#### Parameters

- *v\_range* VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- *quantity* maximum number of groups that can access the VLAN. Value ranges from 0 to 65534.

#### Examples

- This command limits the number of multicast groups that hosts on VLAN 6 can simultaneously access to 25.

```
switch(config)#ip igmp snooping vlan 6 max-groups 25
switch(config)#
```

- This command allows each VLAN between 8 and 15 to receive multicast packets from 30 groups.

```
switch(config)#ip igmp snooping vlan 8-15 max-groups 30
switch(config)#
```

- This command removes the maximum group restriction from all VLAN interfaces between 1 and 50.

```
switch(config)#no ip igmp snooping vlan 1-50 max-groups
switch(config)#
```

---

### 15.2.8.31 ip igmp snooping vlan member

The `ip igmp snooping vlan member` command adds ports as static members to a multicast group. The ports must be in the specified VLAN range.

The `no ip igmp snooping vlan member` and `default ip igmp snooping vlan member` commands remove the specified ports from the multicast group by deleting the corresponding ip igmp snooping member statements from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping vlan v_num member ipv4_addr interface STATIC_INT
```

```
no ip igmp snooping vlan v_num member ipv4_addr interface STATIC_INT
```

```
default ip igmp snooping vlan v_num member ipv4_addr interface STATIC_INT
```

#### Parameters

- *v\_num* VLAN number. Value ranges from 1 to 4094.
- *ipv4\_addr* multicast group IPv4 address.
- *STATIC\_INT* interface the command configures as the static group member. Options include:
  - **ethernet** *e\_range*, where *e\_range* is the number, range, or list of Ethernet ports
  - **port-channel** *p\_range*, where *p\_range* is the number, range, or list of channel ports

#### Example

- This command configures the static connection to a multicast group at 237.2.1.4 through Ethernet port 3.

```
switch(config)#ip igmp snooping vlan 7 member 237.2.1.4 interface
ethernet 3
switch(config)#
```

### 15.2.8.32 ip igmp snooping vlan multicast-router

The `ip igmp snooping vlan multicast-router` command adds a multicast router as a static port to the specified VLANs. The router port must be in the specified VLAN range.

Snooping may not always be able to locate the IGMP querier. This command should specify IGMP queriers that are known to connect to the network through a port on the switch.

The `no ip igmp snooping vlan multicast-router` and `default ip igmp snooping vlan multicast-router` commands remove the specified static port configuration by deleting the corresponding `ip igmp snooping vlan multicast-router` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping vlan v_range multicast-router interface STATIC_INT  
no ip igmp snooping vlan v_range multicast-router interface STATIC_INT  
default ip igmp snooping vlan v_range multicast-router interface STATIC_INT
```

#### Parameters

- *v\_range* VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- STATIC\_INT interface the command configures as a static port. Selection options include:
  - **ethernet** *e\_range* where *e\_range* is the number, range, or list of ethernet ports
  - **port-channel** *p\_range* where *p\_range* is the number, range, or list of channel ports

The STATIC\_INT interface must route traffic through a VLAN specified within *v\_range*.

#### Example

- This command configures the static connection to a multicast router through Ethernet port 3.

```
switch(config)#ip igmp snooping vlan 2 multicast-router interface  
ethernet 3  
switch(config)#
```

---

### 15.2.8.33 ip igmp snooping vlan proxy

The **ip igmp snooping vlan proxy** command enables snooping proxy on individual VLAN, and to enable or disable IGMP snooping vlan proxy globally, use **ip igmp snooping proxy** command.

**Note:** The **ip igmp snooping proxy** command enables snooping proxy on all VLANs only where IGMP snooping is enabled.

The **no** and **default** form of **ip igmp snooping vlan proxy** command disables snooping proxy globally and on individual VLANs by removing the **ip igmp snooping vlan proxy** command from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping vlan [ID | range] proxy
```

```
no ip igmp snooping vlan [ID | range] proxy
```

```
default ip igmp snooping vlan [ID | range] proxy
```

#### Parameters

- *range* specifies the range of VLAN IDs. Numbers range from 1 to 4094.
- *ID* specifies a individual VLAN ID. Numbers range from 1 to 4094.

#### Examples

- This command globally enables IGMP snooping proxy on the switch and on all VLANs where IGMP snooping is enabled.

```
switch(config)#ip igmp snooping proxy  
switch(config)#
```

- This command enables IGMP snooping proxy on VLAN 20.

```
switch(config)#ip igmp snooping vlan 20 proxy  
switch(config)#
```

- This command disables IGMP snooping proxy on VLAN 20.

```
switch(config)#no ip igmp snooping vlan 20 proxy  
switch(config)#
```

### 15.2.8.34 ip igmp snooping vlan querier address

The `ip igmp snooping vlan querier address` command sets the source address for query packets sent from specified VLANs. VLANs not assigned an address use the global address (`ip igmp snooping querier address`). VLAN querier address commands take precedence over the global address.

To use a snooping querier, an address must be explicitly configured globally or for the querier's VLAN.

The `no ip igmp vlan snooping querier address` and `default ip igmp snooping vlan querier address` commands reset the specified VLAN to use the global address by removing the corresponding `ip igmp snooping vlan querier address` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping vlan v_range querier address ipv4_address
```

```
no ip igmp snooping vlan v_range querier address
```

```
default ip igmp snooping vlan v_range querier address
```

#### Parameters

- *v\_range* VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- *ipv4\_address* source IPv4 address.

#### Example

- This command sets the source IPv4 address of 10.14.1.1 for query packets transmitted from VLAN 2.

```
switch(config)#ip igmp snooping vlan 2 querier address 10.14.1.1
switch(config)#
```

---

### 15.2.8.35 ip igmp snooping vlan querier last-member-query-count

The `ip igmp snooping vlan querier last-member-query-count` command specifies an **IGMP snooping querier last member query count (LMQC)** value for the specified VLANs. LMQC specifies the number of query messages the switch sends in response to group-specific or group-source-specific leave messages it receives from a host; the transmission frequency is specified by **IGMP snooping querier last member query interval**. The switch stops forwarding messages to the host if it does not receive a response to these query messages.

VLANs not assigned an LMQC value use the global value (`ip igmp snooping querier last-member-query-count`). VLAN commands take precedence over the global command.

Setting the last member query count (LMQC) to 1 causes the loss of a single packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by `ip igmp snooping querier query-interval I`.

The `no ip igmp snooping vlan querier last-member-query-count` and `default ip igmp snooping vlan querier last-member-query-count` commands reset the specified VLAN to use the global LMQC by removing the corresponding `ip igmp snooping vlan querier last-member-query-count` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping vlan v_range querier last-member-query-count number
```

```
no ip igmp snooping vlan v_range querier address
```

```
default ip igmp snooping vlan v_range querier address
```

#### Parameters

- *v\_range* VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- *number* query message quantity. Value ranges from 1 to 3.

#### Example

- This command configures the last-member-query-count to 1 on VLAN interface 3.

```
switch(config)#ip igmp snooping vlan 3 querier last-member-query-count
1
switch(config)#
```

### 15.2.8.36 ip igmp snooping vlan querier last-member-query-interval

The `ip igmp snooping vlan querier last-member-query-interval` command configures **last-member-query-interval** for packets sent from the specified VLANs. VLANs not assigned a value use the global setting (`ip igmp snooping querier last-member-query-interval`). VLAN commands take precedence over the global value. The global default is one second.

A multicast host sends an IGMP leave report when it leaves a group. To determine if the host was the last group member, the leave message recipient sends an IGMP query. The **last-member-query-interval** determines when the group record is deleted if no subsequent reports are received.

The `no ip igmp snooping vlan querier last-member-query-interval` and `default ip igmp snooping vlan querier last-member-query-interval` commands reset the specified VLAN to use the global **last-member-query-interval** by removing the corresponding `ip igmp snooping vlan querier last-member-query-interval` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping vlan v_range querier last-member-query-interval period  
no ip igmp snooping vlan v_range querier last-member-query-interval  
default ip igmp snooping vlan v_range querier last-member-query-interval
```

#### Parameters

- *v\_range* VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- *period* last member query interval (seconds). Value ranges from 1 to 25.

#### Example

- This command sets the last-member-query-interval for VLAN 10 to 12 seconds.

```
switch(config)#ip igmp snooping vlan 10 querier last-member-query-  
interval 12  
switch(config)#
```

---

### 15.2.8.37 ip igmp snooping vlan querier max-response-time

The `ip igmp snooping vlan querier max-response-time` command configures max-response-time for packets sent from the specified VLANs. VLANs not assigned a value use the global setting (`ip igmp snooping querier max-response-time`). VLAN commands take precedence over the global value. The global default is 10 seconds.

Switches use max-response-time to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

The `no ip igmp snooping vlan querier max-response-time` and `default ip igmp snooping vlan querier max-response-time` commands reset the specified VLAN to use the global max-response-time by removing the corresponding `ip igmp snooping vlan querier max-response-time` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping vlan v_range querier max-response-time resp_sec
```

```
no ip igmp snooping vlan v_range querier max-response-time
```

```
default ip igmp snooping vlan v_range querier max-response-time
```

#### Parameters

- *v\_range* VLAN ID. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- *resp\_sec* max-response-time value (seconds). Values range from 1 to 25.

#### Example

- This command sets the max-response-time for VLAN 2 to 5 seconds.

```
switch(config)#ip igmp snooping vlan 2 querier max-response-time 5
switch(config)#
```

### 15.2.8.38 ip igmp snooping vlan querier query-interval

The `ip igmp snooping vlan querier query-interval` command sets the query interval for the specified VLAN. VLANs not assigned a value use the global value (`ip igmp snooping querier query-interval`). VLAN commands have precedence over the global value. The query interval is the period between IGMP Membership Query messages sent from the querier.

The `no ip igmp snooping vlan querier query-interval` and `default ip igmp snooping vlan querier query-interval` commands reset the specified VLAN to use the global value by removing the corresponding `ip igmp snooping vlan querier query-interval` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping vlan v_range querier query-interval query_sec
```

```
no ip igmp snooping vlan v_range querier query-interval
```

```
default ip igmp snooping vlan v_range querier query-interval
```

#### Parameters

- *v\_range* VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- *query\_sec* query interval (seconds). Values range from 5 to 3600. Default (global) is 125.

#### Example

- This command sets the query interval for VLAN 10 to 240 seconds.

```
switch(config)#ip igmp snooping vlan 10 querier query-interval 240
switch(config)#
```

---

### 15.2.8.39 ip igmp snooping vlan querier startup-query-count

The `ip igmp snooping vlan querier startup-query-count` command specifies the startup query count value for the specified VLANs. The `startup query count` specifies the number of query messages that the querier sends on a VLAN during the `startup query interval` (`ip igmp snooping vlan querier startup-query-interval`).

When an interface starts running IGMP, it can establish the group state more quickly by sending query messages at a higher frequency. The `startup-query-interval` and `startup-query-count` parameters define the startup period and the query message transmission frequency during that period.

VLANs not assigned a `startup query count` value use the global value (`ip igmp snooping querier startup-query-count`). VLAN commands take precedence over the global command.

The `no ip igmp snooping vlan querier startup-query-count` and `default ip igmp snooping vlan querier startup-query-count` commands restore the default condition of using the global `startup query count` value by removing the corresponding `ip igmp snooping vlan querier startup-query-count` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping vlan v_range querier startup-query-count number  
no ip igmp snooping vlan v_range querier startup-query-count  
default ip igmp snooping vlan v_range querier startup-query-count
```

#### Parameters

- *v\_range* VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- *number* startup query count. Value ranges from 1 to 3.

#### Example

- This command configures the startup query count of 3 for VLAN 100.

```
switch(config)#ip igmp snooping vlan 100 querier startup-query-count 3  
switch(config)#
```

#### 15.2.8.40 ip igmp snooping vlan querier startup-query-interval

The `ip igmp snooping vlan querier startup-query-interval` command specifies the **startup query interval** value for the specified VLANs. The **startup query interval** specifies the period between query messages that the querier sends upon startup.

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The `startup-query-interval` and `startup-query-count` parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs not assigned a **startup query interval** value use the global value (`ip igmp snooping querier startup-query-count`). VLAN commands take precedence over the global command.

The `no ip igmp snooping vlan querier startup-query-interval` and `default ip igmp snooping vlan querier startup-query-interval` commands restore the default condition of using the global **startup query interval** value by removing the corresponding `ip igmp snooping vlan querier startup-query-interval` command from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

```
ip igmp snooping vlan v_range querier startup-query-interval period
no ip igmp snooping vlan v_range querier startup-query-interval
default ip igmp snooping vlan v_range querier startup-query-interval
```

##### Parameters

- *v\_range* VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- *period* startup query interval (seconds). Value ranges from 1 to 3600 (1 hour). Default is 31.

##### Example

- This command configures the startup query count of one minute for VLAN interface 100.

```
switch(config)#ip igmp snooping vlan 100 querier startup-query-interval
60
switch(config)#
```

---

### 15.2.8.41 ip igmp snooping vlan querier version

The `ip igmp snooping vlan querier version` command configures the Internet Group Management Protocol (IGMP) snooping querier function on the VLAN. Version 3 is the default IGMP snooping version.

IGMP is enabled by the `pim ipv4 sparse-mode` or `pim ipv4 bidirectional` command. The `ip igmp snooping vlan querier version` command does not affect the IGMP enabled status.

The `no ip igmp snooping vlan querier version` and `default ip igmp snooping vlan querier version` commands restore the configuration mode interface to IGMP snooping VLAN querier version 3 by removing the `ip igmp snooping vlan querier version` statement from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping vlan v_range querier version version_number
```

```
no ip igmp snooping vlan v_range querier version
```

```
default ip igmp snooping vlan v_range querier version
```

#### Parameters

- *v\_range* VLAN ID. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- *version\_number* IGMP version number. Value ranges from 1 to 3. Default value is 3.

#### Example

- The example sets the querier version to 2 on vlan 5.

```
switch(config)# ip igmp snooping vlan 5 querier version 2
switch(config)#
```

- This command restores IGMP snooping querier version 3 to VLAN 5.

```
switch(config)# no ip igmp snooping vlan 5 querier version
switch(config)#
```

### 15.2.8.42 ip igmp snooping vlan querier

The `ip igmp snooping vlan querier` command controls the querier for the specified VLANs. VLANs follow the global querier setting unless overridden by one of these commands:

- `ip igmp snooping vlan querier` enables the querier on specified VLANs.
- `no ip igmp snooping vlan querier` disables the querier on specified VLANs.

VLAN querier commands take precedence over the global querier setting. The `ip igmp snooping querier` controls the querier for VLANs with no snooping querier command.

The IGMP snooping querier supports snooping by sending layer 2 membership queries to hosts attached to the switch. The snooping querier is functional on VLANs where hosts receive IP multicast traffic without access to a network IP multicast router. A snooping querier avoids flooding multicast packets in the VLAN by querying for hosts and routers.

The IGMP snooping querier is functional on VLANs that meet these criteria:

- Snooping is enabled.
- The corresponding SVI (VLAN interface) is active.
- The VLAN querier IP address or the global querier IP address is configured.

The default `ip igmp snooping vlan querier` command restores the usage of the global setting for the specified VLAN by removing the corresponding `ip igmp snooping vlan querier` or `no ip igmp snooping vlan querier` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping vlan v_range querier
no ip igmp snooping vlan v_range querier
default ip igmp snooping vlan v_range querier
```

#### Parameters

- *v\_range* VLAN IDs. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

#### Examples

- These commands globally enable the snooping querier on the switch, explicitly disable snooping on VLANs 1-3, and explicitly enable snooping on VLANs 4-6.

```
switch(config)#ip igmp snooping querier
switch(config)#no ip igmp snooping vlan 1-3 querier
switch(config)#ip igmp snooping vlan 4-6 querier
```

After running these commands, the running-config file contains these lines, which indicate that the snooping querier is enabled on VLANs 4-6.

```
switch(config)#show running-config
<-----OUTPUT OMITTED FROM EXAMPLE----->
no ip igmp snooping vlan 1 querier
no ip igmp snooping vlan 2 querier
no ip igmp snooping vlan 3 querier
ip igmp snooping vlan 4 querier
ip igmp snooping vlan 5 querier
ip igmp snooping vlan 6 querier
ip igmp snooping querier
```

---

<-----OUTPUT OMITTED FROM EXAMPLE----->

- This command removes the querier setting for VLANs 2-5:

```
switch(config)#default ip igmp snooping vlan 2-5 querier
```

When executed after the previous commands, the snooping querier is disabled explicitly on VLANs 1-2, enabled implicitly on VLANs 3-6, and enabled explicitly on VLANs 7-8, as shown by **running-config**:

```
<-----OUTPUT OMITTED FROM EXAMPLE----->
no ip igmp snooping vlan 1 querier
ip igmp snooping vlan 6 querier
ip igmp snooping querier
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

- This command sets the global snooping querier to disabled by removing the global querier setting from running-config:

```
switch(config)#no ip igmp snooping querier
switch(config)#
```

When executed after the previous commands, the snooping querier is disabled explicitly on VLANs 1-2, disabled implicitly on VLANs 3-6 and enabled explicitly on VLANs 7-8, as shown by running-config.

```
<-----OUTPUT OMITTED FROM EXAMPLE----->
no ip igmp snooping vlan 1 querier
ip igmp snooping vlan 6 querier
<-----OUTPUT OMITTED FROM EXAMPLE----->
```

### 15.2.8.43 ip igmp snooping vlan report-flooding switch-port

The `ip igmp snooping vlan report-flooding switch-port` command configures Ethernet ports or port channels to forward IGMP membership report messages for a specified VLAN range where L2 report flooding is enabled. Ports that are connected to multicast routers or queriers continue to forward traffic as previously specified and are not affected by L2 report flooding commands.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. The `ip igmp snooping report-flooding switch-port` command configures a list of forwarding ports for all VLANs where L2 report flooding is enabled.

The `no ip igmp snooping vlan report-flooding switch-port` and `default ip igmp snooping vlan report-flooding switch-port` commands remove the listed ports from the specified report flooding port list by deleting the corresponding `ip igmp snooping vlan report-flooding switch-port` statements from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping vlan v_range report-flooding switch-port INTERFACE
no ip igmp snooping vlan v_range report-flooding switch-port INTERFACE
default ip igmp snooping vlan v_range report-flooding switch-port INTERFACE
```

#### Parameters

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `INTERFACE` Membership report message forwarding is enabled on these ports:
  - **ethernet** `e_range` where `e_range` is the number, range, or list of ethernet ports
  - **port-channel** `p_range` where `p_range` is the number, range, or list of channel ports

#### Related Commands

- `ip igmp snooping report-flooding` globally enables L2 report flooding.
- `ip igmp snooping vlan report-flooding switch-port` specifies a port list for a VLAN range.
- `ip igmp snooping report-flooding switch-port` specifies a port list for all VLANs.

#### Example

- These commands globally enable L2 report flooding, enable flooding on VLANs 201 through 205, and specify Ethernet ports 8-10 as the report flooding port list for VLANs 201-205.

```
switch(config)#ip igmp snooping report-flooding
switch(config)#ip igmp snooping vlan 201-205 report-flooding
switch(config)#ip igmp snooping vlan 201-205 report-flooding switch-
port ethernet
8-10
switch(config)#
```

---

#### 15.2.8.44 ip igmp snooping vlan report-flooding

The `ip igmp snooping vlan report-flooding` command enables L2 report flooding on the specified VLANs if report flooding is globally enabled. When L2 report flooding is not globally enabled, this command has no effect. The `ip igmp snooping report-flooding` command globally enables L2 report flooding.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can degrade performance. L2 report flooding addresses this by facilitating report message forwarding through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

Two commands specify the ports that forward reports:

- `ip igmp snooping vlan report-flooding switch-port` for a VLAN range.
- `ip igmp snooping report-flooding switch-port` for all VLANs where report flooding is enabled.

The `no ip igmp snooping vlan report-flooding` and `default ip igmp snooping vlan report-flooding` commands disable L2 report flooding for the specified VLAN by removing the corresponding `ip igmp snooping vlan report-flooding` statement from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

```
ip igmp snooping vlan v_range report-flooding
no ip igmp snooping vlan v_range report-flooding
default ip igmp snooping vlan v_range report-flooding
```

##### Parameters

- *v\_range* VLAN IDs Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

##### Related Commands

- `ip igmp snooping report-flooding` globally enables L2 report flooding.

##### Example

- These commands enable L2 report flooding globally and on VLANs 201 through 205.

```
switch(config)#ip igmp snooping report-flooding
switch(config)#ip igmp snooping vlan 201-205 report-flooding
switch(config)#
```

### 15.2.8.45 ip igmp snooping vlan

The `ip igmp snooping vlan` command enables snooping on the specified VLANs if snooping is globally enabled. IGMP snooping is globally enabled by default. The `ip igmp snooping` command enables snooping globally.

Note that if IGMP snooping is enabled, QoS will not apply to IGMP packets.

The `no ip igmp snooping vlan` command disables snooping on the specified VLANs.

The `default ip igmp snooping vlan` command returns the snooping setting for the specified VLANs to enabled by removing the corresponding `ip igmp snooping vlan` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
ip igmp snooping vlan v_range
```

```
no ip igmp snooping vlan v_range
```

```
default ip igmp snooping vlan v_range
```

#### Parameters

- *v\_range* VLANs upon which snooping is enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

#### Example

- This command disables snooping on VLANs 2 through 4.

```
switch(config)#no ip igmp snooping vlan 2-4
switch(config)#
```

---

#### 15.2.8.46 ip igmp snooping

The `ip igmp snooping` command enables snooping globally. By default, global snooping is enabled.

When global snooping is enabled, `ip igmp snooping vlan` enables or disables snooping on individual VLANs. When global snooping is disabled, snooping cannot be enabled on individual VLANs.

QoS cannot be used for IGMP packets when IGMP snooping is enabled.

The `no ip igmp snooping` command disables global snooping. The `default ip igmp snooping` command restores the global snooping default setting of enabled by removing the `ip igmp snooping` command from *running-config*.

##### Command Mode

Global Configuration

##### Command Syntax

```
ip igmp snooping
```

```
no ip igmp snooping
```

```
default ip igmp snooping
```

##### Example

- This command globally enables snooping on the switch.

```
switch(config)#ip igmp snooping
switch(config)#
```

### 15.2.8.47 ip igmp startup-query-count

The `ip igmp startup-query-count` command specifies the number of query messages that an interface sends during the startup interval defined by `ip igmp startup-query-interval`.

When an interface starts running IGMP, it can establish the group state more quickly by sending query messages at a higher frequency. The `startup-query-interval` and `startup-query-count` parameters define the startup period and the query message transmission frequency during that period.

The `no ip igmp startup-query-count` and `default ip igmp startup-query-count` commands restore the default `startup-query-count` value of 2 for the configuration mode interface by removing the corresponding `ip igmp startup-query-count` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip igmp startup-query-count number
```

```
no ip igmp startup-query-count
```

```
default ip igmp startup-query-count
```

#### Parameters

- *number* quantity of queries. Values range from 1 to 65535. Default is 2.

#### Example

- This command configures the startup query count of 10 for VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp startup-query-count 10
switch(config-if-Vl4)#
```

---

### 15.2.8.48 ip igmp startup-query-interval

The `ip igmp startup-query-interval` command specifies the configuration mode interface's IGMP startup period, during which query messages are sent at an accelerated rate.

When an interface starts running IGMP, it can establish the group state quicker by sending query messages at a higher frequency. The `startup-query-interval` and `startup-query-count` parameters define the startup period and the query message transmission frequency during that period.

The `no ip igmp startup-query-interval` and `default ip igmp startup-query-interval` commands restore the configuration mode interface default IGMP `startup-query-interval` of 31 seconds by removing the corresponding `ip igmp startup-query-interval` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip igmp startup-query-interval period
```

```
no ip igmp startup-query-interval
```

```
default ip igmp startup-query-interval
```

#### Parameters

- *period* startup query interval, in deciseconds. Value ranges from 10 (one second) to 317440 (8 hours, 49 minutes, 4 seconds). Default is 31 seconds.

#### Example

- This command configures the startup query count of one minute for VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp startup-query-interval 600
switch(config-if-Vl4)#
```

### 15.2.8.49 ip igmp static-group acl

The `ip igmp static-group acl` command configures the configuration mode interface as a static member of the multicast groups specified by an IP access control list (ACL). This command is a variant of the `ip igmp static-group` command that uses ACL rules to specify a set of source-multicast group address pairs instead of specifying a single pair. Multiple static-group ACLs can be assigned to an interface. Static groups can be assigned manually and through ACLs simultaneously.

Access control lists that this command references must contain rules of the following format.

- `permit <protocol><source><destination>`, where
  - `<protocol>` has no effect on the static group.
  - `<source>` address of host originating multicast data packets. Must be a host address.
  - `<destination>` multicast group IP address or subnet. Must be a valid multicast address.

An ACL can contain multiple rules. An ACL can be applied to an interface only when all of its rules comply to the specified restrictions. The `show ip igmp static-groups acl` displays the source-multicast group pairs that the specified list configures and lists issues with illegal rules.

The `no ip igmp static-group acl` and `default ip igmp static-group acl` commands remove the specified static group ACL command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip igmp static-group acl list_name
```

```
no ip igmp static-group acl
```

```
default ip igmp static-group acl
```

#### Parameters

- `list_name` ACL that specifies multicast group addresses for which interface fast-switches packets.

#### Example

- This command configures VLAN interface 4 as a static member of the multicast group specified by the ACL named LIST\_1.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp static-group acl LIST_1
switch(config-if-Vl4)#
```

### 15.2.8.50 ip igmp static-group range

The `ip igmp static-group range` command configures the configuration mode interface as a static member of multicast groups specified by an address range. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, no static group memberships are configured on interfaces.

This command is a variant of the `ip igmp static-group` command that allows the assignment of a subnet range of source addresses or a subnet range of multicast groups. A single `ip igmp static-group range` command is the equivalent of multiple `ip igmp static-group` commands, each of which can only assign a single multigroup-source pair to an interface. Running-config converts the range command to the equivalent list of `ip igmp static-group` commands.

If the command includes a source address range, only multicast group messages received from the range are fast-switched. Otherwise, all multicast messages of the specified group are fast-switched.

The `no ip igmp static-group range` and `default ip igmp static-group range` commands remove the specified range of static group statements from *running-config*. The `no ip igmp static-group` and `default ip igmp static-group` commands can remove an individual static-group command that was initially added to *running-config* by an `ip igmp static-group range` command.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip igmp static-group range GROUP_ADDR[SOURCE_ADDR]
```

```
no ip igmp static-group range GROUP_ADDR[SOURCE_ADDR]
```

```
default ip igmp static-group range GROUP_ADDR[SOURCE_ADDR]
```

#### Parameters

- *GROUP\_ADDR* address of multicast group for which the interface fast-switches packets.
  - *gp\_ipv4\_addr* multicast group IPv4 address.
  - *gp\_ipv4\_subnet* IPv4 subnet address of multicast groups (CIDR or address-mask).
- *SOURCE\_ADDR* IP address of a host range that originates multicast data packets.
  - *<no parameter>* all multicast messages of the specified range are fast-switched.
  - **source** *sr\_ipv4\_address* source IPv4 address (dotted decimal notation).
  - **source** *sr\_ipv4\_subnet* IPv4 subnet address of source hosts (CIDR or address- mask).

**Note:** A command cannot specify a subnet address for both multicast group and source.

#### Examples

- This command configures VLAN interface 4 as a static member of the multicast group range 241.1.4.1/24 for data packets that originate at 10.1.1.1.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp static-group range 239.1.4.1/24 source
10.1.1.1
switch(config-if-Vl4)#
```

- This command attempts to configure VLAN interface 4 as a static member of the multicast group range 241.1.4.1/24 for data packets that originate at the 10.1.1.1/29 subnet. Because the range and source cannot both be subnets, this command generates an error message.

```
switch(config-if-Vl4)#ip igmp static-group range 239.1.1.1/29 source
16.1.1.1/29
% Error: cannot specify source range with group range
switch(config-if-Vl4)#
```

### 15.2.8.51 ip igmp static-group

The `ip igmp static-group` command configures the configuration mode interface as a static member of a specified multicast group. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, static group memberships are not configured on any interfaces.

If the command includes a source address, only multicast group messages received from the specified host address are fast-switched. Otherwise, all multicast messages of the specified group are fast-switched.

**Note:** To become a static member of a multicast group, the switch must be the PIM designated router (DR) for the network. If it is not, you can use the `pim ipv4 dr-priority` command to make it the DR by configuring its PIM DR value to be the highest on the network.

The `no ip igmp static-group` and `default ip igmp static-group` commands remove the configuration mode interface's group membership by removing the corresponding `ip igmp static-group` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip igmp static-group group_address [SOURCE_ADDRESS]
```

```
no ip igmp static-group group_address [SOURCE_ADDRESS]
```

```
default ip igmp static-group group_address [SOURCE_ADDRESS]
```

#### Parameters

- `group_address` IPv4 address of multicast group for which the interface fast-switches packets.
- `SOURCE_ADDRESS` IP address of host that originates multicast data packets.
  - <no parameter> all multicast messages of the specified group are fast-switched.
  - `ipv4_address` source IP address (dotted decimal notation).

#### Related Commands

- `ip igmp static-group acl` configures the configuration mode interface as a static member of the multicast groups specified by an IP access control list (ACL).
- `ip igmp static-group range` configures the configuration mode interface as a static member of multicast groups specified by an address range.

One `ip igmp static-group range` command is equivalent to multiple `ip igmp static-group` commands.

#### Example

- These commands configure VLAN interface 15 as the PIM designated router, then configure it as a static member of the multicast group at address 231.1.1.15 for multicast data packets that originate at 10.1.1.1.

```
switch(config)#interface vlan 15
switch(config-if-Vl15)#pim ipv4 dr-priority 5000
switch(config-if-Vl15)#ip igmp static-group 231.1.1.45 10.1.1.1
switch(config-if-Vl15)#
```

### 15.2.8.52 ip igmp version

The **ip igmp version** command configures the Internet Group Management Protocol (IGMP) version on the configuration mode interface. Version 3 is the default IGMP version.

IGMP is enabled by the [pim ipv4 sparse-mode](#) or [pim ipv4 bidirectional](#) command. The **ig igmp version** command does not affect the IGMP enabled status.

The **no ip igmp version** and **default ip igmp version** commands restore the configuration mode interface to IGMP version 3 by removing the **ip igmp version** statement from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
ip igmp version version_number
```

```
no ip igmp version
```

```
default ip igmp version
```

#### Parameters

- *version\_number* IGMP version number. Value ranges from 1 to 3.

#### Example

- This command configures IGMP version 3 on VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp version 3
switch(config-if-Vl4)#
```

---

### 15.2.8.53 ip igmp

The `ip igmp` command enables IGMP on a routed interface or on SVI (VLAN interface) without enabling PIM.

The `no ip igmp` command removes the corresponding `ip igmp` command from *running-config*.

#### Command Mode

Interface Configuration

#### Command Syntax

```
ip igmp
```

```
no ip igmp
```

#### Example

- This command enables IGMP on Ethernet interface 5/2.

```
switch(config)#interface ethernet 5/2
switch(config-if-Et5/2)#ip igmp
switch(config-if-Et5/2)#
```

### 15.2.8.54 permit / deny

The **permit** command configures the configuration mode IGMP profile as a permit list. Applying a permit list to an interface restricts that interface from joining any multicast group not included in the list.

IGMP profiles are deny lists by default. When applied to an interface, a deny list allows the interface to join any multicast group that is not included in the list.

The **deny** command restores the IGMP list to its default type by removing the corresponding **permit** statement from *running-config*.

The **range** command adds and removes address ranges from the configuration mode profile.

#### Command Mode

IGMP-profile Configuration

#### Command Syntax

**permit**

**deny**

#### Related Commands

- [ip igmp profile](#) places the switch in IGMP-profile configuration mode.

#### Example

- These commands enter IGMP profile configuration mode and configure the profile as a permit list.

```
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
switch(config-igmp-profile-list_1)#
```

---

### 15.2.8.55 range

The **range** command specifies an address range for the configuration mode IGMP profile. A permit range specifies the groups that an interface is permitted to join. A deny range specifies the groups that an interface is not permitted to join. The **permit / deny** command specifies the range type.

A profile may contain multiple range statements to define a discontinuous address range.

The **no range** and **default range** commands remove the specified address range from a previous specified list.

#### Command Mode

IGMP-profile Configuration

#### Command Syntax

```
range init_address [UPPER_RANGE]
```

```
no range init_address [UPPER_RANGE]
```

```
default range init_address [UPPER_RANGE]
```

#### Parameters

- *init\_address* IP address of lower boundary of the address range (dotted decimal notation).
- UPPER\_RANGE sets the upper boundary of the address range. Options include
  - <no parameter> upper boundary is equal to lower boundary: range consists of one address.
  - *range\_address* IP address of upper boundary.

All addresses must be multicast addresses (10.0.0.0 to 239.255.255.255).

#### Related Commands

- [ip igmp profile](#) places the switch in IGMP-profile configuration mode.

#### Example

- These commands enter IGMP profile configuration mode, configure the profile as a permit list, and define the permit address list of 232.1.1.0 to 232.1.1.255 and 233.1.1.10.

```
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
switch(config-igmp-profile-list_1)#232.1.1.0 232.1.1.255
switch(config-igmp-profile-list_1)#233.1.1.10
switch(config-igmp-profile-list_1)#ip igmp profile
```

### 15.2.8.56 show igmp snooping querier counters

The **show igmp snooping querier counters** command displays the counters from the querier, as learned through Internet Group Management Protocol (IGMP).

#### Command Mode

EXEC

#### Command Syntax

```
show igmp snooping querier counters [ VLAN_ID]
```

#### Parameters

- VLAN\_ID specifies VLANs for which command displays information. Options include:
  - <no parameter> displays information for all VLANs.
  - **vlan** *v\_num* displays information for specified VLAN.

#### Example

- This command displays the counters from the querier.

```
switch>show igmp snooping querier counters
-----
Vlan: 1      IP Addr: 100.0.0.1      Op State: Querier      Version: v3

v1 General Queries Sent      :0
v1 Queries Received          :0
v1 Reports Received          :0
v2 General Queries Sent      :1
v2 Queries Received          :0
v2 Reports Received          :25
v2 Leaves Received           :0
v3 General Queries Sent      :655
v3 GSQ Queries Sent          :0
v3 GSSQ Queries Sent         :8
v3 Queries Received          :654
v3 Reports Received          :2385
Error Packets                 :0
Other Packets                 :0
switch>
```

### 15.2.8.57 show igmp snooping querier membership

The `show igmp snooping querier membership` command displays the membership from the querier, as learned through Internet Group Management Protocol (IGMP).

#### Command Mode

EXEC

#### Command Syntax

```
show igmp snooping querier membership [ VLAN_ID [GROUP_LIST]]
```

#### Parameters

- VLAN\_ID specifies VLANs for which command displays information. Options include:
  - <no parameter> displays information for all VLANs.
  - **vlan** *v\_num* displays information for specified VLAN.
- GROUP\_LIST list of groups for which the command displays information. Options include:
  - <no parameter> all multicast groups within specified VLAN.
  - **group** *ipv4\_addr* single multicast group address (dotted decimal notation).

#### Example

- This command displays the membership from the querier from VLAN 1.

```
switch>show igmp snooping querier membership
-----
Vlan: 1      Elected: 10.0.0.1      QQI: 125  QRV: 2  QRI: 10  GMI: 260
Groups      Mode  Ver  Num of Sources
-----
10.0.0.2    EX    v3   0 []
10.0.0.3    IN    v3   2 [ 3.3.3.3, 3.3.3.4 ]
10.0.0.4    EX    v3   0 []
10.0.0.13   EX    v3   0 []
10.0.0.22   EX    v3   0 []
10.0.0.1    IN    v3   3 [ 5.6.7.9, 5.6.7.8, ... ]
switch>
```

### 15.2.8.58 show igmp snooping querier

The **show igmp snooping querier** command displays snooping querier configuration and status information. Command provides options to only include specific VLANs.

#### Command Mode

EXEC

#### Command Syntax

```
show igmp snooping querier [STATUS] [VLAN_ID] [DATA]
```

#### Parameters

- STATUS specifies the type of information displayed. Options include:
  - <no parameter> querier IP address, port, and IGMP version.
  - **status** querier configuration parameters.
- VLAN\_ID specifies VLANs for which command displays information. Options include:
  - <no parameter> all VLANs.
  - **vlan** *v\_num* specified VLAN.
- DATA specifies the type of information displayed. Options include:
  - <no parameter> displays VLAN number and port-list for each group.
  - **detail** displays port-specific data for each group; includes transmission times and expiration.

#### Example

- This command displays the querier IP address, version, and port servicing each VLAN.

```
switch>show igmp snooping querier
Vlan  IP Address      Version  Port
-----
 1     172.17.0.37       v2       Po1
20     172.17.20.1      v2       Po1
26     172.17.26.1      v2       Cpu
2028   172.17.255.29    v2       Po1
switch>
```

- This command displays the querier configuration parameters for each VLAN.

```
switch>show igmp snooping querier status
Global IGMP Querier status
-----
admin state           : Enabled
source IP address     : 0.0.0.0
query-interval (sec)  : 125.0
max-response-time (sec) : 10.0
querier timeout (sec) : 130.0

Vlan Admin   IP           Query   Response Querier Operational
   State     Address      Interval Time    Timeout State
-----
 1   Enabled  0.0.0.0     125.0  10.0    130.0  Non-Querier
 4   Enabled  0.0.0.0     125.0  10.0    130.0  Non-Querier
20   Enabled  0.0.0.0     125.0  10.0    130.0  Non-Querier
22   Enabled  0.0.0.0     125.0  10.0    130.0  Non-Querier
28   Enabled  0.0.0.0     125.0  10.0    130.0  Non-Querier
```

---

### 15.2.8.59 show ip igmp groups count

The **show ip igmp groups count** command displays the number of multicast groups that are joined across the specified interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show ip igmp groups [GROUP_LIST] count
```

#### Parameters

- **INTERF** Specifies the interface for which the command displays information. Options include:
  - <no parameter> all IGMP interfaces.
  - **interface ethernet** *e\_num* Ethernet interface.
  - **interface loopback** *l\_num* Loopback interface.
  - **interface management** *m\_num* Management interface.
  - **interface port-channel** *p\_num* Port-Channel Interface.
  - **interface vlan** *v\_num* VLAN interface.
  - **interface vxlan** *vx\_num* VXLAN interface.

#### Example

- This command displays the number of multicast groups joined across all interfaces.

```
switch>show ip igmp groups count
Number of total groups joined across all IGMP interfaces: 5
switch>
```

- This command displays the number of multicast groups joined on Ethernet 3/4 interface.

```
switch>show ip igmp groups interface ethernet 3/4 count
Number of groups joined on Ethernet3/4: 2
switch>
```

### 15.2.8.60 show ip igmp groups

The **show ip igmp groups** command displays multicast groups that have receivers directly connected to the switch, as learned through Internet Group Management Protocol (IGMP).

- **show ip igmp groups** all multicast groups.
- **show ip igmp groups** *group\_addr* listed multicast group.
- **show ip igmp groups interface** *int\_name* all multicast groups on specified interfaces
- **show ip igmp groups** *group\_addr* **interface** *int\_name* listed multicast group on specified interface.

