precedence over the global value for the specified VLAN.

The `ip igmp snooping querier max-response-time` command specifies the global Max Response Time value used in snooping query packets transmitted from the switch. Values range from 1 to 25 seconds with a default of 10 seconds. VLANs use the global setting unless overwritten with the `ip igmp snooping vlan querier max-response-time` command.

The `ip igmp snooping vlan querier max-response-time` command configures the Max Response Time field contents for packets transmitted from the specified VLAN, overriding the global setting.

### Examples

- This command sets the maximum response time of 15 seconds for queries transmitted from VLANs for which a maximum response time is not configured.

```
switch(config)#ip igmp snooping querier max-response-time 15
switch(config)#
```

- This command sets a maximum response time of 5 seconds for queries that VLAN 2 transmits.

```
switch(config)#ip igmp snooping vlan 2 querier max-response-time 5
switch(config)#
```

### Last Member Query

When the querier receives an IGMP leave message, it verifies the group has no remaining hosts by sending a set of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The switch provides two values for setting this field:

- The global value is used by VLANs for which there is no last-member-query-interval defined.
- VLAN values take precedence over the global value for the specified VLAN.

The `ip igmp snooping querier last-member-query-interval` command specifies the global last-member-query-interval used in snooping query packets transmitted from the switch. This value is used for VLANs that do not have a value specified. Values range from 1 to 25 seconds with a global default of one second.

The `ip igmp snooping vlan querier last-member-query-interval` command configures the last-member-query-interval field contents for packets transmitted from the specified VLAN, overriding the global setting.

**Example**

- This command sets the global snooping querier last-member-query-interval to five seconds and the VLAN 10 last-member-query-interval to 12 seconds.

```
switch(config)#ip igmp snooping querier last-member-query-interval 5
switch(config)#ip igmp snooping vlan 10 querier last-member-query-
interval 12
switch(config)#
```

**Interface Restart Query Spoofing**

When the port status (link status or spanning tree status) changes, an IGMP general query is spoofed based on the information of the last known IGMP querier. This facilitates faster network convergence time.

By default, interfaces wait 2000 milliseconds before sending the spoofed IGMP query. To configure the delay before the spoofed query is sent, use the [ip igmp snooping interface-restart-query](#) command. This setting is applied to all ports.

**Example**

- This command configures the switch to send general IGMP queries at 100 milliseconds, 200 milliseconds, and 300 milliseconds after interface restart or spanning tree status change.

```
switch(config)# ip igmp snooping interface-restart-query 100 200 300
```

**15.2.6.4 IGMP Snooping L2 Report Flooding**

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Report flooding is disabled by default and must be enabled globally before it can be enabled on individual interfaces.

The list of ports that can forward membership report messages must be explicitly configured. Commands are available to define lists of ports that are valid for all VLANs and port lists that are valid for specified VLAN ranges. Ports can forward membership reports only if they are configured to handle VLAN traffic, regardless of any report flooding configuration settings.

**Enabling L2 Report Flooding**

These commands enable L2 report flooding:

- [ip igmp snooping report-flooding](#) enables report flooding globally.
- [ip igmp snooping vlan report-flooding](#) enables report flooding on a specified VLAN range.

**Example**

- These commands enable L2 report flooding globally, and on VLANs 201-205.

```
switch(config)#ip igmp snooping report-flooding
switch(config)#ip igmp snooping vlan 201-205 report-flooding
switch(config)#
```

**Configuring Forwarding Ports**

These commands specify the ports that forward membership report messages:

- [ip igmp snooping report-flooding switch-port](#) configures ports globally.
- [ip igmp snooping vlan report-flooding switch-port](#) configures ports for a specified VLAN range.

## Example

- These commands enable Ethernet ports 5-9 to forward reports on all VLANs and ports 12-15 on VLANs 201-205.

```
switch(config)#ip igmp snooping report-flooding switch-port ethernet
5-9
switch(config)#ip igmp snooping vlan 201-205 report-flooding switch-
port ethernet
12-15
switch(config)#
```

### 15.2.6.5 IGMP Snooping Filters

IGMP snooping filters assigns IGMP profiles only to Layer 2 interfaces, and for Layer 3 interfaces use multicast boundary filters to control the multicast groups that the interfaces can join. An IGMP profile specifies a filter type and a list of address ranges. The address ranges comprise the multicast groups covered by the profile. The filter type determines an interface's accessibility to the multicast groups:

- Permit filters define the multicast groups the interface can join.
- Deny filters define the multicast groups the interface cannot join.

Profiles are created in IGMP-profile configuration mode, then applied to an interface in interface configuration mode.

The `ip igmp profile` command places the switch in IGMP profile configuration mode. The `permit / deny` and `range` commands specify the profile's filter type and address range. A profile may contain multiple range statements to define a discontinuous address range.

## Example

- These commands create an IGMP profile named `list_1` by entering IGMP-profile configuration mode, configure the profile to permit multicast groups 231.22.24.0 through 231.22.24.127, and return the switch to global configuration mode.

```
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
switch(config-igmp-profile-list_1)#range 231.22.24.0 231.22.24.127
switch(config-igmp-profile-list_1)#exit
switch(config)#
```

The `ip igmp snooping filter` command applies an IGMP profile to the configuration mode interface.

## Example

- These commands apply the `list_1` snooping profile to Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#ip igmp snooping filter list_1
switch(config-if-Et7)#
```

#### 15.2.6.5.1 Verifying IGMP Snooping

Show commands are available to display various configurations and IGMP snooping status. IGMP snooping that are viewable include:

- `show ip igmp snooping`
- `show ip igmp snooping counters`
- `show igmp snooping querier`

- `show igmp snooping querier counters`
- `show igmp snooping querier membership`

### IGMP Snooping Status

The `show ip igmp snooping` command displays the switch's IGMP snooping configuration.

#### Example

- This command displays the switch's IGMP snooping configuration.

```
switch>show ip igmp snooping
  Global IGMP Snooping configuration:
-----
IGMP snooping                : Enabled
Robustness variable          : 2

Vlan 1 :
-----
IGMP snooping                : Enabled
Multicast router learning mode : pim-dvmrp

Vlan 20 :
-----
IGMP snooping                : Enabled
Multicast router learning mode : pim-dvmrp

Vlan 2028 :

switch>
```

### IGMP Snooping Counters

The `show ip igmp snooping counters` command displays the number of IGMP messages sent and received through each switch port. The display table sorts the messages by type.

#### Example

- This command displays the number of messages received on each port.