#### Command Mode

EXEC

#### Command Syntax

```
show ip igmp groups GROUP_LIST [DATA]
```

#### Parameters

- GROUP\_LIST list of groups for which the command displays information. Options include:
  - <no parameter> all multicast groups.
  - *group\_addr* single multicast group address (dotted decimal notation).
  - **interface ethernet** *e\_num* all multicast groups on specified Ethernet interface.
  - **interface loopback** *l\_num* all multicast groups on specified Loopback interface.
  - **interface management** *m\_num* all multicast groups on specified Management interface.
  - **interface port-channel** *p\_num* all multicast groups on specified Port-Channel Interface.
  - **interface vlan** *v\_num* all multicast groups on specified VLAN interface.
  - **interface vxlan** *vx\_num* all multicast groups on specified VXLAN interface.
- DATA specifies the type of information displayed. Options include:
  - <no parameter> provides uptime, expiration, and address of reporter.
  - **detail** also include group mode and group source list.

#### Example

- This command displays multicast groups with receivers directly connected to the switch.

```
switch>show ip igmp groups
NOTE: static-group information not shown below. Use the
      'show ip igmp static-groups' command.
IGMP Connected Group Membership

### 15.2.8.61 show ip igmp host-proxy config-sanity

The **show ip igmp host-proxy config-sanity** command displays diagnostic information about an IGMP host proxy configuration.

#### Command Mode

EXEC

#### Command Syntax

```
show ip igmp host-proxy config-sanity
```

#### Example

- This command displays IGMP host proxy configuration diagnostic information.

```
switch>show ip igmp host-proxy config-sanity
Below are hints of potential IGMP Host-Proxy misconfigurations
IGMP host-proxy configured on interface Test3:
Access-lists having "deny ip any any" rule:
acl1
acl2
Groups with overlapping permit and deny configurations:
192.168.1.1/32
192.168.2.2/32
192.168.4.4/32
Groups with source filters configured with IGMP Host-Proxy set to
version 2 :
192.168.2.2/32
192.168.3.0/24
192.168.3.3/32
192.168.8.8/32
switch>
```

### 15.2.8.62 show ip igmp host-proxy interface

The **show ip igmp host-proxy interface** command displays per-interface IGMP host-proxy configuration information, including the IGMP groups joined on the interface. Command filters allow the list to display only data for a specified interface and to include packet counter statistics in the display.

#### Command Mode

EXEC

#### Command Syntax

```
show ip igmp host-proxy interface [interface] [detail]
```

#### Parameters

- *interface* optional parameter to limit the display to a single interface. Omitting the parameter displays host-proxy configuration information for all interfaces on which IGMP host-proxy is configured. Options include:
  - **ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **port-channel** *p\_num* port-channel Interface specified by *p\_num*.
  - **vlan** *v\_num* VLAN interface specified by *v\_num*.
- detail use this optional keyword to include packet counter statistics in the display.

#### Examples

- This command displays host-proxy information for all switch interfaces on which IGMP host-proxy is configured.

```
switch>show ip igmp host-proxy interface
IGMP host-proxy configured on: Test2
IGMP host-proxy version: 3
Unsolicited-report interval: 1.0
Device name: Test2
Interface Group Address IncludeSrc ExcludeSrc
Test2 172.16.89.0
Test2 172.16.0.0 20.0.0.0
Test2 172.16.0.0 10.0.0.0
Test2 192.168.110.0 20.0.0.0
```

- This command displays host-proxy information for all switch interfaces on which IGMP host-proxy is configured, plus host-proxy statistics.

```
switch>show ip igmp host-proxy interface detail
IGMP host-proxy configured on: Test2
IGMP host-proxy version: 3
Unsolicited-report interval: 1.0
Device name: Test2
Interface Group Address IncludeSrc ExcludeSrc
Test2 172.16.89.0
Test2 172.16.0.0 20.0.0.0
Test2 172.16.0.0 10.0.0.0
Test2 192.168.110.0 20.0.0.0
IGMP host-proxy statistics:

### 15.2.8.63 show ip igmp interface

The **show ip igmp interface** command displays multicast information about the specified interface.

#### Command Mode

EXEC

#### Command Syntax

```
show ip igmp interface [INT_NAME]
```

#### Parameters

- INT\_NAME Interface type and number. Values include
  - **<no parameter>** Displays information for all interfaces.
  - **ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **loopback** *l\_num* Loopback interface specified by *l\_num*.
  - **management** *m\_num* Management interface specified by *m\_num*.
  - **port-channel** *p\_num* Port-Channel Interface specified by *p\_num*.
  - **vlan** *v\_num* VLAN interface specified by *v\_num*.
  - **vxlan** *vx\_num* VXLAN interface specified by *vx\_num*.

#### Example

- This command displays multicast related information about VLAN 26.

```
switch>show ip igmp interface vlan 26
Vlan26 is up
Interface address: 172.17.26.1/23
IGMP on this interface: enabled
Multicast routing on this interface: enabled
Multicast TTL threshold: 1
Current IGMP router version: 2
IGMP query interval: 125 seconds
IGMP max query response time: 100 deciseconds
Last member query response interval: 10 deciseconds
Last member query response count: 2
IGMP querier: 172.17.26.1
Robustness: 2
Require router alert: enabled
Startup query interval: 312 deciseconds
Startup query count: 2
General query timer expiry: 00:00:22
Multicast groups joined:
    239.255.255.250
switch>
```

---

### 15.2.8.64 show ip igmp profile

The `show ip igmp profile` command displays the contents of the specified IGMP profile. IGMP snooping filters use an IGMP profile to control the multicast groups that an interface can join.

#### Command Mode

EXEC

#### Command Syntax

```
show ip igmp profile [PROFILES]
```

#### Parameters

- PROFILES IGMP profiles for which command displays contents. Options include:
  - <no parameter> displays all IGMP profiles.
  - *profile\_name* displays specified profile.

#### Example

- This command displays the IGMP profiles configured on the switch.

```
switch>show ip igmp profile
IGMP Profile list_1
permit
range 229.1.24.0 229.1.25.255
IGMP Profile list_2
deny
range 234.1.1.0 234.1.255.255
switch>
```

### 15.2.8.65 show ip igmp snooping counters ethdev-pams

The `show ip igmp snooping counters` command displays the number of dropped IGMP packets messages sent and received through each switch port at the kernel level. The display table sorts the messages by type.

#### Command Mode

EXEC

#### Command Syntax

```
show ip igmp snooping counters ethdev-pams
```

#### Example

- This command displays the number of messages dropped at the kernel level.

```
switch>show ip igmp snooping counters ethdev-pams
  IntfName  rxErrors  txErrors  txDrops
    et9      1          0          0
    et18     1          0          0
    mlag9    1          0          0
    mlag8    1          0          0
    et17     1          0          0
    po1     1          0          0
    po2     1          0          0
    et15     1          0          0
    et6      1          0          0
    mlag10   1          0          0
    et16     1          0          0
    mlag7    1          0          0
    et11     1          0          0
    mlag5    1          0          0
    mlag4    1          0          0
    cpu     1          0          0
    et13     1          0          0
switch>
```

## 15.2.8.66 show ip igmp snooping counters

The **show ip igmp snooping counters** command displays the number of IGMP messages sent and received through each switch port. The display table sorts the messages by type.

### Command Mode

EXEC

### Command Syntax

```
show ip igmp snooping counters [ DATA_TYPE ][ DATA_LEVEL ]
```

### Parameters

- **DATA\_TYPE** Information displayed by the command. Options include:
  - <no parameter> displays transmission counters.
  - **errors** displays error counters.
- **DATA\_LEVEL** specifies the type of information displayed. Options include:
  - <no parameter> number of packets on physical ports.
  - **detail** number of packets on physical ports.

### Example

- This command displays the number of messages received on each port.

```
switch>show ip igmp snooping counters
```

| Port   | Input   |         |        |        | Errors | Output  |         |        |        |
|--------|---------|---------|--------|--------|--------|---------|---------|--------|--------|
|        | Queries | Reports | Leaves | Others |        | Queries | Reports | Leaves | Others |

### 15.2.8.67 show ip igmp snooping groups count

The **show ip igmp snooping groups count** command displays the number of multicast groups on the switch. Command provides options to only include specific VLANs and ports.

#### Command Mode

EXEC

#### Command Syntax

```
show ip igmp snooping groups [VLAN_ID][PORT_INT] count [DATA]
```

#### Parameters

- VLAN\_ID specifies VLAN for which command displays information. Options include:
  - <no parameter> all VLANs.
  - **vlan** *v\_num* specified VLAN.
- PORT\_INT specifies physical ports for which command displays information. Options include:
  - <no parameter> all physical ports.
  - **interface ethernet** *e\_range* specified Ethernet ports.
  - **interface port-channel** *p\_range* specified port channels.

Valid *e\_range* and *p\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

- DATA specifies the type of information displayed. Options include:
  - <no parameter> number of multicast group on specified VLAN and ports.
  - **detail** number of multicast group on specified VLAN and ports.

#### Example

- This command displays the number of multicast groups on the switch.

```
switch>show ip igmp snooping groups count
Total number of multicast groups: 2
switch>
```

### 15.2.8.68 show ip igmp snooping groups

The **show ip igmp snooping groups** command displays IGMP snooping statistics. Available information includes the physical ports that send and receive information, the time when multicast data was originally and most recently heard on the ports, and the version number of the IGMP messages. Command provides options that restrict the output to specific VLANs, ports, and groups.

#### Command Mode

EXEC

#### Command Syntax

```
show ip igmp snooping groups proxy [VLAN_ID][PORT_INT][GROUPS][DATA]
```

#### Parameters

- VLAN\_ID specifies VLAN for which command displays information. Options include:
  - <no parameter> displays information for all VLANs.
  - **vlan** *v\_num* displays information for VLAN *v\_num* (1 to 4094).
- PORT\_INT specifies physical ports for which command displays information. Options include:
  - <no parameter> displays information for all physical ports.
  - **interface ethernet** *e\_range*, where *e\_range* is the number, range, or list of Ethernet ports.
  - **interface port-channel** *p\_range*, where *p\_range* is the number, range, or list of channel ports.
- GROUPS specifies the multicast groups. Options include:
  - <no parameter> all multicast groups on all specified ports.
  - *mgroup\_address* multicast group specified by IPv4 address (dotted decimal notation).
  - **dynamic** multicast groups learned through IGMP.
  - **user** multicast groups manually added.
- DATA specifies the type of information displayed. Options include:
  - <no parameter> VLAN number and port-list for each group.
  - **detail** port-specific information for each group, including transmission times and expiration.
- **proxy** displays IGMP snooping proxy information.

#### Examples

- This command displays the port lists for all multicast groups.

```
switch>show ip igmp snooping groups
Vlan  Group                Type      Version      Port-List

### 15.2.8.69 show ip igmp snooping mrouter

The **show ip igmp snooping mrouter** command displays the status of dynamic and static multicast router ports. Command provides options to include only specific VLANs.

#### Command Mode

EXEC

#### Command Syntax

```
show ip igmp snooping mrouter [VLAN_ID] [DATA]
```

#### Parameters

- VLAN\_ID specifies VLAN for which command displays information. Options include:
  - <no parameter> all VLANs.
  - **vlan** *v\_num* specified VLAN.
- DATA specifies the type of information displayed. Options include:
  - <no parameter> displays VLAN number and port-list for each group.
  - **detail** displays port-specific data for each group; includes transmission times and expiration.

#### Examples

- This command displays port information of each multicast router on all VLANs.

```
switch>show ip igmp snooping mrouter
Vlan    Interface-ports
-----
1       Po1 (dynamic)
20      Po1 (dynamic)
26      Cpu (dynamic)
2028    Cpu (dynamic), Po1 (dynamic)
switch>
```

- This command displays multicast router information for each port.

```
switch>show ip igmp snooping mrouter detail
Vlan  Intf      Address           FirstHeard  LastHeard  Expires
Type
-----
1     Po1       172.17.0.37      31549:12   0:12      1:33      pim
20    Po1       172.17.20.1     7066:51    0:19      1:26      pim
26    Cpu       172.17.26.1     31549:16   0:28      1:17      pim
2028  Po1       172.17.255.29   31549:10   0:18      1:27      pim
2028  Cpu       172.17.255.30   31549:14   0:28      1:17      pim
switch>
```

### 15.2.8.70 show ip igmp snooping report-flooding

The `show ip igmp snooping report-flooding` command displays IGMP snooping L2 report flooding configuration and status information. Command provides options to only include specific VLANs.

#### Command Mode

EXEC

#### Command Syntax

```
show ip igmp snooping report-flooding [VLAN_ID][DATA]
```

#### Parameters

- VLAN\_ID specifies VLANs for which command displays information. Options include:
  - <no parameter> all VLANs.
  - **vlan** *v\_num* specified VLAN.
- DATA specifies the type of information displayed. Options include:
  - <no parameter> displays VLAN number and port-list for each group.
  - **detail** displays port-specific data for each group; includes transmission times and expiration.

---

### 15.2.8.71 show ip igmp snooping

The `show ip igmp snooping` command displays the switch's IGMP snooping configuration.

#### Command Mode

EXEC

#### Command Syntax

```
show ip igmp snooping [VLAN_ID]
```

#### Parameters

- VLAN\_ID specifies VLANs for which command displays information. Options include:
  - <no parameter> displays information for all VLANs.
  - **vlan** *v\_num* displays information for specified VLAN.

#### Example

- This command displays the switch IGMP snooping configuration.

```
switch>show ip igmp snooping
  Global IGMP Snooping configuration:
  -----
IGMP snooping                : Enabled
Robustness variable          : 2

Vlan 1 :
-----
IGMP snooping                : Enabled
Multicast router learning mode : pim-dvmrp

Vlan 20 :
-----
IGMP snooping                : Enabled
Multicast router learning mode : pim-dvmrp

Vlan 26 :
-----
IGMP snooping                : Enabled
Multicast router learning mode : pim-dvmrp

Vlan 2028 :
-----
IGMP snooping                : Enabled
Multicast router learning mode : pim-dvmrp
switch>
```

### 15.2.8.72 show ip igmp static-groups acl

The **show ip igmp static-groups acl** command displays information about the IGMP multicast static groups that are configured by the specified access control list (ACL). The command also displays problems with an ACL that prevent its assignment to an interface.

#### Command Mode

EXEC

#### Command Syntax

```
show ip igmp static-groups acl
```

#### Example

- The following **show ip igmp static-group acl** command example references these ACLs:

```
ip access-list 1
 10 permit igmp host 10.1.1.1 10.1.1.0/29
 20 permit igmp host 10.1.1.2 10.1.1.0/29
!
ip access-list 2
 10 permit igmp 10.1.1.0/29 host 10.1.1.1
!
ip access-list 3
 10 deny igmp host 10.1.1.1 255.1.1.0/29
!
ip access-list 4
 10 permit igmp host 10.1.1.1 10.1.1.0/29
 20 permit igmp 10.1.1.0/29 host 10.1.1.1
```

- This command displays static group configuration data about the various ACLs.

```
switch>show ip igmp static-group acl 1
acl 1
   ( 10.1.1.1, 10.1.1.0/29 )
   ( 10.1.1.2, 10.1.1.0/29 )
Interfaces using this ACL for static groups:
   Ethernet12
switch>show ip igmp static-group acl 2
acl 2
   Seq no 30: source address must be a single host or *, not a
   range
Interfaces using this ACL for static groups:
   Ethernet8
switch>show ip igmp static-group acl 3
acl 4
   Seq no 10: action must be 'permit'
Interfaces using this ACL for static groups:
   none
switch>show ip igmp static-group acl 4
acl 5
   ( 10.1.1.1, 10.1.1.0/29 )
Seq no 20: source address must be a single host
or *, not a range
Interfaces using this ACL for static groups:
   none
switch>
```

---

### 15.2.8.73 show ip igmp static-groups group

The `show ip igmp static-groups group` command displays information about all specified IGMP multicast static groups. IGMP multicast static groups are assigned with the [ip igmp static-group](#) command.

#### Command Mode

EXEC

#### Command Syntax

```
show ip igmp static-groups group [GROUP_LIST]
```

#### Parameters

- GROUP LIST Groups for which command displays information
  - <no parameter> all multicast groups.
  - *group\_address* single multicast group address (dotted decimal notation).

#### Related Commands

- [show ip igmp static-groups](#)

### 15.2.8.74 show ip igmp static-groups

The **show ip igmp static-groups** command displays information about all configured IGMP multicast static groups. IGMP multicast static groups are assigned with the [ip igmp static-group](#) command.

#### Command Mode

EXEC

#### Command Syntax

```
show ip igmp static-groups [INFO_LEVEL] [interface INT_NAME]
```

#### Parameters

- INFO\_LEVEL specifies the type of information displayed. Options include
  - <no parameter> VLAN number and port-list for each group.
  - **detail** port-specific information for each group, including transmission times and expiration.
- INT\_NAME Interface type and number. Values include
  - <no parameter> static groups on all interfaces.
  - **ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **loopback** *l\_num* Loopback interface specified by *l\_num*.
  - **management** *m\_num* Management interface specified by *m\_num*.
  - **port-channel** *p\_num* Port-Channel Interface specified by *p\_num*.
  - **vlan** *v\_num* VLAN interface specified by *v\_num*.
  - **vxlan** *vx\_num* VXLAN interface specified by *vx\_num*.

#### Related Commands

- [show ip igmp static-groups acl](#)
- [show ip igmp static-groups group](#)

#### Examples

- This command displays information about all multicast static groups.

```
switch>show ip igmp static-groups
Interface Vlan281:
    Manually configured groups:
Interface Port-Channel999:
    Manually configured groups:
switch>
```

- This command displays information about the multicast static groups on VLAN interface 21.

```
switch>show ip igmp static-groups interface vlan 21
Interface Vlan281:
    Manually configured groups:
switch>
```

---

### 15.2.8.75 show ip igmp statistics

The **show ip igmp statistics** command displays IGMP transmission statistics for the specified interface.

#### Command Mode

EXEC

#### Command Syntax

```
show ip igmp statistics [ INTERFACE_ID ]
```

#### Parameters

- **INTERFACE\_ID** Specifies interface for which command returns data. Options include:
  - <no parameter> all interfaces.
  - **interface ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **interface loopback** *l\_num* Loopback interface specified by *l\_num*.
  - **interface management** *m\_num* Management interface specified by *m\_num*.
  - **interface port-channel** *p\_num* Port-Channel Interface specified by *p\_num*.
  - **interface vlan** *v\_num* VLAN interface specified by *v\_num*.
  - **interface vxlan** *vx\_num* VXLAN interface specified by *vx\_num*.

#### Example

- This command displays IGMP transmission statistics for ethernet 1 interface.

```
switch>show ip igmp statistics interface ethernet 1
IGMP counters for Ethernet1:
  V1 queries sent: 0
  V2 queries sent: 0
  V3 queries sent: 3
  Total general queries sent: 3
  V3 group specific queries sent: 0
  V3 group-source specific queries sent: 0
  V1 queries received: 0
  V2 queries received: 0
  V3 queries received: 0
  V1 reports received: 0
  V2 reports received: 0
  V3 reports received: 14
  V2 leaves received: 0
  Error Packets received: 0
  Other Packets received: 0
switch>
```

## 15.3 Protocol Independent Multicast

Protocol Independent Multicast (PIM) distributes multicast data using routes gathered by other protocols. Arista switches support two types of PIM: PIM Sparse Mode (PIM-SM) and Bidirectional PIM (Bidir-PIM).

These sections describe the Arista PIM implementation:

- [Introduction](#)
- [Overview](#)
- [Configuring PIM](#)
- [Multicast Example](#)
- [PIM Commands](#)

## 15.3.1 Introduction

Protocol Independent Multicast (PIM) distributes multicast data using routes gathered by other protocols. PIM Sparse Mode (PIM-SM), defined in RFC 4601, is a multicast routing protocol intended for networks where multicast group recipients are sparsely distributed, including wide-area and inter-domain networks. Bidirectional PIM (Bidir-PIM), defined in RFC 5015, is a variant of PIM-SM designed for cases in which the receivers of multicast traffic are also sources and where scalability could affect optimization.

Arista switches support both PIM Sparse-Mode (PIM-SM) and Bidirectional PIM (Bidir-PIM).

## 15.3.2 Overview

PIM builds and maintains multicast routing trees using reverse path forwarding (RPF) on a unicast routing table. PIM is protocol-independent, and can use routing tables consisting of OSPF, BGP, RIP, and static routes. All sources send traffic to multicast groups through shared trees that have a common root node called the rendezvous point (RP).

PIM uses a multicast routing information base (MRIB) that is populated from the unicast table. The MRIB provides the next-hop router for each multicast destination subnet. This determines the next-hop neighbor for sending PIM join or prune messages.

### 15.3.2.1 PIM Sparse Mode

In PIM-SM, each host (sender or receiver) is associated with a designated router (DR) that acts for all directly connected hosts in PIM-SM transactions, and trees are unidirectional. Once sufficient traffic is flowing on a route it usually does not pass through the RP.

PIM-SM establishes multicast routes through three phases:

- Establishing the RP Tree
- Eliminating Encapsulation
- Establishing the Shortest Path Tree (SPT)

#### 15.3.2.1.1 Establishing the RP Tree (Phase 1)

The RP tree is a distribution network that all sources share to deliver multicast data. The root of the RP tree is the Rendezvous Point.

The process starts when a receiver requests multicast data from a group (G). The receiver's DR sends a PIM (\*,G) Join message toward the multicast group's RP. As the message travels towards the RP, it instantiates the multicast (\*,G) state in each router on the path. Join messages converge on the RP to form the RP tree.

The DR resends Join messages periodically, while it has a receiver in the group, to prevent state timeout expiry in the routers along the path. When all receivers on a DRs subnet leave a group, the DR sends a (\*,G) Prune message towards the RP to remove the state from the routers.

A multicast sender transmits multicast data to the RP through its DR. The DR encapsulates the multicast packets and sends them as unicast packets. The RP extracts the native multicast packet and sends it to the RP tree towards the group members.

#### 15.3.2.1.2 Eliminating Multicast Encapsulation (Phase 2)

Data encapsulation, while initially required before the multicast path is established, is inefficient because it requires the transmission of data that is extraneous to multicast. Phase 2 establishes states in the routers that support the transmission of native multicast packets.

When the RP receives an encapsulated packet from source S on group G, it sends an (S,G) join message toward the source. As the message travels towards S, it instantiates the (S,G) state on each

---

router in the path which is used to forward packets from source S destined for group G. Data packets on the (S,G) path are also routed into the RP tree when they encounter an (\*,G) router.

When the RP starts receiving native packets from the sources, it sends a Register-Stop message to the sources DR, halting packet encapsulation. At this time, traffic flows natively from the source along a source-specific tree to the RP, then along the shared RP tree to the receivers.

### 15.3.2.1.3 Establishing the Shortest Path Tree (Phase 3)

The third phase establishes the shortest path from the multicast source to all receivers.

When a multicast packet arrives at the receiver, its router (typically the DR) sends a Join message towards the source to instantiate the (S,G) state in all routers along its path. The message eventually reaches either the sources subnet or a router that already has an (S,G) state. This causes data to flow from the source to the receiver following the (S,G) path. At this time, the receiver is receiving data from the shortest path tree (SPT) and the RP tree (RPT).

The DR (or upstream router) eliminates the data transmission along the RPT by sending a prune message (S,G,rpt) towards the RP. The message instantiates the state on each router in the path, continuing until it reaches the RP or a router that needs traffic from the same source for other receivers.

### 15.3.2.2 Bidirectional PIM

Bidirectional PIM (Bidir-PIM) builds shared trees, rooted at the rendezvous point (RP), for each multicast group. Because the trees are based only on (\*,G) routes, they can accommodate a much larger number of sources without overfilling the MFIB.

In Bidir-PIM, there is no multicast encapsulation or SPT establishment. All packets are natively forwarded toward the RP along shared, bidirectional trees. There are also no designated routers. Instead, a single designated forwarder (DF) is elected on each link to each RP, usually during the RP discovery process. The DF is the router with the shortest route to the RP based on the unicast routing table. It is responsible for forwarding upstream traffic toward the RP and forwarding downstream traffic toward the groups on its link. All routes pass through the RP, and multicast packets are sent from sources toward the RP and to receivers at each hop along the route.

Bidir-PIM elects DFs when a new RP is discovered, when the DF fails, or when there is a change that affects the topology of the link.

### 15.3.2.3 Rendezvous Points (RP)

In PIM-SM, an RP is a router that is configured as the root of multicast groups distribution tree. These distribution trees are not source-specific. The RP is the destination for both join messages from receivers and data from senders, allowing receivers discover sender identity and begin receiving group traffic. In PIM-SM, paths through RP routers are temporary; when traffic volume reaches a sufficient level, the receiver joins a source-specific tree and the path through the RP is dropped. In Bidir-PIM, all paths pass through the RP, and all packets destined for a given multicast group are forwarded to the RP for that group.

RP addresses in Bidir-PIM must be routable from all sources in the domain, but do not have to correspond to any specific physical interface. Multiple groups can use the same RP for distribution.

The switch supports two methods of mapping RPs to multicast groups:

- Static: RPs are statically configured through a CLI statement.
- Dynamic: RPs are dynamically selected by a bootstrap router from a set of candidate RPs.

While dynamic RP mappings have priority over static maps by default, a static RP can be configured to override dynamic mappings.

[Rendezvous Points \(RPs\)](#) describes the configuration of rendezvous points.

### 15.3.3 Configuring PIM

This section describes the following configuration tasks:

- [Enabling PIM IPv4 Sparse Mode](#)
- [Enabling PIM IPv6 Sparse Mode](#)
- [Enabling the S, G Expiry Timer Interval](#)
- [Enabling PIM Bidirectional](#)
- [Rendezvous Points \(RPs\)](#)
- [Hello Messages](#)
- [Hello Hold Time](#)
- [Designated Router Election](#)
- [Designated Forwarder Election](#)
- [Join-Prune Messages](#)
- [Legacy PIM Configuration in Global Configuration Mode](#)
- [Configuring PIM in a Non-default VRF](#)

#### 15.3.3.1 Enabling PIM IPv4 Sparse Mode

By default, IPv4 PIM is disabled on an interface. The [pim ipv4 sparse-mode](#) command enables PIM IPv4 Sparse Mode (PIM-SM) on the configuration mode interface. Enabling PIM on an interface enables IGMP on the interface as well.

##### Example

This command enables IPv4 PIM-SM and IGMP on VLAN interface 8.

```
switch(config)#interface vlan 8
switch(config-if-Vl8)#pim ipv4 sparse-mode
switch(config-if-Vl8)#
```

#### 15.3.3.2 Enabling PIM IPv6 Sparse Mode

By default, IPv6 PIM is disabled on an interface. The [pim ipv6 sparse-mode](#) command enables PIM IPv6 Sparse Mode (PIM-SM) on the configuration mode interface.

##### Example

This command enables IPv6 PIM-SM on Ethernet interface 15.

```
switch(config)#interface ethernet 15
switch(config-if-Et15)#pim ipv6 sparse-mode
switch(config-if-Et15)#
```

#### 15.3.3.3 Enabling the S, G Expiry Timer Interval

The [sg-expiry-timer](#) command enables expiry timer interval for the PIM-SM multicast routes. By default, the [sg-expiry-timer](#) command applies to the default VRF when the command is issued in the Router-Multicast Configuration mode. During the time of interval, there is no multicast traffic activity on the route.

---

## Example

This command configures 150 seconds as the (S,G) expiry timer interval in the default VRF.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#sg-expiry-timer 150
switch(config-router-pim-sparse-ipv4)#
```

### 15.3.3.4 Enabling PIM Bidirectional

By default, PIM is disabled on an interface. The `pim ipv4 bidirectional` command enables Bidirectional PIM (Bidir-PIM) on the configuration mode interface. Enabling PIM on an interface also enables IGMP on that interface.

## Example

These commands enable Bidir-PIM and IGMP on VLAN interface 9.

```
switch(config)#interface vlan 9
switch(config-if-Vl9)#pim ipv4 bidirectional
switch(config-if-Vl9)#
```

### 15.3.3.5 Rendezvous Points (RPs)

The switch supports dynamic RPs, static RPs, and anycast RPs.

## Configuring Static RPs

The `rp address` command configures a static RP, providing an option to override dynamic RPs.

## Examples

- This command creates a static RP at 10.17.255.83 in the default VRF that maps to all multicast groups (224/4) and overrides dynamic RPs.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#rp address 10.17.255.83 override
switch(config-router-pim-sparse-ipv4)#
```

- This command creates a static RP at 10.21.18.23 in the default VRF that maps to the multicast groups at 238.1.12.0/24.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#rp address 10.21.18.23
238.1.12.0/24
switch(config-router-pim-sparse-ipv4)#
```

## Configuring Dynamic RPs

Dynamic RP selection is implemented through a bootstrap router (BSR), which is a PIM router within the PIM domain that selects RPs from a list of candidates. A subset of PIM routers within the domain are configured as candidate bootstrap routers (C-BSRs). Through the exchange of bootstrap messages (BSMs), the C-BSRs elect the BSR, which then uses BSMs to inform all domain routers of its status.

The BSR holdtime defines the timeout period that an elected BSR remains valid after the receipt of a BSM and is also used in dynamic RP configuration. Holdtime is designated by the BSR router and communicated to other routers through BSMs.

Another subset of domain PIM routers are configured as candidate RPs (C-RPs). The BSR creates a set of qualifying RPs from the list of C-RPs, then distributes the group-to RP mapping set to all domain routers through BSMs. Each PIM router, after receiving this set, uses a standard algorithm defined in RFC 6226 to select one RP per multicast group.

The `candidate` command configures the switch as a candidate BSR router (C-BSR). Command parameters specify the switchs BSR address, the interval between BSM transmissions, and the switchs BSR priority rating. Priority ratings range from 0 to 255 with a default of 64. Higher numbers denote higher priority during BSR elections.

### Example

These commands configure the switch as a BSR candidate in the default VRF, using the IP address assigned to VLAN interface 24 as its BSR address. The BSM transmission interval is set to 30 seconds and the priority is set to 192.

```
switch(config)#router pim bsr
switch(config-router-pim-bsr)#ipv4
switch(config-router-pim-bsr-ipv4)#candidate vlan 24 priority 192
interval 30
switch(config-router-pim-bsr-ipv4)#
```

The `holdtime` command specifies the value the switch inserts in the *holdtime* field of bootstrap messages (BSMs) that it sends. This value becomes the holdtime for the PIM domain if the switch is elected as the BSR.

### Example

These commands specify 75 seconds as the value that the switch inserts into BSM holdtime fields in the default VRF.

```
switch(config)#router pim bsr
switch(config-router-pim-bsr)#ipv4
switch(config-router-pim-bsr-ipv4)#holdtime 75
switch(config-router-pim-bsr-ipv4)#
```

The `rp candidate` command configures the switch as a candidate rendezvous point (C-RP). The BSR selects a multicast groups dynamic RP set from the list of C-RPs. Command parameters specify the switchs RP address, C-RP advertisement interval, and priority rating. The priority rating is used by the BSR when selecting RPs. The C-RP advertisement interval specifies the period between successive C-RP advertisement message transmissions to the BSR.

**Running-config** may contain multiple `rp candidate` statements to support multiple multicast groups:

- All commands must specify the same interface. Issuing a command with an interface that differs from existing commands removes all existing commands from **running-config**.
- **Running-config** stores the interval setting in a separate statement that applies to all `rp candidate` statements. Commands that specify an interval that differs from the previously configured value place the new value in **running-config**. This new value applies to all `rp candidate` statements.

---

## Example

These commands configure a switch as a candidate RP for the multicast group 235.1.1.0/24, with a priority of 48 and a RP advertisement interval of 45 seconds, in the default VRF.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#rp candidate vlan 24 235.1.1.0/24
priority 48 interval 45
switch(config-router-pim-sparse-ipv4)#
```

By default, the switch transmits bootstrap router messages (BSMs) over all PIM-enabled interfaces. The `pim bsr ipv4 border` command prevents the switch from transmitting BSMs over the configuration mode interface.

## Example

This command prevents the switch from sending BSMs from VLAN interface 10.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#pim bsr ipv4 border
switch(config-if-Vl10)#
```

## Anycast Rendezvous Points

A PIM anycast rendezvous point (anycast RP) defines a single RP address that exists on multiple devices. An anycast-RP set consists of the routers configured with the same anycast-RP address. An anycast RP provides redundancy protection and load balancing. The anycast-RP set supports all multicast groups.

The `anycast-rp` command configures the switch as a member of an anycast-RP set and establishes a communication link with another member of the set.

## Example

These commands configure a switch (IP address 10.1.1.14) into an anycast-RP set with an RP address of 10.17.255.2 in the default VRF. The anycast-RP set contains three other routers, located at 10.1.2.14, 10.1.3.14, and 10.1.4.14. It sets the number of unacknowledged register messages it sends to each router at 15.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.1.14
register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.2.14
register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.3.14
register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.4.14
register-count 15
switch(config-router-pim-sparse-ipv4)#
```

### 15.3.3.6 Hello Messages

PIM-SM multicast routers send PIM router query messages (hello messages) to elect a designated router (DR) for each subnet. The DR then sends registration messages to the RP.

The `pim ipv4 hello interval` command specifies the transmission interval between PIM hello messages originating from the specified VLAN interface.

## Example

This command configures 45 second intervals between hello messages originating from VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 hello interval 45
switch(config-if-Vl4)#
```

### 15.3.3.7 Hello Hold Time

A PIM interface maintains a hold timer for each of its neighbors. The timer is reset whenever a hello message is received from the neighbor. When the timer expires, the neighbor is considered DOWN. The PIM interface can advertise its neighbor to use a higher hold time by modifying the hello interval, or by setting a higher hello count using the `pim ipv4 hello count` command. The hello count specifies how many hello messages can be missed before the neighbor is considered down; the hold time is therefore the hello interval multiplied by the hello count.

## Examples

- This command configures the PIM hold time on VLAN 2925 to 225 seconds (7.5 times the 30-second hello interval).

```
switch(config)#interface vlan2925
switch(config-if-Vl2925)#ip pim query-count 7.5
```

- This command displays the hold time on VLAN 2925.

```
switch#show ip pim interface vlan2925 details
Interface Vlan2925 address is 1.0.1.1
Vif number is 0
PIM: enabled
PIM version: 2, mode: sparse
PIM neighbor count: 0
PIM Effective DR: 1.0.1.1 (this system)
PIM Effective DR Priority: 1
PIM Effective Propagation Delay: 500 milliseconds
PIM Effective Override Interval: 2500 milliseconds
PIM Effective Tracking Support: disabled
PIM Hello Interval: 30 seconds
PIM Hello Hold Time: 225 seconds <===== New Hold Time ( = 7.5 * 30 )
PIM Hello Priority: 1 seconds
PIM Hello Lan Delay: 500 milliseconds
PIM Assert Override Interval: 3 seconds
switch#
```

### 15.3.3.8 Designated Router Election

PIM-SM uses these criteria for electing a designated router (DR):

- If at least one router does not advertise a DR priority value, then PIM-SM elects the router with the highest IP address as the DR.
- If all routers advertise a DR priority value, then PIM-SM elects the router with the highest DR priority value as the DR.

The `group-expiry-timer` command sets the DR priority value that the switch advertises. If *running-config* does not contain a `pim ipv4 dr-priority` statement, the switch does not advertise a DR priority value.

## Examples

- This command configures a DR priority value of 15 on VLAN interface 4.

```
switch(config-if-Vl4)#pim ipv4 dr-priority 15
switch(config-if-Vl4)#
```

- This command removes the DR priority from VLAN interface 4.

```
switch(config-if-Vl4)#no pim ipv4 dr-priority
switch(config-if-Vl4)#
```

### 15.3.3.9 Designated Forwarder Election

Designated forwarders (DFs) are elected based on route metrics in the unicast routing table; there are no configuration options that affect the selection of DFs.

### 15.3.3.10 Join-Prune Messages

Join/prune messages are sent by the PIM-SM designated router (DR) or the Bidir-PIM designated forwarder (DF) toward the rendezvous point (RP). These messages inform other PIM routers about clients that want to become receivers (join) or stop being receivers (prune) for the groups.

The `pim ipv4 join-prune interval` command specifies the period between join/prune messages that the switch originates from the specified VLAN interface and sends to the upstream RPF neighbor.

#### Example

This command configures 75 second intervals between join/prune messages originating from VLAN interface 4.

```
switch(config-if-Vl4)#pim ipv4 join-prune interval 75
switch(config-if-Vl4)#
```

### 15.3.3.11 Legacy PIM Configuration in Global Configuration Mode

Earlier versions of the EOS managed all non-interface-specific PIM configuration from Global Configuration Mode. Legacy configurations retain these global commands in **running-config** after upgrading to a newer version of the EOS, and the configurations are applied unchanged to the default VRF. PIM configuration commands entered in Global Configuration Mode which can be applied to either PIM-SM or Bidir-PIM will be applied to PIM-SM. If any commands are added to **running-config** using the new configuration modes, all legacy commands will be converted to the new modal commands and applied in the default VRF.

**Note:** Multicast configuration commands issued in Global Configuration Mode are now deprecated, and Arista recommends configuring all multicast parameters in the appropriate configuration mode (i.e., Router-Multicast Configuration, Router-PIM Sparse-mode Configuration, Router-PIM Bidirectional Configuration, Router-PIM BSR Configuration, or Router-MSDP Configuration).

### 15.3.3.12 Configuring PIM in a Non-default VRF

For PIM to function in a non-default VRF, the VRF must be created and configured for multicast traffic, and routed ports must be added to the VRF. Once this is accomplished, configure VRF-global PIM parameters by using the `vrf` command within a PIM configuration mode to place the switch in a PIM VRF configuration submode.

Interface-specific PIM parameters are configured in the interface-configuration mode for VRF-member interface.

Legacy multicast routing commands issued in Global Configuration Mode are applied to the default VRF, but are now deprecated and are available only for backward compatibility. If any PIM commands are issued in the new format, all legacy commands remaining in *running-config* will be replaced with their updated equivalents and applied to the default VRF.

### 15.3.3.12.1 Preparing the VRF for PIM Configuration

The following steps prepare a non-default VRF to use PIM:

1. Enable unicast routing in the default VRF.

```
switch(config)#ip routing vrf default
```

2. Create the non-default VRF if not already created.

```
switch(config)#vrf instance purple
```

3. Enable unicast routing on the new VRF.

```
switch(config-vrf-purple)#exit
switch(config)#ip routing vrf purple
```

4. Add participating routed ports to the new VRF.

```
switch(config)#interface ethernet 9/2-9/4
switch(config-if-Et9/2-4)#no switchport
switch(config-if-Et9/2-4)#vrf purple
switch(config-if-Et9/2-4)#exit
```

5. Enable multicast routing on the new VRF.

```
switch(config)#router multicast
switch(config-router-multicast)#vrf purple
switch(config-router-multicast-vrf-purple)#ip multicast routing
```

### 15.3.3.12.2 Configuring Global PIM Parameters in a Non-default VRF

Global PIM parameters for non-default VRFs are configured in the VRF submode of the appropriate PIM configuration mode.