```
switch>show ip igmp snooping counters
```

| Port | Input   |         |        |        |         | Errors | Output  |        |  |
|------|---------|---------|--------|--------|---------|--------|---------|--------|--|
|      | Queries | Reports | Leaves | Others | Queries |        | Reports | Leaves |  |
| Cpu  | 15249   | 106599  | 4      | 269502 | 0       | 30242  | 102812  | 972    |  |
| Et1  | 0       | 0       | 0      | 0      | 0       | 0      | 0       | 0      |  |
| Et2  | 0       | 6       | 1      | 26     | 0       | 5415   | 0       | 0      |  |
| Et3  | 0       | 10905   | 222    | 1037   | 0       | 15246  | 0       | 0      |  |
| Et4  | 0       | 44475   | 21     | 288    | 0       | 15247  | 0       | 0      |  |
| Et5  | 0       | 355     | 0      | 39     | 0       | 15211  | 0       | 0      |  |
| Et6  | 0       | 475     | 13     | 0      | 0       | 15247  | 0       | 0      |  |

|        |       |        |      |        |   |       |        |     |
|--------|-------|--------|------|--------|---|-------|--------|-----|
| Et7    | 0     | 0      | 0    | 151    | 0 | 15247 | 0      | 0   |
| 2336   |       |        |      |        |   |       |        |     |
| Et8    | 0     | 578    | 6    | 75     | 0 | 2859  | 0      | 0   |
| 931    |       |        |      |        |   |       |        |     |
| Et9    | 0     | 0      | 0    | 27     | 0 | 15247 | 0      | 0   |
| 2460   |       |        |      |        |   |       |        |     |
| Et10   | 0     | 12523  | 345  | 54     | 0 | 15247 | 0      | 0   |
| 2433   |       |        |      |        |   |       |        |     |
| Et11   | 0     | 0      | 0    | 0      | 0 | 0     | 0      | 0   |
| 0      |       |        |      |        |   |       |        |     |
| Et12   | 0     | 4509   | 41   | 22     | 0 | 15247 | 0      | 0   |
| 2465   |       |        |      |        |   |       |        |     |
| Et13   | 0     | 392    | 29   | 119    | 0 | 15247 | 0      | 0   |
| 2368   |       |        |      |        |   |       |        |     |
| Et14   | 0     | 88     | 3    | 6      | 0 | 15247 | 0      | 0   |
| 2481   |       |        |      |        |   |       |        |     |
| Et15   | 0     | 16779  | 556  | 72     | 0 | 15117 | 0      | 0   |
| 66     |       |        |      |        |   |       |        |     |
| Et16   | 0     | 2484   | 13   | 66     | 0 | 15247 | 0      | 0   |
| 2421   |       |        |      |        |   |       |        |     |
| Et17   | 0     | 0      | 0    | 0      | 0 | 0     | 0      | 0   |
| 0      |       |        |      |        |   |       |        |     |
| Et18   | 0     | 20     | 6    | 160    | 0 | 3688  | 0      | 0   |
| 803    |       |        |      |        |   |       |        |     |
| Et19   | 0     | 4110   | 17   | 0      | 0 | 15247 | 0      | 0   |
| 2487   |       |        |      |        |   |       |        |     |
| Et20   | 0     | 0      | 0    | 0      | 0 | 0     | 0      | 0   |
| 0      |       |        |      |        |   |       |        |     |
| Et21   | 0     | 0      | 0    | 0      | 0 | 0     | 0      | 0   |
| 0      |       |        |      |        |   |       |        |     |
| Et22   | 0     | 0      | 0    | 52     | 0 | 15247 | 0      | 0   |
| 2435   |       |        |      |        |   |       |        |     |
| Et23   | 0     | 5439   | 181  | 138    | 0 | 15247 | 0      | 0   |
| 2349   |       |        |      |        |   |       |        |     |
| Et24   | 0     | 2251   | 21   | 4      | 0 | 15247 | 0      | 0   |
| 2483   |       |        |      |        |   |       |        |     |
| Po1    | 45360 | 540670 | 8853 | 464900 | 0 | 15249 | 224751 | 618 |

## IGMP Snooping Querier

The `show igmp snooping querier` command displays snooping querier configuration and status information. Command provides options to only include specific VLANs.

### Example

- This command displays the querier IP address, version, and port servicing each VLAN.

```
switch>show igmp snooping querier
Vlan  IP Address      Version  Port
-----
1     172.17.0.37     v2      Po1
20    172.17.20.1     v2      Po1
26    172.17.26.1     v2      Cpu
2028  172.17.255.29   v2      Po1
switch>
```

## IGMP Snooping Querier Counters

The `show igmp snooping querier counters` command displays the counters from the querier, as learned through Internet Group Management Protocol (IGMP).

### Example

- This command displays the counters from the querier.

```
switch>show igmp snooping querier counters
-----
Vlan: 1      IP Addr: 100.0.0.1      Op State: Querier      Version: v3

v1 General Queries Sent      :0
v1 Queries Received          :0
v1 Reports Received          :0
v2 General Queries Sent      :1
v2 Queries Received          :0
v2 Reports Received          :25
v2 Leaves Received           :0
v3 General Queries Sent      :655
v3 GSQ Queries Sent          :0

## IGMP Snooping Querier Membership

The `show igmp snooping querier membership` command displays the membership from the querier, as learned through Internet Group Management Protocol (IGMP).

### Example

- This command displays the membership from the querier fro VLAN 1.

```
switch>show igmp snooping querier membership
-----
Vlan: 1      Elected: 100.0.0.1      QQI: 125  QRV: 2  QRI: 10  GMI:
260

Groups      Mode  Ver  Num of Sources
-----
10.0.0.2    EX    v3   0 [ ]
10.0.0.3    IN    v3   2 [ 3.3.3.3, 3.3.3.4 ]
10.0.0.4    EX    v3   0 [ ]
10.0.0.13   EX    v3   0 [ ]
10.0.0.22   EX    v3   0 [ ]
10.0.0.1    IN    v3   3 [ 5.6.7.9, 5.6.7.8, ... ]
switch>
```

### 15.2.6.6 Configuring IGMP Snooping Proxy

Use the `ip igmp snooping proxy` command to enable IGMP snooping proxy globally. Enabling IGMP snooping proxy enables it for all VLANs where IGMP snooping is enabled. IGMP snooping proxy is globally disabled by default.

Use the `ip igmp snooping proxy` command to enable IGMP snooping proxy globally. Use the `no ip igmp snooping vlan proxy` command to disable IGMP snooping proxy on specified VLANs.

#### Examples

This command globally enables IGMP snooping proxy on the switch.

```
switch(config)#ip igmp snooping proxy
switch(config)#
```

This command disables IGMP snooping proxy on VLANs 2 through 4.

```
switch(config)#no ip igmp snooping proxy vlan 2-4 proxy
switch(config)#
```

#### 15.2.6.6.1 Configuring Snooping Proxy Querier

To configure the IGMP snooping proxy querier use the existing `ip igmp snooping querier` commands. For more information on these commands, refer to [IGMP and IGMP Snooping Commands](#).

**Note:** The proxy querier by default uses 0.0.0.0 IP address.

#### Example:

In this example, IGMP snooping proxy is enabled using the `ip igmp snooping proxy` command and the snooping proxy is set to reports for all the VLANs except VLANs 100 through 110 using the `ip igmp snooping vlan` command. The proxy querier operates in version 3 and sends queries at a 15-second interval and hosts can take up to 5 seconds to respond.

```
switch(config)#ip igmp snooping proxy
switch(config)#no ip igmp snooping vlan 100-110 proxy
switch(config)#ip igmp snooping querier query-interval 15
switch(config)#ip igmp snooping querier max-response-time 5
switch(config)#ip igmp snooping querier version 3
switch(config)#ip igmp snooping querier
switch(config)#
```

## 15.2.7 IGMP Host Proxy

Interfaces on the switch can be configured to serve as IGMP host proxies. An IGMP host proxy exchanges IGMP reports (joins/leaves) between networks whose connection does not support PIM along network boundaries.

- [IGMP Host Proxy Description](#)
- [IGMP Host Proxy Configuration](#)

### 15.2.7.1 IGMP Host Proxy Description

The figure displays a typical IGMP host-proxy implementation. The customer network connects to the sender network through the edge switch's Ethernet 1 interface, which is configured as an IGMP host

proxy. PIM is enabled within the sender and customer networks but not on the connection between the networks.

**Figure 48: IP IGMP Host Proxy Implementation**

The IGMP proxy agent sends unsolicited IGMP joins when a (S,G) or (\*,G) entry arrives in the multicast routing table (mroute table). Subsequently, IGMP reports are sent when queries or group-specific queries arrive on the host proxy interface. When the customer network is void of active listeners, the connection eventually expires and the senders stop transmitting to the network.

IGMP host proxy requires the following:

- PIM multicast border router (MBR) must be enabled on the interface.
- IP IGMP and IP multicast must be enabled.
- The switch must be an RP or in each host's RP path.
- Fast-drop entries are required when there are no interested listeners for the group.

IGMP host proxy is configurable to filter for specific multicast groups and sources.

### 15.2.7.2 IGMP Host Proxy Configuration

#### Enabling IGMP Host Proxy

Enable PIM MBR on the interface using the `pim ipv4 border-router` command. The IGMP host proxy service is then configured on the interface using the `ip igmp host-proxy` command. When the host proxy is configured, it sends reports for (S,G) entries in the multicast routing (mroute) table if these are the only routes there; if there are any (\*,G) entries, it sends reports only for these. To send reports for a specific group even when there is no (\*, G) entry in the mroute table for that group, include the group address in the `ip igmp host-proxy` command. Multiple `ip igmp host-proxy` statements are required to specify multiple groups. The interval between IGMP reports is configured by `ip igmp host-proxy report-interval`.

#### Host Proxy IGMP Version and Source Filtering

IGMP host proxies can be configured with IGMP versions 1, 2, or 3, and use version 3 by default. When the host-proxy IGMP version is set to 3, the proxy can explicitly include or exclude source addresses. Otherwise, include/exclude configuration for source addresses is ignored. The IGMP version of unsolicited reports is specified with the `ip igmp host-proxy version` command. Reports that are triggered by IGMP queries, however, are sent in the same IGMP version as the received query. (An interface may also have a different IGMP version configured on it for other purposes using the `ip igmp version` command.)

#### Using ACLs

IGMP host proxy can also be enabled for the addresses defined by an ACL; if one or more groups are configured in addition to ACLs, the groups are processed first. Implicit deny in the ACL is ignored, but if

---

the ACL includes an explicit deny rule, then the interface sends joins only to groups configured directly on the interface or included in a permit ACL. Deny rules take precedence over permit rules. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

### Disabling Host Proxy or Removing an Individual Group or Source

The `no igmp host-proxy` command can be entered with group or source parameters to remove the specified group or source from the list. Entering the `no igmp host-proxy` command without specifying group or source disables the forwarding of all IGMP reports on the interface.

### Examples

- These commands enable IGMP host proxy on Ethernet interface 17 for all multicast group addresses.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy
switch(config-if-Et17)#
```

- These commands enable IGMP host proxy on Ethernet interface 18 for the multicast group at 231.10.10.1. The list of source addresses is not restricted.

```
switch(config)#interface ethernet 18
switch(config-if-Et18)#pim ipv4 border-router
switch(config-if-Et18)#ip igmp host-proxy 231.10.10.1
switch(config-if-Et18)#
```

- These commands enable IGMP host proxy on Ethernet interface 19 for the multicast group at 231.10.10.2. The list of source addresses only excludes 10.4.4.1 and 10.4.5.2.

```
switch(config)#interface ethernet 19
switch(config-if-Et19)#pim ipv4 border-router
switch(config-if-Et19)#ip igmp host-proxy 231.10.10.2 exclude 10.4.4.1
switch(config-if-Et19)#ip igmp host-proxy 231.10.10.2 exclude 10.4.5.2
switch(config-if-Et19)#
```

- These commands enable IGMP host proxy on Ethernet interface 16 for the multicast group at 231.10.10.3. The list of source address for this group only includes 10.5.5.1 and 10.5.5.2

```
switch(config)#interface ethernet 16
switch(config-if-Et16)#pim ipv4 border-router
switch(config-if-Et16)#ip igmp host-proxy 231.10.10.3 include 10.5.5.1
switch(config-if-Et16)#ip igmp host-proxy 231.10.10.3 include 10.5.5.2
switch(config-if-Et16)#
```

- These commands configure an IGMP host proxy interval of five seconds on port channel 100.

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#ip igmp host-proxy report-interval 5
switch(config-if-Po100)#
```

- These commands enable IGMP host proxy on Ethernet interface 17 for the group address(es) specified in ACL "acl1."

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy access-list acl1
switch(config-if-Et17)#
```

## 15.2.8 IGMP and IGMP Snooping Commands

### IGMP Configuration Commands (Interface Configuration Mode)

- `igmp query-max-response-time`
- `ip igmp last-member-query-count`
- `ip igmp last-member-query-interval`
- `ip igmp query-interval`
- `ip igmp router-alert`
- `ip igmp startup-query-count`
- `ip igmp startup-query-interval`
- `ip igmp static-group`
- `ip igmp static-group acl`
- `ip igmp static-group range`
- `ip igmp version`

### IGMP Clear Commands

- `clear ip igmp group`
- `clear ip igmp statistics`

### IGMP Display Commands

- `show ip igmp groups`
- `show ip igmp groups count`
- `show ip igmp interface`
- `show ip igmp static-groups`
- `show ip igmp static-groups acl`
- `show ip igmp static-groups group`
- `show ip igmp statistics`

### IGMP Snooping Configuration Commands (Global Configuration Mode)

- `ip igmp`
- `ip igmp profile`
- `ip igmp snooping`
- `ip igmp snooping proxy`
- `ip igmp snooping querier`
- `ip igmp snooping querier address`
- `ip igmp snooping querier last-member-query-count`
- `ip igmp snooping querier last-member-query-interval`
- `ip igmp snooping querier max-response-time`
- `ip igmp snooping querier query-interval`
- `ip igmp snooping querier startup-query-count`
- `ip igmp snooping querier startup-query-interval`
- `ip igmp snooping querier version`
- `ip igmp snooping report-flooding`
- `ip igmp snooping report-flooding switch-port`
- `ip igmp snooping restart query-interval`
- `ip igmp snooping robustness-variable`
- `ip igmp snooping vlan`

- 
- ip igmp snooping vlan fast-leave
  - ip igmp snooping vlan max-groups
  - ip igmp snooping vlan member
  - ip igmp snooping vlan multicast-router
  - ip igmp snooping vlan proxy
  - ip igmp snooping vlan querier
  - ip igmp snooping vlan querier address
  - ip igmp snooping vlan querier last-member-query-count
  - ip igmp snooping vlan querier last-member-query-interval
  - ip igmp snooping vlan querier max-response-time
  - ip igmp snooping vlan querier query-interval
  - ip igmp snooping vlan querier startup-query-count
  - ip igmp snooping vlan querier startup-query-interval
  - ip igmp snooping vlan querier version
  - ip igmp snooping vlan report-flooding
  - ip igmp snooping vlan report-flooding switch-port

#### **IGMP Configuration Commands (Interface Configuration Mode)**

- ip igmp snooping filter

#### **IGMP Snooping Clear Commands**

- clear ip igmp snooping counters

#### **IGMP Snooping Display Commands**

- show igmp snooping querier
- show igmp snooping querier counters
- show igmp snooping querier membership
- show ip igmp profile
- show ip igmp snooping
- show ip igmp snooping counters
- show ip igmp snooping counters ethdev-pams
- show ip igmp snooping groups
- show ip igmp snooping groups count
- show ip igmp snooping mrouter
- show ip igmp snooping report-flooding

#### **IGMP Profile Configuration Mode Commands**

- permit / deny
- range

#### **IGMP Host Proxy Commands**

- ip igmp host-proxy
- ip igmp host-proxy report-interval
- ip igmp host-proxy version
- show ip igmp host-proxy config-sanity
- show ip igmp host-proxy interface

### 15.2.8.1 clear ip igmp group

The `clear ip igmp group` command deletes IGMP cache entries as follows:

- `clear ip igmp group` all entries from the IGMP cache.
- `clear ip igmp group gp_addr` all entries for a specified multicast group.
- `clear ip igmp group interface int_id` all entries that include a specified interface.
- `clear ip igmp group gp_addr interface int_id` all entries for a specified interface in a specified group.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ip igmp group [ gp_addr ] [ interface INT_ID ]
```

#### Parameters

- `gp_addr` multicast group IP address (dotted decimal notation).
- `INT_ID` interface name. Options include:
  - **ethernet** `e_num` Ethernet interface specified by `e_num`.
  - **loopback** `l_num` Loopback interface specified by `l_num`.
  - **management** `m_num` Management interface specified by `m_num`.
  - **port-channel** `p_num` Port-channel interface specified by `p_num`.
  - **vlan** `v_num` VLAN interface specified by `v_num`.
  - **vxlan** `vx_num` VXLAN interface specified by `vx_num`.