#### Example

These commands configure a switch as a candidate RP for the multicast group 235.1.1.0/24, with a priority of 48 and a RP advertisement interval of 45 seconds, in VRF purple.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#vrf purple
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-vrf-purple-ipv4)#rp candidate vlan 24
235.1.1.0/24 priority 48 interval 45
switch(config-router-pim-sparse-vrf-purple-ipv4)#
```

### 15.3.3.12.3 Configuring Interface-specific PIM Parameters in a Non-default VRF

Interface-specific PIM parameters for member interfaces of a non-default VRF are configured just as they are for the default VRF: in the interface-configuration mode for the interface.

## 15.3.4 Multicast Example

This section provides an example network that implements multicast (PIM-SM) in the default VRF and includes the required commands.

### 15.3.4.1 Diagram

Figure 49: Multicast Example displays the multicast network example. The network contains four routers. Multicast routing (PIM-SM) is enabled on two switches. One switch has its IGMP Snooping Querier enabled.

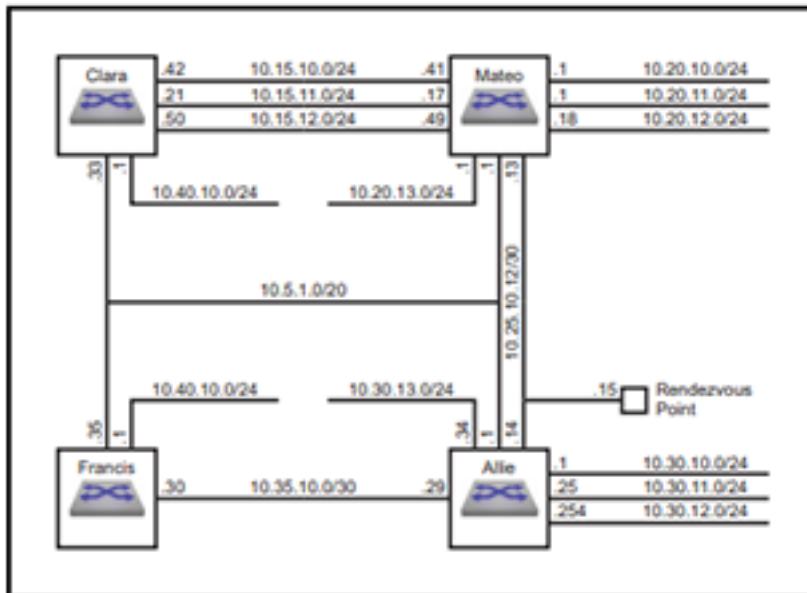

Figure 49: Multicast Example

The example multicast network implements these multicast parameters:

**Rendezvous Point Address: 10.25.10.15**

#### Switch Clara

- IGMP Snooping: disabled
- Subnet Summary:
  - 10.40.10.0/24: VLAN 11
  - 10.15.10.0/24: VLAN 12
  - 10.15.11.0/24: VLAN 13
  - 10.15.12.0/24: VLAN 14
  - 10.5.1.0/20: VLAN 10

#### Switch Mateo

- IGMP Snooping: disabled
- Subnet Summary:
  - 10.20.13.0/24: VLAN 18
  - 10.20.10.0/24: VLAN 15
  - 10.20.11.0/24: VLAN 16

- 10.20.12.0/24: VLAN 17
- 10.15.10.0/24: VLAN 12
- 10.15.11.0/24: VLAN 13
- 10.15.12.0/24: VLAN 14
- 10.25.10.12/30: VLAN 19
- 10.5.1.0/20: VLAN 10

#### Switch Allie

- IGMP Snooping: enabled
- Multicast Routing: enabled
- Querier: enabled
- Rendezvous Point Address: 10.25.10.15
- MFIB activity polling interval: 5 second
- Subnet Summary:
  - 10.30.13.0/24: VLAN 23
  - 10.30.10.0/24: VLAN 20 PIM-SM enabled
  - 10.30.11.0/24: VLAN 21 PIM-SM enabled
  - 10.30.12.0/24: VLAN 22
  - 10.25.10.12/30: VLAN 19
  - 10.35.10.0/30: VLAN 24 PIM-SM enabled
  - 10.5.1.0/20: VLAN 10 PIM-SM enabled

#### Switch Francis

- IGMP Snooping: enabled
- Multicast Routing: enabled
- Subnet Summary:
  - 10.40.10.0/24: VLAN 25 PIM-SM enabled
  - 10.35.10.0/30: VLAN 24 PIM-SM enabled
  - 10.5.1.0/20: VLAN 10

#### 15.3.4.2 Example

This example configures PIM-SM.

##### 1. Configure the interface addresses

###### a. Router Clara interfaces

```
Clara(config)#interface vlan 11
Clara(config-if-vl11)#ip address 10.40.10.1/24
Clara(config-if-vl11)#interface vlan 12
Clara(config-if-vl12)#ip address 10.15.10.42/24
Clara(config-if-vl12)#interface vlan 13
Clara(config-if-vl13)#ip address 10.15.11.21/24
Clara(config-if-vl13)#interface vlan 14
Clara(config-if-vl14)#ip address 10.15.12.50/24
Clara(config-if-vl14)#interface vlan 10
Clara(config-if-vl10)#ip address 10.5.1.33/20
Clara(config-if-vl10)#router ospf 1
Clara(config-router-ospf)#redistribute static
```

## b. Router Mateo interfaces

```
Mateo(config)#interface vlan 18
Mateo(config-if-vl18)#ip address 10.20.13.1/24
Mateo(config-if-vl18)#interface vlan 15
Mateo(config-if-vl15)#ip address 10.20.10.1/24
Mateo(config-if-vl15)#interface vlan 16
Mateo(config-if-vl16)#ip address 10.20.11.1/24
Mateo(config-if-vl16)#interface vlan 17
Mateo(config-if-vl17)#ip address 10.20.12.16/24
Mateo(config-if-vl17)#interface vlan 12
Mateo(config-if-vl12)#ip address 10.15.10.41/24
Mateo(config-if-vl12)#interface vlan 13
Mateo(config-if-vl13)#ip address 10.15.11.17/24
Mateo(config-if-vl13)#interface vlan 14
Mateo(config-if-vl14)#ip address 10.15.12.49/24
Mateo(config-if-vl14)#interface vlan 19
Mateo(config-if-vl19)#ip address 10.25.10.13/30
Mateo(config-if-vl19)#interface vlan 10
Mateo(config-if-vl10)#ip address 10.5.1.1/20
Mateo(config-if-vl10)#router ospf 1
Mateo(config-router-ospf)#redistribute static
```

## c. Router Allie interfaces

```
Allie(config)#interface vlan 23
Allie(config-if-vl23)#ip address 10.30.13.34/24
Allie(config-if-vl23)#interface vlan 20
Allie(config-if-vl20)#ip address 10.30.10.1/24
Allie(config-if-vl20)#interface vlan 21
Allie(config-if-vl21)#ip address 10.30.11.25/24
Allie(config-if-vl21)#interface vlan 22
Allie(config-if-vl22)#ip address 10.30.12.254/24
Allie(config-if-vl22)#interface vlan 19
Allie(config-if-vl19)#ip address 10.25.10.14/30
Allie(config-if-vl19)#interface vlan 24
Allie(config-if-vl24)#ip address 10.35.10.29/30
Allie(config-if-vl24)#interface vlan 10
Allie(config-if-vl10)#ip address 10.5.1.1/20
Allie(config-if-vl10)#router ospf 1
Allie(config-router-ospf)#redistribute static
```

## d. Router Francis interfaces

```
Francis(config)#interface vlan 25
Francis(config-if-vl25)#ip address 10.40.10.1/24
Francis(config-if-vl25)#interface vlan 24
Francis(config-if-vl24)#ip address 10.35.10.30/24
Francis(config-if-vl24)#interface vlan 10
Francis(config-if-vl10)#ip address 10.5.1.35/24
Francis(config-if-vl10)#router ospf 1
Francis(config-router-ospf)#redistribute static
```

## 2. Configure the interface multicast parameters

### a. Router Allie interfaces

```
Allie(config-router-ospf)#interface vlan 20
Allie(config-if-vl20)#pim ipv4 sparse-mode
Allie(config-if-vl20)#interface vlan 21
Allie(config-if-vl21)#pim ipv4 sparse-mode
Allie(config-if-vl21)#interface vlan 24
```

```
Allie(config-if-vl24)#pim ipv4 sparse-mode
Allie(config-if-vl24)#interface vlan 10
Allie(config-if-vl10)#pim ipv4 sparse-mode
```

**b. Router Francis interfaces**

```
Francis(config-router-ospf)#interface vlan 25
Francis(config-if-vl25)#pim ipv4 sparse-mode
Francis(config-if-vl25)#interface vlan 24
Francis(config-if-vl24)#pim ipv4 sparse-mode
```

**3. Configure the router multicast parameters**

**a. Router Clara parameters**

```
Clara(config-router-ospf)#exit
Clara(config)#no ip igmp snooping
```

**b. Router Mateo router**

```
Mateo(config-router-ospf)#exit
Mateo(config)#no ip igmp snooping
```

**c. Router Allie router**

```
Allie(config-if-vl10)#exit
Allie(config)#router multicast
Allie(config-router-multicast)#ipv4
Allie(config-router-multicast-ipv4)#routing
Allie(config-router-multicast-ipv4)#activity polling-interval 5
Allie(config-router-multicast-ipv4)#router pim sparse-mode
Allie(config-router-pim-sparse)#ipv4
Allie(config-router-pim-sparse-ipv4)#rp address 10.25.10.15
```

**d. Router Francis router**

```
Francis(config-if-vl24)#exit
Francis(config)#router multicast
Francis(config-router-multicast)#ipv4
Francis(config-router-multicast-ipv4)#routing
Francis(config-router-multicast-ipv4)#router pim sparse-mode
Francis(config-router-pim-sparse)#ipv4
Francis(config-router-pim-sparse-ipv4)#rp address 10.25.10.15
```

---

## 15.3.5 PIM Commands

### PIM Configuration Commands (Global)

- `anycast-rp`
- `candidate`
- `fast-reroute`
- `group-expiry-timer`
- `holdtime`
- `ip pim dr-notify-delay`
- `log neighbors`
- `register local-interface`
- `router pim bidirectional`
- `router pim bsr`
- `router pim sparse-mode`
- `rp address`
- `rp allow`
- `rp candidate`
- `rp-candidate advertisement-filter`
- `rp hash algorithm modulo`
- `sg-expiry-timer`
- `spt threshold`
- `ssm range`

### PIM Configuration Commands (Interface)

- `ipv4`
- `pim bsr ipv4 border`
- `pim ipv4 bidirectional`
- `pim ipv4 border-router`
- `pim ipv4 dr-priority`
- `pim ipv4 hello count`
- `pim ipv4 hello interval`
- `pim ipv4 join-prune count`
- `pim ipv4 join-prune interval`
- `pim ipv4 neighbor-filter`
- `pim ipv4 sparse-mode`
- `pim ipv6 sparse-mode`

### PIM Display Commands

- `show ip pim bsr`
- `show ip pim config-sanity`
- `show ip pim interface`
- `show ip pim neighbor`
- `show ip pim protocol counters`
- `show ip pim register-source`
- `show ip pim rp`
- `show ip pim rp-candidate`
- `show ip pim rp-hash`
- `show ip pim upstream joins`

### 15.3.5.1 anycast-rp

The **anycast-rp** command configures the switch as a member of an anycast-RP set and establishes a communication link with another member of the set.

When the command is issued in Router-Multicast IPv4 Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF IPv4 Configuration Mode.

The **no anycast-rp** and **default anycast-rp** commands remove the corresponding **anycast-rp** command from **running-config**. When the **no** and **default** commands do not include a peer address, all commands for the specified RP address are removed.

#### Command Mode

Router-Multicast IPv4 Configuration

Router-Multicast VRF IPv4 Configuration

#### Command Syntax

```
anycast-rp rp_addr peer_addr [REGISTER]
```

```
no anycast-rp rp_addr [peer_addr]
```

```
default anycast-rp rp_addr [peer_addr]
```

#### Parameters

- **rp\_addr** Rendezvous point IP address (dotted decimal notation).
- **peer\_addr** IP address of another anycast-RP set member (dotted decimal notation).
- **REGISTER** Number of unacknowledged register messages the switch sends to the peer router.
  - *<no parameter>* register count is set to default value of 10.
  - **register-count** *r\_num* where *r\_num* is an integer that ranges from 1 to 4294967295.
  - **register-count infinity**

#### Example

These commands configure a switch (IP address 10.1.1.14) into an anycast-RP set with an RP address of 10.17.255.2 in the default VRF. The anycast-RP set contains three other routers, located at 10.1.2.14, 10.1.3.14, and 10.1.4.14. It sets the number of unacknowledged register messages it sends to each router at 15.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.1.14
register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.2.14
register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.3.14
register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.4.14
register-count 15
switch(config-router-pim-sparse-ipv4)#
```

### 15.3.5.2 candidate

The **candidate** command configures the switch as a candidate BSR router (C-BSR). A BSR is a PIM router within the PIM domain through which dynamic RP selection is implemented. The BSR selects RPs from a list of candidate RPs and exchange bootstrap messages (BSM) with all routers in the domain. The BSR is elected from one of the C-BSRs through an exchange of BSMs.

A subset of PIM routers within the domain are configured as candidate bootstrap routers (C-BSRs). Through the exchange of bootstrap messages (BSMs), the C-BSRs elect the BSR, which then uses BSMs to inform all domain routers of its status.

Command parameters specify the switchs BSR address, the interval between BSM transmissions, the length of the hash mask, and the priority assigned to the switch when electing a BSR.

Entering an **candidate** command replaces any previously configured **candidate** command. If the new command does not specify a priority, hash mask length, or interval, the previously configured values persist in **running-config**.

When the command is issued in Router-PIM BSR IPv4 Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-PIM BSR VRF IPv4 Configuration Mode for the appropriate VRF.

The **no candidate** and **default candidate** commands remove the corresponding **candidate** commands from **running-config**. The **no** and **default** commands restore the priority, hash mask length, and interval parameters to their default values.

#### Command Mode

Router-PIM BSR IPv4 Configuration

Router-PIM BSR VRF IPv4 Configuration

#### Command Syntax

```
candidate INTERFACE [HASHMASK_LENGTH][INTERVAL_PERIOD][PRIORITY_NUM]
no candidate [priority][interval]
default candidate[priority][interval]
```

#### Parameters

- **INTERFACE** Switch uses IP address of specified interface as its BSR address. Options include:
  - **ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **loopback** *l\_num* Loopback interface specified by *l\_num*.
  - **management** *m\_num* Management interface specified by *m\_num*.
  - **port-channel** *p\_num* Port-Channel Interface specified by *p\_num*.
  - **vlan** *v\_num* VLAN interface specified by *v\_num*.
- **HASHMASK\_LENGTH** Length (in bits) of the hash mask.
  - *<no parameter>* hash mask remains unchanged from previous setting.
  - **hashmask** *<0 - 32>* hash mask length (in bits). Default value is 30.
- **INTERVAL\_PERIOD** Period between the transmission of BSMs (seconds). Default value is 60.
  - *<no parameter>* interval remains unchanged from previous setting.
  - **interval** *<10 - 536870906>* transmission interval in seconds.
- **PRIORITY\_NUM** BSR election priority rating. Larger numbers denote higher priority. Default value is 64.
  - *<no parameter>* priority remains unchanged from previous setting.
  - **priority** *<0 - 255>* priority rating.

#### Example

---

These commands configure the switch as a BSR candidate in the default VRF, using the IP address assigned to VLAN interface 24 as its BSR address. The BSM transmission interval is set to 30 seconds and the priority is set to 192.

```
switch(config)#router pim bsr  
switch(config-router-pim-bsr)#ipv4  
switch(config-router-pim-bsr-ipv4)#candidate vlan 24 priority 192  
interval 30  
switch(config-router-pim-bsr-ipv4)#
```

### 15.3.5.3 fast-reroute

The **fast-reroute** command enables Multicast only Fast Re-Route (MoFRR) to minimize traffic loss in a network when a link or node failure occurs. Traffic loss is minimized by allowing the traffic to flow from the secondary path upon the failure of the primary path.

The **no fast-reroute** and **default fast-reroute** commands disable MoFRR by removing the corresponding fast-reroute command from **running-config**.

#### Command Mode

Router-PIM BSR IPv4 Configuration

Router-PIM BSR VRF IPv4 Configuration

#### Command Syntax

```
fast-reroute acl_name
```

```
no fast-reroute acl_name
```

```
default fast-reroute acl_name
```

#### Parameters

**acl\_name** standard access list name.

#### Examples

- These commands enable fast reroute for ACL acl2 in the default VRF under the IPv4 configuration.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#fast-reroute acl2
switch(config-router-pim-sparse-ipv4)#
```

- These commands enable fast reroute for ACL acl2 in VRF red under the IPv4 configuration.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#vrf red
switch(config-router-pim-sparse-vrf-red)#ipv4
switch(config-router-pim-sparse-vrf-red-ipv4)#fast-reroute acl2
switch(config-router-pim-sparse-vrf-red-ipv4)#
```

---

### 15.3.5.4 group-expiry-timer

The **group-expiry-timer** command sets the group-expiry-timer in seconds after which a group with no activity gets deleted from the PIM rendezvous point (RP) tree.

When the command is configured in Global Configuration Mode, the configuration is applied globally on the switch. To apply the configuration only in Bidir-PIM mode, the command is configured in Router-PIM Bidirectional Configuration Mode. To apply the configuration for a specific VRF, the command is configured in the VRF sub-mode of the Router-PIM Bidirectional Configuration Mode. Use the [pim ipv4 bidirectional](#) command to enter Router-PIM Bidirectional Configuration Mode.

The **no group-expiry-timer** and **default group-expiry-timer** applies the system default configuration and removes the corresponding **group-expiry-timer** command from *running-config*.

#### Command Mode

Router-PIM Bidirectional IPv4 Configuration

Router-PIM Bidirectional VRF IPv4 Configuration

#### Command Syntax

```
group-expiry-timer value
```

```
no group-expiry-timer value
```

```
default group-expiry-timer value
```

#### Parameter

**value** specifies the time in seconds after which a group with no activity expires from the PIM RP. Values range from 1 to 210. There is no default value.

#### Examples

- This command configures PIM expiry-timer of 40 seconds in PIM-bidirectional sub-mode.

```
switch(config)#router pim bidirectional
switch(config-router-pim-bidir)#ipv4
switch(config-router-pim-bidir-ipv4)#group-expiry-timer 40
```

- This command configures PIM expiry-timer of 120 seconds for VRF v1.

```
switch(config)#router pim bidirectional
switch(config-router-pim-bidir)#vrf v1
switch(config-router-pim-bidir-vrf-v1)#ipv4
switch(config-router-pim-bidir-vrf-v1-ipv4)#group-expiry-timer 120
```

### 15.3.5.5 holdtime

The **holdtime** command specifies the value the switch inserts in the **holdtime** parameter field in bootstrap messages (BSM) that it sends. The BSR holdtime defines the timeout period that an elected BSR remains valid after the receipt of a BSM and is also used in dynamic RP configuration. BSR holdtime is designated by the BSR router and communicated to other routers through BSMs.

When the command is issued in Router-PIM BSR IPv4 Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-PIM BSR VRF IPv4 Configuration Mode for the appropriate VRF.

The **no holdtime** and **default holdtime** commands restore the default holdtime parameter field insertion value of 130 seconds by removing the **holdtime** statement from **running-config**.

#### Command Mode

Router-PIM BSR IPv4 Configuration

Router-PIM BSR VRF IPv4 Configuration

#### Command Syntax

```
holdtime period
```

```
no holdtime
```

```
default holdtime
```

#### Parameters

**period** BSR holdtime (seconds). Value ranges from 12 to 1073741823 (1.073 billion seconds, approximately 34 years). Default is 130.

#### Example

These commands specify 75 seconds as the value that the switch inserts into BSM holdtime fields in the default VRF.

```
switch(config) #router pim bsr  
switch(config-router-pim-bsr) #ipv4  
switch(config-router-pim-bsr-ipv4) #holdtime 75  
switch(config-router-pim-bsr-ipv4) #
```

---

### 15.3.5.6 ip pim dr-notify-delay

The **ip pim dr-notify-delay** command configures the designated routers (DR) notification delay time. The command is more effective when all PIM routers on the LAN segment have PIM DR priority that is greater than 1.

When the command is issued in Router-Multicast Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF Configuration Mode.

The **no ip pim dr-notify-delay** command removes the previously configured DR notification delay time.

#### Command Mode

Router-Multicast Configuration

Router-Multicast VRF Configuration

#### Command Syntax

```
ip pim dr-notify-delay notify_delay_time  
no ip pim dr-notify-delay
```

#### Parameters

***notify\_delay\_time*** The PIM-designated router notify delay time in seconds. The value ranges from -32767 to 32768.

#### Guidelines

The notification delay time is configured with a positive or negative value. The timer influences DR election timing when a router with the highest DR priority on a LAN segment is reloaded. In an MLAG configuration, the notification delay time begins shortly after the MLAG reload delay expires (before which the PIM hello messages are sent with a priority of 1). In a non-MLAG configuration, the notification delay time begins as soon as the PIM is configured first on the interface.

Positive values for notify delay time cause the device to send PIM hello messages with a priority of 1 until the time the notify delay time expires. During this time, DR responsibilities of the device will continue according to configured DR priority. Negative values configured for the notification delay time will not modify the priority sent in PIM hello messages, but the device will not perform any DR responsibility until the notify delay time expires. Positive values are used to avoid loss of multicast packets, but they may create a few duplicate packets from multiple PIM routers forwarding traffic for the same S,G. Negative values are used to avoid duplicate packets, but they may cause packet loss when there are no PIM routers forwarding traffic for an S,G.

#### Example

These commands configure a DR notification delay time of 2 seconds.

```
switch(config) #router multicast  
switch(config-router-multicast) #ip pim dr-notify-delay 2  
switch(config-router-multicast) #
```

### 15.3.5.7 ipv4

The **ipv4** command places the switch in the IPv4 submode for the PIM configuration mode in which it is entered.

#### Command Mode

Router Multicast Configuration

Router-PIM Bidirectional Configuration

Router-PIM BSR Configuration

Router-PIM Sparse-mode Configuration

#### Command Syntax

```
ipv4
```

#### Examples

- These commands place the switch in Router Multicast IPv4 Configuration Mode.

```
switch(config)#router multicast  
switch(config-router-multicast)#ipv4  
switch(config-router-multicast-ipv4)#
```

- These commands place the switch in Router-PIM Bidirectional IPv4 Configuration Mode.

```
switch(config)#router pim bidirectional  
switch(config-router-pim-bidir)#ipv4  
switch(config-router-pim-bidir-ipv4)#
```

- These commands place the switch in Router-PIM BSR IPv4 Configuration Mode.

```
switch(config)#router pim bsr  
switch(config-router-pim-bsr)#ipv4  
switch(config-router-pim-bsr-ipv4)#
```

- These commands place the switch in Router-PIM Sparse-mode IPv4 Configuration Mode.

```
switch(config)#router pim sparse-mode  
switch(config-router-pim-sparse)#ipv4  
switch(config-router-pim-sparse-ipv4)#
```

---

### 15.3.5.8 log neighbors

The **log neighbors** command configures the switch to generate a log message when a neighbor entry is added or removed from the PIM Neighbor table. This function is enabled by default.

The **no log neighbors** command disables log message generation based on changes to the PIM Neighbor table; this command is stored in the **running-config**. The **log neighbors** and **default log neighbors** commands restore the default setting of generating log messages by deleting the **no log neighbors** statement from **running-config**.

#### Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Router-PIM Bidirectional IPv4 Configuration

Router-PIM Bidirectional VRF IPv4 Configuration

#### Command Syntax

```
log neighbors
```

```
no log neighbors
```

```
default log neighbors
```

#### Examples

- These commands configure the switch to stop generating log messages based on PIM Neighbor table changes in the default VRF.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#no log neighbors
switch(config-router-pim-sparse-ipv4)#
```

- These commands configure the switch to generate log messages when a neighbor entry is added or removed from the PIM Neighbor table in the default VRF.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#log neighbors
switch(config-router-pim-sparse-ipv4)#
```

### 15.3.5.9 pim bsr ipv4 border

The **pim bsr ipv4 border** command prevents the switch from sending bootstrap router messages (BSMs) over the configuration mode interface. By default, BSMs are transmitted over all PIM-enabled interfaces.

The **no pim bsr ipv4 border** and **default pim bsr ipv4 border** commands restore the transmission of BSMs over the configuration mode interface by removing the corresponding **pim bsr ipv4 border** statement from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
pim bsr ipv4 border
```

```
no pim bsr ipv4 border
```

```
default pim bsr ipv4 border
```

#### Example

This command prevents the switch from sending BSMs from VLAN interface 10.

```
switch(config)#interface vlan 10  
switch(config-if-Vl10)#pim bsr ipv4 border  
switch(config-if-Vl10)#
```

---

### 15.3.5.10 pim ipv4 bidirectional

The **pim ipv4 bidirectional** command enables PIM bidirectional and IGMP (router mode) on the configuration mode interface.

**Note:** PIM and multicast border router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The **no pim ipv4 bidirectional**, **no pim ipv4**, **default pim ipv4 bidirectional**, and **default pim ipv4** commands restore the default PIM and IGMP (router mode) settings of **disabled** on the configuration mode interface by removing the **pim ipv4 bidirectional** statement from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
pim ipv4 bidirectional
no pim ipv4
no pim ipv4 bidirectional
default pim ipv4
default pim ipv4 bidirectional
```

#### Example

This command enables PIM bidirectional on VLAN 4 interface.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 bidirectional
switch(config-if-Vl4)#
```

### 15.3.5.11 pim ipv4 border-router

The **pim ipv4 border-router** command configures the configuration mode interface as a PIM multicast border router (MBR). A PIM MBR interface allows multicast traffic from sources that are outside of the PIM domain.

This command does not control the transmission or reception of PIM protocol packets by the interface.

Sources learned through an MBR interface are treated as local sources (directly connected to the switch). The border-bit is set in all PIM register messages sent for these sources.

**Note:** Configuration as an MBR and configuration in PIM sparse mode must be mutually exclusive. Ensure that PIM sparse mode is not configured by issuing the **pim ipv4 sparse-mode** command on the interface before issuing this command.

The **no pim ipv4 border-router** and **default pim ipv4 border-router** commands removes the PIM MBR configuration for the configuration mode interface by removing the corresponding **pim ipv4 border-router** statement from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
pim ipv4 border-router
no pim ipv4 border-router
default pim ipv4 border-router
```

#### Example

These commands configure VLAN interface 200 as a PIM MBR, then display its status.

```
switch(config)#interface vlan 200
switch(config-if-VL200)#ip address 10.44.2.1/24
switch(config-if-VL200)#no pim ipv4 sparse-mode
switch(config-if-VL200)#pim ipv4 border-router
switch(config-if-VL200)#show active
interface Vlan200
ip address 10.44.2.1/24
pim ipv4 border-router
switch(config-if-VL200)#exit
switch(config)#show ip pim interface
AddressInterfaceModeNeighborHello DRDR
AddressPktsQedPktsDropped
CountIntvl Pri
10.44.2.1Vlan200mbr030110.44.2.100
switch(config)#
```

---

### 15.3.5.12 pim ipv4 dr-priority

PIM-SM uses these criteria for electing a designated router (DR):

- If at least one router does not advertise a DR priority value, then PIM-SM elects the router with the highest IP address as the DR.
- If all routers advertise a DR priority value, then PIM-SM elects the router with the highest DR priority value as the DR.

The **pim ipv4 dr-priority** command sets the DR priority value that the configuration mode interface advertises. By default, the interface does not advertise a DR priority value.

The **no pim ipv4 dr-priority** and **default pim ipv4 dr-priority** commands force the use of IP addresses to elect the designated router by removing the corresponding **pim ipv4 dr-priority** statement from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
pim ipv4 dr-priority level  
no pim ipv4 dr-priority [level]  
default pim ipv4 dr-priority [level]
```

#### Parameters

***level*** DR selection priority rating. Value ranges from 0 to 4294967295.

#### Examples

- This command configures the dr-priority value of 15 on VLAN interface 4.

```
switch(config)#interface vlan 4  
switch(config-if-Vl4)#pim ipv4 dr-priority 15  
switch(config-if-Vl4)#
```

- This command force the use of IP addresses to elect the designated router.

```
switch(config-if-Vl4)#no pim ipv4 dr-priority  
switch(config-if-Vl4)#
```

### 15.3.5.13 pim ipv4 hello count

The `pim ipv4 hello count` command sets the PIM hello count for the interface being configured. PIM hold time is calculated by multiplying the configured hello interval by the hello count, ensuring that the PIM neighbor stays up for the specified time after which the neighbor expires.

The `no pim ipv4 hello count` command removes the corresponding `pim ipv4 hello count` command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
pim ipv4 hello count[multiple]
```

```
no pim ipv4 hello count[multiple]
```

#### Parameters

**multiple** hello count multiplier. Value ranges from 1.5 to 65535. The hello hold time is the configured hello interval multiplied by the hello count.

#### Examples

- This command configures a hold time interval of 225 seconds on VLAN interface 2925 by multiplying the default 30-second hello interval by a hello count of 7.5.

```
switch(config)#interface vlan2925
switch(config-if-Vl2925)#pim ipv4 hello count 7.5
switch(config-if-Vl2925)#
```

- This show command displays the hold time and other configuration details on VLAN 2925.

```
switch#show ip pim interface vlan2925 details
Interface Vlan2925 address is 1.0.1.1
Vif number is 0
PIM: enabled
PIM version: 2, mode: sparse
PIM neighbor count: 0
PIM Effective DR: 1.0.1.1 (this system)
PIM Effective DR Priority: 1
PIM Effective Propagation Delay: 500 milliseconds
PIM Effective Override Interval: 2500 milliseconds
PIM Effective Tracking Support: disabled
PIM Hello Interval: 30 seconds
PIM Hello Hold Time: 225 seconds <===== New Hold Time (= 7.5 * 30)
PIM Hello Priority: 1 seconds
PIM Hello Lan Delay: 500 milliseconds
PIM Assert Override Interval: 3 seconds
mrtrl#
```

---

### 15.3.5.14 pim ipv4 hello interval

The **pim ipv4 hello interval** command specifies the transmission interval between PIM hello messages originating from the configuration mode interface.

The **no pim ipv4 hello interval** and **default pim ipv4 hello interval** commands restore the default query interval of 30 seconds for the configuration mode interface by removing the corresponding **pim ipv4 hello interval** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
pim ipv4 hello interval period
```

```
no pim ipv4 hello interval [period]
```

```
default pim ipv4 hello interval [period]
```

#### Parameters

***period*** query interval (seconds). Value ranges from 1 to 1000000 (1 million). Default is 30.

#### Example

This command configures 45 second intervals between hello messages originating from VLAN interface 4.

```
switch(config)#interface vlan 4  
switch(config-if-Vl4)#pim ipv4 hello interval 45  
switch(config-if-Vl4)#
```

### 15.3.5.15 pim ipv4 join-prune count

The **pim ipv4 join-prune count** command configures the number of times a join or prune messages can be missed before the upstream neighbor time expires.

The join-prune interval multiplied by the count is considered as join or prune hold time (specified in seconds), which is used in the join or prune messages. It is recommended to use the default configuration for **pim ipv4 join-prune interval**, and modify the **pim ipv4 join-prune count** to increase the join or prune holdtime. Increasing the join-prune hold time delays the deletion of an S,G route on the upstream neighbor when join-prune messages are not sent to the neighbor. The maximum possible value for join or prune hold-time is 65535.

The **no pim ipv4 join-prune count** and **default pim ipv4 join-prune count** commands restore the default join or prune count for the configuration mode interface by removing the corresponding **pim ipv4 join-prune count** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-VLAN Configuration

#### Command Syntax

```
pim ipv4 join-prune count count_value
no pim ipv4 join-prune count count_value
default pim ipv4 join-prune count count_value
```

#### Parameters

**count\_value** The number of missed join or prune after which the route expires. Value ranges from 1.5 to 65535.

#### Example

This command indicates the number of times a join or prune messages can be missed.

```
switch(config)# interface Ethernet 1/1
switch(config-if-Et1/1)# pim ipv4 join-prune count 5
switch(config-if-Et1/1)#
```

---

### 15.3.5.16 pim ipv4 join-prune interval

The **pim ipv4 join-prune interval** command specifies the period between join or prune messages that the configuration mode interface originates and sends to the upstream RPF neighbor.

The **no pim ipv4 join-prune interval** and **default pim ipv4 join-prune interval** commands restores the default join or prune interval to 60 seconds for the configuration mode interface by removing the corresponding **pim ipv4 join-prune interval** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
pim ipv4 join-prune interval [period]  
no pim ipv4 join-prune interval [period]  
default pim ipv4 join-prune interval [period]
```

#### Parameters

***period*** join or prune interval (seconds). Value ranges from 1 to 18724. Default is 60.

#### Example

This command configures 75-second intervals between join or prune messages originating from VLAN interface 4.

```
switch(config)#interface vlan 4  
switch(config-if-Vl4)#pim ipv4 join-prune interval 75  
switch(config-if-Vl4)#
```

### 15.3.5.17 pim ipv4 neighbor-filter

The **pim ipv4 neighbor-filter** command configures the configuration mode interface to filter PIM control packets on the basis of neighbor addresses listed in a specified standard access list.

The **no pim ipv4 neighbor-filter** and **default pim ipv4 neighbor-filter** commands disable the configuration mode interface from filtering PIM control packets by removing the corresponding **ip pim ipv4 neighbor-filter** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
pim ipv4 neighbor-filter access_list
```

```
no pim ipv4 neighbor-filter
```

```
default pim ipv4 neighbor-filter
```

#### Parameters

**access\_list** name of the standard IP access list.

#### Example

This command configures the IP access list named *filter\_1* to filter neighbor PIM control messages for *VLAN 4*.

```
switch(config)#ip access-list standard filter_1
switch(config-std-acl-filter_1)#permit 10.13.24.9/24
switch(config-std-acl-filter_1)#exit
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 neighbor-filter filter_1
switch(config-if-Vl4)#
```

---

### 15.3.5.18 pim ipv4 sparse-mode

The `pim ipv4 sparse-mode` command enables PIM IPv4 Sparse Mode (PIM-SM) and IGMP (router mode) on the configuration mode interface.

**Note:** PIM and multicast border router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The `no pim ipv4 sparse-mode`, `no pim ipv4`, `default pim ipv4 sparse-mode`, and `default pim ipv4` commands restore the default PIM and IGMP (router mode) settings of **disabled** on the configuration mode interface by removing the `pim ipv4 sparse-mode` statement from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
pim ipv4 sparse-mode
no pim ipv4
no pim ipv4 sparse-mode
default pim ipv4
default pim ipv4 sparse-mode
```

#### Example

This command enables PIM sparse mode on *VLAN 4* interface.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 sparse-mode
switch(config-if-Vl4)#
```

### 15.3.5.19 pim ipv6 sparse-mode

The **pim ipv6 sparse-mode** command enables PIM IPv6 Sparse Mode (PIM-SM) on the configuration mode interface.

**Note:** PIM and multicast border router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The **no pim ipv6 sparse-mode**, **no pim ipv6**, **default pim ipv6 sparse-mode**, and **default pim ipv6** commands restore the default PIM settings of **disabled** on the configuration mode interface by removing the **pim ipv6 sparse-mode** command from the **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

#### Command Syntax

```
pim ipv6 sparse-mode
no pim ipv6
no pim ipv6 sparse-mode
default pim ipv6
default pim ipv6 sparse-mode
```

#### Example

This command enables IPv6 PIM sparse mode on *VLAN 8* interface.

```
switch(config)#interface vlan 8
switch(config-if-Vl8)#pim ipv6 sparse-mode
switch(config-if-Vl8)#
```

---

### 15.3.5.20 register local-interface

The **register local-interface** command programs the switch to fill the source field in all outbound PIM SM register packets with the IP address of a specified interface or the incoming interface of the group specified by the message. By default, the source field is filled with the IP address from the interface associated with the best route to the RP.

When the command is issued in Router-PIM Sparse-mode IPv4 ConfigurationMode, it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-PIM Sparse-mode VRF IPv4 Configuration.

The **no register local-interface** and **default register local-interface** commands restore the default method of filling the register packet source field by removing the **ip register local-interface** statement from *running-config*.

#### Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

#### Command Syntax

```
register local-interface INT_NAME
```

```
no register local-interface
```

```
default register local-interface
```

#### Parameters

- **INT\_NAME** Interface type and number. Values include:
  - **ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **loopback** *l\_num* Loopback interface specified by *l\_num*.
  - **management** *m\_num* Management interface specified by *m\_num*.
  - **port-channel** *p\_num* Port channel interface specified by *p\_num*.
  - **vlan** *v\_num* VLAN interface specified by *v\_num*.

#### Example

These commands program the switch to fill the source field of outbound PIM SM register packets in the default VRF with the IPv4 address of loopback interface 2.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#register local-interface loopback 2
switch(config-router-pim-sparse-ipv4)#
```

### 15.3.5.21 router pim bidirectional

The `router pim bidirectional` command places the switch in Router-PIM Bidirectional Configuration Mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
router pim bidirectional
```

#### Example

This command places the switch in Router-PIM Bidirectional Configuration Mode.

```
switch(config)#router pim bidirectional  
switch(config-router-pim-bidir)#
```

---

### 15.3.5.22 router pim bsr

The `router pim bsr` command places the switch in Router-PIM BSR Configuration Mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
router pim bsr
```

#### Example

This command places the switch in Router-PIM BSR Configuration Mode.

```
switch(config)#router pim bsr  
switch(config-router-pim-bsr)#
```

### 15.3.5.23 router pim sparse-mode

The `router pim sparse-mode` command places the switch in Router-PIM Sparse-Mode Configuration Mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
router pim sparse-mode
```

#### Example

This command places the switch in Router-PIM Sparse-Mode Configuration Mode.

```
switch(config)#router pim sparse-mode  
switch(config-router-pim-sparse)#
```

---

### 15.3.5.24 rp address

The **rp address** command configures the address of a Protocol Independent Multicast (PIM) static rendezvous point (RP) for a specified multicast subnet. If the command does not specify a subnet, the static RP maps to all multicast groups (224/4). Dynamic RPs override static RPs unless the static RP is given priority by using the **override** option of this command.

Multicast groups use RPs to connect sources and receivers. A PIM domain requires that all routers have consistently configured RP addresses.

The switch uses multiple **rp address** commands to configure multiple RPs or to assign multiple subnets to an RP. When the address of a multicast group falls within multicast subnets configured by multiple **rp address** commands, the groups RP address is selected by comparing the commands multicast subnet size.

- Different size subnets: group uses command with the largest subnet.
- Same size subnets: group uses command as determined by hash algorithm.

When the command is issued in Router-Multicast Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF Configuration Mode.

The **no rp address** and **default rp address** commands remove the corresponding **rp address** command from **running-config**.

#### Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

#### Command Syntax

```
rp address rp_addr [MULTICAST_SUBNET][HASHMASK_LENGTH][BSR_OVERRIDE]  
[PRIORITY_NUM]
```

```
no rp address rp_addr [MULTICAST_SUBNET]
```

```
default rp address rp_addr [MULTICAST_SUBNET]
```

#### Parameters

- **rp\_addr** Rendezvous point IP address (dotted decimal notation).
- **MULTICAST\_SUBNET** Multicast IP address space (CIDR or address-mask).
  - *<no parameter>* Default multicast group IP address of 224/4.
  - **gp\_addr** Multicast group IP address (CIDR or address-mask).
  - **access-list** *acl\_name* Standard access control list that specifies the multicast group address.
  - **acl\_name** Standard access control list that specifies the multicast group address.
- **HASHMASK\_LENGTH** Length (in bits) of the hash mask.
  - *<no parameter>* hash mask remains unchanged from previous setting.
  - **hashmask** *<0 - 32>* hash mask length (in bits). Default value is 30.
- **BSR\_OVERRIDE** Configures priority relative to dynamic RPs selected by BSR.
  - *<no parameter>* Dynamic RPs have priority over specified RP.
  - **override** RP has priority over dynamic RPs.
- **PRIORITY\_NUM** BSR election priority rating. Larger numbers denote higher priority. Default value is 0.
  - *<no parameter>* priority remains unchanged from previous setting.
  - **priority** *<0 - 255>* priority rating.

#### Example

These commands configure 10.17.255.2 as a static RP for all multicast groups in the default VRF.

```
switch(config)#router pim sparse-mode  
switch(config-router-pim-sparse)#ipv4  
switch(config-router-pim-sparse-ipv4)#rp address 10.17.255.2  
switch(config-router-pim-sparse-ipv4)#
```

---

### 15.3.5.25 rp allow

The **rp allow** command accepts and allows PIM (\*,G) join message with an RP address that is different from the configured RPs for that particular (\*,G).

The **no rp allow** and **default rp allow** commands disable this behavior by removing the corresponding **rp allow** command from *running-config*.

#### Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

#### Command Syntax

```
rp allow
```

```
no rp allow
```

```
default rp allow
```

#### Examples

- These commands configure the switch to accept PIM (\*,G) join messages in the default VRF that include RP addresses not configured on the switch for that (\*,G) route.

```
switch(config-router-pim-sparse)# ipv4  
switch(config-router-pim-sparse-ipv4)# rp allow
```

- These commands configure the switch to accept PIM (\*,G) join messages in VRF blue that include RP addresses not configured on the switch for that (\*,G) route.

```
switch(config-router-pim-sparse)# vrf blue  
switch(config-router-pim-sparse-vrf-blue)# ipv4  
switch(config-router-pim-sparse-vrf-blue-ipv4)# rp allow
```

### 15.3.5.26 rp candidate

The **rp candidate** command configures the switch as a candidate rendezvous point (C-RP). The BSR selects a multicast groups dynamic RP set from the list of C-RPs in the PIM domain. The command specifies the interface (used to derive the RP address), C-RP advertisement interval, and priority rating. The BSR selects the RP set by comparing C-RP priority ratings. The C-RP advertisement interval specifies the period between successive C-RP advertisement message transmissions to the BSR.

**Running-config** supports multiple multicast groups through multiple **rp candidate** statements:

- All commands must specify the same interface. Issuing a command with an interface that differs from existing commands removes all existing commands from **running-config**.
- **Running-config** stores the **interval** setting in a separate statement that applies to all **rp candidate** statements. When a command specifies an interval that differs from the previously configured value, the new value replaces the old value and applies to all configured **rp candidate** statements. The default **interval** value is 60 seconds.

When the command is issued in Router-Multicast Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF Configuration Mode.

The **no rp candidate** and **default rp candidate** commands remove **rp candidate** from **running-config** for the specified group. When these commands do not specify a multicast group, all **rp candidate** statements are removed from **running-config**.

The **no rp candidate interval** and **default rp candidate interval** commands restore the interval setting to the default value of 60 seconds. The **no rp candidate priority** and **default rp candidate priority** commands restore the priority setting to the default value of 0.

#### Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Router-PIM Bidirectional IPv4 Configuration

Router-PIM Bidirectional VRF IPv4 Configuration

#### Command Syntax

 **Note:** The **INTERFACE** parameter is always listed first. All other parameters can be placed in any order.

```
rp candidate INTERFACE [GROUP_ADDR][PRIORITY_NUM][INTERVAL_PERIOD]
```

```
no rp candidate [INTERFACE][GROUP_ADDR]
```

```
no rp candidate [INTERFACE] interval
```

```
no rp candidate [INTERFACE] priority
```

```
default rp candidate [INTERFACE][GROUP_ADDR]
```

```
default rp candidate [INTERFACE] interval
```

```
default rp candidate [INTERFACE] priority
```

#### Parameters

- **INTERFACE** Switch uses IP address of specified interface as its C-RP address. Options include:
  - **ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **loopback** *l\_num* Loopback interface specified by *l\_num*.
  - **management** *m\_num* Management interface specified by *m\_num*.
  - **port-channel** *p\_num* Port-Channel Interface specified by *p\_num*.
  - **vlan** *v\_num* VLAN interface specified by *v\_num*.

- 
- **vxlan** *vx\_num* VXLAN interface specified by *vx\_num*.
  - **GROUP\_ADDR** address of multicast group for which candidate is configured. Options include:
    - *<no parameter>* default multicast group (224.0.0.0/4).
    - **net\_addr** multicast IPv4 subnet address (CIDR or address mask).
    - **access-list** *acl\_name* standard access control list that specifies the multicast group address.
  - **PRIORITY\_NUM** RP selection priority rating. Smaller numbers denote higher priority.
    - *<no parameter>* priority rating is set to the default value of 0.
    - **priority** *<0 - 255>* priority rating.
  - **INTERVAL\_PERIOD** Period between consecutive RP-advertisement message transmissions (seconds). Value also applies to previously configured **rp candidate** statements.
    - *<no parameter>* interval remains unchanged from previous setting.
    - **interval** *<10 - 16383>* transmission interval.

### Example

These commands configure a switch as a candidate RP for the multicast group 235.1.1.0/24 with a priority of 48 and an RP advertisement interval of 45 seconds in the default VRF. The switch advertises the IP address assigned to VLAN 24 as its RP address.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#rp candidate vlan 24 235.1.1.0/24
priority 48 interval 45
switch(config-router-pim-sparse-ipv4)#
```

### 15.3.5.27 rp hash algorithm modulo

The **rp hash algorithm modulo** command configures the load-balancing scheme across available rendezvous points (RP).

The configuration results in a round robin-based load balancing across available RPs, achieved by module operation of the destination group address with the number of RPs available.

The **no rp hash algorithm modulo** and **default rp hash algorithm modulo** commands result in the default load-balancing scheme which is to use a hash function to get a group-RP mapping.

#### Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Router-PIM Sparse-mode IPv6 Configuration

Router-PIM Sparse-mode VRF IPv6 Configuration

Router-PIM Bidirectional VRF IPv4 Configuration

#### Command Syntax

```
rp hash algorithm modulo
no rp hash algorithm modulo
default rp hash algorithm modulo
```

#### Examples

- These commands configures the hash algorithm module for a VRF named blue in the Router-PIM sparse-mode IPv4 configuration mode.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#vrf red
switch(config-router-pim-sparse-vrf-red-ipv4)#rp hash algorithm modulo
```

- These commands configures the hash algorithm module for a VRF named blue in the Router-PIM bidirectional-mode VRF IPv4 configuration mode.

```
switch(config)#router pim bidirectional
switch(config-router-pim-bidir)#ipv4
switch(config-router-pim-bidir-ipv4)#vrf red
switch(config-router-pim-bidir-vrf-red-ipv4)#rp hash algorithm modulo
```

---

### 15.3.5.28 rp-candidate advertisement-filter

The **rp-candidate advertisement-filter** command filters the RP candidate advertisements from certain IP addresses. When **rp-candidate advertisement-filter** command is configured, PIM BSR filters RP candidate messages from ip-addresses matching the prefix list from the access-list that is configured.

The **no rp-candidate advertisement-filter** and **default rp-candidate advertisement-filter** commands removes **rp-candidate advertisement-filter** from **running-config** for the specified group.

#### Command Mode

Router-PIM BSR IPv4 Configuration

Router-PIM BSR VRF IPv4 Configuration

#### Command Syntax

```
rp-candidate advertisement-filter access-list access-list_name
```

```
no rp-candidate advertisement-filter access-list access-list_name
```

```
default rp-candidate advertisement-filter access-list access-list_name
```

#### Parameters

**access-list\_name** Standard access control list that specifies the multicast group address.

#### Example

These commands configure the switch as a candidate RP advertisement filter for the multicast group in the non-default VRF.

```
switch(config-router-pim-bsr) #ipv4  
switch(config-router-pim-bsr-ipv4) #rp-candidate advertisement-filter  
  access-list test1  
switch(config-router-pim-bsr-vrf-red-ipv4) #rp-candidate advertisement-  
  filter access-list test2
```

### 15.3.5.29 sg-expiry-timer

The **sg-expiry-timer** command configures the (S, G) expiry timer interval for PIM-SM (S, G) multicast routes. The command does not apply to (\*, G) mroutes.

When the command is issued in Router-Multicast Configuration mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF Configuration mode.

The **no sg-expiry-timer** and **default sg-expiry-timer** commands restore the default setting of 210 seconds by removing the **sg-expiry-timer** statement from *running-config*.

#### Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

#### Command Syntax

```
sg-expiry-timer period
```

```
no sg-expiry-timer
```

```
default sg-expiry-timer
```

#### Parameters

***period*** expiry timer interval (seconds). Value ranges from 120 to 65535 seconds. The default value is 210 seconds.

#### Example

These commands configure 150 seconds as the (S,G) expiry timer interval in the default VRF.

```
switch(config)#router pim sparse-mode  
switch(config-router-pim-sparse)#ipv4  
switch(config-router-pim-sparse-ipv4)#sg-expiry-timer 150  
switch(config-router-pim-sparse-ipv4)#
```

---

### 15.3.5.30 show ip pim bsr

The `show ip pim bsr` command displays the switch's bootstrap router (BSR) information.

#### Command Mode

EXEC

#### Command Syntax

```
show ip pim bsr [GROUP_FILTER]
```

#### Parameters

- **GROUP\_FILTER** specifies groups for which command displays information.
  - **<no parameter>** Displays data for all groups.
  - **net\_addr** Displays message for specified group address. (CIDR or address mask).

#### Example

This command configures the switch's BSR information.

```
switch>show ip pim bsr
PIMv2 Bootstrap information
This system is the Bootstrap Router (BSR)
BSR address: 10.1.1.1
Uptime:      00:14:42, BSR Priority: 0, Hash mask length: 30
Next bootstrap message in 00:00:05
```

### 15.3.5.31 show ip pim config-sanity

The **show ip pim config-sanity** command displays diagnostic information about the switch's PIM configuration.

#### Command Mode

EXEC

#### Command Syntax

```
show ip pim config-sanity
```

#### Example

This command displays PIM configuration diagnostic information.

```
switch>show ip pim config-sanity  
DISCLAIMER: Below are only hints of potential PIM misconfiguration.  
They do not necessary imply that there is a real problem.  
  
The interfaces with PIM which are down: V14  
  
switch>
```

### 15.3.5.32 show ip pim interface

The **show ip pim interface** command displays information about interfaces configured for PIM.

#### Command Mode

EXEC

#### Command Syntax

```
show ip pim interface [INT_NAME][INFO_LEVEL]
```

#### Parameters

- **INT\_NAME** Interface type and number. Values include
  - *<no parameter>* displays information for all interfaces.
  - **ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **port-channel** *p\_num* Port-Channel Interface specified by *p\_num*.
  - **vlan** *v\_num* VLAN interface specified by *v\_num*.
  - **vxlan** *vx\_num* VXLAN interface specified by *vx\_num*.
- **INFO\_LEVEL** specifies level of information detail provided by the command.
  - *<no parameter>* table of basic configuration information.
  - **detail** list of complete configuration information.

#### Examples

- This command displays information about all interfaces on which PIM is enabled.

```
switch>show ip pim interface
Address InterfaceModeNeighbor Hello DR DR Address PktsQed
PktsDropped Count Intvl Pri
10.17.254.30 Vlan3910 sparse1 30 1 10.17.254.30
0 0
10.17.254.162 Vlan3925 sparse2 30 1
10.17.254.163 0 0
10.17.254.106 Vlan3912 sparse1 30 1
10.17.254.106 0 0
10.17.254.137 Ethernet12 sparse1 30 1
10.17.254.138 0 0
switch>
```

- This command displays detailed PIM information for VLAN 26 interface.

```
switch>show ip pim interface vlan 26 detail
Interface address is 172.17.26.1
Vif number is 1
PIM: enabled
PIM version: 2, mode: sparse
PIM DR: 172.17.26.1 (this system)
PIM DR Priority: 1
PIM neighbor count: 0
PIM Hello Interval: 30 seconds
PIM Hello Priority: 1
PIM Hello Lan Delay: 500 milliseconds
PIM Hello Override Interval: 2500 milliseconds
PIM Hello Lan Prune Delay in use
PIM Hello Generation ID: 0x4a05aa0
PIM Hello Generation ID is not required
PIM Triggered Hello Delay: 5 seconds
PIM Join-Prune Interval: 60 seconds
PIM State-Refresh processing: disabled
PIM State-Refresh Interval: unknown seconds
PIM Graft Retry Interval: unknown seconds
```

```
PIM domain border: disabled  
switch>
```

### 15.3.5.33 show ip pim neighbor

The **show ip pim neighbor** command displays information about Protocol Independent Multicast (PIM) neighbors discovered by hello messages.

#### Command Mode

EXEC

#### Command Syntax

```
show ip pim neighbor [INT_NAME][BFD_DATA]
```

#### Parameters

- **INT\_NAME** Interface type and number. Values include
  - *<no parameter>* displays information for all interfaces.
  - **ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **loopback** *l\_num* Loopback interface specified by *l\_num*.
  - **management** *m\_num* Management interface specified by *m\_num*.
  - **port-channel** *p\_num* Port-Channel Interface specified by *p\_num*.
  - **vlan** *v\_num* VLAN interface specified by *v\_num*.
  - **vxlan** *vx\_num* VXLAN interface specified by *vx\_num*.
- **BFD\_DATA** Specifies inclusion of BFD data.
  - *<no parameter>* BFD data is not displayed.
  - **bfd** BFD data is displayed.

#### Examples

- This command displays information about neighbor PIM routers.

```
switch>show ip pim neighbor
PIM Neighbor Table
Neighbor Address  Interface      Uptime      Expires      Mode
10.17.255.2      Vlan2028      21d22h      00:01:31    sparse
switch>
```

- This command displays information about neighbor PIM routers and the status of BFD.

```
switch>show ip pim neighbor bfd
PIM Neighbor Table
Flags: U - BFD is enabled and is UP
      I - BFD is enabled and is INIT
      D - BFD is enabled and is DOWN
      N - Not running BFD

Neighbor Address  Interface      Uptime      Expires      ModeFlags
10.17.255.2      Vlan2028      21d22h      00:01:31    sparseU
switch>
```

### 15.3.5.34 show ip pim protocol counters

The `show ip pim protocol` command displays statistics about Protocol Independent Multicast (PIM) control messages sent and received by the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show ip pim protocol counters[INT_NAME]
```

#### Parameters

- **INT\_NAME** Interface type and number. Values include
  - *<no parameter>* displays information for all interfaces.
  - **ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **loopback** *l\_num* Loopback interface specified by *l\_num*.
  - **management** *m\_num* Management interface specified by *m\_num*.
  - **port-channel** *p\_num* Port-Channel Interface specified by *p\_num*.
  - **vlan** *v\_num* VLAN interface specified by *v\_num*.
  - **vxlan** *vx\_num* VXLAN interface specified by *vx\_num*.

#### Example

This command displays statistics about inbound and outbound PIM control messages.

```
switch>show ip pim protocol counters
PIM Control Counters
```

|                   | Received | Sent   | Invalid |
|-------------------|----------|--------|---------|
| Assert            | 0        | 37     | 0       |
| Bootstrap Router  | 0        | 0      | 0       |
| CRP Advertisement | 0        | 0      | 0       |
| Graft             | 0        | 0      | 0       |
| Graft Ack         | 0        | 0      | 0       |
| Hello             | 63168    | 126355 | 0       |
| J/P               | 275714   | 143958 | 0       |
| Join              | 0        | 0      | 0       |
| Prune             | 0        | 0      | 0       |
| Register          | 0        | 13643  | 0       |
| Register Stop     | 11839    | 0      | 0       |
| State Refresh     | 0        | 0      | 0       |

```
switch>
```

---

### 15.3.5.35 show ip pim register-source

The **show ip pim register-source** command displays the name of the interface from where the switch derives the IP address that it uses to fill the source field in all outbound PIM SM register packets. The [register local-interface](#) command specifies this interface.

By default, the source field is filled with the IP address from the interface associated with the best route to the RP. The **show ip pim register-source** command does not return a value when the source field is filled with the default value.

#### Command Mode

EXEC

#### Command Syntax

```
show ip pim register-source
```

#### Example

This command displays the register-source interface.

```
switch>show ip pim register-source  
Ethernet22  
switch>
```

### 15.3.5.36 show ip pim rp

The **show ip pim rp** command displays the status and multicast group of each cached rendezvous point (RP).

#### Command Mode

EXEC

#### Command Syntax

```
show ip pim rp
```

#### Example

This command displays the cached RPs.

```
switch>show ip pim rp  
show ip pim rp  
The PIM RP Set  
Group: 224.0.0.0/4  
RP: 10.1.2.3  
Uptime: 00:05:12, Expires: never, Priority: 1 Override: 1
```

---

### 15.3.5.37 show ip pim rp-candidate

The **show ip pim rp-candidate** command displays the rendezvous point (RP) that is used for a specified multicast group.

#### Command Mode

EXEC

#### Command Syntax

```
show ip pim rp-candidate
```

#### Example

This command displays the switch's candidate-RP information.

```
switch>show ip pim rp-candidate  
Candidate RP information  
Candidate RP Address: 10.0.12.2  
CRP Holdtime: 150 seconds  
Group 224.2.0.0/16 Priority 2
```

### 15.3.5.38 show ip pim rp-hash

The **show ip pim rp-hash** displays the group to RP-hash mapping for the specified group and the list of qualifying candidate RPs.

#### Command Mode

EXEC

#### Command Syntax

```
show ip pim rp-hash ipv4_addr[INFO_LEVEL]
```

#### Parameters

- ***ipv4\_addr*** multicast group IPv4 address.
- **INFO\_LEVEL** specifies level of information detail provided by the command.
  - *<no parameter>* RP-hash map and list of candidate RPs.
  - **detail** includes data about the selected RP.

#### Example

This command displays the RP that the switch uses for multicast group 224.1.0.0.

```
switch>show ip pim rp-hash 224.1.0.0  
RP 10.1.2.3
```

---

### 15.3.5.39 show ip pim upstream joins

The `show ip pim upstream joins` command displays the join messages that the switch is scheduled to send.

#### Command Mode

EXEC

#### Command Syntax

```
show ip pim upstream joins[JOIN_ADDRESSES][NEIGHBOR_FILTER]
```

#### Parameters

- **JOIN\_ADDRESSES** Filters messages by source and group addresses.
  - *<no parameter>* displays all join messages.
  - **source\_addr** displays all join messages for specified source group IPv4 address.
  - **group\_addr** displays all join messages for specified multicast IPv4 address.
  - **source\_addr group\_addr** displays join message with specified source and group addresses.
  - **group\_addr source\_addr** displays join message with specified group and source addresses.

*group\_addr* must be a valid multicast IPv4 address.

- **NEIGHBOR\_FILTER** specifies neighbors for which command provides data.
  - *<no parameter>* Displays messages for all neighbors.
  - **neighbor neighbor\_addr** Displays message for specified neighbor address.

#### Example

This command displays the list of join messages the switch is scheduled to send. The example only displays the first two messages.

```
switch>show ip pim upstream joins

----- show ip pim upstream joins -----

Neighbor address: 10.1.1.1
Via interface: 10.1.1.2
Next message in 1 seconds
  Group: 10.10.10.3
    Joins:
      10.25.1.1/32 SPT
    Prunes:
      No prunes included
Neighbor address: 10.1.1.6
Via interface: 10.1.1.5
Next message in 1 seconds
  Group: 10.14.1.69
    Joins:
      10.105.14.3/32 SPT
    Prunes:
      No prunes included
switch>
```

### 15.3.5.40 spt threshold

The **spt threshold** command configures shortest path tree (SPT) threshold actions for IPv4 multicast groups. To specify the threshold action for multicast groups that match a specified access control list (ACL), use the **match list** option. When the command is issued without this option, it is applied throughout the configuration-mode VRF. Any ACL-based configuration overrides global configuration.

- When **running-config** does not list this command, the switch joins the SPT immediately after receiving the first PIM packet from a new source. The switch joins the SPT by sending PIM join message toward the source.
- When **running-config** lists this command with a value of infinity, the switch never joins the SPT.

The **no spt threshold** and **default spt threshold** commands remove the corresponding **spt threshold** command from **running-config**.

#### Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

#### Command Syntax

```
spt threshold {0 | infinity} [match list acl_name]  
no spt threshold {0 | infinity} [match list acl_name]  
default spt threshold {0 | infinity} [match list acl_name]
```

#### Parameters

- **0** The switch immediately joins the SPT. This is the default value.
- **infinity** The switch never joins the SPT.
- **acl\_name** name of access control list. If no ACL is supplied, the configuration is applied to all multicast groups within the VRF which are not configured by an ACL.

#### Example

This command configures the switch in the default VRF to immediately join the SPT for multicast groups matched by the *ACL group-1*.

```
switch(config) #router pim sparse-mode  
switch(config-router-pim-sparse) #ipv4  
switch(config-router-pim-sparse-ipv4) #spt threshold 0 match list group-1  
switch(config-router-pim-sparse-ipv4) #
```

### 15.3.5.41 ssm range

The **ssm range** command defines the source specific multicast (SSM) range of IP multicast addresses.

SSM is a multicast packet delivery method where only packets originating from a specific source address requested by a receiver are routed to that receiver. SSM explicitly excludes the use of (\*,G) join for applicable multicast groups. Source-specific multicast differs from any-source multicast (ASM), where a receiver expresses interest in traffic to a multicast address, then receives traffic from all multicast sources sending to that address.

When the command is issued in Router-PIM Sparse-mode IPv4 Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-PIM Sparse-mode VRF IPv4 Configuration Mode.

The **no ssm range** and **default ssm range** commands remove the SSM IP multicast address range by deleting the **ssm range** statement from *running-config*.

#### Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

#### Command Syntax

```
ssm range {acl_name|standard}
```

```
no ssm range
```

```
default ssm range
```

#### Parameters

- **acl\_name** sets the SSM range to address set specified by the standard ACL.
- **standard** sets the SSM range to 232/8.

#### Examples

- These commands configure the SSM address range to 232/8 in the default VRF.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#ssm range standard
switch(config-router-pim-sparse-ipv4)#
```

- These commands configure the SSM address range to those permitted by the LIST\_1 standard ACL in the default VRF. The ACL permits the subnet address range 233.0.0.0/24.

```
switch(config)#ip access-list standard LIST_1
switch(config-std-acl-LIST_1)#permit 233.0.0.0/24
switch(config-std-acl-LIST_1)#exit
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#ssm range LIST_1
switch(config-router-pim-sparse-ipv4)#
```

### 15.3.5.42 sptimeout

The `sptimeout` command configures the maximum span of active scope-zone.

The `no sptimeout` and `default sptimeout` commands delete the current scope zoned timeout configuration.

#### Command Modes

Router-PIM BSR IPv4 Configuration

Router-PIM BSR VRF IPv4 Configuration

#### Syntax

```
sptimeout timeout
```

```
no sptimeout
```

```
default sptimeout
```

#### Parameter

**timeout** Maximum span of active scope-zone in seconds. The value ranges from 120 to 4294967295. The default value is 1300.

#### Guideline

The scope zoned timeout must contain a minimum value of 10 times of configured holdtime; else the system displays a warning message.

#### Examples

- This command configures 600 seconds as the maximum of active scope-zone in router-pim bsr ipv4 configuration mode.

```
switch(config)#router pim bsr
switch(config-router-pim-bsr)#ipv4
switch(config-router-pim-bsr-ipv4)#sptimeout 600
switch(config-router-pim-bsr-ipv4)#
```

- This command configures 2200 seconds as the maximum of active scope-zone in router-pim bsr vrf ipv4 configuration mode.

```
switch0(config)#router pim bsr
switch(config-router-pim-bsr)#vrf vrf01
switch(config-router-pim-bsr-vrf-vrf01)#ipv4
switch(config-router-pim-bsr-vrf-vrf01-ipv4)#sptimeout 2200
switch(config-router-pim-bsr-vrf-vrf01-ipv4)#
```

## 15.4 Multicast Source Discovery Protocol (MSDP)

Multicast Source Discovery Protocol (MSDP) describes a topology that connects multiple IPv4 Protocol Independent Multicast Sparse-Mode (PIM-SM) domains. Each PIM-SM domain uses its independent Rendezvous Point (RP) without depending on RPs in other domains.

These sections describe the Arista MSDP implementation.

- [MSDP Introduction](#)
- [MSDP Description](#)
- [MSDP Configuration](#)
- [MSDP Commands](#)

---

## 15.4.1 MSDP Introduction

Arista switches support these MSDP features:

- Basic MSDP speaker functions.
- MSDP peer configuration: description, connect-source interface, keepalive time, and hold time.
- ACL filtering of inbound and outbound Source-Active (SA) messages.
- Mesh groups.
- Display of peer status.
- Display of filtered SA messages received from MSDP peers.

These MSDP features are not supported:

- MSDP is not supported with Anycast-RP (RFC4610).
- IP packet encapsulation.

## 15.4.2 MSDP Description

The Multicast Source Discovery Protocol (MSDP) defines a topology connecting Protocol Independent Multicast sparse mode (PIM-SM) domains.

MSDP provides inter-domain access to multicast sources in all domains by enabling all rendezvous points (RPs) to discover multicast sources outside of their domains. RPs also use MSDP to announce sources that are sending to a multicast group.

- [MSDP Speakers](#)
- [Network Configuration](#)
- [MSDP Exchange Processes](#)

### 15.4.2.1 MSDP Speakers

An MSDP speaker is a router in a PIM-SM domain that has MSDP peering sessions with MSDP peers in other domains. An MSDP peering session is a TCP connection through which peers exchange MSDP control information. An MSDP peer is a router that is connected to the speaker through a peering session.

PIM uses MSDP to register a local source with remote domain RPs through Source Active (SA) messages, which originate at the local domain's RP. Receivers in remote PIM-SM domains depend only on RPs in their domains to learn of multicast data sources in other domains. Multicast data is subsequently delivered from a source to receivers in different domains through a PIM-SM source tree.

[MSDP Speaker Configuration](#) describes the process of configuring MSDP speakers.

### 15.4.2.2 Network Configuration

The TCP connections between RPs are defined either through an underlying unicast routing table or by configuring a default MSDP peer. A typical MSDP configuration utilizes a BGP specified routing table. SA messages are MSDP control messages that peers exchange during peering sessions.

- [Source Active Messages](#)
- [Reverse Path Forwarding](#)
- [Default MSDP Peers](#)

#### 15.4.2.2.1 Source Active Messages

A Source Active (SA) message is a message that an RP creates and sends to MSDP peers when it learns of a new multicast source through a PIM register message. RPs that intend to originate or receive SA messages must establish MSDP peering with other RPs, either directly or through intermediate MSDP peers. An RP that is not a DR on a shared network should only originate SAs in

response to register messages it receives from the DR. It does not originate SA's for directly connected sources in its domain.

SA messages contain the following fields:

- Source address of the data source.
- Group address that receives data sent by the source.
- IP address of the RP.

The SA Cache is the repository of SA messages received by the MSDP speaker. The switch always stores received SA messages. [Managing the SA Cache](#) describes procedures that limit the size of the SA cache and options for displaying the cache.

#### 15.4.2.2.2 Reverse Path Forwarding

Reverse path forwarding (RPF) is a multicast packet transport technique that ensures loop-free packet forwarding by using a router's unicast routing table. Traffic forwarding is based on source addresses instead of destination addresses. RPF is implemented as defined in RFC 3618.

Packet forwarding is based on the packet's unicast reverse path. An RPF router prevents network loops by only forwarding a packet when it enters through the interface holding its source routing entry.

When a multicast packet enters a router's interface, the router checks the reverse path of the packet by examining the list of networks that are reachable through the input interface. If the list contains a matching routing entry for the multicast packet's source IP address, the packet is forwarded to all other interfaces that are participants in the multicast group. Otherwise, the packet is dropped.

RPF requires that the unicast routing table is correct and converged. It also assumes that the use of symmetric forward and reverse paths between router and sender. RPF fails on uni-directional links.

[Displaying RPF Peers](#) describes commands that display RPF peers.

#### 15.4.2.2.3 Default MSDP Peers

The default peer is the MSDP peer from which the MSDP speaker accepts SA messages. If there is only one MSDP peer, all of its SA messages will be accepted. When multiple default peers are configured the switch uses the first default peer to appear in *running-config*. Default MSDP peers invalidate the use of RPF over unicast routing tables.

Each default peer may be associated with a prefix list. The prefix list specifies the RPs from where the speaker accepts SA messages. When *running-config* contains multiple default peers with prefix lists, an SA is accepted from the first default peer in *running-config* whose prefix list contains the RP in the SA. The speaker accepts all remaining SAs from the first default peer that is not associated with a prefix list.

[Configuring the Default Peer](#) describes commands that configure default peers.

#### 15.4.2.3 MSDP Exchange Processes

- [Control Information Exchange](#)
- [MSDP Data Exchange](#)

##### 15.4.2.3.1 Control Information Exchange

An RP originates an SA message when a source registers with the RP to send data to a multicast group. RPs periodically originate SA messages while its registered sources send data to maintain messages in SA caches of its MSDP peers. RPs that have no registered sources periodically send keepalive messages to maintain TCP connections with its peers.

MSDP defines the following timers that specify the transmission frequency of control messages:

- 
- **SA Advertisement Time:** Duration of SA Advertisement intervals. An RP sends periodic SA messages to reference each registered source once per interval. SA advertisement time is 60 seconds.
  - **Keepalive Time:** Period between the transmission of consecutive keepalive messages. Default keepalive time is 60 seconds. Minimum keepalive time is one second.
  - **Hold Timer:** Period an MSDP speaker maintains a peer TCP connection after receiving an SA or keepalive message from the peer. Default time is 75 seconds. Minimum hold time is three seconds.

#### 15.4.2.3.2 MSDP Data Exchange

This sequence describes the exchange of multicast data across PIM domains through MSDP:

1. When a source's first data packet is registered by the first hop router, the RP extracts the data from the packet and forwards it down the shared tree in the PIM domain.
2. The RP informs MSDP peers of the new source by sending a Source-Active (SA) message that identifies the source, the recipient group, and the RP's address or originator ID.
3. Upon receiving the SA message, an MSDP peer which is the RP for a multicast tree that includes members interested in the multicast sends a PIM join message (S,G) toward the data source.
4. The PIM designated router (DR) sends subsequent data encapsulated in PIM register messages directly to the remote domain's RP when the source becomes active.
5. If the source times out, this process repeats when the source goes active again.

#### 15.4.3 MSDP Configuration

These sections describe the configuration of the switch as an MSDP speaker and the establishment of MSDP peering sessions.

- [MSDP Speaker Configuration](#)
- [Establishing MSDP Peers](#)
- [MSDP Network Configuration](#)
- [Managing the SA Cache](#)
- [Configuring MSDP in a non-default VRF](#)

MSDP requires that TCP port 639 (MSDP) is open on the control plane. The default control-plane ACL includes a permit rule that allows TCP packets access through the MSDP port.

##### 15.4.3.1 MSDP Speaker Configuration

The switch is configured as an MSDP speaker when MSDP is enabled. MSDP is enabled by configuring an MSDP peer. [Configuring an MSDP Peer](#) describes the process of configuring an MSDP peer.

Source-Address (SA) messages that an MSDP speaker originates contain the speaker's rendezvous point (RP) address, as configured through PIM statements and processes. MSDP provides a method of assigning an originator ID address, which the speaker uses in place of its RP address when advertising SA messages. The [originator-id local-interface](#) command configures the switch to set the RP address to the specified interface's IP address in SA messages that it originates as an MSDP speaker.

Only RPs originate SA messages and only for its registered sources. RPs do not originate periodic SA messages for sources in other PIM domains. MSDP speakers that are not RPs do not originate periodic SA messages. Intermediate MSDP speakers forward SA messages received from other domains. Intermediate speakers are not required to be RPs.

**Example**

These commands configure the switch to use the IP address assigned to loopback interface 100 as the RP address in SA messages that it originates.

```
switch(config)#router msdp  
switch (config-router-msdp)#originator-id local-interface loopback 100  
switch (config-router-msdp)#
```

**15.4.3.5 Configuring MSDP in a non-default VRF**

The MSDP can also be configured in a non-default VRF, when the default VRF used does not have a name. The following commands configure MSDP in a non-default VRF.

**Example**

These commands configure MSDP peer *1.1.1.1* in a non-default VRF blue.

```
switch(config)#router msdp  
switch (config-router-msdp)#vrf blue  
switch (config-router-msdp-vrf-blue)#peer 1.1.1.1
```

---

## 15.4.4 MSDP Commands

### MSDP Configuration Commands (Global)

- `connection retry interval`
- `group-limit`
- `ip msdp rejected-limit`
- `originator-id local-interface`
- `peer`
- `router msdp`

### MSDP Peer Configuration Commands

- `default-peer`
- `description (MSDP)`
- `disabled (MSDP)`
- `keepalive (MSDP)`
- `local-interface`
- `mesh-group`
- `sa-filter in`
- `sa-filter out`
- `sa-limit`

### MSDP SA Cache Commands

- `clear ip msdp sa-cache`

### MSDP Display Commands

- `show ip msdp peer`
- `show ip msdp pim sa-cache`
- `show ip msdp sa-cache`
- `show ip msdp sanity`
- `show ip msdp summary`
- `show msdp mesh-group`
- `show msdp rpf-peer`

### 15.4.4.1 clear ip msdp sa-cache

The `clear ip msdp sa-cache` command removes contents of the Source-Active (SA) message cache. The command provides these filter options for removing partial cache contents:

- contents of a multicast group by specifying its group address.
- all cache contents.

#### Command Mode

Router MSDP Configuration

Router MSDP VRF Configuration

#### Command Syntax

```
clear ip msdp sa-cache [ADDRESS_FILTER]
```

#### Parameters

**ADDRESS\_FILTER** IPv4 address used to select table entries for removal.

- *<no parameter>* All SA messages.
- *grp\_addr* Multicast group address (IPv4 address). The *grp\_addr* must be a valid multicast address.

#### Example

This command deletes all SA message cache contents.

```
switch(config) #router msdp  
switch(config-router-msdp) #clear ip msdp sa-cache
```

---

#### 15.4.4.2 connection retry interval

The **connection retry interval** command specifies the period that the switch waits after an MSDP peering session is reset before trying to reestablish the session. The default period is 30 seconds.

The **no connection retry interval** and **default connection retry interval** commands reset the timer interval to the default period of 30 seconds by removing the **connection retry interval** command from *running-config*.

##### Command Mode

Router MSDP Configuration

Router MSDP VRF Configuration

##### Command Syntax

```
connection retry interval connect_retry
```

```
no connection retry interval connect_retry
```

```
default connection retry interval connect_retry
```

##### Parameter

*connect\_retry* Reconnect period (seconds). Value ranges from 1 to 65535. Default is 30.

##### Example

This command configures the switch to wait 45 seconds after an MSDP peering session is reset before attempting to reestablish the session.

```
switch(config)#router msdp  
switch(config-router-msdp)#connection retry interval 45
```

### 15.4.4.3 default-peer

The **default-peer** command configures the specified MSDP peer connection as a default peer on the switch. The default peer configuration defines the peers from which the switch accepts Source-Active (SA) messages. When the command includes a **prefix list** parameter, the specified peer is the default peer for only SA messages originating from rendezvous points (RPs) covered by prefix list entries. The default peer address must be a previously configured MSDP peer (configured using the **peer** command).

Default peers provide an alternative to reverse packet forwarding (RPF) typically used by MSDP to specify the peers from which a switch accepts SA messages. However, RPF requires a unicast routing table that is correct and converged. RPF also assumes symmetric forward and reverse paths between router and sender. RPF fails on uni-directional links. Default MSDP peers invalidate the use of RPF over unicast routing tables.

The switch can designate multiple default peers:

- Switch defines one peer: A default peer statement is not required; the switch accepts SA traffic from the configured peer.
- Switch defines one default peer (no prefix list): The switch accepts all SA messages from only the default peer.
- Switch defines multiple default peers (no prefix lists): The switch accepts all SA messages from only the first default peer listed in *running-config*. Other listed default peers are used only when peers listed before them in *running-config* are not accessible.
- First default-peer statement includes a prefix list: The switch accepts all SA messages from the default peer whose originating RP is covered in the prefix list. The disposition of SA messages originating from other RPs is determined by subsequent **default-peer** statements.

The **no default-peer** and **default default-peer** commands remove the corresponding **default-peer** command from *running-config*.

#### Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

#### Command Syntax

```
default-peer [PREFIX]
no default-peer
default default-peer
```

#### Parameters

**PREFIX** List of RPs from the SA messages originate for which the default peer is valid.

- *<no parameter>* default peer is valid for SAs from all originating RPs.
- **prefix-list list\_name** name of the prefix list that defines affected originating RP prefixes.

#### Example

These commands configure two MSDP peers and configure the peer at 10.5.2.2 as the default peer.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.6.2.2
switch(config-router-msdp-peer-10.6.2.2)#exit
switch(config-router-msdp)#peer 10.5.2.2
switch(config-router-msdp-peer-10.5.2.2)#default-peer
switch(config-router-msdp-peer-10.5.2.2)#
```

---

#### 15.4.4.4 description (MSDP)

The **description** command associates descriptive text with the configuration-mode MSDP peer.

The **no description** and **default description** commands remove the text association from the specified peer.

##### Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

##### Command Syntax

```
description description_string
```

```
no description
```

```
default description
```

##### Parameters

- *description\_string* text string that is associated with the peer.

##### Example

These commands associate the string NORTH with the MSDP peer located at *10.4.4.12*.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#description NORTH
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
  State: Connect
  Resets: 0
  Connection Source: Loopback100 (10.6.8.6)
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```

### 15.4.4.5 disabled (MSDP)

The **disabled** command closes the peering session with the specified MSDP peer by terminating the TCP connection between the switch and the peer. The connection is not resumed until the shutdown command is removed from *running-config*.

The **no disabled** and **default disabled** commands establish an MSDP peering session with the specified peer by removing the corresponding **disabled** command from *running-config*.

#### Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

#### Command Syntax

```
disabled
```

```
no disabled
```

```
default disabled
```

#### Examples

- This command closes the peering session with the MSDP peer at *10.4.4.12*.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#disabled
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
  State: Disbled
  Resets: 0
  Connection Source: Loopback100 ( 10.6.8.6 )
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```

- This command reopens the peering session with the peer at *10.4.4.12*.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#no disabled
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
  State: Connect
  Resets: 0
  Connection Source: Loopback100 ( 10.6.8.6 )
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```

---

#### 15.4.4.6 group-limit

The **group-limit** command specifies the maximum number of Source-Active (SA) messages that the switch allows in the SA cache for a specified multicast group address.

SA messages have an expiration period of 90 seconds and remain in the SA cache until they expire. The switch does not accept SA messages for a group whose cache limit is reached until its cached messages start expiring.

The **no group-limit** and **default group-limit** command removes the maximum group limit for the specified prefix by removing the corresponding **group-limit** statement from **running-config**.

##### Command Mode

Router MSDP Configuration

Router MSDP VRF Configuration

##### Command Syntax

```
group-limit quantity source src_subnet
```

```
no group-limit quantity source src_subnet
```

```
default group-limit quantity source src_subnet
```

##### Parameters

- *quantity* maximum number of groups that can access the interface. Value ranges from 1 to 40000.
- *src\_subnet* Source IPv4 subnet (CIDR or address-mask notation).

##### Example

This command sets the maximum number of 1000 SAs for multicast group *10.13.15.8/29*.

```
switch(config)#router msdp  
switch(config-router-msdp)#group-limit 1000 source 10.13.15.8/29
```

### 15.4.4.7 ip msdp rejected-limit

The **ip msdp rejected-limit** command specifies the maximum number of rejected Source-Active messages that the switch allows in the SA cache.

SA messages have an expiration period of 90 seconds. They remain in the SA cache during this time. The default limit of rejected SA messages that the switch can store is 40000.

The **no ip msdp rejected-limit** and **default ip msdp rejected-limit** commands restore the rejected SA limit of 40000 by removing the **ip msdp rejected-limit** statement from **running-config**.

#### Command Mode

Router MSDP Configuration

Router MSDP VRF Configuration

#### Command Syntax

```
ip msdp rejected-limit quantity
```

```
no ip msdp rejected-limit
```

```
default ip msdp rejected-limit
```

#### Parameter

*quantity* maximum rejected SA messages the SA cache can store. Value ranges from 0 to 40000.