#### Examples

- This command deletes all IGMP cache entries for the multicast group 231.23.23.14.

```
switch#clear ip igmp group 231.23.23.14
switch#
```

- This command deletes IGMP cache entries for Ethernet interface 16 in multicast group 226.45.10.45.

```
switch#clear ip igmp group 226.45.10.45 interface ethernet 16
switch#
```

---

### 15.2.8.2 clear ip igmp snooping counters

The **clear ip igmp snooping counters** command resets the snooping message counters for the specified interface. The snooping counters for all interfaces are reset if the command does not include an interface name.

The **show ip igmp snooping counters** command displays the counter contents. See the [show ip igmp snooping counters](#) command description for a list of available snooping counters.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ip igmp snooping counters [ INT_NAME ]
```

#### Parameters

- INT\_NAME interface name. Formats include:
  - **ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **port-channel** *p\_num* Port-channel interface specified by *p\_num*.
  - **switch** virtual interface to an L2 querier.

#### Example

- This command clears the snooping counters for messages received on Ethernet interface 15.

```
switch(config)#clear ip igmp snooping counters ethernet 15
switch(config)#
```

### 15.2.8.3 clear ip igmp statistics

The `clear ip igmp statistics` command resets IGMP transmission statistic counters for the specified interface.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear ip igmp statistics [ INTF_ID ]
```

#### Parameters

- INTF\_ID nterface name. Options include:
  - <no parameter> all interfaces.
  - **interface ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **interface loopback** *l\_num* Loopback interface specified by *l\_num*.
  - **interface management** *m\_num* Management interface specified by *m\_num*.
  - **interface port-channel** *p\_num* Port-channel interface specified by *p\_num*.
  - **interface vlan** *v\_num* VLAN interface specified by *v\_num*.
  - **interface xlan** *vx\_num* VXLAN interface specified by *vx\_num*.

#### Examples

- This command resets IGMP transmission statistic counters on Ethernet 1 interface.

```
switch#clear ip igmp statistics interface ethernet 1  
switch#
```

---

#### 15.2.8.4 igmp query-max-response-time

The **igmp query-max-response-time** command configures the query-max-response-time variable for the configuration mode interface. This variable is used to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

The router with the lowest IP address on a subnet sends membership queries as the IGMP querier. When a membership query is received from a source with a lower IP address, the router resets its query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The **no igmp query-max-response-time** and **default igmp query-max-response-time** commands restore the default query-max-response-time of 10 seconds for the configuration mode interface by removing the corresponding **igmp query max-response-time** command from **running-config**.

##### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

##### Command Syntax

```
igmp query-max-response-time period
```

```
no igmp query-max-response-time
```

```
default igmp query-max-response-time
```

##### Parameters

- *period* maximum response time (deciseconds). Values range from 1 to 31744 (52 minutes, 54 seconds). Default is 100 (ten seconds).

##### Example

- This command configures the query-max-response-time of 18 seconds for VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)# igmp query-max-response-time 180
switch(config-if-Vl4)#
```

### 15.2.8.5 ip igmp host-proxy report-interval

The **ip igmp host-proxy report-interval** command configures the period between unsolicited join reports that the switch sends as an IGMP host proxy from the configuration mode interface to a sender network after a (S,G) or (\*,G) entry arrives in the multicast route (mroute) table. When the interface receives a query in response, this interval is set to the [ip igmp last-member-query-interval](#). This command also enables the host proxy on the configuration mode interface if it was not previously enabled.

The **no ip igmp host-proxy report-interval** and **default ip igmp host-proxy report-interval** commands reset the query interval to the default value of one second by removing the corresponding **ip igmp host-proxy report-interval** command from running-config. The **no ip igmp host-proxy** and **default ip igmp host-proxy** commands also remove the corresponding **report-interval** command.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip igmp host-proxy report-interval period
```

```
no ip igmp host-proxy report-interval
```

```
default ip igmp host-proxy report-interval
```

#### Parameters

- *period* transmission interval (seconds) between consecutive reports. Value range: 1 (one second) to 31744 (8 hours, 49 minutes, 4 seconds). Default is 1 (one second).

#### Example

- These commands configures a IGMP host proxy interval of five seconds on port channel 100.

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#ip igmp host-proxy report-interval 5
switch(config-if-Po100)#
```

---

### 15.2.8.6 ip igmp host-proxy version

The **ip igmp host-proxy version** command configures the version number to be used in unsolicited reports when the interface is serving as an IGMP host proxy. To configure the IGMP version used by the interface for other purposes, use the [ip igmp version](#) command instead.

The **no ip igmp host-proxy version** and **default ip igmp host-proxy version** commands reset the version to the default value of 3.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip igmp host-proxy version version_number
```

```
no ip igmp host-proxy version
```

```
default ip igmp host-proxy version
```

#### Parameters

- *version\_number* values range from 1 to 3. The default value is 3.

#### Example

- These commands configure the IGMP host proxy version on port channel interface 100 to 2.

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#ip igmp host-proxy version 2
switch(config-if-Po100)#
```

### 15.2.8.7 ip igmp host-proxy

The `ip igmp host-proxy` command enables the IGMP host proxy service on the configuration mode interface. The IGMP host proxy performs IGMP joins and leaves between networks that are directly connected by an exchange that does not support PIM on the network boundary.

**Note:** For an interface to serve as an IGMP host proxy, PIM MBR must also be enabled on that interface using the `pim ipv4 border-router` command.

The IGMP host proxy sends unsolicited IGMP join reports when an (S,G) or (\*,G) entry arrives in the multicast routing (mroute) table. Reports are subsequently sent upon the arrival of queries on the interface. The interval between IGMP reports is configured through `ip igmp host-proxy report-interval`.

The `ip igmp host-proxy` command can also specify a group address; this ensures that reports are generated for the specified group even if there is no (\*,G) entry in the mroute table for that group. Multiple `ip igmp host-proxy` statements are required to specify multiple groups.

When the host proxy IGMP version is set to 3 using the `ip igmp host-proxy version` command, the `ip igmp host-proxy` command can also include or exclude source addresses. These options are ignored when the interface runs host proxy IGMP version 1 or 2. Note that the IGMP version set using the `ip igmp version` command does not affect host proxy behavior.

An ACL can also be used in place of a group address by using the `access-list` option. If one or more groups are configured in addition to ACLs, the groups are processed first. Implicit deny in the ACL is ignored, but if the ACL includes an explicit deny rule, then the interface sends joins only to groups configured directly on the interface or included in a permit ACL. Deny rules take precedence over permit rules. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

The `no ip igmp host-proxy` and `default ip igmp host-proxy` commands remove the corresponding `ip igmp host-proxy` command from `running-config`. When these commands do not include a group address, all `ip igmp host-proxy` statements are deleted. When inclusion or exclusion parameters are not specified, all statements with the specified group address are deleted.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip igmp host-proxy [ GROUP_ADDRESS [SOURCE_ADDRESS ]] | [ access-list acl]
```

```
no ip igmp host-proxy [ GROUP_ADDRESS [ SOURCE_ADDRESS ]]
```

```
default ip igmp host-proxy [ GROUP_ADDRESS [SOURCE_ADDRESS]]
```

#### Parameters

- **GROUP\_ADDRESS** IPv4 address of group address for which host proxy sends reports.
  - *<no parameter>* only groups for which there is a (\*,G) entry in the mroute table.
  - *ipv4\_address* IP address of multicast group (dotted decimal notation). This ensures that reports are generated for this group even if it does not have a (\*,G) entry in the mroute table.
- **SOURCE\_ADDRESS** IP address of a host that originates multicast data packets.
  - *<no parameter>* Proxy sends report for all received or configured groups regardless of source address.
  - **exclude** *ipv4\_address* Proxy does not send reports for specified source address.
  - **include** *ipv4\_address* Proxy always sends reports for specified source address.