#### Example

This command sets 5000 as the maximum number of rejected SAs that the SA cache can contain.

```
switch(config) #router msdp  
switch(config-router-msdp) #ip msdp rejected-limit 5000
```

---

#### 15.4.4.8 keepalive (MSDP)

The **keepalive** command configures the MSDP keep-alive and hold time intervals for a specified MSDP peer connection.

- Keep-alive time interval is the period between the transmission of consecutive keep-alive messages. The default keep-alive time interval is 60 seconds.
- Hold time interval is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering. The default hold time interval is 75 seconds.

The **no keepalive** and **default keepalive** commands restore the default keep-alive and hold time intervals for the specified MSDP peer connection by removing the corresponding **keepalive** command from **running-config**.

##### Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

##### Command Syntax

```
keepalive keep_alive hold_time
```

```
no keepalive
```

```
default keepalive
```

##### Parameters

- *keep\_alive* keep-alive period in seconds. Value ranges from 1 to 65535. Default value is 60.
- *hold\_time* hold time in seconds. Value ranges from 1 to 65535. Default value is 75.

**Note:** The hold time interval must be longer than or equal to the keep-alive time interval.

##### Example

This command sets the keep-alive time to 45 seconds and the hold time to 80 seconds for the connection with the MSDP peer at *10.4.4.12*.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#keepalive 45 80
switch(config-router-msdp-peer-10.4.4.12)#
```

### 15.4.4.9 local-interface

MSDP peering sessions are established over a TCP connection. The `local-interface` command specifies the interface through which the TCP connection is established with the configuration-mode MSDP peer. When the `local-interface` command is not used to specify an interface, the connection is established through an interface determined by existing routing algorithms.

The `no local-interface` and `default local-interface` commands remove the corresponding `local-interface` command from *running-config*, returning selection of the connecting interface to the routing algorithm.

#### Command Mode

Router MSDP Peer Configuration

Router MSDP VRF Peer Configuration

#### Command Syntax

```
local-interface interface
```

```
no local-interface
```

```
default local-interface
```

#### Parameters

*interface* local interface through which the TCP connection is established. Options include:

- ethernet *e\_num* Ethernet interface.
- loopback *l\_num* Loopback interface.
- management *m\_num* Management interface.
- port-channel *p\_num* Port-Channel Interface.
- vlan *v\_num* VLAN interface.
- vxlan *vx\_num* VXLAN interface.

#### Example

These commands assign an IP address to loopback interface 100, then establish the TCP peer session to the MSDP peer at `10.4.4.12` through the loopback in the default VRF.

```
switch(config)#interface loopback 100
switch(config-if-Lo100)#ip address 10.6.8.6/24
switch(config-if-Lo100)#exit
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#local-interface loopback 100
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
  State: Connect
  Resets: 0
  Connection Source: Loopback100 (10.6.8.6)
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```

#### 15.4.4.10 mesh-group

The **mesh-group** command configures the configuration-mode MSDP peer connection as an MSDP mesh group member. A peer can be assigned to multiple mesh groups. Multiple MSDP peers can be assigned to a common mesh group.

An MSDP mesh group is a network of MSDP speakers where each speaker directly connects to every other speaker. The switch does not forward Source-Active (SA) messages that it receives from a mesh group peer to other peers of the same group.

The **no mesh-group** and **default mesh-group** commands delete the configuration-mode peer connection from a mesh group by removing the corresponding **mesh-group** command from **running-config** when issued in Router MSDP Peer Configuration or Router MSDP Peer VRF Configuration Mode.

**Note:** To delete all configured connections from a specified mesh group, use the **no mesh-group** command in Router MSDP Configuration mode.

#### Command Mode

Router MSDP Configuration

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

#### Command Syntax

```
mesh-group group_name
```

```
no mesh-group group_name
```

```
default mesh-group group_name
```

#### Parameters

*group\_name* name of mesh group.

#### Related Command

[show msdp mesh-group](#) .

#### Examples

- These commands configure the MSDP peer connection to *10.1.1.14* as a member of the AREA-1 mesh group, then display members of mesh groups to which configured MSDP peers belong.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.1.1.14
switch(config-router-msdp-peer-10.1.1.14)#mesh-group AREA-1
switch(config-router-msdp-peer-10.1.1.14)#show msdp mesh-group
Mesh Group: AREA-1
    10.1.1.14
Mesh Group: tier_01
    10.24.18.13
Mesh Group: tier_02
    10.26.101.18
switch(config-router-msdp-peer-10.1.1.14)#
```

- These commands delete all configured connections from the AREA-1 mesh group.

```
switch(config)#router msdp
switch(config-router-msdp)#no mesh-group AREA-1
switch(config-router-msdp)#
```

### 15.4.4.11 originator-id local-interface

The **originator-id local-interface** command configures an originator ID to replace the rendezvous point (RP) address in source-address (SA) messages that it originates as an MSDP speaker.

SA messages that an MSDP speaker originates contain the speaker's rendezvous point (RP) address, as configured through PIM statements and processes. An originator ID is an alternative IPv4 address that a speaker uses in place of its RP address when advertising SA messages. This command configures the switch to use the specified interface's IP address as the RP address in SA messages that it originates.

The **no originator-id local-interface** and **default originator-id local-interface** commands configure the switch to use its RP address in SA messages that it sends by removing the **originator-id local-interface** command from *running-config*.

#### Command Mode

Router MSDP Configuration

Router MSDP VRF Configuration

#### Command Syntax

```
originator-id local-interface INTERFACE
no originator-id local-interface INTERFACE
default originator-id local-interface INTERFACE
```

#### Parameters

**INTERFACE** Specifies the interface from which the IP address is derived. Options include:

- ethernet *e\_num* Ethernet interface.
- loopback *l\_num* Loopback interface.
- management *m\_num* Management interface.
- port-channel *p\_num* Port-Channel Interface.
- vlan *v\_num* VLAN interface.
- vxlan *vx\_num* VXLAN interface.

#### Example

These commands configure the switch to use the IP address assigned to loopback interface 100 as the RP address in SA messages that it originates.

```
switch(config)#router msdp
switch (config-router-msdp)#originator-id local-interface loopback 100
switch (config-router-msdp)#
```

---

#### 15.4.4.12 peer

The **peer** command configures the specified address as an MSDP peer, enables MSDP on the switch if it was not previously enabled, and places the switch in Router MSDP Peer Configuration Mode for the specified peer.

The peering session with the device at the specified network is established over a TCP connection. The **local-interface** command can specify an interface through which the TCP connection is established. When the **local-interface** command is not used to specify an interface, the connection is established through an interface determined by existing routing algorithms.

The **no peer** and **default peer** commands remove the specified MSDP peer configuration by deleting the corresponding **peer** command from **running-config**. MSDP is disabled when the last **peer** command is removed.

##### Command Mode

Router MSDP Configuration

##### Command Syntax

```
peer ip_address
```

##### Parameters

*ip\_address* IP address of the MSDP peer to be configured.

##### Commands Available in Router MSDP Peer Configuration Mode

- [default-peer](#)
- [description \(MSDP\)](#)
- [disabled \(MSDP\)](#)
- [keepalive \(MSDP\)](#)
- [local-interface](#)
- [mesh-group](#)
- [sa-filter in](#)
- [sa-filter out](#)
- [sa-limit](#)

##### Example

These commands establish an MSDP peer relationship with the peer at *192.168.3.17* and place the switch in the Router MSDP Peer Configuration Mode for that peer.

```
switch(config)#router msdp  
switch(config-router-msdp)#peer 192.168.3.17  
switch(config-router-msdp-peer-192.168.3.17)#
```

### 15.4.4.13 router msdp

The **router msdp** command places the switch in the router MSDP configuration mode, and allows to configure the global IP configuration commands and VRF commands in this mode.

The **no router msdp** and **default router msdp** commands removes the corresponding **router msdp** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
router msdp
```

```
no router msdp
```

```
default router msdp
```

#### Example

This command places the switch in the router MSDP configuration mode.

```
switch(config)#router msdp  
switch(config-router-msdp)#
```

#### Related Commands

- [connection retry interval](#)
- [default-peer](#)
- [description \(MSDP\)](#)
- [disabled \(MSDP\)](#)
- [group-limit](#)
- [ip msdp rejected-limit](#)
- [keepalive \(MSDP\)](#)

#### 15.4.4.14 sa-filter in

The **sa-filter in** command assigns an IP access control list (ACL) as a filter for inbound Source-Active (SA) messages from the configuration-mode MSDP peer connection. The switch only accepts SA messages from the peer that are accepted by the assigned ACL. The switch accepts all SA messages from the peer when an ACL is not assigned as an inbound filter.

Only one ACL can be assigned as an inbound filter to an MSDP peer. Any subsequent **sa-filter in** commands for the peer replace the existing command.

The **no sa-filter in** and **default sa-filter in** commands remove the ACL assignment as an inbound filter by removing the corresponding **sa-filter in** command from **running-config**.

##### Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

##### Command Syntax

```
sa-filter in list list_name
```

```
no sa-filter in
```

```
default sa-filter in
```

##### Parameters

- *peer\_id* MSDP peer address (IPv4 address).
- *list\_name* name of ACL that filters SA messages.

##### Related Command

[sa-filter out](#).

##### Guideline

The command accepts standard and extended ACLs. The address field in a standard ACL filters an SA message on its group address.

##### Example

These commands create an IP ACL named LIST-IN as the inbound SA message filter for the MSDP peer connection to *10.4.4.12*. The ACL permits SAs from the multicast group *239.14.4.2/28*.

```
switch(config)#ip access-list LIST-IN
switch(config-acl-LIST-IN)#permit ip any 239.14.4.2/28
switch(config-acl-LIST-IN)#exit
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#sa-filter in list LIST-IN
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
  State: Listen
  Connection Source: Loopback100 (10.6.8.6)
SA Filtering:
Input Filter: LIST-IN
```

### 15.4.4.15 sa-filter out

The **sa-filter out** command assigns an IP access control list (ACL) as a filter for outbound Source-Active (SA) messages to the configuration-mode MSDP peer connection, after which the switch only sends SA messages to the peer that are accepted by the assigned ACL. The switch sends all SA messages to the peer when an ACL is not assigned as an output filter to the peer.

Only one ACL can be assigned as an outbound filter to an MSDP peer. Any subsequent **sa-filter out** commands for the peer replace the existing command.

The **no sa-filter out** and **default sa-filter out** commands remove the ACL assignment as an outbound filter by removing the corresponding **sa-filter out** command from **running-config**.

#### Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

#### Command Syntax

```
sa-filter out list list_name
```

```
no sa-filter out
```

```
default sa-filter out
```

#### Parameters

- *peer\_id* MSDP peer address (IPv4 address).
- *list\_name* name of ACL that filters SA messages.

#### Related Command

[sa-filter in](#) assigns an IP ACL to filter inbound SA messages from the MSDP peer being configured.

#### Guidelines

The command accepts standard and extended ACLs. The address field in a standard ACLs filters an SA message on its group address.

#### Example

These commands assign the IP ACL named LIST-OUT as the outbound SA message filter for the MSDP peer connection to *10.4.4.12*.

```
switch(config)#router msdp
switch(config-router-msdp)#ip access-list LIST-OUT
switch(config-acl-LIST-OUT)#permit ip any 239.14.4.2/28
switch(config-acl-LIST-OUT)#exit
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#sa-filter out list LIST-OUT
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
  State: Listen
  Connection Source: Loopback100 ( 10.6.8.6 )
SA Filtering:
Output Filter: LIST-OUT
switch(config-router-msdp-peer-10.4.4.12)#
```

---

#### 15.4.4.16 sa-limit

The **sa-limit** command specifies the maximum number of Source-Active messages from a specified MSDP peer that the switch allows in the SA cache. SA messages have an expiration period of 90 seconds, during which time they remain in the SA cache. The switch does not accept SA messages from a peer after the peer's SA limit is reached. By default, The limit to the number of SA messages that the switch can store from a specified peer is 40000, by default.

The **no sa-limit** and **default sa-limit** commands restore the SA limit of 40000 for the specified MSDP peer by removing the corresponding **sa-limit** statement from **running-config**.

##### Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

##### Command Syntax

```
sa-limit quantity
```

```
no sa-limit
```

```
default sa-limit
```

##### Parameters

- *peer\_id* MSDP peer (IPv4 address).
- *quantity* maximum number of SA messages that the switch can store. Value ranges from 0 to 40000.

##### Example

This command sets the SA limit of 500 for the MSDP peer at *10.1.1.5*.

```
switch(config)#router msdp  
switch(config-router-msdp)#peer 10.1.1.5  
switch(config-router-msdp-peer-10.1.1.5)#sa-limit 500  
switch(config-router-msdp-peer-10.1.1.5)#
```

### 15.4.4.17 show ip msdp peer

The **show ip msdp peer** command displays information about specified MSDP peers. The command includes an optional parameter for displaying SAs accepted from the peer.

#### Command Mode

#### EXEC Command Syntax

```
show ip msdp peer [PEER_ADDR][SA_ACCEPT]
```

#### Parameters

- *PEER\_ADDR* Peers for which command displays information.
  - *<no parameter>* All peers configured on the switch.
  - *ipv4\_addr* Address of specified MSDP peer.
- *SA\_ACCEPT* Command displays SAs accepted from the specified peers.
  - *<no parameter>* Accepted SAs are not displayed.
  - *accepted-sas* Accepted SAs are displayed.

#### Example

This command displays MSDP information concerning the peer located at *10.2.42.4*, including SAs that the switch accepted from this peer.

```
switch(config)#show ip msdp peer 10.2.42.4 accepted-sas
MSDP Peer 10.2.42.4
Connection status:
  State: Up
  Connection Source: Loopback4 ( 10.2.43.4 )
SA Filtering:
Input Filter: allow-multicast-for-msdp
Output Filter: allow-multicast-for-msdp
SAs accepted:
(10.62.79.30, 234.1.4.2), RP 10.2.42.4
(10.61.79.29, 234.1.4.1), RP 10.2.42.4
(10.62.79.30, 234.1.4.1), RP 10.2.42.4
```

---

#### 15.4.4.18 show ip msdp pim sa-cache

The `show ip msdp pim sa-cache` command displays the SA cache for the local PIM domain configured on the switch. An SA cache is a table of Source-Active messages that are generated or accepted by the PIM domain.

##### Command Mode

EXEC

##### Command Syntax

```
show ip msdp pim sa-cache
```

##### Example

This command displays the SA cache for the local PIM domain.

```
switch(config)#show ip msdp pim sa-cache
MSDP Source Active Messages for local Pim RP
(10.51.71.23, 234.1.4.1), RP 10.2.43.4
(10.20.91.26, 234.1.4.1), RP 10.2.43.4
(10.51.71.23, 234.1.4.2), RP 10.2.43.4
(10.20.91.21, 234.1.4.1), RP 10.2.43.4
(10.51.79.23, 234.1.4.1), RP 10.2.43.4
(10.20.91.24, 234.1.4.2), RP 10.2.43.4
(10.51.79.23, 234.1.4.2), RP 10.2.43.4
(10.20.91.21, 234.1.4.2), RP 10.2.43.4
(10.20.91.26, 234.1.4.2), RP 10.2.43.4
(10.20.91.24, 234.1.4.1), RP 10.2.43.4
```

### 15.4.4.19 show ip msdp sa-cache

The **show ip msdp sa-cache** command displays contents of the Source-Active (SA) message cache. The command provides these filter options for displaying partial cache contents:

- multicast group address: multicast group
- source address and group address

The command can also display unexpired SAs that were rejected by ACL filters or cache limit exceeded conditions.

#### Command Mode

EXEC

#### Command Syntax

```
show ip msdp sa-cache [ADDRESS_FILTER][CONTENTS]
```

#### Parameters

- ADDRESS\_FILTER IPv4 address used to filter SA messages.
  - *<no parameter>* All SA messages.
  - *grp\_addr* Multicast group address (IPv4 address).
  - *src\_addr grp\_addr* Source and multicast group addresses (two IPv4 addresses).

*grp\_addr* must be a valid multicast address.

- CONTENTS type of SAs that the command displays.
  - *<no parameter>* Displays contents of SA Cache.
  - *rejected* Displays rejected SAs in addition to the SA cache contents.

#### Example

This command displays the contents of the SA message cache.

```
switch(config)#show ip msdp sa-cache
MSDP Source Active Cache
(10.61.71.29, 234.1.4.2), RP 10.5.29.4, heard from 10.5.29.4
(10.51.71.23, 234.1.4.1), RP 10.5.29.4, heard from 10.5.29.4
(10.61.79.29, 234.1.4.2), RP 10.5.29.4, heard from 10.5.29.4
(10.53.71.27, 234.1.4.2), RP 10.3.25.4, heard from 10.3.25.4
(10.10.101.24, 234.1.4.1), RP 10.2.44.4, heard from 10.2.44.4
(10.10.151.22, 234.1.4.2), RP 10.1.12.4, heard from 10.1.12.4
(10.61.71.29, 234.1.4.1), RP 10.5.29.4, heard from 10.5.29.4
(10.20.91.21, 234.1.4.1), RP 10.2.44.4, heard from 10.2.44.4
(10.61.79.29, 234.1.4.1), RP 10.2.42.4, heard from 10.2.42.4
(10.53.79.27, 234.1.4.2), RP 10.3.25.4, heard from 10.3.25.4
(10.10.151.28, 234.1.4.2), RP 10.3.25.4, heard from 10.3.25.4
(10.52.79.25, 234.1.4.2), RP 10.2.44.4, heard from 10.2.44.4
(10.52.71.25, 234.1.4.2), RP 10.2.44.4, heard from 10.2.44.4
(10.20.91.24, 234.1.4.1), RP 10.5.29.4, heard from 10.5.29.4
(10.10.151.22, 234.1.4.1), RP 10.1.12.4, heard from 10.1.12.4
```

---

#### 15.4.4.20 show ip msdp sanity

The **show ip msdp sanity** command performs a consistency check between the multicast routing table and the MSDP Source-Address (SA) caches. When the command detects inconsistencies, it displays the cache entries that are not in the table.

##### Command Mode

EXEC

##### Command Syntax

```
show ip msdp sanity
```

##### Examples

- This command displays a sanity check that detects no inconsistencies between the SA cache and the multicast routing table.

```
switch(config)#show ip msdp sanity
PIM SA cache entries not in the MRT
Msdp-learnt MRT entries not in the SA cache
SA cache entries not in the MRT
May-Notify-MSDP entries not in the PIM SA cache
(need not be an error condition)
```

- This command displays inconsistencies between the SA cache and the multicast routing table.

```
switch(config)#show ip msdp sanity
PIM SA cache entries not in the MRT
Msdp-learnt MRT entries not in the SA cache
SA cache entries not in the MRT
(192.168.3.8, 224.1.154.1)
(192.168.3.35, 224.1.167.1)
(192.168.3.16, 224.1.226.1)
(192.168.3.19, 224.1.246.1)
(192.168.3.17, 224.1.204.1)
(192.168.3.12, 224.1.182.1)
(192.168.3.33, 224.1.150.1)
(192.168.3.26, 224.1.198.1)
(192.168.3.33, 224.1.195.1)
(192.168.3.4, 224.1.246.1)
(192.168.3.37, 224.1.188.1)
(192.168.3.12, 224.1.245.1)
(192.168.3.31, 224.1.206.1)
(192.168.3.35, 224.1.178.1)
(192.168.3.6, 224.1.155.1)
May-Notify-MSDP entries not in the PIM SA cache
(need not be an error condition)
4.1), RP 10.2.42.4
```

### 15.4.4.21 show ip msdp summary

The **show ip msdp summary** command displays a list of peer addresses, the operational status of the peer, and the number of Source-Active messages in the SA cache from that peer.

#### Command Mode

EXEC

#### Command Syntax

```
show ip msdp summary
```

#### Example

This command displays the configured peers, the status of the peers, and the number of SA message received from those peers.

```
switch(config)#show ip msdp summary
MSDP Peer Status Summary
Peer Address      State  SA Count
192.168.3.18      Up     0
192.168.3.16      Up     0
192.168.3.37      Listen 0
192.168.3.46      Up     0
192.168.3.47      Up     0
```

---

#### 15.4.4.22 show msdp mesh-group

The **show msdp mesh-group** command displays the mesh group membership of MSDP peers that are configured on the switch. An MSDP mesh group is a network of MSDP speakers where each speaker is directly connected to every other speaker. The switch does not forward Source-Active (SA) messages that it receives from a mesh group peer to other peers of the same group.

##### Command Mode

EXEC

##### Command Syntax

```
show msdp mesh-group
```

##### Related Command

[mesh-group](#) configures the MSDP peer connection as an MSDP mesh group member.

##### Example

This command displays the mesh group membership of configured MSDP peers.

```
switch(config)#show msdp mesh-group
Mesh Group: tier_01
             10.24.18.13
Mesh Group: tier_02
             10.26.101.18
```

### 15.4.4.23 show msdp rpf-peer

The **show msdp rpf-peer** command displays MSDP information for the peer from which the switch accepts SA messages for a specified rendezvous point (RP).

The switch examines the BGP routing table to determine the next hop peer toward the originating RP of an SA message. This next hop peer is the reverse path forwarding (RPF) peer. Because the switch receives SA messages from the RPF peer, it forwards the message to all other MSDP peers. The switch rejects identical SA messages that it receives from a non-RPF peer.

#### Command Mode

EXEC

#### Command Syntax

```
show msdp rpf-peer rp_addr
```

#### Parameter

*rp\_addr* PIM RP IPv4 address.

#### Example

This command displays MSDP information for the peer from which the switch accepts SA messages for the RP at *10.5.29.4*.

```
switch(config)#show msdp rpf-peer 10.5.29.4
Rpf Peer is 10.5.29.4 for RP 10.5.29.4
```

## 15.5 Audio Video Bridging (AVB)

Arista switches support Audio Video Bridging (AVB) and the associated protocols. This section describes AVB concepts and the implementation of associated protocols.

Topics in this section include:

- [AVB Overview](#)
- [AVB Protocols](#)
- [AVB Configuration](#)
- [AVB Command Descriptions](#)

### 15.5.1 AVB Overview

Audio Video Bridging (AVB) is a protocol set that provides precision time synchronization, admission control, queuing reservation, and guaranteed bandwidth of professional grade quality audio and video across an IP network.

Supported AVB protocols include:

- Generalized Precision Time Protocol (gPTP)
- Multiple Stream Reservation Protocol (MSRP)
- Multiple VLAN Registration Protocol (MVRP)

These AVB features are supported on Arista 7280, 7150 Series, and 7500E Series switches:

- gPTP with hardware time stamping
- gPTP Grandmaster function
- MSRP protocol on Ethernet interfaces: stream admission control and propagation
- Control plane protection for PTP and MSRP control frames
- MVRP

- 
- Traffic classes 2 and 3 for AVB traffic
  - Traffic shaping on egress ports

These AVB features are not available on Arista switches:

- MSRP protocol on LAGs
- MSRP co-ordination with gPTP; streams are allowed even when gPTP is not in sync
- MMRP
- Signaling message support in gPTP
- Running peer delay mechanism on STP blocked ports
- Grandmaster-specific state machines (gPTP)

## 15.5.2 AVB Protocols

This section describes supported AVB protocols:

- [gPTP](#)
- [MVRP](#)
- [MSRP](#)
- [MRP](#)

### 15.5.2.1 gPTP

Generalized Precision Time Protocol (gPTP) is a network time synchronization standard for bridged Local Area Networks based on the IEEE 1588v2 Precision Time Protocol and supports the AVB protocol standards.

Time synchronization in a gPTP domain is conducted the same way as in a PTP 1588 domain. A grandmaster is selected through the best grand master clock algorithm and distributes timing synchronization information to all directly attached peers. This information is propagated across the network to provide a common time reference to all Audio and Video end stations.

### 15.5.2.2 MVRP

Multiple VLAN Registration Protocol (MVRP) is an application of Multiple Registration Protocol used by AVB endpoints to dynamically register and unregister VLANs on an interface.

When an interface wishes to join a VLAN advertised by an MSRP talker (to receive a stream), MVRP sends a Join message. On receiving the Join message, the interface is added to the VLAN. If the VLAN does not already exist, MVRP dynamically creates the VLAN and propagates it through the network.

MVRP events post Syslog messages, with the severity level of **INFO** for each message.

- **MVRP\_VLAN\_JOIN**

MVRP VLAN Join received/transmitted on an interface.

- **MVRP\_VLAN\_LV**

MVRP VLAN Leave received/transmitted on an interface.

- **MVRP\_ERROR**

MVRP Join was discarded due to an error.

### 15.5.2.3 MSRP

Multiple Stream Registration Protocol (MSRP) is a signaling protocol that allows end stations (nodes) to reserve network resources and ensure QoS for communicating with other end stations.

MSRP nodes are specified as talkers or listeners:

- Talker nodes transmit multimedia streams to other nodes in the AVB network.
- Listener nodes receive multimedia streams from the AVB talker nodes.

MSRP is implemented by the switch on individual interfaces. MSRP is active when it is enabled on at least one interface, and stopped when it is disabled on all interfaces. MSRP uses Multiple Registration Protocol (MRP) to facilitate attribute registrations and distribution across connected end points in a LAN environment.

MSRP events post Syslog messages, with the severity level of INFO for each message.

- **MSRP\_SR\_CLASS\_TRANSITION**  
MSRP SR Class state transition occurred on an interface.
- **MSRP\_TALKER\_ADV\_JOIN**  
Talker Advertise Join message for a stream was transmitted/received on an interface.
- **MSRP\_TALKER\_FAIL\_JOIN**  
Talker Failed Join message for a stream was transmitted/received on an interface.
- **MSRP\_LISTENER\_JOIN**  
Listener Join message for a stream was transmitted/received on an interface.
- **MSRP\_DOMAIN\_JOIN**  
Domain Join message was transmitted/received on an interface.
- **MSRP\_TALKER\_ADV\_LV**  
Talker Advertise Leave message for a stream was transmitted/received on an interface.
- **MSRP\_TALKER\_FAIL\_LV**  
Talker Failed Leave message for a stream was transmitted/received on an interface.
- **MSRP\_LISTENER\_LV**  
Listener Leave message for a stream was transmitted/received on an interface.
- **MSRP\_DOMAIN\_LV**  
Domain Leave message was transmitted/received on an interface.
- **MSRP\_BW\_ALLOC\_SUCCESS**  
MSRP Bandwidth was allocated for a listener on an interface.
- **MSRP\_BW\_ALLOC\_FAIL**  
MSRP Bandwidth could not be allocated for a listener on an interface.
- **MSRP\_BW\_DEALLOC**  
MSRP Bandwidth was de-allocated for a listener on an interface.
- **MSRP\_ERROR**  
MSRP Join was discarded because of an error.

#### 15.5.2.4 MRP

Multiple Registration Protocol (MRP) protocol includes MSRP and MVRP, and allows participants in an MRP application to register attributes with participants in a Bridged Local Area Network (BLAN).

### 15.5.3 AVB Configuration

This section describes the AVB configuration:

- [Enabling gPTP](#)
- [Enabling MSRP](#)
- [Displaying MSRP Configuration and Status](#)

- [Enabling MVRP](#)
- [Displaying MVRP Configuration and Status](#)

### 15.5.3.1 Enabling gPTP

Configure gPTP on the switch through the `ptp mode gptp` command. PTP is enabled on individual interfaces with the `ptp enable` command.

#### Example

- These commands configure gPTP on the switch and enable PTP on Ethernet interfaces 41-45.

```
switch(config)#ptp mode gptp
switch(config)#interface ethernet 41-45
switch(config-if-Et41-45)#ptp enable
switch(config)#show running-config
    <-----OUTPUT OMITTED FROM EXAMPLE----->
!
ptp mode gptp
!
    <-----OUTPUT OMITTED FROM EXAMPLE----->
end
switch(config-if-Et41-45)#show active
interface Ethernet41
    speed forced 10000full
    msrp
    ptp enable
interface Ethernet42
    speed forced 10000full
    msrp
    ptp enable
interface Ethernet43
    speed forced 10000full
    msrp
    ptp enable
interface Ethernet44
    speed forced 10000full
    ptp enable
interface Ethernet45
    ptp enable
switch(config-if-Et41-45)#
```

### 15.5.3.2 Enabling MSRP

MSRP is enabled on an interface with the `msrp` command.

#### Example

- These commands enable MSRP on Ethernet interfaces 41-43.

```
switch(config)#interface ethernet 41-43
switch(config-if-Et41-43)#msrp
switch(config-if-Et41-43)#show active
interface Ethernet41
    speed forced 10000full
    msrp
interface Ethernet42
    speed forced 10000full
    msrp
interface Ethernet43
```

```

speed forced 10000full
msrp
switch(config-if-Et41-43)#

```

### 15.5.3.3 Displaying MSRP Configuration and Status

MSRP configuration information and status is displayed with the **show msrp** command.

#### Example

- This command displays the MSRP status for Ethernet interfaces 41-43.

```

switch(config)#show msrp interfaces ethernet 41-43

MSRP Global Status : Enabled
Max Frame Size : 1522
Max Fan-In Ports : No limit

Class Supported Priority Delta
-----
A           Y       3       75%

Et43     Disabled 3

switch(config)#

```

Stream data is available for the talker and listener. The **show msrp interfaces** command displays the status and configuration information for each stream.

#### Examples

- This command displays data for listener station streams on Ethernet interfaces 1 and 2.

```

switch(config)#show msrp interfaces ethernet 1-2
MSRP Global Status : Enabled
Max Frame Size : 1522
Max Fan-In Ports : No limit

Class Supported Priority Delta

```

#### 15.5.3.4 Enabling MVRP

MVRP is disabled by default. To enable MVRP on an interface, use the `mvrp` command. MVRP is enabled globally if it is enabled on at least one interface.

##### Example

- These commands enable MVRP on Ethernet interface 34.

```

switch(config)#interface ethernet 34
switch(config-if-Et34)#mvrp
switch(config-if-Et34)#

```

#### 15.5.3.5 Displaying MVRP Configuration and Status

MVRP configuration information and status are displayed with the `show mvrp` command.

##### Example

- This command displays the MVRP status for Ethernet interfaces 30 through 40.

```

switch(config)#show mvrp interfaces Ethernet 30-40

MVRP Global Status : Enabled

      Port      Admin State  Registered Vlans  Declared Vlans

## 15.5.4 AVB Command Descriptions

### MSRP Commands

- [msrp](#)
- [msrp streams load-file](#)
- [show msrp](#)
- [show msrp interfaces](#)
- [show msrp streams](#)

### MRP Commands

- [mrp leave-all-timer](#)
- [mrp leave-timer](#)

### MVRP Commands

- [mvrp](#)
- [show mvrp](#)

### 15.5.4.1 mrp leave-all-timer

The **mrp leave-all-timer** command specifies the mrp leave all timer interval for the configuration mode interface.

When starting MRP, a participant starts its LeaveAll timer. Upon timer expiry, it sends a LeaveAll message and restarts its timer. When other participants receive the message, they register their attributes and restart their leave-all timers.

The default leave-all timer interval is a randomly selected value from 10 to 15 seconds. Under normal conditions, this value should not be adjusted.

The **no mrp leave-all-timer** and **default mrp leave-all-timer** commands restore the default leave-all timer interval on the configuration mode interface by removing the corresponding **mrp leave-all-timer** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
mrp leave-all-timer period
mrp leave-all-timer
default mrp leave-all-timer
no mrp leave-all-timer
```

#### Parameters

- ***period*** leave all timer interval (seconds). Values range from 10 to 60. Default value is a randomly selected value from 10 to 15.

#### Example

This command sets the MRP leave-all timer interval on Ethernet interface 17 to twelve seconds.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#mrp leave-all-timer 12
switch(config-if-Et17)#
```

---

### 15.5.4.2 mrp leave-timer

The leave-timer controls the deregistration of attributes. If an MRP participant needs other participants to unregister their attributes, it sends a Leave message. When receiving a Leave message, the Leave-timer starts and unregisters the attributes if it doesn't receive Join messages for the attributes before the Leave-timer expires.

The **mrp leave-timer** command specifies the mrp leave-timer interval for the configuration mode interface. The default leave-timer interval is 0.6 seconds. Under normal operation conditions, this value should not be adjusted.

The **no mrp leave-timer** and **default mrp leave-timer** commands restore the default leave-timer interval of 0.6 seconds on the configuration mode interface by removing the corresponding **mrp leave-timer** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
mrp leave-timer period
```

```
no mrp leave-timer
```

```
default mrp leave-timer
```

#### Parameters

- *period* leave all timer interval (seconds). Values range from 10 to 60. Default value is a randomly selected value from 10 to 15.

#### Example

- This command sets the MRP leave timer interval on Ethernet interface 17 to 0.8 seconds.

```
switch(config)#interface ethernet 17  
switch(config-if-Et17)#mrp leave-timer 12  
switch(config-if-Et17)#
```

### 15.5.4.3 msrp streams load-file

The load-file for MSRP streams provides a file that contains an alias that can be substituted in the name (stream-id) of a string.

The `msrp streams load-file` command allows users to include a line in the file (example: **0102.0304.0506 XYZW4** or **0102.0304 XYZW5**) that causes the bytes to be replaced with the accompanying string in `show msrp streams` commands.

The `no msrp streams load-file` and `default msrp streams load-file` commands remove the alias assignment by removing the corresponding `msrp streams load-file` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
msrp streams load-file [FILE TYPE]
no msrp streams load-file
default msrp streams load-file
```

#### Parameters

- **FILE TYPE** The options include:
  - **certificate**: device name, directory, or file name
  - **extension**: device name, directory, or file name
  - **file**: device name, directory, or file name
  - **flash**: device name, directory, or file name
  - **ftp**: device name, directory, or file name
  - **http**: device name, directory, or file name
  - **https**: device name, directory, or file name
  - **scp**: device name, directory, or file name
  - **sftp**: device name, directory, or file name
  - **sslkey**: device name, directory, or file name
  - **system**: device name, directory, or file name
  - **terminal**: device name, directory, or file name
  - **tftp**: device name, directory, or file name
  - **usb1**: device name, directory, or file name
- **Example**

This command indicates that the file named file1 contains the alias names that is used in MSRP stream names.

```
switch(config)#msrp streams load-file file1
switch(config)#
```

---

#### 15.5.4.4 msrp

MSRP enables Multiple Stream Registration Protocol (MSRP), which is a signaling protocol that provides nodes with the ability to reserve network resources to ensure Quality of Service (QoS) between talker and listener endpoints. The Stream Reservation Protocol (SRP) utilizes MSRP to reserve bandwidth for data streams, and configure a complete path between endpoints.

The **msrp** command enables MSRP on the configuration mode interface. If MSRP was not previously enabled on any interface, the MSRP agent is launched by this command.

The **no msrp** and **default msrp** commands disable MSRP on the configuration mode interface, and removes the corresponding **msrp** command from *running-config*. The command stops the MSRP agent when MSRP is no longer enabled on any interface.

##### Command Mode

Interface-Ethernet Configuration

##### Command Syntax

```
msrp
no msrp
default msrp
```

##### Example

These commands enable MSRP on Ethernet interface 3/3/3. Because it was not previously enabled on any other interface, the command launches the MSRP agent.

```
switch(config)#interface ethernet 3/3/3
switch(config-if-Et3/3/3)#msrp
Launching MSRP Agent
switch(config-if-Et3/3/3)#show active
  interface Ethernet3/3/3
  msrp
switch(config-if-Et3/3/3)#
```

These commands disable the MSRP agent on Ethernet interface 3/3/3. Because it is not enabled on any other interface, the command stops the MSRP agent.

```
switch(config-if-Et3/3/3)#no msrp
Stopping MSRP agent
switch(config-if-Et3/3/3)#show active
  interface Ethernet3/3/3
switch(config-if-Et3/3/3)#msrp
```

### 15.5.4.5 show msrp interfaces

The **show msrp interfaces** command displays station stream information for the specified station type, interfaces and streams.

#### Command Mode

EXEC

#### Command Syntax

```
show msrp interfaces [INTERFACE_NAME] STATION_TYPE_NAME [STREAMS]
```

#### Parameters

- **INTERFACE\_NAME** Interface type and number. Values include:
  - <no parameter> all Ethernet interfaces.
  - ethernet *e\_range* Ethernet interface list.
  - **STATION\_TYPE** Endpoint type. Values include:
    - talker Command displays data for talker station streams.
    - listeners Command displays data for listener station streams.
    - streams Command displays data for talker and listener station streams.

**STREAMS** Streams for which command displays information. Options include:

- <no parameter> all streams.
- *stream-id hex\_string* specifies the stream command for which command displays information.

Valid *e\_range* formats include number, range, or comma-delimited list of numbers and ranges.

Valid *hex\_string* formats include <H>, <H.H>, <H.H.H>, or <H.H.H.H>, where H is a four-digit hex number that ranges from 0 to FFFF.

#### Example

- This command displays data for listener station streams on Ethernet interfaces 1 and 2.

```
switch(config)#show msrp interfaces ethernet 1-2 listeners

### 15.5.4.6 show msrp streams

The **show msrp streams** command displays configuration and status information on the specified MSRP streams.

#### Command Mode

EXEC

#### Command Syntax

```
show msrp streams [STREAM_NAME] [INFO_LEVEL]
```

#### Parameters

- **STREAMS** Streams for which command displays information. Options include:
  - <no parameter> all streams.
  - **stream-id** *hex\_string* specifies the stream command for which command displays information.

Valid *hex\_string* formats include <H>, <H.H>, <H.H.H>, or <H.H.H.H>, where H is a four-digit hex number that ranges from **0** to **FFFF**.

- **INFO\_LEVEL** type of information that the command displays. Options include:
  - <no parameter> command displays stream identification information.
  - **detail** command displays identification and transmission characteristics.
  - **propagation** command displays ingress and egress port information.

#### Examples

- This command displays stream identification information.

## Virtual Extensible LANs (VXLANs)

---

This chapter describes Arista's Virtual Extensible LAN (VXLAN) implementation. Sections in this chapter include:

- [VXLAN Introduction](#)
- [VXLAN Description](#)
- [VXLAN Configuration](#)
- [VXLAN Command Descriptions](#)

### 16.1 VXLAN Introduction

Virtual Extensible LAN (VXLAN) is a networking technology that encapsulates MAC-based Layer 2 Ethernet frames within Layer 3 UDP packets to aggregate and tunnel multiple layer 2 networks across a Layer 3 infrastructure. VXLAN scales up to 16 million logical networks and supports layer 2 adjacency across IP networks. Multicast transmission architecture is used for broadcast, multicast, and unknown unicast traffic.

For a list of VXLAN feature support in a specific EOS release, consult the appropriate release notes here: <https://www.arista.com/en/support/software-download>.

For a list of VXLAN feature support by platform in the latest EOS release, see <https://www.arista.com/en/support/product-documentation/supported-features>

**Note:** VXLAN and NAT cannot co-exist.

### 16.2 VXLAN Description

These sections describe VXLAN architecture, the data objects that comprise a VXLAN network, and process of bridging packets through a VXLAN network.

- [VXLAN Architecture](#)
- [VXLAN Processes](#)
- [Multicast and Broadcast over VXLAN](#)
- [VXLAN Gateway](#)
- [VXLAN and MLAG](#)
- [Data Structures](#)

#### 16.2.1 VXLAN Architecture

The VXLAN architecture extends an L2 network by connecting VLANs from multiple hosts through UDP tunnels called VXLAN segments. VXLAN segments are identified by a 24-bit virtual network identifier (VNI). Within a host, each VLAN whose network is extended to other hosts is associated with a VNI. An extended L2 network comprises the devices attached to VLANs from all hosts that are on VLANs that are associated with the same VNI.