---

Commands that list at least one parameter must specify a group address. Parameters may be listed in any order. When a command specifies include and exclude parameters, the exclude parameter is ignored.

- **access-list** *acl* specifies an access control list (ACL); a join is sent for all groups and/or sources obtained by processing the rules from all configured ACLs.
- **version** *version* specifies the IGMP version on IGMP host-proxy interface. The value ranges from 1 to 3. Default value is 3.

### Guidelines

Multiple statements for a group address may be configured. The effect of entering a command depends on previously entered commands. The following describes command combination:

- **ip igmp host-proxy**: IGMP host proxy is enabled for all multicast groups and their source addresses. When enabled for all group addresses, the source address list cannot be restricted.
- **ip igmp host-proxy** *group\_ipv4*: IGMP host proxy is enabled for a specified multicast group. The list of source addresses for this group is not restricted. Enabling host proxy for another group address requires another **ip igmp host-proxy** command.
- **ip igmp host-proxy** *group\_ipv4* **exclude** *source\_ipv4*: IGMP host proxy is enabled for the specified multicast group. Sources for this group include all addresses not in an exclude statement. Multiple source addresses for the group are excluded by multiple statements.
- **ip igmp host-proxy** *group\_ipv4* **include** *source\_ipv4*: IGMP host proxy is enabled for the specified group address for only the specified source address. Additional statements are required to include other source addresses for the group. The presence of one include parameter invalidates all exclude statements for the specified multicast group.
- **ip igmp host-proxy access-list** *acl*: IGMP host proxy is enabled for the addresses defined by the specified ACL. If one or more groups are configured in addition to ACLs, the groups are processed first. If the ACL has a “deny all” rule for a group, then this filter takes precedence over configurations with include /exclude keywords or permit/deny rules for that group. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

### Example

- These commands enable IGMP host proxy on Ethernet interface 17 for all multicast group addresses.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy
switch(config-if-Et17)#
```

- These commands enable IGMP host proxy on Ethernet interface 17 for the multicast group at 231.10.10.1. The list of source addresses is not restricted.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.1
switch(config-if-Et17)#
```

- These commands enable IGMP host proxy on Ethernet interface 17 for the multicast group at 231.10.10.2. The list of source addresses only excludes 10.4.4.1 and 10.4.5.2.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.2 exclude 10.4.4.1
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.2 exclude 10.4.5.2
switch(config-if-Et17)#
```

- These commands enable IGMP host proxy on Ethernet interface 17 for the multicast group at 231.10.10.3. The list of source address for this group only includes 10.5.5.1 and 10.5.5.2

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.3 include 10.5.5.1
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.3 include 10.5.5.2
switch(config-if-Et17)#
```

- These commands enable IGMP host proxy on Ethernet interface 17 for the group address(es) specified in ACL "acl1"

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy access-list acl1
switch(config-if-Et17)#
```

---

### 15.2.8.8 ip igmp last-member-query-count

The `ip igmp last-member-query-count` command specifies the number of query messages the switch sends in response to a group-specific or group-source-specific leave message.

After receiving a message from a host leaving a group, the switch sends query messages at intervals specified by `ip igmp last-member-query-interval`. If the switch does not receive a response to the queries after sending the number of messages specified by this parameter, it stops forwarding messages to the host.

Setting the last member query count (LMQC) to 1 causes the loss of a single packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by `ip igmp query-interval`.

The `no ip igmp last-member-query-count` and `default ip igmp last-member-query-count` commands reset the LMQC to the default value by removing the corresponding `ip igmp last-member-query-count` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip igmp last-member-query-count number
```

```
no ip igmp last-member-query-count
```

```
default ip igmp last-member-query-count
```

#### Parameters

- *number* query message quantity. Values range from 0 to 3. Default is 2.

#### Example

- This command configures the last-member-query-count to 3 on VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp last-member-query-count 3
switch(config-if-Vl4)#
```

### 15.2.8.9 ip igmp last-member-query-interval

The `ip igmp last-member-query-interval` command configures the switch's transmission interval for sending group-specific or group-source-specific query messages from the configuration mode interface.

When a switch receives a message from a host that is leaving a group it sends query messages at intervals set by this command. The `ip igmp startup-query-count` specifies the number of messages that are sent before the switch stops forwarding packets to the host.

If the switch does not receive a response after this period, it stops forwarding traffic to the host on behalf of the group, source, or channel.

The `no ip igmp last-member-query-interval` and `default ip igmp last-member-query-interval` commands reset the query interval to the default value of one second by removing the `ip igmp last-member-query-interval` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip igmp last-member-query-interval period
no ip igmp last-member-query-interval
default ip igmp last-member-query-interval
```

#### Parameters

- *period* transmission interval (deciseconds) between consecutive group-specific query messages. Value range: 10 (one second) to 317440 (8 hours, 49 minutes, 4 seconds). Default is 10 (one second).

#### Example

- This command configures the last member query interval of 6 seconds for VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp last-member-query-interval 60
switch(config-if-Vl4)#
```

---

### 15.2.8.10 ip igmp profile

The `ip igmp profile` command places the switch in IGMP-profile configuration mode to configure an IGMP profile. IGMP profiles control the multicast groups that an interface can join.

Profiles consist of the filter type and an address range:

- Filter types specify accessibility to the listed address range:
  - Permit filters define the multicast groups the interface can join.
  - Deny filters define the multicast groups the interface cannot join.

Profiles are deny filters by default.

- Address ranges specify a list of addresses and ranges:
  - In permit filters, permitted groups are specified by the address range.
  - In deny filters, all groups are permitted except those specified by the address range.

Implementing IGMP filtering affects IGMP report forwarding as follows:

- IGMPv2: Report is forwarded to mrouter for permitted groups and dropped for disallowed groups.
- IGMPv3: There may be multiple group records in a report.
  - No groups are allowed: The report is dropped.
  - All groups are allowed: The report is forwarded to mrouter ports as normal.
  - Some groups are allowed: A revised report is forwarded to mrouter ports.

The revised report includes records for the allowed group addresses with the same source MAC and IP addresses.

The `no ip igmp profile` and `default ip igmp profile` commands delete the specified IGMP profile from *running-config*.

IGMP-profile configuration mode is not a group change mode; *running-config* is changed immediately upon entering commands. Exiting IGMP-profile configuration mode does not affect the configuration. The `exit` command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp profile profile_name
no ip igmp profile profile_name
default igmp profile profile_name
```

#### Parameters

- *profile\_name* name of the IGMP profile.

#### Commands Available in igmp-profile Configuration Mode

- [permit / deny](#)
- [range](#)

#### Related Commands

- [ip igmp snooping filter](#) applies an IGMP snooping filter to a configuration mode interface.

#### Example

- These commands enter IGMP-profile configuration mode and configure the profile as a permit list.

```
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
```

---

```
switch(config-igmp-profile-list_1)#
```

---

### 15.2.8.11 ip igmp query-interval

The **ip igmp query-interval** command configures the frequency at which the configuration mode interface, as an IGMP querier, sends host-query messages.

An IGMP querier sends host-query messages to discover the multicast groups that have members on networks attached to the interface. The switch implements a default query interval of 125 seconds.

The **no ip igmp query-interval** and **default ip igmp query-interval** commands reset the IGMP query interval to the default value of 125 seconds by removing the **ip igmp query-interval** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip igmp query-interval period
```

```
no ip igmp query-interval
```

```
default ip igmp query-interval
```

#### Parameters

- *period* interval (seconds) between IGMP query messages. Values range from 1 to 3175 (52 minutes, 55 seconds). Default is 125.

#### Example

- This command configures the query-interval of 2 minutes, 30 seconds for VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp query-interval 150
switch(config-if-Vl4)#
```

### 15.2.8.12 ip igmp router-alert

The `ip igmp router-alert` command configures the switch disposition of inbound IGMP packets to the configuration mode interface based on the presence of the router-alert option in the IP header. By default, the port accepts all IGMP packets that arrive on the local subnet and rejects all other packets that arrive without the router-alert option.