The following figure displays the data objects that comprise a VXLAN implementation on a local host.

**Figure 50: VXLAN Architecture**

- **VXLAN Tunnel End Point (VTEP):** a host with at least one VXLAN Tunnel Interface (VTI).
- **VXLAN Tunnel Interface (VTI):** a switchport linked to a UDP socket that is shared with VLANs on various hosts. Packets bridged from a VLAN to the VTI are sent out the UDP socket with a VXLAN header. Packets arriving on the VTI through the UDP socket are demuxed to VLANs for bridging.
- **Virtual Network Identifier (VNI):** a 24-bit number that distinguishes between the VLANs carried on a VTI. It facilitates the multiplexing of several VLANs over a single VTI.

VNIs can be expressed in digital or dotted decimal formats. VNI values range from 1 to 16777215 or from 0.0.1 to 255.255.255.

The network in the figure above has the following assignments:

- VTEP IP address of 10.10.1.1
- UDP port of 4789
- One VTI that supports three VXLAN segments (UDP tunnels): VNI 200, VNI 2000, and VNI 20000
- Five VLANs, of which three VLANs can communicate with remote devices over Layer 2.

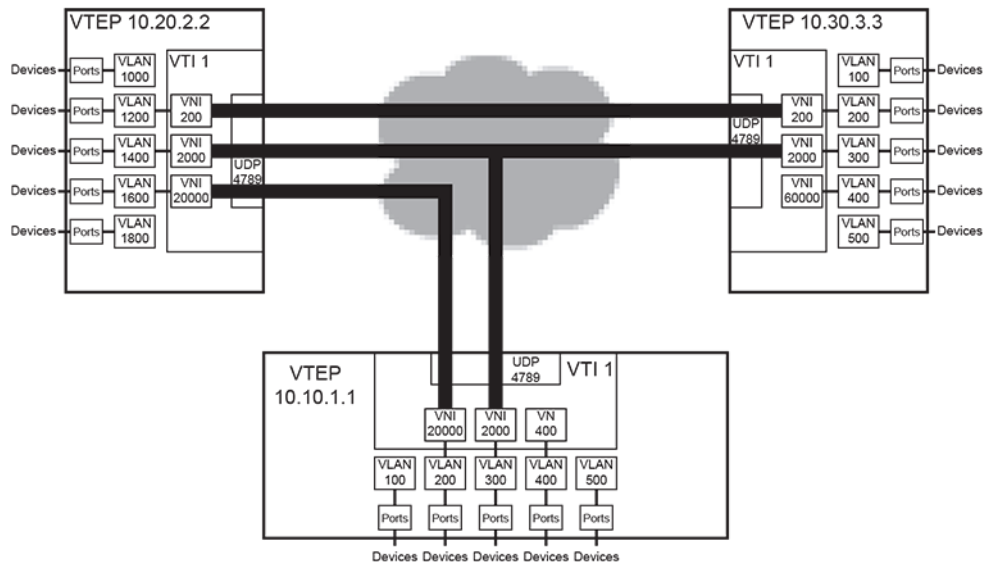

## 16.2.2 VXLAN Processes

When a packet enters a VLAN from a member (ingress) port, the VLAN learns the source address by adding an entry to the MAC address table that associates the source to the ingress-port. The VLAN then searches the table for destination address. If the MAC address table lists the address, the packet is sent out the corresponding port. If the MAC address table does not list the address, the packet is flooded to all ports except the ingress port.

VXLANs extend VLANs through the addition of a VXLAN address table that correlates remote MAC addresses to their port and resident host IP address. Packets that are destined to a remote device are sent to the VXLAN tunnel interface (VTI), which is the switchport that is linked to the UDP socket. The packet is encapsulated with a VXLAN header which includes the VNI associated with the VLAN and the IP mapping of the destination host. The packet is sent through a UDP socket to the destination VTEP IP. The VTI on the remote host extracts the original packet and bridges it to the VLAN associated with the VNI on the remote host.

UDP port 4789 is recognized as the VXLAN socket and listed as the destination port on the UDP packets. The UDP source port field is filled with a hash of the inner header to facilitate load balancing.

**Figure 51: XLAN Implementation**

The figure above displays a configuration that includes three VTEPs. The VXLAN defines three inter-host L2 networks. The VLANs that comprise the networks include:

- VNI 200: VTEP 10.20.2.2: VLAN 1200 and VTEP 10.30.3.3: VLAN 200
- VNI 2000: VTEP 10.10.1.1: VLAN 300, VTEP 10.20.2.2: VLAN 1400, and VTEP 10.30.3.3: VLAN 300
- VNI 20000: VTEP 10.10.1.1: VLAN 200, and VTEP 10.20.2.2: VLAN 1600

### VXLAN Routing

VXLAN routing is enabled by creating a VLAN interface on the VXLAN-enabled VLAN and assigning an IP address to the VLAN interface. The IP address serves as VXLAN gateway for devices that are accessible from the VXLAN-enabled VLAN.

## 16.2.3 Multicast and Broadcast over VXLAN

These sections describe multicast and broadcast over VXLANs. Multicast packet flooding describes broadcast and multicast transmission by associating a multicast group to a VTI through a configuration command.

Head-end Replication (HER) optimizes flooding of inter VTEP broadcast, unknown unicast and broadcast (BUM) traffic by using hardware and flood lists to perform replication on the supported platform.

- [Multicast Packet Flooding](#)
- [Head-end Replication](#)

### 16.2.3.1 Multicast Packet Flooding

Multicast packet flooding is supported with VXLAN bridging without MLAG. A VTI is associated with a multicast group through a configuration command.

#### VXLAN and Broadcast

When a VLAN receives or sends a broadcast packet the VTI is treated as a bridging domain L2 interface. The packet is sent from this interface on the multicast group associated with the VTI. The VTIs on remote VTEPs that receive this packet extract the original packet, which is then handled by the VLAN associated with the packet's VNI. The VLAN floods the packet, excluding the VTI. When

---

the broadcast results in a response, the resulting packet can be unicast back to the originating VTEP because the VXLAN address table obtained the host MAC to VTEP association from the broadcast packet.

### **VXLAN and Multicast**

A VTI is treated as an L2 interface in the VLAN for handling multicast traffic, which is mapped from the VLAN to the multicast group associated with the VTI. All VTEPs join the configured multicast group for inter-VTEP communication within a VXLAN segment; this multicast group is independent of any other multicast groups that the hosts in the VLAN join.

The IP address space for the inter-host VXLAN communication may be sourced from a different VRF than the address space of the hosts in the VLAN. The multicast group for inter-VTEP transmissions must not be used for other purposes by any device in the VXLAN segment space.

#### **16.2.3.2 Head-end Replication**

Head-end replication uses a flood list to support broadcast, unknown unicast, and multicast (BUM) traffic over VXLAN. The flood list specifies a list of remote VTEPs. The switch replicates BUM data locally for bridging across the remote VTEPs specified by the flood list. This data flooding facilitates remote MAC address learning by forwarding data with unknown MAC addresses.

Head-end replication is required for VXLAN routing and to support VXLANs over MLAG.

#### **16.2.4 VXLAN Gateway**

A VXLAN gateway is a service that exchanges VXLAN data and packets with devices connected to different network segments. VXLAN traffic must pass through a VXLAN gateway to access services on physical devices in a distant network.

A VXLAN gateway requires the following information:

- An IP address that is designated as the VXLAN interface source.
- VLAN to VNI mapping.
- VTEP list for each VNI.
- A method for handling broadcast, unknown unicast, and multicast (BUM) packets.

Arista switches manually perform VXLAN gateway services. The switch connects to VXLAN gateways that serve other network segments. MAC address learning is performed in hardware from inbound VXLAN packets.

#### **16.2.5 VXLAN and MLAG**

VXLAN over MLAG provides redundancy in hardware VTEPs. VTI configuration must be identical on each MLAG peer for them to act as a single VTEP. This also prevents the remote MAC from flapping between the remote VTEPs by ensuring that the rest of the network sees a host that is connected to the MLAG interface as residing behind a single VTEP.

Differences between VXLAN bridging and routing implementations over MLAG are applicable for the DCS-7050X series platform.

- VXLAN routing recirculates a packet twice, with the first iteration performing the routing action involving an L2 header rewrite, and the second recirculation performing VXLAN encap and decap operations. Recirculation is achieved by MAC loopback on dedicated loopback interfaces.
- The configuration for VXLAN routing on an MLAG VTEP includes separate Recirc-Channel configuration on both peers. The virtual IP, virtual MAC, and virtual VARP VTEP IP addresses are identical on both peers.

The following VTI elements must be configured identically on both MLAG peers:

- VLAN-VNI mappings
- VTEP IP address of the source loopback interface
- Flood VTEP list used for head-end replication

If OSPF is also in use, configure the OSPF router ID manually to prevent the switch from using the common VTEP IP address as the router ID.

The following rules are observed by MLAG switches so that they behave as a single VXLAN VTEP:

- Only the MLAG peer that receives a packet performs VXLAN encapsulation on it.
- Packets are not VXLAN encapsulated if they are received from the peer link.
- If a packet is decapsulated and sent over the peer link, it should not be flooded to active MLAG interfaces.
- If a packet is sent over the peer link to the CPU, it is not head-end replicated to other remote VTEPs.
- If a packet's destination is the VTEP IP address, it is terminated by the MLAG peer that receives it.

### Example

These commands complete the configuration required for a VXLAN routing deployment.

```
switch(config)#interface Vxlan1
switch(config-if-Vx1)#vxlan source-interface Loopback0
switch(config-if-Vx1)#vxlan udp-port 4789
switch(config-if-Vx1)#vxlan vlan 2417 vni 8358534
switch(config-if-Vx1)#vxlan flood vtep 1.0.1.1 1.0.2.1
switch(config-if-Vx1)#interface Vlan2417
switch(config-if-Vl2417)#ip address 1.0.4.1/24
switch(config-if-Vl2417)#interface Loopback0
switch(config-if-Lo0)#ip address 1.0.1.1/32
switch(config-if-Lo0)#ip routing
switch(config)#interface Recirc-Channel627
switch(config-if-Re627)#switchport recirculation features vxlan
switch(config-if-Re627)#interface Ethernet 1
switch(config-if-Et1)#traffic-loopback source system device mac
switch(config-if-Et1)#channel-group recirculation 627
switch(config-if-Et1)#exit
switch(config)#interface Ethernet 2
switch(config-if-Et2)#traffic-loopback source system device mac
switch(config-if-Et2)#channel-group recirculation 627
switch(config-if-Et2)#
```

### Configuring Unconnected Ethernet Interfaces for Recirculation

On systems where bandwidth is not fully used by the front panel ports, unused bandwidth is used for recirculation.

The following example is applicable to the DCS-7050X series platform.

### Example

These commands expose unconnected Ethernet interfaces which are used for recirculation, in order to use them to replace or use along with front panel Ethernet interfaces.

```
switch(config)#service interface unconnected expose
switch(config)#interface UnconnectedEthernet 2
switch(config-if-Ue2)#traffic-loopback source system device mac
switch(config-if-Ue2)#channel-group recirculation 627
```

---

## 16.2.6 Data Structures

VXLAN implementation requires two VXLAN tables and a MAC address table accommodation.

### 16.2.6.1 MAC Address Table VXLAN Support

MAC address table entries correlate MAC addresses with the port upon which packets arrive. In addition to Ethernet and port channels, the port column may specify a VTI for packets that arrive on a VLAN from a remote port through the VXLAN segment.

### 16.2.6.2 VTEP-MAC Address Table

VTEP-MAC address table entries correlate MAC address with the IP address of the VTEP from where packets bearing the MAC address arrive. The VTI uses this table to determine the destination address for packets that are sent to remote hosts.

### 16.2.6.3 VNI-VLAN Map

The VNI-VLAN map displays the one-to-one correspondence between the VNIs assigned on the switch and the VLANs to which they are assigned. Each VNI can be assigned to only one VLAN; each VLAN can be assigned a maximum of one VNI. Each VNI-VLAN assignment constitutes a VXLAN segment.

## 16.3 VXLAN Configuration

These sections describe VXLAN configuration tasks:

- [Configuring the VTI](#)
- [Head End Replication Configuration](#)
- [VXLAN Routing Configuration](#)
- [Configuring VXLAN Routing with Overlay VRFs](#)
- [Configuring VXLAN over MLAG](#)
- [Configuring VXLAN Control Service](#)
- [Configuring VXLAN Multicast Decapsulation](#)
- [VXLAN Rules Support for Mirror ACLs Configuration](#)
- [Displaying VXLAN Configuration](#)

### 16.3.1 Configuring the VTI

Configuring the VTI enables VXLAN bridging and is a requirement for VXLAN Routing. The following sections describe the steps required to enabling VXLAN bridging by bringing up the VXLAN line protocol. [VXLAN Routing Configuration](#) describes the additional steps required to enable VXLAN routing.

#### Instantiating the VTI and VXLAN Configuration Mode

The `interface vxlan` command places the switch in VXLAN-interface configuration mode for modifying the specified VXLAN tunnel interface (VTI). The command also instantiates the interface if it was not previously created.

VXLAN interface configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

#### Example

These commands create VXLAN tunnel interface 1, place the switch in VXLAN-interface configuration mode, and display parameters of the new VTI.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#show active
interface Vxlan1
    vxlan udp-port 4789
switch(config-if-Vx1)#
```

### Assigning an IP address to the VTEP

The `vxlan source-interface` command specifies the loopback interface from which the VTEP derives the source address (IP) that it uses when exchanging VXLAN frames. This address is used by UDP headers to specify source and destination addresses of hosts that send or receive VXLAN encapsulated packets.

There is no default source interface assignment. A valid VXLAN configuration requires the assignment of a loopback interface to the VTEP and the assignment of a valid IP address to the specified interface.

### Example

These commands configure VTI 1 to use IP address 10.25.25.3 (loopback interface 15) as the source interface in the encapsulation fields of outbound VXLAN frames.

```
switch(config)#interface loopback 15
switch(config-if-Lo15)#ip address 10.25.25.3/24
switch(config-if-Lo15)#exit
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan source-interface loopback 15
switch(config-if-Vx1)#show active
interface Vxlan1
    vxlan source-interface Loopback15
    vxlan udp-port 4789
switch(config-if-Vx1)#
```

### Assigning a UDP Port to the VTEP

Packets bridged to the VTI from a VLAN are encapsulated with a VXLAN header, then sent through a pre-configured UDP port. Packets that arrive through this port are assumed to be VXLAN encapsulated and sent to the bridging domain of the recipient VLAN as determined by the VNI in the VXLAN header and the VNI-VLAN map.

The `vxlan udp-port` command associates a UDP port with the configuration mode VXLAN interface (VTI). By default, UDP port 4789 is associated with the VTI.

**Note:** UDP port 4789 is reserved by convention for VXLAN usage. Under most typical applications, this parameter should be set to the default value.

### Examples

- This command associates UDP port 5500 with VXLAN interface 1.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan udp-port 5500
switch(config-if-Vx1)#show active
interface Vxlan1
    vxlan udp-port 5500
switch(config-if-Vx1)#
```

- This command resets the VXLAN interface 1 UDP port association of 4789.

```
switch(config-if-Vx1)#no vxlan udp-port
```

```
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan udp-port 4789
switch(config-if-Vx1)#
```

### Assigning a VNI to a VLAN

When a VLAN bridges a packet to the VTI, the packet is encapsulated with a VXLAN header that includes the VNI associated with the VLAN. Packets that arrive on the VTI's UDP socket are bridged to the VLAN that is associated with the VNI specified by the VXLAN header that encapsulates the packet.

The VTI requires a one-to-one correspondence between specified VLANs and VNI values. Commands that assign a new VNI to a previously configured VLAN replace existing VLAN assignment statements in **running-config**. Commands that attempt to assign a VNI value to a second VLAN generate a CLI error.

The `vxlan vlan vni` command associates a VLAN ID with a virtual network identifier (VNI).

### Example

These commands associate VLAN 100 to VNI 100 and VLAN 200 to VNI 10.10.200.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan vlan 100 vni 100
switch(config-if-Vx1)#vxlan vlan 200 vni 10.10.200
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan udp-port 4789
  vxlan vlan 200 vni 658120
  vxlan vlan 100 vni 100
switch(config-if-Vx1)#vxlan vni notation dotted
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan udp-port 4789
  vxlan vlan 100 vni 0.0.100
  vxlan vlan 200 vni 10.10.200
switch(config-if-Vx1)#
```

### Assigning a Multicast Group to the VTI

The VTI maps multicast traffic from its associated VLANS to a specified multicast group. Inter-VTEP multicast communications include all VTEPs that are associated with the specified multicast group, which is independent of any other multicast groups that VLAN hosts may join.

The `vxlan multicast-group` command associates a specified multicast group with the configuration mode VXLAN interface (VTI), which handles multicast and broadcast traffic as a layer 2 interface in a bridging domain.

### Example

This command associates the multicast address of 227.10.1.1 with VTI 1.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan multicast-group 227.10.1.1
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan multicast-group 227.10.1.1
  vxlan udp-port 4789
switch(config-if-Vx1)#
```

## Verifying the VXLAN Configuration

The **show interface vxlan 1** displays the configuration and connection status of the VXLAN

### Example

This command indicates that the VXLAN line protocol status is *up*.

```
switch(config-if-Vx1)#show interface vxlan 1
Vxlan1 is up, line protocol is up (connected)
  Hardware is Vxlan
  Source interface is Loopback15 and is active with 10.25.25.3
  Static vlan to vni mapping is
    [100, 0.0.100]    [200, 10.10.200]
  Multicast group address is 227.1.1.1
switch(config-if-Vx1)#
```

## 16.3.2 Head End Replication Configuration

Head-end replication is a data distribution method that supports broadcast, unknown unicast, and multicast (BUM) traffic over VXLANs by replicating BUM data locally for transmission to the set of remote VTEPs specified by a flood list. This data flooding facilitates remote MAC address learning through the forwarding of data with unknown MAC addresses.

Each **vxlan flood vtep** statement in **running-config** associates a set of VTEP addresses to an access VNI. A default flood list is also configurable that applies to all VNIs for which a flood list is not configured.

The VTEP flood list is created and modified through the **vxlan flood vtep** command. When configuring VXLAN bridging, the flood list can replace **vxlan multicast-group**.

### Examples

- These commands create a default VXLAN head-end replication flood list.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan flood vtep 10.1.1.1 10.1.1.2
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan flood vtep 10.1.1.1 10.1.1.2
  vxlan udp-port 4789
switch(config-if-Vx1)#
```

- These commands create VXLAN head-end replication flood lists for the VNIs accessed through VLANs 101 and 102.

```
switch(config-if-Vx1)#vxlan vlan 101-102 flood vtep 11.1.1.1 11.1.1.2
11.1.1.3
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan flood vtep 10.1.1.1 10.1.1.2
  vxlan vlan 101 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  vxlan vlan 102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  vxlan udp-port 4789
switch(config-if-Vx1)#
```

## 16.3.3 VXLAN Routing Configuration

- [Implementing VXLAN Routing](#)
- [Configuring Direct VXLAN Routing](#)
- [Configuring VXLAN VTEP counters](#)

### 16.3.3.1 Implementing VXLAN Routing

VXLAN routing is enabled by creating a VLAN interface (SVI) on a VLAN that is associated to a VNI. In the figure below, VXLAN routing is enabled on Switch A by configuring a VLAN interface with an IP address of 10.10.10.1. Packets from Devices A-1 and B-2 that have destinations other than 10.10.10.0/28 are VXLAN-bridged to the default gateway (10.10.10.1), then routed from Switch A.

Figure 52: Implementing VXLAN Routing

#### Example

These commands configure Switch A to perform VXLAN routing. The example includes OSPF routing that is used for underlay routing.

```
switch-A(config)#route-map vxlanvlan permit 10
switch-A(config-route-map-vxlanvlan)#match interface loopb5
switch-A(config-route-map-vxlanvlan)#exit
switch-A(config)#route-map vxlanvlan permit 20
switch-A(config-route-map-vxlanvlan)#match interface vlan 100
switch-A(config-route-map-vxlanvlan)#exit
switch-A(config)#router ospf 1
switch-A(config-router-ospf)#redistribute connected route-map vxlanvlan
switch-A(config-router-ospf)#exit
switch-A(config)#interface loopback 5
switch-A(config-if-Lo5)#ip address 10.25.25.3/24
switch-A(config-if-Lo5)#exit
switch-A(config)#interface vxlan 1
switch-A(config-if-Vxl)#vxlan source-interface loopback 5
switch-A(config-if-Vxl)#vxlan vlan 100 vni 10000
switch-A(config)#interface vlan 100
switch-A(config-if-Vl100)#ip address 10.10.10.1/28
switch-A(config-if-Vl100)#exit
```

### 16.3.3.2 Configuring Direct VXLAN Routing

Figure [Implementing VXLAN Routing](#), VXLAN routing is enabled on Switch A only; Switch B supports VXLAN bridging. Traffic from Switch B devices to the external routes must go through the core route twice: once as they are bridged to is VXLAN gateway and once when routed to its next hop device.

Direct VXLAN routing with VXLAN enabled addresses this issue by configuring each VTEP with all VLANs. This allows packets to be VXLAN-bridged to a local VTEP and routed to remote VTEPs. Indirect routing scales well but is complex to engineer efficiently, and naked routing provides the same scalability to indirect routing. Direct routing leads to the most efficient traffic flows, with the number of virtual subnets or virtual machines increasing at scale, and is thereby optimal from a data plane viewpoint.

The following sections describe conventions required to implement Direct VXLAN Routing, then presents a direct VXLAN routing implementation.

### Configuring VARP addresses

For direct routing, an anycast IP address is used as the gateway address on the SVI for a VLAN on all hardware VTEPs associated with that VLAN.

#### Examples

- These commands configure an IP virtual-router and virtual MAC address.

```
switch(config)#interface Vlan2417
switch(config-if-Vl2417)#ip address 1.0.4.50/24
switch(config-if-Vl2417)#ip virtual-router address 1.0.4.1
switch(config-if-Vl2417)#ip virtual-router mac-address 00:00:11:11:2
2:22
switch(config)#
```

- These commands configure an IP virtual address (instead of IP virtual-router address) for the VLAN SVI, and a secondary address on the loopback interface for the virtual VTEP IP. The virtual VTEP IP is the logical VTEP hosting the virtual MAC address.

```
switch(config)#interface Vlan2417
switch(config-if-Vl2417)#ip address virtual 1.0.4.1/24
switch(config-if-Vl2417)#exit
switch(config)#interface Loopback0
switch(config-if-Lo0)#ip address 1.0.1.1/32
switch(config-if-Lo0)#ip address 1.0.1.2/32 secondary
switch(config-if-Lo0)#ip virtual-router mac-address 00:00:11:11:22:22
switch(config)#
```

### Virtual IP and MAC Addresses

Virtual-router IP addresses can be configured on VLAN interfaces in addition to a primary address. All VTEPs in a direct VXLAN network can be configured with the same virtual router address. This allows devices to use a common IP address as their VXLAN gateway.

The `ip address virtual` command configures a specified address as the primary IPv4 address and as a virtual IP address for the configuration mode VLAN interface. This results in the virtual MAC address (`ip virtual-router mac-address`) assignment to the VLAN interface. In large VXLAN networks, using distinct primary IP addresses for each VTEP limits the number addresses on its subnet for connected hosts. Defining a common virtual IP address for all VTEPs and using that their primary addresses conserves subnet addresses

#### Example

These commands specify a virtual router address of 00:00:00:00:00:48 for the switch and, for VLAN 100, a primary address of 10.10.10.10/28 and a virtual IP address of 10.10.10.10.

```
switch(config)#ip virtual-router mac-address 00:00:00:00:00:48
switch(config)#interface vlan 100
switch(config-if-Vl100)#ip address virtual 10.10.10.10/28
switch(config-if-Vl100)#show active
  interface Vlan100
    ip address virtual 10.10.10.10/28
switch(config-if-Vl100)#
```

## Virtual VTEP Configuration

A virtual VTEP address is specified by configuring a secondary address on the loopback interface designated as the VXLAN's source interface. All VTEPs in the direct routing topology share the same virtual VTEP address.

You must also configure the secondary VTEP IP on the flood-list of the downstream VXLAN VTEPS as shown below.

### Example

These commands specify a primary (10.1.1.1) and virtual VTEP address (10.2.2.2).

```
switch1
switch(config)#interface loopback 5
switch(config-if-Lo5)#ip address 10.1.1.1/24
switch(config-if-Lo5)#ip address 10.2.2.2/24 secondary
switch(config-if-Lo5)#show active
  interface Loopback5
    ip address 10.1.1.1/24
    ip address 10.2.2.2/24 secondary
switch(config-if-Lo5)#exit
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan source-interface loopback 5
switch(config-if-Vx1)#show active
  interface Vxlan1
    vxlan source-interface Loopback5
    vxlan udp-port 4789
    vxlan vlan 100 vni 10000
switch(config-if-Vx1)#

switch2
switch(config)#interface vxlan1
switch(config-if-Vx1)#vxlan flood vtep 10.1.1.1
switch(config-if-Vx1)#vxlan flood vtep 10.2.2.2
```

## Direct VXLAN Topology

The following figure displays a direct VXLAN topology, where each VTEP is configured with the same set of VNIs, VLAN interfaces, and virtual VTEP address.

Figure 53: Direct VXLAN Routing

## Example

These commands configure VXLAN parameters for Switch-A.

```

switch-A(config) #route-map vxlanvlan permit 10
switch-A(config-route-map-vxlanvlan) #match interface loopb5
switch-A(config-route-map-vxlanvlan) #exit
switch-A(config) #route-map vxlanvlan permit 20
switch-A(config-route-map-vxlanvlan) #match interface vlan 100
switch-A(config-route-map-vxlanvlan) #exit
switch-A(config) #router ospf 1
switch-A(config-router-ospf) #redistribute connected route-map vxlanvlan
switch-A(config-router-ospf) #exit
switch-A(config) #ip virtual-router mac-address 00:00:00:00:00:48
switch-A(config) #interface loopback 5
switch-A(config-if-Lo5) #ip address 10.1.1.3/24
switch-A(config-if-Lo5) #ip address 10.1.1.10/24 secondary
switch-A(config-if-Lo5) #exit
switch-A(config) #interface vxlan 1
switch-A(config-if-Vxl) #vxlan source-interface loopback 5
switch-A(config-if-Vxl) #vxlan vlan 100 vni 10000
switch-A(config) #interface vlan 100
switch-A(config-if-Vl100) #ip address virtual 10.10.10.10/28
switch-A(config-if-Vl100) #exit

```

### 16.3.3.3 Configuring VXLAN VTEP Counters

The switch platforms which use this feature are:

- DCS-7050X
- DCS-7250X
- DCS-7300X

The VXLAN VTEP counters feature enables a device to count VXLAN packets received and sent by the device on a per VTEP basis. Specifically, it enables the device to count bytes and packets that are getting encapsulated and decapsulated as they are passing through.

The counters are logically split up in the two VXLAN directions. Encapsulated on the device and directed to the core, “encap” counters count packets coming from the edge. Decapsulated on the device and heading towards the edge, “decap” counters count packets coming from the core.

To be able to count VXLAN packets the device has to support VXLAN and have a VXLAN interface correctly configured.

#### Examples

- This command configures the enabling of VXLAN VTEP counters for encap.

```

switch(config) #hardware counter feature vtep encap
switch(config) #

```

- This command configures the disabling of VXLAN VTEP counters for encap.

```

switch(config) #no hardware counter feature vtep encap
switch(config) #

```

- This commands configures the enabling of VXLAN VTEP counters for decap.

```

switch(config) #hardware counter feature vtep decap
switch(config) #

```

- This commands configures the disabling of VXLAN VTEP counters for decap.

```
switch(config)#no hardware counter feature vtep decap
switch(config)#
```

### 16.3.4 Configuring VXLAN Routing with Overlay VRFs

The switch platforms which use this feature are:

- DCS-7050X
- DCS-7250X
- DCS-7300X

VXLAN SVIs configured in non-default VRFs are supported with VXLAN routing using overlay VRFs. Overlay SVIs are configured in non-default VRFs but underlay SVIs, which provide IP connectivity between VTEPs, must remain in the default VRF. VXLAN routing is deployable by allowing users to configure separate overlay routing domains using VRFs per tenant, thereby allowing support for overlapping IP addresses in the overlay. This provides separation between overlay and underlay traffic, including simpler and cleaner protocol configuration, without using complicated route-maps to control distribution of prefixes to peers in the overlay VRFs and underlay SVIs. IPv4 based VXLAN routing is currently supported.

### 16.3.5 Configuring VXLAN over MLAG

VTI configuration must be identical on each MLAG peer for them to act as a single VTEP.

The following VTI elements must be configured identically on both MLAG peers:

#### VLAN-VNI Mappings

Configure identical VLAN to VNI mappings on both MLAG peers using the [vxlan vlan vni](#) command.

#### Example

These commands associate VLAN 100 to VNI 100 and VLAN 200 to VNI 10.10.200.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan vlan 100 vni 100
switch(config-if-Vx1)#vxlan vlan 200 vni 10.10.200
switch(config-if-Vx1)#
```

#### VTEP IP Address of the Source Loopback Interface

Configure the same VTEP IP address for the source loopback interface on both MLAG peers using the [vxlan source-interface](#) command.

#### Example

These commands configure a primary VTEP address.

```
switch(config)#interface loopback 5
switch(config-if-Lo5)#ip address 10.1.1.1/24
switch(config-if-Lo5)#exit
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan source-interface loopback 5
switch(config-if-Vx1)#
```

#### Flood VTEP List

Configure the same VTEP flood list on both MLAG peers using the [vxlan flood vtep](#) command.

**Example**

These commands create a default VXLAN head-end replication flood list.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan flood vtep 10.1.1.1 10.1.1.2
switch(config-if-Vx1)#
```

**OSPF Configuration**

If OSPF is in use, configure the OSPF router ID using the `router-id (OSPFv2)` command to prevent the switch from using the common VTEP IP address as the router ID.

**Example**

These commands assign 10.0.0.1 as the OSPFv2 router ID.

```
switch(config)#router ospf 100
switch(config-router-ospf)#router-id 10.0.0.1
switch(config-router-ospf)#
```

**16.3.6 Configuring VXLAN Control Service**

The VXLAN Control Service (VCS) provides a mechanism by which hardware VTEPs share states between each other in order to establish VXLAN tunnels, without the need for a multicast control plane. This feature enables the use of a VCS client.

**Examples**

- These commands connect a switch to the VCS running on CVX. The server host IP address is the management IP address of the CVX controller or the IP address that CVX is listening on for client connections.

```
switch(config)#management cvx
switch(config-mgmt-cvx)#server host 172.27.6.248
switch(config-mgmt-cvx)#no shutdown
switch(config-mgmt-cvx)#
```

- These commands configure the VXLAN interface, except for the multicast group configuration, in order to learn from the controller.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan controller-client
switch(config-if-Vx1)#
```

**16.3.7 Configuring VXLAN Multicast Decapsulation**

The switch platforms which use this feature are:

- DCS-7050X
- DCS-7250X
- DCS-7300X

VXLAN multicast decapsulation enables VTEPs that support Head End Replication (HER). Multicast encapsulated Broadcast/Unknown/Multicast (BUM) packets terminate VTEPs from remote VTEPs that do not support HER.

**Examples**

- These commands enable VXLAN multicast decapsulation.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan multicast-group decap 230.1.1.1
switch(config-if-Vx1)#
```

- These commands disable VXLAN multicast decapsulation.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#no vxlan multicast-group decap 230.1.1.1
switch(config-if-Vx1)#
```

### 16.3.8 VXLAN Rules Support for Mirror ACLs Configuration

The switch platforms which use this feature are:

- DCS-7150S

VXLAN rules support for mirror ACLs configuration permit VXLAN deep inspection rules to be specified in the mirroring ACLs when the switch is operating in normal mode.

#### Examples

The following are examples of VXLAN rules specified in mirroring ACLs.

- These commands permit all VXLAN traffic (udp protocol and destination port 4789).

```
switch(config)#ip access-list miracl
switch(config-acl-miracl)#permit vxlan any any
switch(config-acl-miracl)#
```

- These commands permit VXLAN traffic with vni 1001 only.

```
switch(config)#ip access-list miracl
switch(config-acl-miracl)#permit vxlan any any vni 1001 0x000000
switch(config-acl-miracl)#
```

- These commands deny VXLAN traffic with vni 0x1000 through 0x100f.

```
switch(config)#ip access-list miracl
switch(config-acl-miracl)#permit vxlan any any vni 0x1000 0x100f
switch(config-acl-miracl)#
```

### 16.3.9 Displaying VXLAN Configuration

The following section describes the commands that control the display format of VNIs and the commands that list VXLAN configuration and transmission information.

#### Configuring VNI Display Format

The `vxlan vni notation dotted` command configures the switch to display VNIs in dotted decimal notation. VNI values range from 1 to 16777215 in decimal notation and from 0.0.1 to 255.255.255 in dotted decimal notation.

The command affects the VNI number display in all `show` commands, including `show running-config`. Commands that include VNI as a parameter may use decimal or dotted decimal notation regardless of the setting of this command. By default, show commands display VNI number in decimal notation.

#### Examples

- These commands configure the switch to display vni numbers in dotted decimal notation, then displays a configuration that includes a VNI setting.

```
switch(config)#vxlan vni notation dotted
switch(config)#interface vxlan 1
switch(config-if-Vx1)#show active
interface Vxlan1
    vxlan udp-port 4789
    vxlan vlan 333 vni 3.4.5
switch(config-if-Vx1)#
```

- These commands configure the switch to display vni numbers in decimal notation, then displays a configuration that includes a VNI setting.

```
switch(config)#no vxlan vni notation dotted
switch(config)#interface vxlan 1
switch(config-if-Vx1)#show active
interface Vxlan1
    vxlan udp-port 4789
    vxlan vlan 333 vni 197637
switch(config-if-Vx1)#
```

## MAC Address Table

The MAC address table indicates a MAC address from a device on a remote host by indicating Vx interface as the port that corresponds to the address.

### Example

The `show mac address-table` command displays a MAC address table that includes entries of devices from remote hosts by specifying Vx1 as the corresponding port.

```
switch> show mac address-table
      Mac Address Table
-----
Vlan  Mac Address      Type      Ports      Moves      Last Move
----  -
1     0050.5682.6725     DYNAMIC   Et16       1           0:02:01 ago
1     0050.568e.58e9     DYNAMIC   Et23       2           0:08:53 ago
1     0050.56a0.474a     DYNAMIC   Et16       1           0:18:04 ago
51    0000.0051.0004     DYNAMIC   Et5        1           12 days, 1:02:44 ago
51    0000.0051.0005     DYNAMIC   Et5        1           12 days, 1:02:44 ago
51    0000.0051.0101     DYNAMIC   Vx1        1           12 days, 0:17:30 ago
51    0000.0051.0102     DYNAMIC   Vx1        1           12 days, 0:17:30 ago
61    0000.0061.0005     DYNAMIC   Et5        1           12 days, 1:02:44 ago
Total Mac Addresses for this criterion: 8

      Multicast Mac Address Table
-----
Vlan  Mac Address      Type      Ports
----  -
Total Mac Addresses for this criterion: 0
switch>
```

## VXLAN MAC Address Table

VXLAN MAC address table entries correlate MAC addresses accessible through remote VTEPs with the local VLAN and the IP address of the VTEP through which the addressed device is accessed. The VTI uses this table when constructing the VXLAN encapsulation to specify the destination IP address of the recipient VTEP and the VNI segment through which the device's remote VLAN is accessed.

The `show vxlan address-table` command displays the VXLAN MAC address table.

### Example

This command displays the VXLAN address table.

```
switch> show vxlan address-table
      Vxlan Mac Address Table
-----
Vlan  Mac Address      Type      Prt  Vtep          Moves  Last Move
----  -
51    0000.0051.0101    DYNAMIC   Vx1  10.25.2.12    1      4 days, 0:37:14 ago
51    0000.0051.0102    DYNAMIC   Vx1  10.25.2.12    1      4 days, 0:37:14 ago
51    0000.0051.0103    DYNAMIC   Vx1  10.25.2.12    1      4 days, 0:37:14 ago
51    0000.0051.0104    DYNAMIC   Vx1  10.25.2.12    1      4 days, 0:37:14 ago
51    0000.0051.0105    DYNAMIC   Vx1  10.25.2.12    1      4 days, 0:37:14 ago
61    0000.0061.0103    DYNAMIC   Vx1  10.25.2.12    1      4 days, 0:37:14 ago
61    0000.0061.0104    DYNAMIC   Vx1  10.25.2.12    1      4 days, 0:37:14 ago
61    0000.0061.0105    DYNAMIC   Vx1  10.25.2.12    1      4 days, 0:37:14 ago
switch>
```

### VXLAN MAC Address Table

The `show vxlan vtep` command displays information about remote VTEPs that the configured VTI has discovered and with whom it has exchanged packets.

### Example

These commands display the VTEPs that have exchanged data with the configured VTI.

```
switch>show vxlan vtep
Remote vteps for Vxlan1:
10.52.2.12
Total number of remote vteps:  1
switch>
```

### VXLAN Counters

The `clear vxlan counters` command resets the VXLAN counters. The `show vxlan counters` command displays the VXLAN counters.

### Example

This command displays the VXLAN counters

```
switch>show vxlan counters software
encap_bytes:3452284
encap_pkts:27841
encap_read_err:1
encap_discard_runt:0
encap_discard_vlan_range:0
encap_discard_vlan_map:0
encap_send_err:0
encap_timeout:1427
decap_bytes_total:382412426
decap_pkts_total:2259858
decap_bytes:0
decap_pkts:0
decap_runt:0
decap_pkt_filter:45128
decap_bytes_filter:5908326
decap_discard_vxhdr:0
decap_discard_vlan_map:2214730
decap_timeout:0
decap_sock_err:1
switch>
```

## 16.4 VXLAN Command Descriptions

### VXLAN Global Configuration Commands

- [interface vxlan](#)
- [ip address virtual](#)
- [vxlan vni notation dotted](#)

### VXLAN Interface Configuration Commands

- [vxlan flood vtep](#)
- [vxlan multicast-group](#)
- [vxlan multicast-group decap](#)
- [vxlan source-interface](#)
- [vxlan udp-port](#)
- [vxlan vlan vni](#)

### VXLAN Display and Clear Commands

- [clear vxlan counters](#)
- [show service vxlan](#)
- [show vxlan address-table](#)
- [show vxlan counters](#)
- [show vxlan flood vtep](#)
- [show vxlan vtep](#)

---

## 16.4.1 clear vxlan counters

The `clear vxlan counters` command resets the VXLAN counters.

### Command Mode

Privileged EXEC

### Command Syntax

```
clear vxlan counters ROUTE_TYPE
```

### Parameters

- `ROUTE_TYPE` Specifies the type of VXLAN counter reset by the command.
  - `software` Command resets software counters.
  - `varp` Command resets virtual-ARP counters.

### Related Commands

- [show vxlan counters](#) displays the VXLAN counters.

### Example

This command resets the VXLAN counters

```
switch# clear vxlan counters software
switch# show vxlan counters software
encap_bytes:0
encap_pkts:0
encap_read_err:0
encap_discard_runt:0
encap_discard_vlan_range:0
encap_discard_vlan_map:0
encap_send_err:0
encap_timeout:0
decap_bytes_total:0
decap_pkts_total:0
decap_bytes:0
decap_pkts:0
decap_runt:0
decap_pkt_filter:0
decap_bytes_filter:0
decap_discard_vxhdr:0
decap_discard_vlan_map:0
decap_timeout:0
decap_sock_err:0
switch#
```

## 16.4.2 interface vxlan

The **interface vxlan** command places the switch in VXLAN-interface configuration mode for modifying the specified VXLAN tunnel interface (VTI). The command also instantiates the interface if it was not previously created.