The command provides three IGMP packet disposition options:

- **mandatory**: packets are accepted only when router-alert is present.
- **optional**: packets are accepted regardless of router-alert presence.
- **optional connected**: packets are accepted from the same subnet; other packets require router-alert.

The `no ip igmp router-alert` and `default ip igmp router-alert` commands reset the default setting of optional connected on the configuration mode interface by removing the corresponding `ip igmp router-alert` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip igmp router-alert DISPOSITION
```

```
no ip igmp router-alert
```

```
default ip igmp router-alert
```

#### Parameters

- DISPOSITION IGMP packet disposition method. Options include:
  - **mandatory** Rejects packets if router-alert is not present.
  - **optional** Accepts packets regardless of router-alert presence.
  - **optional connected** Accepts packets from same subnet. Other packets require router-alert.

#### Example

- This command configures the switch to accept IGMP packets on Ethernet interface 8 only if the IP header contains router alert.

```
switch(config)#interface ethernet 8
switch(config-if-Et8)#ip igmp router-alert mandatory
switch(config-if-Et8)#
```

---

### 15.2.8.13 ip igmp snooping filter

The `ip igmp snooping filter` command applies the specified IGMP snooping profile to the configuration mode interface. An IGMP snooping profile specifies the multicast groups that an interface may join. Profiles consist of the filter type and an address range:

- Filter type: Specifies accessibility to the listed address range:
  - Permit filters define the multicast groups the interface can join.
  - Deny filters define the multicast groups the interface cannot join.
- Address range: Specifies a list of addresses and ranges.
  - In permit filters, the permitted groups are specified by the address range.
  - In deny filters, all groups are permitted except those specified by the address range.

An interface without a snooping profile assignment may join any multicast group.

Snooping profiles are configured in IGMP-profile configuration mode ([ip igmp profile](#)).

The `no ip igmp snooping filter` and `default ip igmp snooping filter` commands restore the default setting of allowing an interface to join any multicast group by deleting the corresponding `ip igmp snooping filter` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
ip igmp snooping filter profile_name
no ip igmp snooping filter [profile_name]
default ip igmp snooping filter [profile_name]
```

#### Parameters

- *profile\_name* name of profile assigned to interface.

#### Example

- This command applies the list\_1 snooping profile to Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#ip igmp snooping filter list_1
switch(config-if-Et7)#
```

### 15.2.8.14 ip igmp snooping interface-restart-query

The `ip igmp snooping interface-restart-query` command configures the interface startup initial query time used for IGMP query spoofing. When an interface restarts or there is a change to the spanning tree, the interface will send general IGMP queries after this interval. The query is based on the information of the last known IGMP querier, and serves to facilitate faster network convergence times.

Multiple values can be configured with a single command; issuing the command again replaces any previously configured value(s).

The `no ip igmp snooping interface-restart-query` and `default ip igmp snooping interface-restart-query` commands restore the default setting of 2000 milliseconds by deleting the corresponding `ip igmp snooping interface-restart-query` command from *running-config*.

#### Command Mode

General Configuration

#### Command Syntax

```
ip igmp snooping interface-restart-query query_time
```

```
no ip igmp snooping interface-restart-query
```

```
default ip igmp snooping interface-restart-query
```

#### Parameters

- *query\_time*  $\frac{1}{2}$ interval (in milliseconds) after an interface restart or spanning tree change at which the interface will send general IGMP queries. Values range from 100 to 50000 milliseconds; default is 2000.

#### Example

- This command configures interfaces to send IGMP queries at 100, 200, and 300 milliseconds after an interface restart or spanning tree change.

```
switch(config)#ip igmp snooping interface-restart-query 100 200 300
switch(config)#
```

---

### 15.2.8.15 ip igmp snooping proxy

The **ip igmp snooping proxy** command enables snooping proxy globally. By default, IGMP snooping proxy is disabled globally.

When the snooping proxy is enabled globally, it enables IGMP snooping proxy on an individual VLANs and when the IGMP snooping proxy is globally disabled the snooping proxy is disabled on individual VLANs.

The **no ip igmp snooping proxy** and **default ip igmp snooping proxy** commands disable snooping proxy globally and on individual VLANs by removing the **ip igmp snooping proxy** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping proxy
```

```
no ip igmp snooping proxy
```

```
default ip igmp snooping proxy
```

#### Examples

- This command globally enables snooping proxy on the switch.

```
switch(config)#ip igmp snooping proxy
switch(config)#
```

- This command explicitly disables IGMP snooping proxy on VLAN 20.

```
switch(config)#no ip igmp snooping vlan 20 proxy
switch(config)#
```

### 15.2.8.16 ip igmp snooping querier address

The `ip igmp snooping querier address` command sets the global querier source IP address, which specifies the source address for packets transmitted from VLANs for which a querier address (`ip igmp snooping vlan querier address`) is not configured. To use a snooping querier, an address must be explicitly configured globally or for the VLAN.

The switch does not define a default global querier address.

The `no ip igmp snooping querier address` and `default ip igmp snooping querier address` commands remove the global querier address command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping querier address ipv4_address
```

```
no ip igmp snooping querier address
```

```
default ip igmp snooping querier address
```

#### Parameters

- `ipv4_address` source IPv4 address.

#### Example

- This command sets the source IP address to 10.1.1.41 for query packets transmitted from the switch.

```
switch(config)#ip igmp snooping querier address 10.1.1.41
switch(config)#
```

### 15.2.8.17 ip igmp snooping querier last-member-query-count

The `ip igmp snooping querier last-member-query-count` command configures the global **IGMP snooping querier last member query count** (LMQC) value. LMQC specifies the number of query messages the switch sends in response to group-specific or group-source-specific leave messages it receives from a host; the transmission frequency is specified by **IGMP snooping querier last member query interval**. The switch stops forwarding messages to the host if it does not receive a response to these query messages.

Setting LMQC to 1 causes the loss of one packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by `ip igmp snooping querier query-interval`.

VLANs use the global value when they are not assigned a value (`ip igmp snooping vlan querier last-member-query-count`). VLAN commands take precedence over the global value. The default global value is specified by the robustness variable (`ip igmp snooping robustness-variable`).

The `no ip igmp snooping querier last-member-query-count` and `default igmp snooping querier last-member-query-count` commands reset the LMQC to the default value by removing the corresponding `ip igmp snooping querier last-member-query-count` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping querier last-member-query-count number
```

```
no ip igmp snooping querier last-member-query-count
```

```
default ip igmp snooping querier last-member-query-count
```

#### Parameters

- *number* query message quantity. Value ranges from 1 to 3. Default is set by robustness-variable.

#### Example

- This command configures the global last-member-query-count to 3.

```
switch(config)#ip igmp snooping querier last-member-query-count 3
switch(config)#show igmp snooping querier status
  Global IGMP Querier status
-----
admin state                : Disabled
source IP address         : 0.0.0.0
query-interval (sec)      : 125.0
max-response-time (sec)   : 10.0
querier timeout (sec)     : 255.0
last-member-query-interval (sec) : 1.0
last-member-query-count   : 3
startup-query-interval (sec) : 31.25 (query-interval/4)
startup-query-count       : 2 (robustness)
Vlan Admin IP             Query Response Querier Operational Ver
  State                   Interval Time      Timeout State
-----
1   Disabled 0.0.0.0       125.0   10.0    255.0   Non-Querier v2
100 Disabled 0.0.0.0       125.0   10.0    255.0   Non-Querier v2
101 Disabled 0.0.0.0       125.0   10.0    255.0   Non-Querier v2
switch(config)#
```

### 15.2.8.18 ip igmp snooping querier last-member-query-interval

The `ip igmp snooping querier last-member-query-interval` command sets the global IGMP snooping last member query interval. The default interval is one second.

A multicast host sends an IGMP leave report when it leaves a group. To determine if the host was the last group member, the leave message recipient sends an IGMP query. The last-member-query-interval determines when the group record is deleted if no subsequent reports are received.

VLANs not assigned a **last member query interval** value ([ip igmp snooping vlan querier last-member-query-interval](#)) use the global value. VLAN commands take precedence over the global value.

The `no ip igmp snooping querier last-member-query-interval` and `default ip igmp snooping querier last-member-query-interval` commands reset the **last-member-query-interval** value the default interval of one second by removing the `ip igmp snooping querier last-member-query-interval` statement from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping querier last-member-query-interval period
no ip igmp snooping querier last-member-query-interval
default ip igmp snooping querier last-member-query-interval
```

#### Parameters

- *period* last member query interval (seconds). Value ranges from 1 to 25. Default is one second.

#### Related Commands

- [ip igmp snooping vlan querier last-member-query-interval](#) assign a last member query interval value to the specified VLANs.

#### Example

- This command sets the IGMP snooping querier last-member-query-interval to five seconds.

```
switch(config)#ip igmp snooping querier last-member-query-interval 5
switch(config)#
```

---

### 15.2.8.19 ip igmp snooping querier max-response-time

The `ip igmp snooping querier max-response-time` command specifies the global max-response-time value. The switch uses max-response-time to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

VLANs not assigned a max-response-time value (`ip igmp snooping vlan querier max-response-time`) use the global value. VLAN commands take precedence over the global value.

Values range from 1 to 25 seconds. The default global value is 10 seconds.

The `no ip igmp snooping querier max-response-time` and `default ip igmp snooping querier max-response-time` commands restore the global max-response-time default value by removing the `ip igmp snooping querier max-response-time` statement from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping querier max-response-time resp_sec
no ip igmp snooping querier max-response-time
default ip igmp snooping querier max-response-time
```

#### Parameters

- `resp_sec` max-response-time value (seconds). Values range from 1 to 25. Default (global) is 10.

#### Example

- This command sets the global max-response-time to 15 seconds.

```
switch(config)#ip igmp snooping querier max-response-time 15
switch(config)#
```

### 15.2.8.20 ip igmp snooping querier query-interval

The `ip igmp snooping querier query-interval` command sets the global query interval. This command also sets the query-interval of IGMP Snooping when using IGMP version 2. Values range from 5 to 3600 seconds. The default global value is 125 seconds. The query interval is the period between IGMP Membership Query messages sent from the querier. The global value specifies the query interval for VLANs with no query-interval command.

VLANs not assigned a query interval value (`ip igmp snooping vlan querier query-interval`) use the global value. VLAN commands take precedence over the global value.

The `no ip igmp snooping querier query-interval` and `default ip igmp snooping querier query-interval` commands reset the global query-interval value to 125 seconds by removing the `ip igmp snooping querier query-interval` statement from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping querier query-interval query_sec
```

```
no ip igmp snooping querier query-interval
```

```
default ip igmp snooping querier query-interval
```

#### Parameters

- *query\_sec* query interval (seconds). Values range from 5 to 3600. Default (global) is 125.

#### Example

- This command sets the global query interval to 150 seconds.

```
switch(config)#ip igmp snooping querier query-interval 150
switch(config)#
```

### 15.2.8.21 ip igmp snooping querier startup-query-count

The `ip igmp snooping querier startup-query-count` command configures the global **startup query count** value. The **startup query count** specifies the number of query messages that the querier sends on a VLAN during the **startup query interval** (`ip igmp snooping querier startup-query-interval`).

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The `startup-query-interval` and `startup-query-count` parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs use the global **startup query count** value when they are not assigned a value (`ip igmp snooping vlan querier startup-query-count`). VLAN commands take precedence over the global value. The default global value is specified by the robustness variable (`ip igmp snooping robustness-variable`).

The `no ip igmp snooping querier startup-query-count` and `default ip igmp snooping querier startup-query-count` commands restore the default startup-query-count value by removing the corresponding `ip igmp snooping querier startup-query-count` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping querier startup-query-count number
```

```
no ip igmp snooping querier startup-query-count
```

```
default ip igmp snooping querier startup-query-count
```

#### Parameters

- *number* global startup query count. Value ranges from 1 to 3.

#### Example

- These commands configure the global startup query count value of 2, then displays the status of the snooping querier.

```
switch(config)#ip igmp snooping querier startup-query-count 2
switch(config)#show igmp snooping querier status
  Global IGMP Querier status
-----
admin state                : Disabled
source IP address         : 0.0.0.0
query-interval (sec)      : 125.0
max-response-time (sec)   : 10.0
querier timeout (sec)     : 255.0
last-member-query-interval (sec) : 1.0
last-member-query-count   : 2 (robustness)
startup-query-interval (sec) : 31.25 (query-interval/4)
startup-query-count       : 2

Vlan Admin   IP           Query   Response Querier Operational Ver
      State   Address      Interval Time    Timeout State
-----
1     Disabled 0.0.0.0     125.0   10.0    255.0   Non-Querier v2
100   Disabled 0.0.0.0     125.0   10.0    255.0   Non-Querier v2
101   Disabled 0.0.0.0     125.0   10.0    255.0   Non-Querier v2
switch(config)#
```

### 15.2.8.22 ip igmp snooping querier startup-query-interval

The `ip igmp snooping querier startup-query-interval` command configures the global startup query interval value. The `startup query interval` specifies the period between query messages that the querier sends upon startup.

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The `startup-query-interval` and `startup-query-count` parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs use the global `startup query interval` value when they are not assigned a value (`ip igmp snooping vlan querier startup-query-interval`). VLAN commands take precedence over the global value. The default global value equals the query interval divided by four. (`ip igmp snooping querier query-interval`).

The `no ip igmp snooping querier startup-query-interval` and `default ip igmp snooping querier startup-query-interval` commands restore the default method of specifying the startup query interval by removing the corresponding `ip igmp snooping querier startup-query-interval` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping querier startup-query-interval period
```

```
no ip igmp snooping querier startup-query-count
```

```
default ip igmp snooping querier startup-query-count
```

#### Parameters

- *period* startup query interval (seconds). Value ranges from 1 to 3600 (1 hour).

#### Example

- This command configures the startup query count of one minute for VLAN interface 4.

```
switch(config)#ip igmp snooping querier startup-query-interval 40
switch(config)#show igmp snooping querier status
  Global IGMP Querier status
-----
admin state                : Enabled
source IP address         : 0.0.0.0
query-interval (sec)      : 125.0
max-response-time (sec)   : 10.0
querier timeout (sec)     : 255.0
last-member-query-interval (sec) : 1.0
last-member-query-count   : 2 (robustness)
startup-query-interval (sec) : 40.0
startup-query-count       : 2

Vlan Admin   IP           Query   Response Querier Operational Ver
   State                    Interval Time    Timeout State
-----
1    Enabled  0.0.0.0    125.0   10.0    255.0   Non-Querier v3
100  Enabled  0.0.0.0    125.0   10.0    255.0   Non-Querier v3
101  Enabled  0.0.0.0    125.0   10.0    255.0   Non-Querier v3
switch(config)#
```

---

### 15.2.8.23 ip igmp snooping querier version

The `ip igmp snooping querier version` command configures the Internet Group Management Protocol (IGMP) snooping querier version on the configuration mode interfaces. Version 3 is the default IGMP version.

IGMP is enabled by the `pim ipv4 sparse-mode` or `pim ipv4 bidirectional` command. The `ig igmp snooping querier version` command does not affect the IGMP enabled status.

The `no ip igmp snooping querier version` and `default ip igmp snooping querier version` commands restore the configuration mode to IGMP version 3 by removing the `ip igmp snooping querier version` statement from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping querier version version_number
no ip igmp snooping querier startup-query-count
default ip igmp snooping querier startup-query-count
```

#### Parameters

- *version\_number* IGMP version number. Value ranges from 1 to 3. Default value is 3.