VXLAN interface configuration mode is not a group change mode; **running-config** is changed immediately after commands are executed. The **exit** command does not affect the configuration.

The **no interface vxlan** deletes the specified VTI interface, including its configuration statements, from **running-config**. The **default interface vxlan** command removes all configuration statements for the specified VTI from **running-config** without deleting the interfaces.

### Command Mode

Global Configuration

### Command Syntax

```
interface vxlan vx_range
no interface vxlan vx_range
default interface vxlan vx_range
```

### Parameter

- *vx\_range* VXLAN interface number. The only permitted value is 1.

### Commands Available in link-flap Configuration Mode

- [vxlan multicast-group](#)
- [vxlan source-interface](#)
- [vxlan udp-port](#)
- [vxlan vlan vni](#)

### Examples

- These commands create VXLAN tunnel interface 1, place the switch in VXLAN-interface configuration mode, then display parameters of the new VTI.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# show active
interface Vxlan1
  vxlan udp-port 4789
switch(config-if-Vx1)#
```

- This command exits VXLAN-interface configuration mode, placing the switch in global configuration mode.

```
switch(config-if-Vx1)# exit
switch(config)#
```

---

### 16.4.3 ip address virtual

The `ip address virtual` command configures a specified address as the primary IPv4 address and as a virtual IP address for the configuration mode VLAN interface. The address resolves to the virtual MAC address configured through the `ip virtual-router mac-address` command. The command includes a subnet designation that is required in primary IP address assignments.

This command is typically used in VXLAN routing configurations as an alternative to assigning a unique IP address to each VTEP. All existing IPv4 addresses must be removed from the interface before executing this command.

The `no ip address virtual` and `default ip address virtual` commands remove the IPv4 address and virtual IP assignment from the configuration mode interface by deleting the `ip address virtual` command from *running-config*.

Removing the IPv4 address assignments from an interface disables IPv4 processing on that port.

#### Command Mode

Interface-VLAN Configuration

#### Command Syntax

```
ip address virtual ipv4_subnet
no ip address virtual
default ip address virtual
```

#### Parameters

- *ipv4\_subnet* IPv4 and subnet address (CIDR or address-mask notation).

#### Related Commands

- `ip address`
- `ip address virtual`
- `ip virtual-router mac-address`

#### Example

This command configures 10.10.10.1 as the IPv4 address and virtual address for VLAN 100.

```
switch(config-if-Vl100)#show active
  interface Vlan100
    ip address virtual 10.10.10.1/28
switch(config-if-Vl100)#
```

## 16.4.4 show service vxlan

The `show service vxlan` command displays the status of the Vxlan Control Service (VCS) and the received (from all connected VTEPs) and advertised (to all connected VTEPs) MAC address reachability information.

### Command Mode

EXEC

### Command Syntax

```
show service vxlan [status | switch [SWITCH_TYPE] | vni [VNI_INFO]]
```

### Parameters

- SWITCH\_TYPE displayed by switch type. Options include:
  - word hostname, IP address, or ID of the switch.
  - all all switches.
- VNI\_INFO displayed with VNI information. Options include:
  - advertised advertised MAC addresses.
  - received received MAC addresses.

### Example

This command displays the status of the VCS.

```
switch(config)#show service vxlan status
Vxlan Controller Service is      : stopped
Mac learning                     : Control plane
Resync period                    : 300 seconds
Resync in progress               : No
Capability                       : VXLAN v4 overlay routing
                                VXLAN v4 overlay indirect routing

fm319(config-if-Vx1)#show service vxlan status
Vxlan Controller Service is      : stopped
Mac learning                     : Control plane
Resync period                    : 300 seconds
Resync in progress               : No
Capability                       : VXLAN v4 overlay routing
                                VXLAN v4 overlay indirect routing

switch(config)#
```

## 16.4.5 show vxlan address-table

The `show vxlan address-table` command displays the VXLAN address table. Entries are created by extracting information from packets received from remote VTEPs.

The VXLAN address table correlates MAC addresses that are accessible through remote VTEPs with the local VLAN and the IP address of the VTP through which the addressed device is accessible. The VTI uses this table when constructing the VXLAN encapsulation fields to specify the destination IP address of the recipient VTEP and the VNI segment through which the device's remote VLAN is accessed.

### Command Mode

EXEC

### Command Syntax

```
show vxlan address-table [ENTRY_TYPE][MAC_ADDR][VLANS][REMOTE_VTEP]
```

### Parameters

- **ENTRY\_TYPE** command filters display by entry type. Options include:
  - `<no parameter>` all table entries.
  - `configured` static entries; includes unconfigured VLAN entries.
  - `dynamic` entries learned through packet receipts.
  - `static` entries entered by CLI commands.
  - `unicast` entries with unicast MAC address.
- **MAC\_ADDR** command uses MAC address to filter displayed entries.
  - `<no parameter>` all MAC addresses table entries.
  - `address mac_address` displays entries with specified address (dotted hex notation – H.H.H).
- **VLANS** command filters display by VLAN.
  - `<no parameter>` all VLANs.
  - `vlan v_num` VLAN specified by `v_num`.
- **REMOTE\_VTEP** Filters entries by IP address of the remote VTEPs. Options include:
  - `<no parameter>` all items.
  - `vtep ipaddr_1 [ipaddr_2...ipaddr_n]` Identifies VTEPs by their IP address.

### Example

This command displays the VXLAN address table.

```
switch>show vxlan address-table
      Vxlan Mac Address Table
-----
Vlan  Mac Address      Type      Prt  Vtep          Moves  Last Move
----  -
51    0000.0051.0101    DYNAMIC  Vx1  10.25.2.12    1      4 days, 0:37:14 ago
51    0000.0051.0102    DYNAMIC  Vx1  10.25.2.12    1      4 days, 0:37:14 ago
51    0000.0051.0103    DYNAMIC  Vx1  10.25.2.12    1      4 days, 0:37:14 ago
51    0000.0051.0104    DYNAMIC  Vx1  10.25.2.12    1      4 days, 0:37:14 ago
51    0000.0051.0105    DYNAMIC  Vx1  10.25.2.12    1      4 days, 0:37:14 ago
61    0000.0061.0102    DYNAMIC  Vx1  10.25.2.12    1      4 days, 0:37:14 ago
61    0000.0061.0103    DYNAMIC  Vx1  10.25.2.12    1      4 days, 0:37:14 ago
61    0000.0061.0104    DYNAMIC  Vx1  10.25.2.12    1      4 days, 0:37:14 ago
61    0000.0061.0105    DYNAMIC  Vx1  10.25.2.12    1      4 days, 0:37:14 ago
switch>
```

## 16.4.6 show vxlan counters

The `show vxlan counters` command displays the VXLAN counters.

### Command Mode

EXEC

### Command Syntax

```
show vxlan counters ROUTE_TYPE
```

### Parameters

- `ROUTE_TYPE` Specifies the type of VXLAN counter displayed by the command.
  - `software` Command displays software routers.
  - `varp` Command displays virtual-ARP counters.
  - `vtep` Command displays counters for VTEPs which are identified by their IP address. An optional keyword allows the user to view a single direction of the counters:
    - `encap` “encap” counters count packets coming from the edge, encapsulated on the device and directed to the core.
    - `decap` “decap” counters count packets coming from the core, decapsulated on the device and heading towards the edge.

### Related Command

[clear vxlan counters](#) resets the VXLAN counters.

### Examples

- This command displays the VXLAN counters for software routers.

```
switch>show vxlan counters software
encap_bytes:3452284
encap_pkts:27841
encap_read_err:1
encap_discard_runt:0
encap_discard_vlan_range:0
encap_discard_vlan_map:0
encap_send_err:0
encap_timeout:1427
decap_bytes_total:382412426
decap_pkts_total:2259858
decap_bytes:0
decap_pkts:0

switch>

## 16.4.7 show vxlan flood vtep

The `show vxlan flood vtep` command displays the flood list that the switch is using to perform head-end replication. Head-end replication is a data distribution method that supports broadcast, unknown unicast, and multicast (BUM) traffic over VXLANs by replicating BUM data locally for transmission to the set of remote VTEPs that a flood list specifies. The command displays the VLAN ID that references the configured VNIs (`vxlan vlan vni`).

The flood list is determined by the `vxlan flood vtep` command.

### Command Mode

EXEC

### Command Syntax

```
show vxlan flood vtep [VLANS]
```

### Parameters

- `VLANS` command filters display by the reference VLAN.
  - `<no parameter>` all VLANs.
  - `vlan v_range` VLANs specified by `v_range`.

Valid `v_range` formats include number, range, or comma-delimited list of numbers and ranges.

### Guidelines

The command displays flood list contents only when the VLAN line protocol status is **up**.

### Related Commands

- `vxlan flood vtep` configures the flood list.

### Example

These commands display the VTEPs that have exchanged data with the configured VTI.

```
switch> show vxlan flood vtep vlan 100-102

          Vxlan Flood Vtep Table
-----
Vlan    Ip Address
-----
100     3.3.3.3
101     11.1.1.1          11.1.1.2          11.1.1.3
102     11.1.1.1          11.1.1.2          11.1.1.3
        12.1.1.1
switch>
```

---

## 16.4.8 show vxlan vtep

The `show vxlan vtep` command displays information about remote VTEPs that the configured VTI has discovered and with whom it has exchanged packets.

### Command Mode

EXEC

### Command Syntax

```
show vxlan vtep
```

### Example

These commands display the VTEPs that have exchanged data with the configured VTI.

```
switch>show vxlan vtep
Remote vteps for Vxlan1:
10.52.2.12
Total number of remote vteps: 1
switch>
```

## 16.4.9 vxlan flood vtep

The `vxlan flood vtep` command supports VXLAN head-end replication by creating or modifying a list that specifies remote VTEPs to which the switch bridges replicated traffic. Head-end replication is a data distribution method that supports broadcast, unknown unicast, and multicast (BUM) traffic over VXLANs by replicating BUM data locally for transmission to the set of remote VTEPs that a flood list specifies. This data flooding facilitates remote MAC address learning through the forwarding of data with unknown MACs.

Each `vxlan flood vtep` statement in *running-config* associates a set of VTEP addresses to an access VNI. A default flood list is also configurable that applies to all VNIs for which a flood list is not configured. The `vxlan flood vtep` command is available in the following formats to create or modify corresponding *running-config* statements:

- `vxlan flood vtep` creates a statement for a specified VNI and replaces existing statements for that VNI.
- `vxlan flood vtep add` modifies an existing flood statement by adding the specified VTEPs. This statement creates a list if it references a VNI that has no flood statement.
- `vxlan flood vtep remove` modifies an existing flood statement by deleting the specified VTEPs. This statement has no effect if it references a VNI that has no flood statement.

The `vxlan flood vtep` command specifies a VNI by referencing its associated VLAN ID (`vxlan vlan vni`). The command provides these options for specifying the reference VLANs:

- **a single VLAN:** creates or modifies a single statement referenced by the command.
- **a range of VLANs:** creates or modifies all statements referenced by the VLAN range.
- **no VLAN:** creates or modifies the default list

The `no vxlan flood vtep` and `default vxlan flood vtep` commands remove the specified flood list by deleting the corresponding `vxlan flood vtep` statements from *running-config*. Commands that specify a VLAN range remove all corresponding statements.

### Command Mode

Interface-VXLAN Configuration

### Command Syntax

```
vxlan [ ACCESS_VNI] flood vtep] MODIFY] VTEP_1 [VTEP_2]...[VTEP_N]
no vxlan [ACCESS_VNI] flood vtep
default vxlan [ACCESS_VNI] flood vtep
```

### Parameters

- `ACCESS_VNI` VLAN ID associated to the flood list's target VNI. Value ranges from 1 to 4094.
  - `<no parameter >` default list.
  - `vlan vlan_range` List of VLANs. (Number, range, comma-delimited list of numbers and ranges). Numbers range from 1 to 4094.
- `MODIFY` Statement modification method. Options include:
  - `<no parameter >` creates new list for specified VLANs. Current list is overwritten.
  - `add` specified VTEPs are added to existing list.
  - `remove` specified VTEPs are deleted from existing list.
- `VTEP_X` IPv4 address of VTEPs that are added or removed from the list.

### Examples

- These commands create a default VXLAN head-end replication flood list.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan flood vtep 10.1.1.1 10.1.1.2
```

---

```
switch(config-if-Vx1)# show active
interface Vxlan1
  vxlan flood vtep 10.1.1.1 10.1.1.2
  vxlan udp-port 4789
switch(config-if-Vx1)#
```

- These commands create VXLAN head-end replication flood lists for the VNIs accessed through VLANs 101 and 102.

```
switch(config-if-Vx1)# vxlan vlan 101-102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
switch(config-if-Vx1)# show active
interface Vxlan1
  vxlan flood vtep 10.1.1.1 10.1.1.2
  vxlan vlan 101 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  vxlan vlan 102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  vxlan udp-port 4789
switch(config-if-Vx1)#
```

- These commands add two VTEPs for the VNI access through VLAN 102.

```
switch(config-if-Vx1)# vxlan vlan 102 flood vtep add 12.1.1.1
switch(config-if-Vx1)# show active
interface Vxlan1
  vxlan flood vtep 10.1.1.1 10.1.1.2
  vxlan vlan 101 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  vxlan vlan 102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3 12.1.1.1
  vxlan udp-port 4789
switch(config-if-Vx1)#
```

## 16.4.10 vxlan multicast-group decap

The `vxlan multicast-group decap` command enables VXLAN multicast decapsulation.

VTEPs are enabled by VXLAN multicast decapsulation, supporting Head End Replication (HER). Multicast encapsulated Broadcast/Unknown/Multicast (BUM) packets terminate VTEPs from remote VTEPs that do not support HER.

The `no vxlan multicast-group decap` and `default vxlan multicast-group decap` commands disable VXLAN multicast decapsulation.

### Command Mode

Interface-VXLAN Configuration

### Command Syntax

```
vxlan multicast-group decap group_addr
```

```
no vxlan multicast-group decap
```

```
default vxlan multicast-group decap
```

### Parameters

- *group\_addr* IPv4 address of multicast group. Dotted decimal notation of a valid multicast address.

### Examples

- This command enables VXLAN multicast decapsulation.

```
switch(config)# interface vxlan 1  
switch(config-config-if-Vx1) #vxlan multicast-group decap 230.1.1.1  
switch(config-config-if-Vx1) #
```

- This command disables VXLAN multicast decapsulation.

```
switch(config) #interface vxlan 1  
switch(config-config-if-Vx1) #no vxlan multicast-group decap 230.1.1.1  
switch(config-config-if-Vx1) #
```

---

## 16.4.11 vxlan multicast-group

The **vxlan multicast-group** command associates a specified multicast group with the configuration mode VXLAN interface (VTI), which handles multicast and broadcast traffic as a layer 2 interface in a bridging domain.

The VTI maps multicast traffic from its associated VLANs to the specified multicast group. Inter-VTEP multicast communications include all VTEPs that are associated with the specified multicast group, which is independent of any other multicast groups that VLAN hosts may join.

A VTI can be associated with one multicast group. By default, a VTI is not associated with any multicast group.

The **no vxlan multicast-group** and **default vxlan multicast-group** commands removes the multicast group – VTI association by removing the **vxlan multicast-group** command from *running-config*.

### Command Mode

Interface-VXLAN Configuration

### Command Syntax

```
vxlan multicast-group group_addr
no vxlan multicast-group
default vxlan multicast-group
```

### Parameters

*group\_addr* IPv4 address of multicast group. Dotted decimal notation of a valid multicast address.

### Related Command

[interface vxlan](#) places the switch in VXLAN interface configuration mode.

### Examples

- This command associates the multicast address of 227.10.1.1 with VTI 1.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan multicast-group 227.10.1.1
switch(config-if-Vx1)# show active
interface Vxlan1
    vxlan multicast-group 227.10.1.1
    vxlan udp-port 4789
switch(config-if-Vx1)#
```

- This command changes VTI 1's multicast group association.

```
switch(config-if-Vx1)# vxlan multicast-group 227.10.5.5
switch(config-if-Vx1)# show active
interface Vxlan1
    vxlan multicast-group 227.10.5.5
    vxlan udp-port 4789
switch(config-if-Vx1)#
```

- This command removes the multicast group association from VTI 1.

```
switch(config-if-Vx1)#no vxlan multicast-group
switch(config-if-Vx1)#show active
interface Vxlan1
    vxlan udp-port 4789
switch(config-if-Vx1)#
```

## 16.4.12 vxlan source-interface

The `vxlan source-interface` command specifies the interface from which the configuration mode VXLAN interface (VTI) derives the source address (IP) that it uses when exchanging VXLAN frames. There is no default source interface assignment.

The `no vxlan source-interface` and `default vxlan source-interface` commands remove the source interface assignment from the configuration mode VXLAN interface by deleting the corresponding `ip vxlan source-interface` command from *running-config*.

### Command Mode

Interface-VXLAN Configuration

### Command Syntax

```
vxlan source-interface INT_NAME
no vxlan source-interface
default vxlan source-interface
```

### Parameters

- INT\_NAME Interface type and number. Options include:
  - loopback *L\_num* Loopback interface specified by *L\_num*.

### Guidelines

A VXLAN interface is inoperable without the source-interface assignment.

### Related Command

[interface vxlan](#) places the switch in VXLAN interface configuration mode.

### Example

These commands configure VTI 1 to use the IP address 10.25.25.3 as the source address of outbound VXLAN frames.

```
switch(config)#interface loopback 15
switch(config-if-Lo15)#ip address 10.25.25.3/24
switch(config-if-Lo15)#exit
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan source-interface loopback 15
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan source-interface Loopback15
  vxlan udp-port 4789
switch(config-if-Vx1)#
```

---

## 16.4.13 vxlan udp-port

The `vxlan udp-port` command associates a UDP port with the configuration mode VXLAN interface (VTI). By default, UDP port 4789 is associated with the VTI.

Packets bridged to the VTI from a VLAN are encapsulated with a VXLAN header that includes the VNI associated with the VLAN and the IP address of the VTEP that connects to the recipient, then sent through the UDP port. Packets that arrive through the UDP port are sent to the bridging domain of the recipient VLAN as determined by the VNI number in the VXLAN header and the interface's VNI-VLAN map.

The `no vxlan udp-port` and `default vxlan udp-port` command restores the default UDP port association (4789) on the configuration mode interface by deleting the corresponding `vxlan udp-port` command from *running-config*.

### Command Mode

Interface-VXLAN Configuration

### Command Syntax

```
vxlan udp-port port_id
no vxlan udp-port
default vxlan udp-port
```

### Parameters

- *port\_id* UDP port number. Value ranges from 1024 to 65535.

### Guidelines

UDP port 4789 is reserved by convention for VXLAN usage. Under most typical applications, this parameter should be set to the default value.

### Related Commands

- [interface vxlan](#) places the switch in VXLAN interface configuration mode.

### Examples

- This command associates UDP port 5500 with VXLAN interface 1.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan udp-port 5500
switch(config-if-Vx1)#show active
interface Vxlan1
    vxlan udp-port 5500
switch(config-if-Vx1)#
```

- This command resets the VXLAN interface 1 UDP port association of 4789.

```
switch(config-if-Vx1)#no vxlan udp-port
switch(config-if-Vx1)#show active
interface Vxlan1
    vxlan udp-port 4789
switch(config-if-Vx1)#
```

## 16.4.14 vxlan vlan vni

The `vxlan vlan vni` command associates a VLAN ID with a virtual network identifier (VNI). A VNI is a 24-bit number that is assigned to a VLAN to distinguish it from other VLANs that are on a VXLAN tunnel interface (VTI). VNI values range from 1 to 16777215 in decimal notation and from 0.0.1 to 255.255.255 in dotted decimal notation.

When a VLAN bridges a packet to the VTI, the packet is encapsulated with a VXLAN header that includes the VNI that is associated with the VLAN. Packets that arrive on the VTI's UDP socket are bridged to the VLAN that is associated with the VNI specified by the VXLAN header that encapsulates the packet.

The VTI requires a one-to-one correspondence between specified VLANs and VNI values. Commands that assign a new VNI to a previously configured VLAN replace the existing VLAN assignment statement in *running-config*. Commands that attempt to assign a VNI value to a second VLAN generate a CLI error.

The `no vxlan vlan vni` and `default vxlan vlan vni` commands remove the specified VLAN-VNI association from the configuration mode interface by deleting the corresponding `vxlan vlan` command from *running-config*.

### Command Mode

Interface-VXLAN Configuration

### Command Syntax

```
vxlan vlan vlan_id vni [vni_id]
no vxlan vlan vlan_id vni [vni_id]
default vxlan vlan vlan_id vni [vni_id]
```

### Parameters

- *vlan\_id* number of access VLAN. Value ranges from 1 to 4094.
- *vni\_id* VNI number. Valid formats: decimal <1 to 16777215> or dotted decimal <0.0.1 to 255.255.255>.

### Example

- These commands associate VLAN 100 to VNI 100 and VLAN 200 to VNI 10.10.200.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan vlan 100 vni 100
switch(config-if-Vx1)#vxlan vlan 200 vni 10.10.200
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan udp-port 4789
  vxlan vlan 200 vni 658120
  vxlan vlan 100 vni 100
switch(config-if-Vx1)#vxlan vni notation dotted
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan udp-port 4789
  vxlan vlan 200 vni 10.10.200
  vxlan vlan 100 vni 0.0.100
switch(config-if-Vx1)#
```

## 16.4.15 vxlan vni notation dotted

The **vxlan vni notation dotted** command configures the switch to display VNIs in dotted decimal notation. A virtual network identifier (VNI) is a 24-bit number that is assigned to a VLAN to distinguish it from other VLANs that are on a VXLAN tunnel interface. VNI values range from 1 to 16777215 in decimal notation and from 0.0.1 to 255.255.255 in dotted decimal notation.

The command affects the VNI number display in all **show** commands, including **show running-config**. Commands that include VNI as a parameter may use decimal or dotted decimal notation regardless of the setting of this command. By default, show commands display VNI number in decimal notation.

The **no vxlan vni notation dotted** and **default vxlan vni notation dotted** commands restore the default setting of displaying vni numbers in decimal notation by deleting the **vxlan vni notation dotted** command from **running-config**.

### Command Mode

Global Configuration

### Command Syntax

```
vxlan vni notation dotted
no vxlan vni notation dotted
default vxlan vni notation dotted
```

### Examples

- These commands configure the switch to display vni numbers in dotted decimal notation, then displays a configuration that includes a vni setting.

```
switch(config)#vxlan vni notation dotted
switch(config)#interface vxlan 1
switch(config-if-Vx1)#show active
interface Vxlan1
    vxlan udp-port 4789
    vxlan vlan 333 vni 3.4.5
switch(config-if-Vx1)#
```

- These commands configure the switch to display vni numbers in decimal notation, then displays a configuration that includes a vni setting.

```
switch(config)#no vxlan vni notation dotted
switch(config)#interface vxlan 1
switch(config-if-Vx1)#show active
interface Vxlan1
    vxlan udp-port 4789
    vxlan vlan 333 vni 197637
switch(config-if-Vx1)#
```

## Ethernet VPN (EVPN)

---

This chapter describes Arista's EVPN implementation. Sections in this chapter include:

- [EVPN Overview](#)
- [EVPN Layer 3 Core Operations](#)
- [Integrated Routing and Bridging](#)
- [VPN MPLS Transport Options](#)
- [EVPN Type-5 Routes: IP Prefix Advertisement](#)
- [Inter-VRF Local Route Leaking](#)
- [Configuring EVPN](#)
- [Sample Configurations](#)
- [EVPN and VCS Commands](#)

### 17.1 EVPN Overview

Ethernet VPN (EVPN) is a standards-based BGP control plane to advertise MAC addresses, MAC and IP bindings and IP Prefixes. This document focuses on EVPN and its operation with a VXLAN data plane for building overlay networks in the data center.

A number of control planes exist today for VXLAN, based on specific use cases, whether it be a requirement to integrate with an SDN overlay controller, or operate in a standards based flood and learn control plane model.

Current flood and learn models operate either with a multicast control plane, or ingress replication, where the operator manually configures the remote VTEPs in the flood list. Both of these are data-plane driven, that is, MAC's are learned via flooding. In the IP multicast model MAC's are learned in the underlay via flooding to an IP multicast group, while ingress replication (HER) floods to configured VTEP endpoints and no IP Multicast is required in the underlay.

The controller based solution with cloud vision exchange (CVX), locally learned MAC's are published to a centralized controller and these MAC's are then programed to all participating VTEPs.

**Figure 54: Different VXLAN Control Planes**

A controller-less BGP EVPN MAC learning is a standards-based control-plane (MP-BGP) is used to discover remote VTEPs and advertise MAC address and MAC/IP bindings in the VXLAN overlay, thus eliminating the flood and learn paradigms of the previously mentioned (multicast or HER) controller-less approaches. As a standards-based approach, the discovery and therefore the advertisement of the EVPN service models can inter-operate amongst multiple vendors.

This highlights an important and powerful advantage of BGP EVPN; that being, it is a single control plane for multiple data-plane encapsulations and defines both Layer 2 and layer 3 VPN services. As network operators drive toward simplicity and automation, having one control plane protocol and address family for all data-planes and VPN services will prove extremely powerful.

**Figure 55: VXLAN Control Plane and Data-plane Definitions**

The initial EVPN standard is RFC 7432 defined the BGP EVPN control plane and specifies an MPLS data-plane. The control plane with an MPLS data plane was extended to consider additional data plane encapsulations models including VXLAN, NVGRE and MPLS over GRE.

### 17.1.1 EVPN Terminology

The EVPN standard in the context of an NVO environment, defines the functionality for delivering multi-tenant Layer 2/3 VPN services using either VXLAN, NVGRE or MPLS over GRE encapsulation, across a common physical IP infrastructure. The standard introduces new terminology specific to a NVO environment, which are summarized below in relation to VXLAN encapsulation.

- **Network Virtualization Overlay (NVO):** The overlay network used to deliver the Layer 2 and Layer 3 VPN services. For VXLAN encapsulation, this would define a VXLAN domain, which would include one or more VNIs, for the transportation of tenant traffic over a common IP underlay infrastructure.

- **Network Virtualization End-Point (NVE):** The provider edge node within the NVO environment responsible for the encapsulation of tenant traffic into the overlay network. For a VXLAN data plane, this defines the Virtual Tunnel End-Point (VTEP)
- **Virtual Network Identifier (VNI):** The label identifier within the VXLAN encapsulated frame, defining a Layer 2 domain in the overlay network.
- **EVPN instance (EVI):** A logical switch within the EVPN domain which spans and interconnects multiple VTEPs to provide tenant Layer 2 and layer 3 connectivity.
- **MAC-VRF:** A Virtual Routing and Forwarding table for storing Media Access Control (MAC) addresses on a VTEP for a specific tenant.

**Figure 56: EVPN Terminology for a VXLAN Data Plane**

The new EVPN Network Layer Reachability Information (NLRI) is carried in BGP using Multi-protocol BGP Extensions with a newly defined Address Family Identifier (AFI) and Subsequent Address Family Identifier (SAFI).

To provide multi-tenancy, the standard uses the above traditional VPN methods to control the import and export of routes and provide support for overlapping IP address between tenants.

- **Multi-protocol BGP for EVPN:** A new AFI and SAFI have been defined for EVPN. These are AFI=25 (Layer 2 VPN) and SAFI = 70 (EVPN)
  - **EVPN Layer 2/Layer 3 tenant segmentation:** Similar to standard MPLS VPN configurations Route Distinguisher's (RD's) and Route Targets (RT's) are defined for the VPN.
  - **Route Target (RT):** To control the import and export of routes across VRFs, EVPN routes are advertised with Route-Target (RT) (BGP extended communities). The RT can be auto derived to simplify the rule configuration, typically this is based on the AS number and the VNI of the MAC-VRF.
  - **Route Distinguisher (RD):** Unique number prepended to the advertised address within the VRF, ensuring support for overlapping IPs and MACs across different tenants.

The format of the MP\_REACH\_NLRI/MP\_UNREACH\_NLRI attribute, holding the new EVPN NLRI is illustrated below, where the next-hop address within the NLRI is the IP address of the VTEP advertising the EVPN route.

**Figure 57: EVPN NLRI Route Format**

As illustrated, the original MPLS RFC (7348) and subsequent IP prefix draft ([EVPN Terminology](#)), introduce five unique EVPN route types.

**Type-1 Route: Ethernet A-D route**

Ethernet A-D route per ESI route, announces the reachability of a multi-homed Ethernet Segment. The route type is used for fast convergence (ie: ‘mass withdraw’) functions, as well as split horizon filtering used for active-active multi-homing.

Ethernet A-D route per EVI route, is used to implement the Aliasing and Backup Path features of EVPN associated with active-active multi-homing.

**Type-2 Route: Host advertisement Route**

Used to advertise the reachability of a MAC address, or optionally a MAC and IP binding as learned by a specific EVI. With the advertisement of the optional IP address of the host, EVPN provides the ability for VTEPs to perform ARP suppression and ARP proxy to reduce flooding within the Layer 2 VPN.

**Type-3 Route: Inclusive Multicast route**

The type-3 route is used to advertise the membership of a specific Layer 2 domain (VNI within the VXLAN domain), allowing the dynamic discovery of remote VTEPs in a specific VNI and the population of a VTEP ingress flood list for the forwarding of Broadcast Unknown unicast and Multicast (BUM) traffic.

**Type-4 Route: Ethernet Segment Route**

The type-4 route is specific to VTEPs supporting the EVPN multi-homing model, for active-active and active-standby forwarding. The route is used to discover VTEPs which are attached to the same shared Ethernet Segment. Additionally, this route type is used in the Designated Forwarder (DF) election process.

**Type-5 Route: IP-prefix route advertisement**

The type-5 route is used to advertise IP prefixes rather the MAC and IP hosts addresses of the type-2 route. This advertisement of prefixes into the EVPN domain provides the ability to build classic layer 3 VPN topologies.

A detailed understanding of the function of each of these route types in the operation of EVPN to provide multi-tenant Layer 2 and 3 VPN services, is defined in Section 4 of this document.

While this guide focuses on EVPN with VXLAN data-plane encapsulation, it's important to note that, in addition to the new routes type, a BGP encapsulated extended community is included in all advertisements to determine the data-plane encapsulation.

The Encapsulation extended community is defined in RFC 5512. The different IANA registered tunnel types for an NVO environment are summarized in the table below.

| Extended Community Value | Name     | Reference                       |
|--------------------------|----------|---------------------------------|
| 8                        | VXLAN    | draft-ietf-bess-evpn-overlay-08 |
| 9                        | NVGRE    | draft-ietf-bess-evpn-overlay-08 |
| 10                       | MPLS     | RFC 7342                        |
| 11                       | MPLSoGRE | draft-ietf-bess-evpn-overlay-08 |

**Figure 58: Defined Data-Plane Encapsulations**

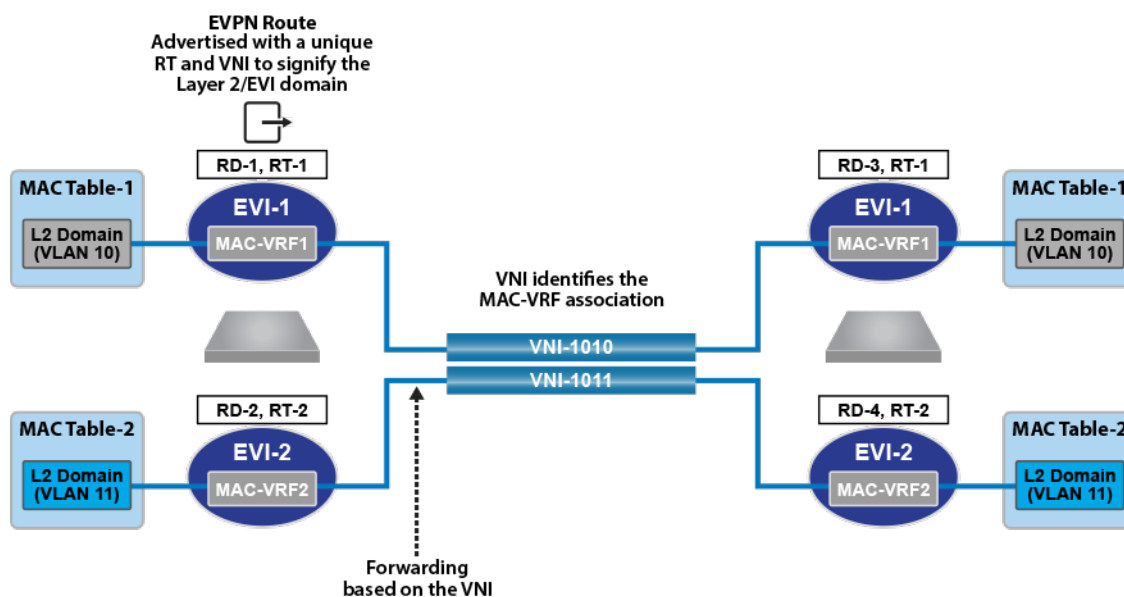

### 17.1.2 EVPN Service Models

An EVPN instance (EVI), can contain, one or more Layer 2 broadcast domains (VLANs).

The association of a VLAN-IDs to a specific EVI instance and how a VLAN tag can be transported within the EVI if required, is defined by three EVPN service models: VLAN based, VLAN Bundle, and VLAN aware bundle.

#### 17.1.2.1 VLAN Based Service Interface

In the VLAN based service there is a one-to-one mapping between the VLAN-ID and the MAC-VRF of the EVPN instance. With the MAC-VRF mapping directly to the associated VLAN, there will be a single bridge table within the MAC-VRF. The VLAN tag is not carried in any route update and the VNI label in the route advertisement is used to uniquely identify the bridge domain of the MAC-VRF in the VXLAN forwarding plane.

**Figure 59: VLAN Based Service Interface**

With a one-to-one mapping between the VLAN-ID and the MAC-VRF of EVI instance, the EVI will represent an individual tenant subnet/VLAN in the overlay. The one-to-one mapping also means the

route-target associated with the MAC-VRF, uniquely identifies the tenant's subnet/VLAN, providing granular importing of MAC routes on a per VLAN basis on each VTEP.

In this service, the associated MAC-VRF table is identified by the Route-Target in the control plane and by the VNI in the data plane and the MAC-VRF table corresponds to a single VLAN bridge domain.

### 17.1.2.2 VLAN Bundle Service Interface

In the VLAN bundle service, there is a many-to-one mapping between the VLAN-IDs and the MAC-VRF of the EVPN instance. The MAC-VRF however only contains a single Layer 2 bridge table and VNI label, thus MAC addresses must be unique across all associated VLANs.

With the MAC-VRF containing a single Layer 2 bridge table and a single VNI, the original VLAN tag has no significance in the control plane and is not carried in any EVPN route update. The original Ethernet tag and the VNI label are carried in the VXLAN data plane, to allow forwarding to the correct tenant VLAN.

**Figure 60: VLAN Bundle Service Interface**

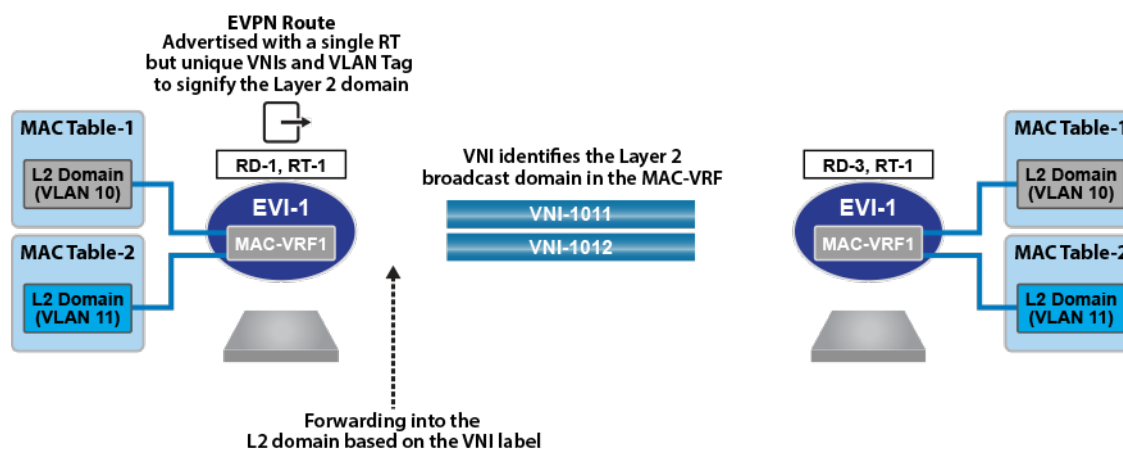

In this service, the Route-Target associated with the MAC-VRF identifies the tenant rather than an individual subnet/VLAN of a tenant. This means all MAC routes for the tenant will be imported on the VTEP regardless of whether or not the specific tenant VLAN exists. The MAC-VRF table is identified by the Route-Target in the control plane and forwarding to the appropriate tenant VLAN is achieved via a combination of the VNI and Ethernet tag in the VXLAN data plane.

### 17.1.2.3 VLAN Aware Bundle Service Interface

In the VLAN aware bundle service, there is a many-to-one mapping between the VLAN-IDs and the MAC-VRF of the EVPN instance. However, the MAC-VRF contains a unique Layer 2 bridge table for each associated VLAN-ID and a unique VNI label for each bridge domain.

With the MAC-VRF containing multiple Layer 2 bridge tables, the VLAN tag is carried in any EVPN route update to allow mapping to the correct tenant bridge table within the MAC-VRF. Only the unique VNI label is carried in the VXLAN data plane, to allow forwarding to the correct VLAN with the MAC-VRF.

**Figure 61: VLAN Aware Bundle Service**

In this service, the MAC-VRF of the EVI instance represents multiple subnet/VLANs of the tenant. The Layer 2 bridge table of the MAC-VRF is identified by a combination of the Route-Target and the Ethernet tag in the control plane and by the unique VNI and in the VXLAN data plane.

This service type is a common DCI/WAN deployment, where a tenant's VLANs are bundled into single EVI instance, while VLAN "awareness" can be retained in the EVPN service as the VNI tag is advertised in the MAC-IP route (which now identifies the VLAN within the EVI). Bundling into a service like this reduces the number of EVI's that need to be configured, reducing complexity and the control-plane signaling between PE's.

### 17.1.3 VCS and EVPN in DCI

When VXLAN Control Services (VCS) is enabled on a CloudVision eXchange (CVX) of a Data Center (DC), each VXLAN Tunnel End Point (VTEP) connects to the corresponding CVX for sharing the Layer 2 bridging information of its attached hosts. In turn, CVX advertises this information to all VTEPs within the DC.

In a topology consisting of multiple DCs where each DC runs its own CVX instance as shown below, a federation of CVXs can be created by using BGP-EVPN. In such Data Center Interconnect (DCI) topologies, CVX in each DC performs the following functions to advertise the Layer 2 bridging information (MAC-VTEP bindings) to all VTEPs in different DCs:

- Receives the local Layer 2 bridging information in CVX control plane format from all VTEPs within the DC; and advertises it to remote CVXs in the BGP-EVPN NLRI format.
- Receives the Layer 2 bridging information in BGP-EVPN NLRI format from remote CVXs; and advertises it to local VTEPs in the CVX control plane format.

 **Note:** The distribution of Layer 2 bridging information as described above allows a Layer 2 overlay network to be stretched across multiple DCs without additional VTEP configurations.

The following graphic illustrates the federation of CVX across multiple DCs.