#### Example

- This command configures IGMP snooping querier version 2.

```
switch(config)#ip igmp snooping querier version 2
switch(config)#
```

- This command restores the IGMP snooping querier to version 3.

```
switch(config)# no ip igmp snooping querier version
switch(config)#
```

### 15.2.8.24 ip igmp snooping querier

The `ip igmp snooping querier` command enables the snooping querier globally, which controls the querier for VLANs that are not configured with a snooping querier command. The `ip igmp snooping vlan querier` command controls the querier on individual VLANs.

The IGMP snooping querier supports snooping by sending layer 2 membership queries to hosts attached to the switch. The snooping querier is functional on VLANs where hosts receive IP multicast traffic without access to a network IP multicast router. A snooping querier avoids flooding multicast packets in the VLAN by querying for hosts and routers.

The IGMP snooping querier is functional on VLANs that meet these criteria:

- Snooping is enabled.
- The corresponding SVI (VLAN interface) is active.
- The VLAN querier IP address or the global querier IP address is configured.

The `no ip igmp snooping querier` and `default ip igmp snooping querier` commands disable the snooping querier globally by removing the `ip igmp snooping querier` statement from *running-config*. The snooping querier is globally disabled by default.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping querier
```

```
no ip igmp snooping querier
```

```
default ip igmp snooping querier
```

#### Guidelines

- Enabling a querier after it was disabled is equivalent to establishing a new querier.
- Changing the querier's IP address is equivalent to establishing a new querier.

#### Example

- This command globally enables the snooping querier on the switch.

```
switch(config)#ip igmp snooping querier
switch(config)#
```

---

### 15.2.8.25 ip igmp snooping report-flooding switch-port

The `ip igmp snooping report-flooding switch-port` command specifies Ethernet ports or port channels that can forward IGMP membership report messages for all VLANs where L2 report flooding is enabled. Ports that are connected to multicast routers or queriers continue to forward traffic as previously specified and are not affected by L2 report flooding commands.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. The `ip igmp snooping vlan report-flooding switch-port` command configures a list of forwarding ports for a specified VLAN range.

The `no ip igmp snooping report-flooding switch-port` and `default ip igmp snooping report-flooding switch-port` commands remove the specified ports from the global report flooding port list by deleting the corresponding `ip igmp snooping report-flooding switch-port` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping report-flooding switch-port INTERFACE
no ip igmp snooping report-flooding switch-port INTERFACE
default ip igmp snooping report-flooding switch-port INTERFACE
```

#### Parameters

- INTERFACE Membership report message forwarding is enabled on these ports:
  - **ethernet** *e\_range* *e\_range* is the number, range, or list of ethernet ports
  - **port-channel** *p\_range* where *p\_range* is the number, range, or list of channel ports

#### Related Commands

- `ip igmp snooping report-flooding` globally enables L2 report flooding.
- `ip igmp snooping vlan report-flooding switch-port` specifies a port list for a VLAN range.

#### Example

- This command configures Ethernet ports 7-9 for report message forwarding for any VLAN where L2 report flooding is enabled.

```
switch(config)#ip igmp snooping report-flooding switch-port ethernet
7-9
switch(config)#
```

### 15.2.8.26 ip igmp snooping report-flooding

The `ip igmp snooping report-flooding` command globally enables L2 report flooding on the switch. When report flooding is globally enabled, the `ip igmp snooping vlan report-flooding` configures a VLAN range to forward membership report messages to specified ports. When report flooding is not globally enabled, L2 report flooding cannot be enabled on individual VLANs.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can result in performance issues. L2 report flooding addresses this by facilitating report message transmissions through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

The `no ip igmp snooping report-flooding` and `default ip igmp snooping report-flooding` commands disable global L2 report flooding by removing `ip igmp report flooding` from *running-config*. L2 report flooding is disabled by default.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping report-flooding
```

```
no ip igmp snooping report-flooding
```

```
default ip igmp snooping report-flooding
```

#### Related Commands

- [ip igmp snooping vlan report-flooding](#) enables L2 report flooding on a specified VLAN range.

#### Example

- This command globally enables the snooping L2 report-flooding.

```
switch(config)#ip igmp snooping report-flooding
switch(config)#
```

---

### 15.2.8.27 ip igmp snooping restart query-interval

The `ip igmp snooping restart query-interval` command sets the query interval for all VLANs during an IGMP snooping restart. By default, the query interval during an IGMP snooping restart is a VLAN's configured query interval divided by five. This accelerates the transmission of robustness queries to establish the IGMP snooping state more quickly. However, some large scale configurations may not be able to process all of the queries at this query interval rate. The restart query interval, when configured, is valid for all VLANs.

The `no ip igmp snooping resrtart query-interval` and `default ip igmp snooping restart query-interval` commands removes the global restart query interval by deleting the `ip igmp snooping restart query-interval` statement from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping restart query-interval query_sec
```

```
no ip igmp snooping restart query-interval
```

```
default ip igmp snooping restart query-interval
```

#### Parameters

- `query_sec` query interval (seconds). Values range from 2 to 400. Default (global) is 125.

#### Example

- This command sets the global query interval to 35 seconds.

```
switch(config)#ip igmp snooping restart query-interval 35
switch(config)#
```

### 15.2.8.28 ip igmp snooping robustness-variable

The `ip igmp snooping robustness-variable` command configures the robustness variable for snooping packets sent from any VLAN. Values range from 1 to 3 with a default of 2.

The robustness variable specifies the number of unacknowledged snooping queries that a switch sends before removing the recipient from the group list.

The `no ip igmp snooping robustness-variable` and `default ip igmp snooping robustness-variable` commands reset the robustness variable to 2 by removing the `ip igmp snooping robustness-variable` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping robustness-variable robust_value
```

```
no ip igmp snooping robustness-variable
```

```
default ip igmp snooping robustness-variable
```

#### Parameters

- *robust\_value* robustness variable. Values range from 1 to 3. Default is 2.

#### Example

- This command sets the robustness-variable value to 3.

```
switch(config)#ip igmp snooping robustness-variable 3
switch(config)#
```

---

### 15.2.8.29 ip igmp snooping vlan fast-leave

The **ip igmp snooping vlan fast-leave** command enables fast-leave processing on specified VLANs. When fast-leave processing is enabled, the removal of a VLAN interface's multicast group entry from the IGMP table is not preceded by an IGMP group-specific query to the interface. The switch removes an interface from the forwarding table when it detects an IGMP leave message on the interface. IGMP fast-leave processing is enabled on all VLANs by default.

The **no ip igmp snooping vlan fast-leave** command disables fast-leave processing on the specified VLANs. The **default ip igmp snooping vlan fast-leave** command restores fast-leave processing on the specified VLANs by removing the corresponding **no ip igmp snooping vlan fast-leave** statement from running-config.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping vlan v_range fast-leave
```

```
no ip igmp snooping vlan v_range fast-leave
```

```
default ip igmp snooping vlan v_range fast-leave
```

#### Parameters

- *v\_range* VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

#### Example

- This command enables IGMP fast-leave processing on VLAN 10.

```
switch(config)#ip igmp snooping vlan 10 fast-leave
switch(config)#
```

### 15.2.8.30 ip igmp snooping vlan max-groups

The `ip igmp snooping vlan max-groups` command configures the quantity of multicast groups that the specified VLAN's forwarding table can contain. After the limit is reached, attempts to join new groups are ignored. There is no default limit.

The `no ip igmp snooping vlan max-groups` and `default ip igmp snooping vlan max-groups` removes the maximum group limit by deleting the `ip igmp snooping vlan max-groups` statement from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping vlan v_range max-groups quantity
```

```
no ip igmp snooping vlan v_range max-groups
```

```
default ip igmp snooping vlan v_range max-groups
```