Figure 62: CVX Connected from Multiple DCs

### 17.1.4 EVPN MPLS LAYER 3 VPN (Type-5 Route)

Ethernet VPN (EVPN) is an extension of the BGP protocol introducing a new address family: Layer 2 VPN (address family number 25) / EVPN (subsequent address family number 70). It is used to exchange overlay MAC and IP address reachability information between BGP peers using type-2 routes. Additionally, EVPN supports the exchange of layer 3 IP overlay routes through the extensions described in (type 5 EVPN routes).

An IP VRF is used on a PE router for each layer 3 overlay. VRF IP routes are exported into the EVPN BGP table and advertised to remote VTEPs as type 5 routes. The exported EVPN routes carry the Route-Target (RT) extended communities that are configured as export route-targets on the IP VRF from which they were exported.

The RTs carried by the EVPN type 5 routes received by a PE are matched against the VRF import route-target configuration. When a received route carries an RT that is configured as an import route-target on an IP VRF, the route is imported into the IP table for that VRF.

PE routers allocate per-VRF and address family Labels that are advertised as part of the layer 3 (type 5) EVPN route NLRI. Forwarding of overlay packets between PEs across the underlay requires underlay MPLS connectivity provided by an IP backbone.

The type-5 routes provide the ability to decouple the advertisement of an IP prefix from any specific MAC address, providing the ability to support floating IP address, optimized the mechanism for advertising external IP prefixes, and reduce the churn when withdrawing IP prefixes.

The format of the new type-5 IP-prefix route is illustrated in the figure below. Unlike when VXLAN is used as a transport, BGP route update for MPLS does not specify the router-mac extended community and sets the tunnel encapsulation to MPLS. Unlike with VXLAN encapsulation, which uses the VNI as the overlay index, the MPLS Type-5 route uses the MPLS label.

**Figure 63: EVPN Route Type-5, for Advertisement of IP-Prefixes over MPLS**

The following example offers a more detailed view of the route as displayed on a PE router.

```

dml-261sw24-backbone1.22:22:54#sh bgp evpn route-type ip-prefix ipv4 rd 6.6.6.6:64512 detail

IP-prefix and RD being advertised

Next hop (6.6.6.6) for the prefix and advertising Router (7.7.7.7)

Route-target (64512:11), encapsulation (MPLS) label for the VPN route (116384)

**Figure 64: EVPN Route Type-5 as Shown on PE**

As shown in the example, the route contains the VPN route (prefix and RD), the next-hop for the route and the advertising router ID, along with the extended communities of tunnel type (MPLS), MPLS Label value and route-target.

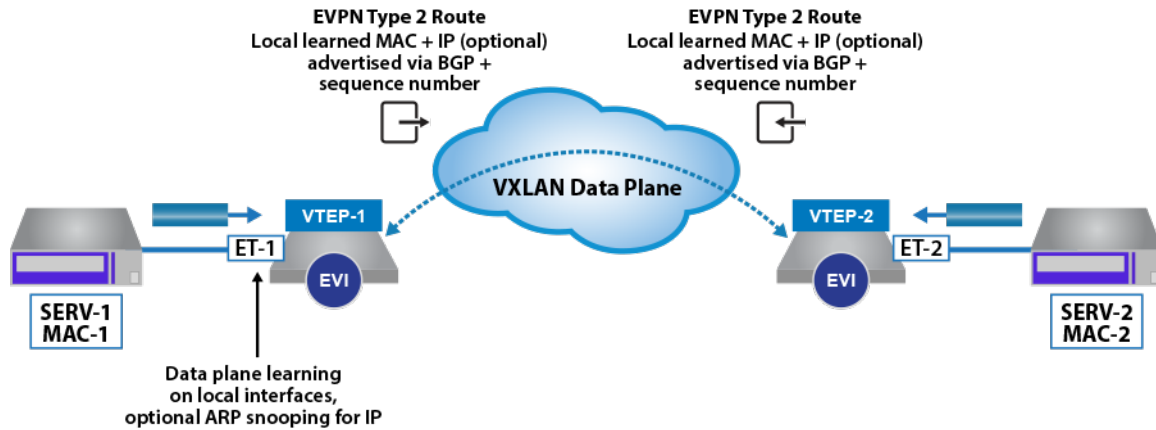

**Note:** You require 4.21.1F release and later versions with Jericho/Jericho+ platforms.

## 17.2 EVPN Layer 3 Core Operations

The EVPN standard defines a number of operations and functionality to allow the dynamic learning of MAC and IP bindings, management of MAC moves (VM/host mobility), ARP suppression, automated discovery of remote VTEPs and multi-homing to support active-active topologies.

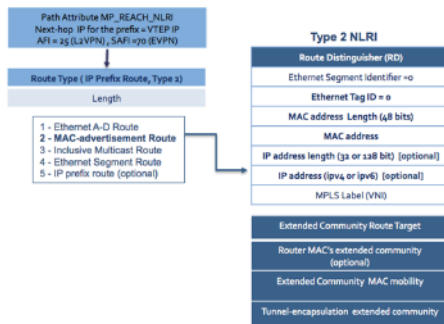

### 17.2.1 MAC Address Learning

MAC address learning on the local interface of a VTEP is flow-based learning, however once the MAC addresses are learned locally they are advertised to BGP peers within the EVI via an EVPN route update. The next hop of the update is set to IP of the advertising VTEP. In the case of EVPN VXLAN the label advertised in the update is the VNI, which identifies the MAC-VRF in the case of a VLAN Based service, or the EVI for a VLAN aware bundle service.

**Figure 65: EVPN Type 2 Route Announcement**

The route advertisements are EVPN type-2 routes, which can advertise just the MAC address of the host, or optionally the MAC and IP address of the host. The format of the type-2 route is illustrated in the figure below, along with the mandatory and optional extended community attached to the route.

**Figure 66: EVPN Type 2 MAC and IP Route Format**

Notable fields:

- Multi-protocol Reachable NLRI (MP\_REACH\_NLRI) attribute of the route is used to carry the next-hop hop for the advertised route. In the context of a VXLAN forwarding plane, this will be the source address (VTI) of the advertising VTEP.
- Route Distinguisher of the advertising node's MAC-VRF.
- Ethernet Segment Identifier (ESI), this field is populated when the VTEP participating in a multi-homed topology. This is discussed in the following sections.
- Ethernet tag ID that will be 0 for VLAN-based service, and the customer VLAN ID in a VLAN-aware bundle service.
- IP address of the host which is associated with advertised MAC address. The advertisement of the Host's IP address is optional.
- Label in the context of a VXLAN forwarding plane is the VNI associated with the MAC-VRF/Layer 2 domain the advertised MAC address has been learned on.
- Route Target associated with the MAC-VRF advertised with route to allow the control of the import and export of routes.

The MAC mobility extended community, as discussed in the following section is used during MAC moves to update all VTEPs of the new location of the host.

## 17.2.2 ARP Suppression

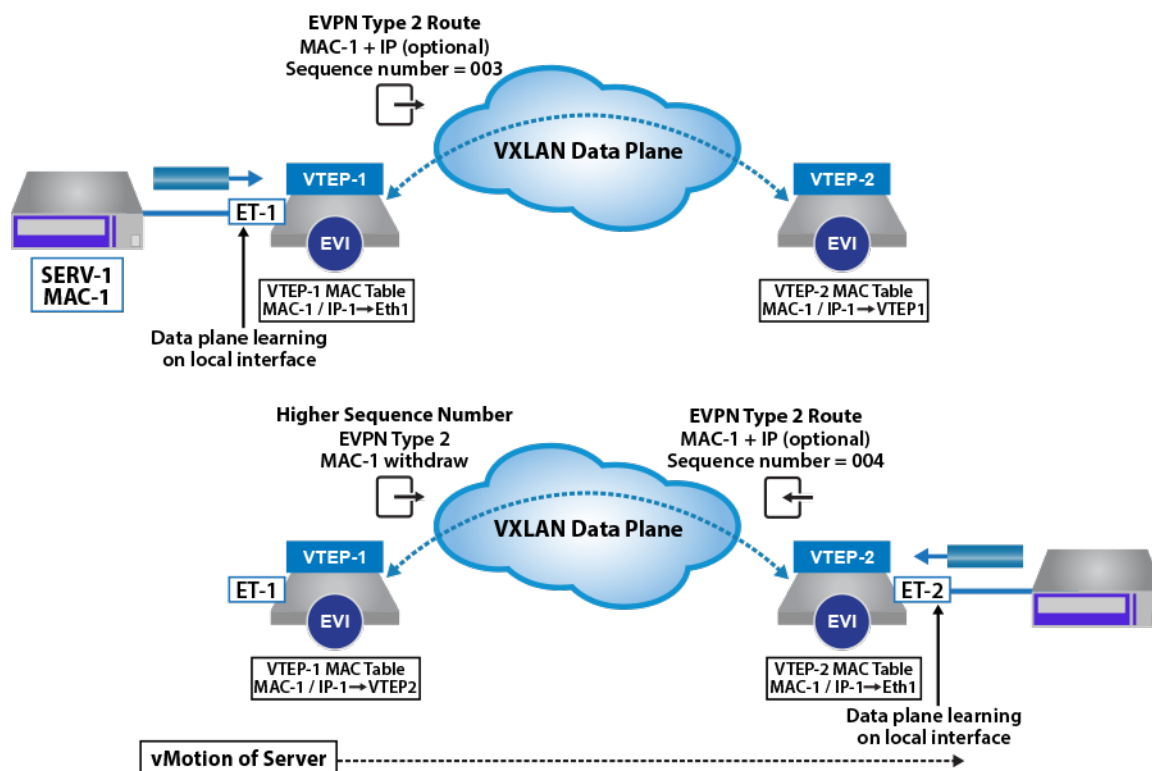

Providing the option to advertise the MAC and IP binding in the type-2 route, ARP suppression can be supported on the remote VTEPs. The MAC to IP binding can be learned locally, via ARP snooping or DHCP traffic on the VTEP. Once the MAC and IP binding has been learned, it is advertised to the remote VTEPs as a type-2 route. This allows remote VTEPs to respond to any ARP requests for the host locally, thus reducing the amount of ARP traffic across the EVI.

Importantly, the optional MAC and IP route can be advertised separately from the MAC only type-2 route. This is done so that if the MAC and IP route is cleared, i.e. ARP flushed, or the ARP timeout is set to less than the MAC timeout, then the MAC only route will still exist.

## 17.2.3 MAC Mobility

A common scenario in a data center environment is virtual machines (VMs) moving between physical servers, for maintenance or performance reasons, this will result in the MAC of the VM being learned and advertised by a new VTEP.

To cater for this situation a sequence number is attached to the new MAC advertisement ensuring an EVI wide refresh of the MAC table, with VTEPs updating their forwarding tables to point to the advertising VTEP as the new next-hop for MAC address.

**Figure 67: EVPN type-2 MAC Mobility Behavior**

When a MAC address is learned and advertised for the first time, it is advertised without a sequence number and the receiving VTEP assume the sequence to be zero. On detection of a MAC move, i.e. a MAC is learned locally when the same MAC route is active via a type-2 advertisement, then the sequence number is incremented by one, and the MAC route is advertised to the remote peers. The original advertising VTEP, receives the MAC route with a now higher sequence number and withdraws its own local MAC route. All other VTEPs flush the original MAC route, and update their tables with the new higher sequence number route.

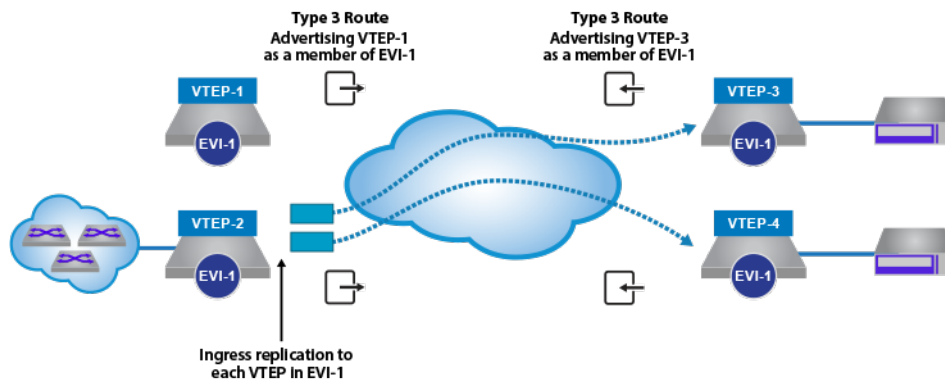

## 17.2.4 MAC Address Damping

In addition to MAC mobility, EVPN defines a protection mechanism to detect and prevent MAC routes flapping between VTEPs, which can occur during network instability or when hosts have been mis-configured with the same (duplicate) MAC address.

On advertising a locally learned MAC, the VTEP will start a M second counter (default is 180s), if the VTEP detects N MAC moves (default is 5) for the route within the M second window, it will generate a syslog message and stop sending and processing any further updates for the route.

## 17.2.5 Broadcast and Multicast Traffic

Broadcast, unknown unicast and Multicast (BUM) traffic is handled within the EVPN forwarding model using ingress replication. Where the BUM frame is replicated on the ingress VTEP to each of the remote VTEPs in the associated EVI/VNI. The VTEP replication list for the EVI, is dynamically populated based on Type-3 route advertisements (Inclusive Multicast Ethernet Tag Route), where VTEPs advertise type-3 routes for each EVI they are members.

**Figure 68: EVPN type-3 IMET Route Behavior for Ingress Replication**

The format of the type-3 route is illustrated below.

**Figure 69: EVPN Type-3 IMET Route Format**

Notable fields of the type-3 route:

- Multi-protocol Reachable NLRI (MP\_REACH\_NLRI) attribute of the route is used to carry the next-hop hop for the advertised route. In the context of a VXLAN forwarding plane, this will be the source address (VTI) of the advertising VTEP.
- Route Distinguisher of the advertising node's MAC-VRF.

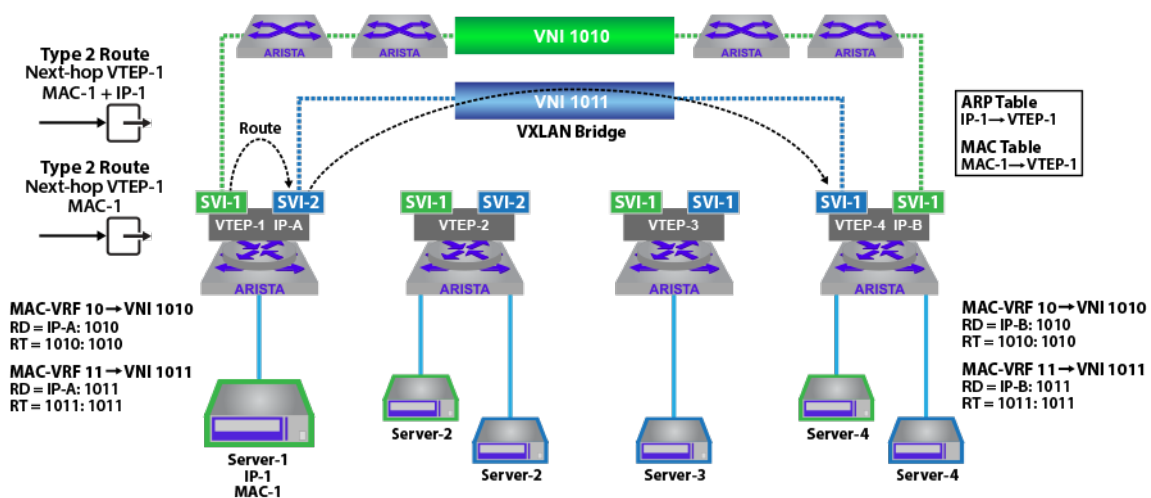

- Ethernet tag that will be 0 for VLAN-based service, and the MAC-VRF VNI for a VLAN-aware bundle service.
- IP address of the VTEP advertising the type 3 route.
- Route Target associated with the MAC-VRF or the EVI in a VLAN-aware bundle service.
- PMSI Tunnel Attribute, to advertise the replication model the VTEP is supporting. The supported options defined within the standard are ingress replication and IP multicast.

## 17.3 Integrated Routing and Bridging

In the traditional data center design, inter-subnet forwarding is provided by a centralized router, where traffic traverse across the network to a centralized routing node and back again to its final destination. In a large multi-tenant data center environment this operational model can lead to inefficient use of bandwidth and sub-optimal forwarding.

To provide a more optimal forwarding model and avoid traffic tromboning, the EVPN inter-subnet draft ([draft-sajassi-l2vpn-evpn-inter-subnet-forwarding](#)) proposes integrating the routing and bridging (IRB) functionality directly onto the VTEP, thereby allowing the routing operation to occur as close to the end host as possible. The draft proposes two forwarding models for the IRB functionality, which are termed asymmetric IRB and symmetric IRB, these two models are described in the following sections.

In the asymmetric IRB model, the inter-subnet routing functionality is performed by the ingress VTEP, with the packet after the routing action being VXLAN bridged to the destination VTEP. The egress VTEP only then needs to remove the VXLAN header and forward the packet onto the local Layer 2 domain based on the VNI to VLAN mapping. In the return path, the routing functionality is reversed with the destination VTEP now performing the ingress routing and VXLAN bridging operation, hence the term asymmetric IRB.

**Figure 70: EVPN Asymmetric IRB**

To provide inter-subnet routing on all VTEPs for all subnets, an anycast IP address is utilized for each subnet and configured on each VTEP. The anycast IP acts as the default gateway for the hosts, therefore regardless of where the host resides the directly attached VTEPs can act as the host's default gateway. The host MAC and MAC to IP bindings are learned by each VTEP based on a combination of local learning/ARP snooping and type-2 route advertisement from remote VTEPs.

In a typical implementation, the optional MAC and IP, type-2 route is advertised separately from the MAC only type-2 route. This is done so that if the MAC and IP route is cleared, for example the ARP flushed, or the ARP timeout is set to less than the MAC timeout, then the MAC only route will still exist.

The format of the two advertised type-2 routes for Server-1 are illustrated below, where the RD IP-A:1010 and route-target 1010:1010 are used to distinguish the uniqueness of the route and allow the

route to be imported into the correct remote MAC-VRF based on the route-target import policy of the VTEP.

Figure 71: EVPN Comparison of MAC & MAC+IP Type 2 Route in Asymmetric IRB

For the traffic flow between Server-1 in subnet-10 and Server-4 in subnet-11, the ingress VTEP (VTEP-1) locally routes the packet into subnet-11/VNI 1011 and then VXLAN bridges the frame, inserting the VNI 1011 into the VXLAN header with an inner DMAC equal to the destination host, Server-4. This requires the receiving VTEP, (VTEP-4) to only perform a local Layer 2 lookup, based on the VNI to VLAN mapping, for the DMAC of Server-4.

Figure 72: EVPN Asymmetric IRB VxLAN Data-plane Forwarding Detail

For the asymmetric model to operate the sending VTEP needs the information for all the tenant's hosts (MAC and MAC to IP binding), to route and bridge the packet. This means the VTEP needs to be member of all the tenant's subnets/VNI and have an associated SVI with anycast IP for all the subnets, and this will be required on all VTEPs participating in the routing functionality for the tenant. This introduces scaling issues on multiple fronts.

- VNI Scaling: The number of VNIs supported on a hardware VTEP will be finite, so not all VNIs can reside on all VTEPs. This is especially true in data-center deployments, where the TOR's have traditionally been more resource constrained than chassis-based edge systems.
- Forwarding memory scaling: The VTEPs needs to store all host MACs and ARP entries for all subnets in the network, on leaf switch this is hardware resource which again will be a finite resource defined by the specific hardware platform deployed at the leaf.

### Symmetric IRB

To address the scale issues of the asymmetric model, in the symmetric model the VTEP is only configured with the subnets that are present on the directly attached hosts. Connectivity to non-local subnets on a remote VTEP is achieved through an intermediate IP-VRF. The subsequent forwarding model for symmetric IRB is illustrated in the figure below, for traffic between Server-1 on subnet-10 (Green) and Server-4 on the remote subnet-11 (Blue). In this model, the ingress VTEP routes the traffic between the local subnet-10) and the IP-VRF, which both VTEPs are a member of, the egress VTEP then routes the frame from the IP-VRF to the destination subnet. The forwarding model results in both VTEPs performing a routing function, hence the term symmetric IRB.

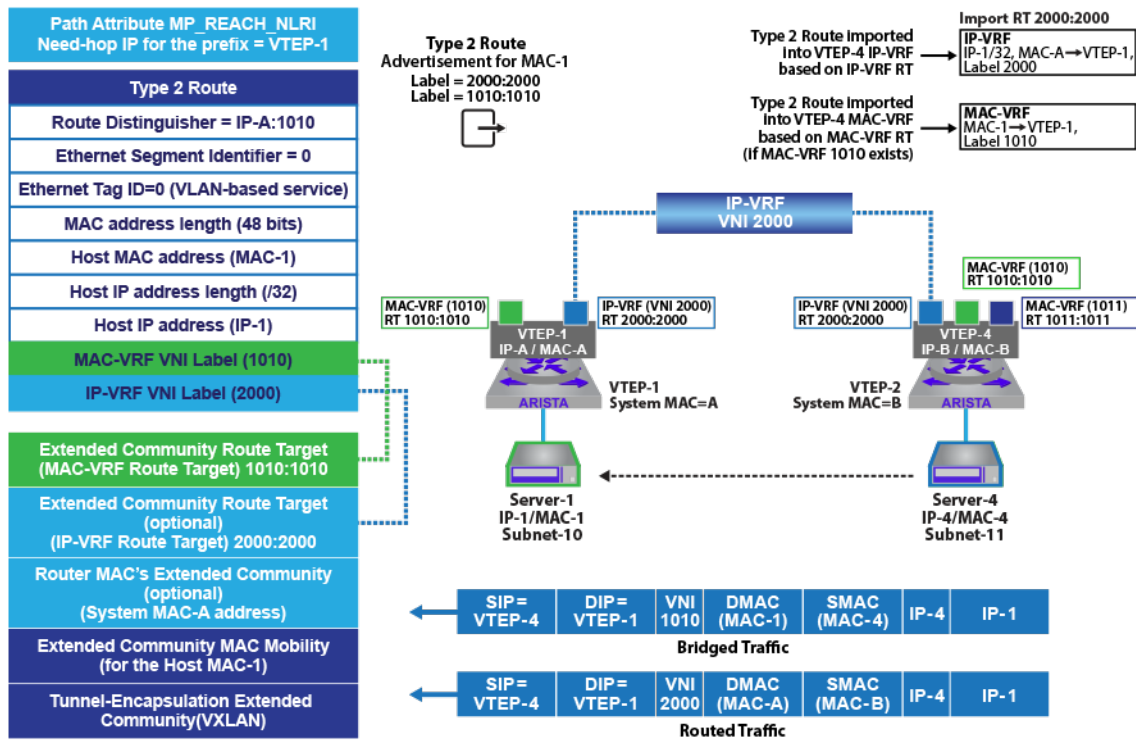

Figure 73: EVPN Symmetric IRB

To provide the inter-subnet routing, when the subnet is stretched across multiple VTEPs, an anycast IP address is utilized for each subnet, but only configured on the VTEP's where the subnet exists. The host MAC and MAC to IP bindings are learned by each VTEP based on a combination of local learning/ARP snooping and type-2 route advertisements.

For the symmetric IRB model the type-2 (MAC and IP) route is advertised with two labels and two route-targets corresponding to the MAC-VRF the MAC address is learned on and the IP-VRF. Remote VTEP's receiving the route, import the IP host route into the corresponding IP-VRF based on the IP-VRF route-target and if the corresponding MAC-VRF exists on the VTEP the MAC address is imported into the local MAC-VRF based on the MAC-VRF's Route-Target. The import behavior for the type-2 route is illustrated in the diagrams below for the host Server-1.

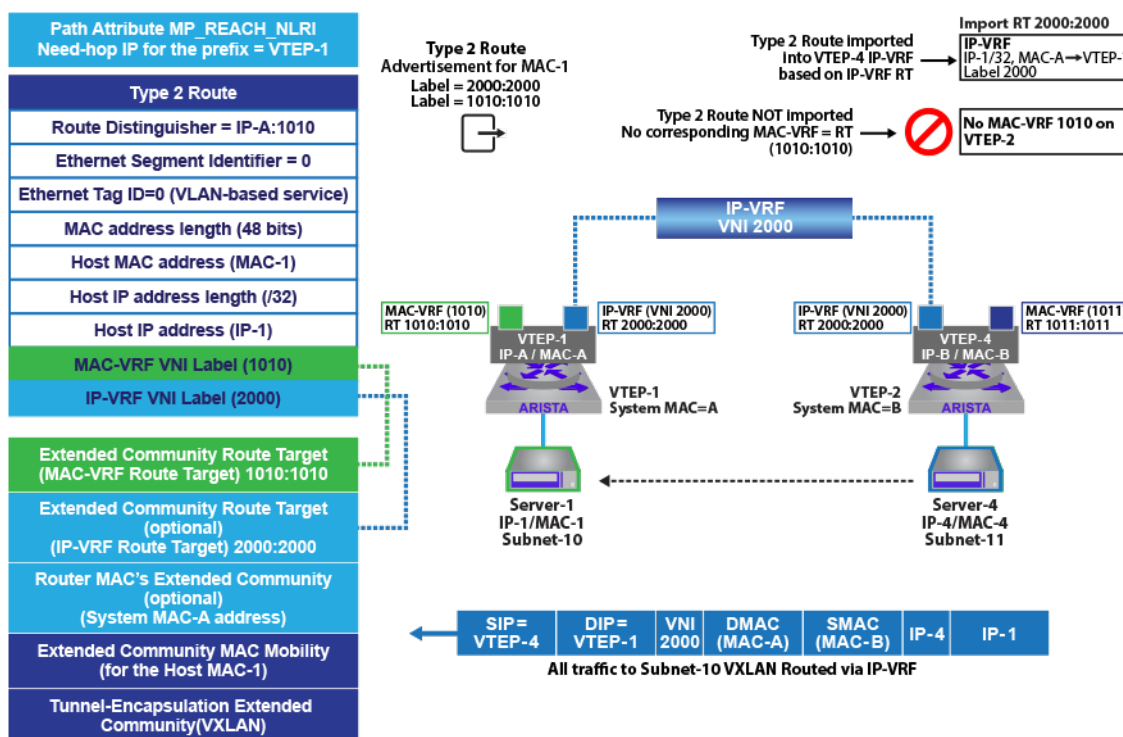

If the MAC-VRF exists locally on the receiving router, both the IP host route will be installed in the IP-VRF, and the MAC address will be installed in the MAC-VRF. As shown in Figure 30. With both a MAC route in the MAC-VRF and an IP host route in the IP-VRF, the VNI used in the data-path will depend

on whether the traffic is being VXLAN bridged between hosts in the same VNI (1010) or VXLAN routed (VNI 2000).

**Figure 74: EVPN Type 2 Route in Symmetric IRB - MAC-VRF on Both VTEPs**

Compare this to the figure below, where the MAC-VRF does not exist on the receiving VTEP (VTEP-2). In this case the MAC route is not installed and ignored, as there is no corresponding Route Target on the VTEP. In this scenario, only the IP-VRF host route is installed on VTEP-2. Traffic from VTEP-2 destined to hosts on subnet-10, are therefore always VXLAN routed via the IP-VRF, VNI 2000.

**Figure 75: EVPN Type 2 Route in Symmetric IRB - MAC-VRF Only Exists on Sending VTEP**

The symmetric IRB type-2 route contains a number of additional extended community attributes over the asymmetric IRB type-2 route, the salient fields of the route are summarized below.

- Multi-protocol Reachable NLRI (MP\_REACH\_NLRI) attribute is used to carry the next-hop hop for the advertised route. In the context of a VXLAN forwarding plane, this will be the source address of the advertising VTEP.
- Route Distinguisher of the advertising node's MAC-VRF. For Server-1 in the example above this would be IPA:1010.
- MAC address field contains the 48-bit MAC address of the host being advertised. For Server-1 in the example above this would be MAC-1.
- IP address and length field contain the IP address and 32-bit mask for the host being advertised. For Server-1 in the example above this would be IP-1.
- MAC-VRF label, this contains the VNI number (label) corresponding to the local Layer 2 domain/ MAC-VRF the host MAC was learned on. For Server-1 in the example above this would be VNI 1010.
- IP-VRF label, this contains the VNI number (label) corresponding to the MAC-VRF's associated IP-VRF. For MAC-VRF 10 in the example above this would be IP-VRF 2000.
- Extended community Route Target for the IP-VRF. This contains the route-target of the IP-VRF associated with the learned MAC address.
- Extended community Router MAC. This field advertises the system MAC of the advertising VTEP and is used as the DMAC for any packet sent to the VTEP via the IP-VRF.
- Extended community Route Target for the MAC-VRF. This contains the route-target of the MAC-VRF associated with the learned MAC address.

### 17.3.1 IP VPN

RFC 4364 allows Service Providers and Enterprises to use their backbone infrastructure to provide the services to multiple customers, or internal departments; while performing the following functions:

- Maintaining privacy

- Allowing for IP address overlap amongst customers
- Constraining route distribution - so that only the service provider routers which need the routes have them.

This is achieved through the usage of VRFs, Route Distinguishers and Route-Targets

The IPv4/IPv6 VPN Standard RFC 4364 does the following:

- Specifies an BGP IPv4 VPN control plane with a MPLS data plane
- BGP control plane, new address family to advertise IP VPN prefixes.
- This RFC obsoleted the original RFC 2547
- MPLS data-plane defined in multiple RFCs and drafts.

The RED circle in the figure below highlights the main Drafts and RFCs in use today for an MPLS data-plane.

**Figure 76: MPLS data-plane**

IPv4 VPN and IPv6 VPN are an extensions of the BGP protocol introducing new address families: IPv4 (address family number 1), IPv6 (address family number 2), and a subsequent address family number 128: MPLS Layer 3 VPN unicast. It is used to exchange overlay IP prefix reachability information between MP-BGP peers.

| AFI | Description      |   | SAFI | Description          |   | AFI | SAFI | Description             |

**Figure 77: IPv4 VPN and IPv6 VPN**

IPv4 VPN defines two route types:

- Update
- Withdrawal

Each route type has its own NLRI prefix format and each route type advertises its own set of prefixes to update/withdraw.

The format of the IPv4 VPN prefix update route is illustrated in the following figure. As detailed, the update route contains the VPN route (prefix and RD), the next-hop for the route and the advertising router ID, along with the MPLS Label, along with a number of path attributes (where the RT extended communities are defined), which are associated with these IPv4 NLRIs.

**Figure 78: IPv4 and IPv6 VPN Update Route Detail**

The output in P4 VPN Route as Shown on PE and IPv6 VPN Route as Shown on PE offer a more detailed view of the route as displayed on a PE router.

**Figure 80: IPv6 VPN Route as Shown on PE**

The following is an illustration of a basic MPLS Layer 3 VPN topology.

**Figure 81: MPLS Layer 3 VPN Topology**

An IP VRF is used on a PE router for each customer (Layer 3 overlay). VRF IP routes are exported into the MP-BGP table and advertised to remote PEs as VPN routes. The exported VPN routes carry the Route-Target (RT) extended communities that are configured as export route-targets on the IP VRF from which they were exported.

The RTs carried by the VPN routes received by a PE are matched against the VRF import route-target configuration. When a received route carries an RT that is configured as an import route-target on an IP VRF, the route is imported into the IPv4 or IPv6 table for that VRF.

PE routers allocate per-VRF and address family Labels that are advertised as part of the VPN route NLRI. Forwarding of overlay packets between PEs across the underlay requires underlay MPLS connectivity provided by a backbone.

**Note:** You require 4.21.1F release and later versions with Jericho/Jericho+ platforms.

## 17.4 VPN MPLS Transport Options

EVPN-MPLS and IP-VPN sample topologies illustrate co-existing LDP, BGP-SR, and ISIS-SR on the core.

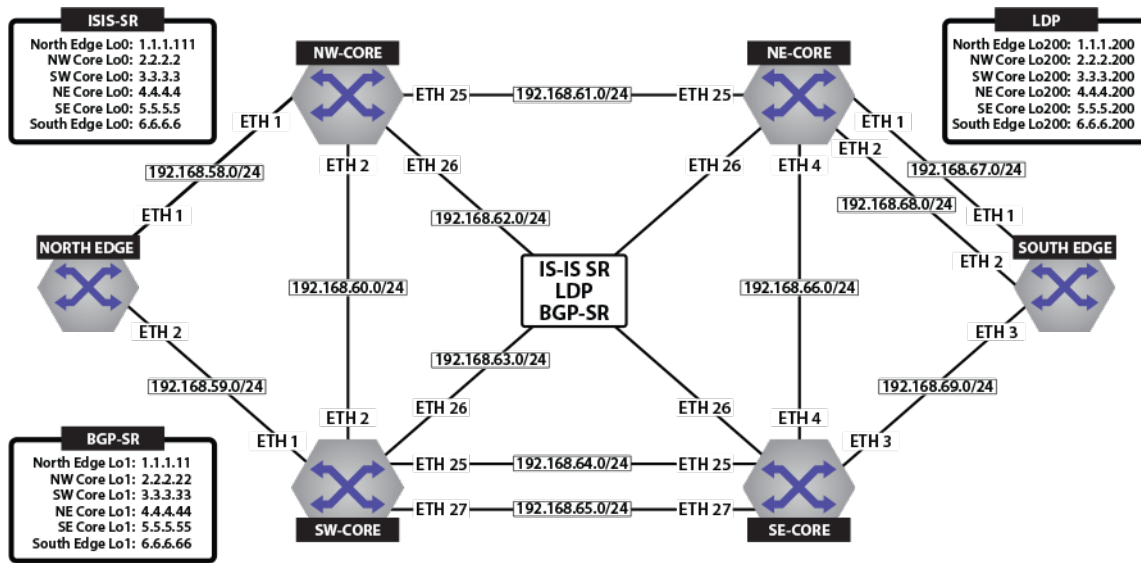

Figure 82: Physical Topology For ISIS-SR, LDP and BGP-SR Transport

LDP, ISIS-SR, and BGP-LU (BGP-SR) demonstrates the corresponding Label Switched Paths (LSPs) as the MPLS transport LSPs for Layer3 EVPN and IP VPN services.

### EVPN Sample Topology

In the figures below **Tenant-A DCI** and **Tenant-B DCI**, the prefixes from each DC are transported over the WAN/DCI domain, maintaining the Layer 3 multi-tenancy in tenant-a and tenant-b.

Figure 83: Tenant-A DCI

**Figure 84: Tenant-B DCI**

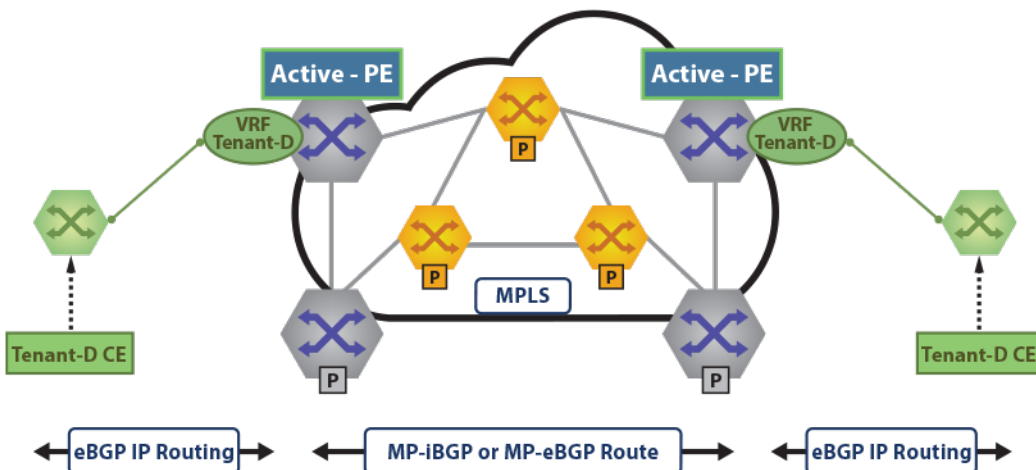

To provide external connectivity from the DC into the MPLS domain, leaf-11 and leaf-12 are eBGP peering via the tenants VRFs with the border routers. Both core routers are advertising external prefixes for Internet and any remote site connectivity (default route and ip-prefixes from the other DC for the tenant). To provide connectivity within the EVPN domain, the leaf switches (leaf-21 and leaf-2) re-advertise the prefixes into the tenant's VRF via a type-5 route advertisement, with a next-hop equal to the advertising PE.

Let us review the concepts of transport labels, advertised to provide the label switched path, or LSP, across the back-bone and the VPN, or tenant label, used by the provider edge (PE) routers to identify a particular tenant.

[EVPN MPLS Sample Configuration](#) displays BGP route updates and how the tenant VRF is transported over these transport LSPs.

### IP VPN Sample Topology

Let us review the concepts of transport labels, advertised to provide the label switched path, or LSP, across the back-bone and the VPN, or tenant label, used by the Provider Edge (PE) routers to identify a particular tenant.

**Figure 85: IPv4 & IPv6 VPN Sample Topology**

In the figures **Tenant-D IPv4 VPN** and **Tenant-D IPv6 VPN**, the prefixes for VRF tenant-d are transported over the MPLS WAN between North Edge and South Edge routers.

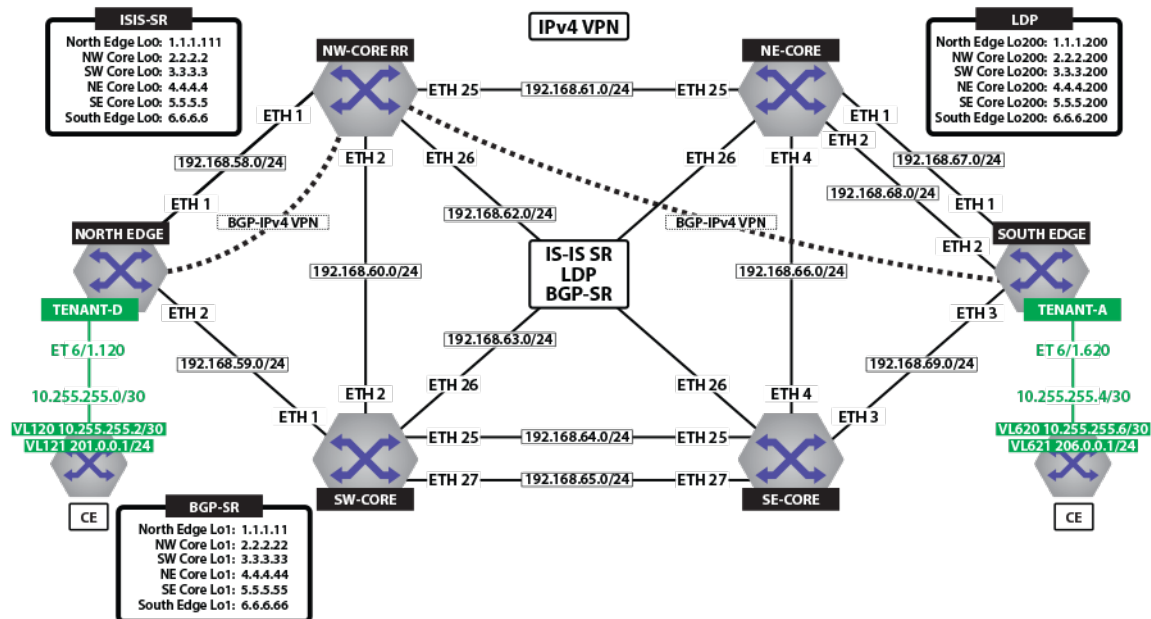

Figure 86: Tenant-D IPv4 VPN

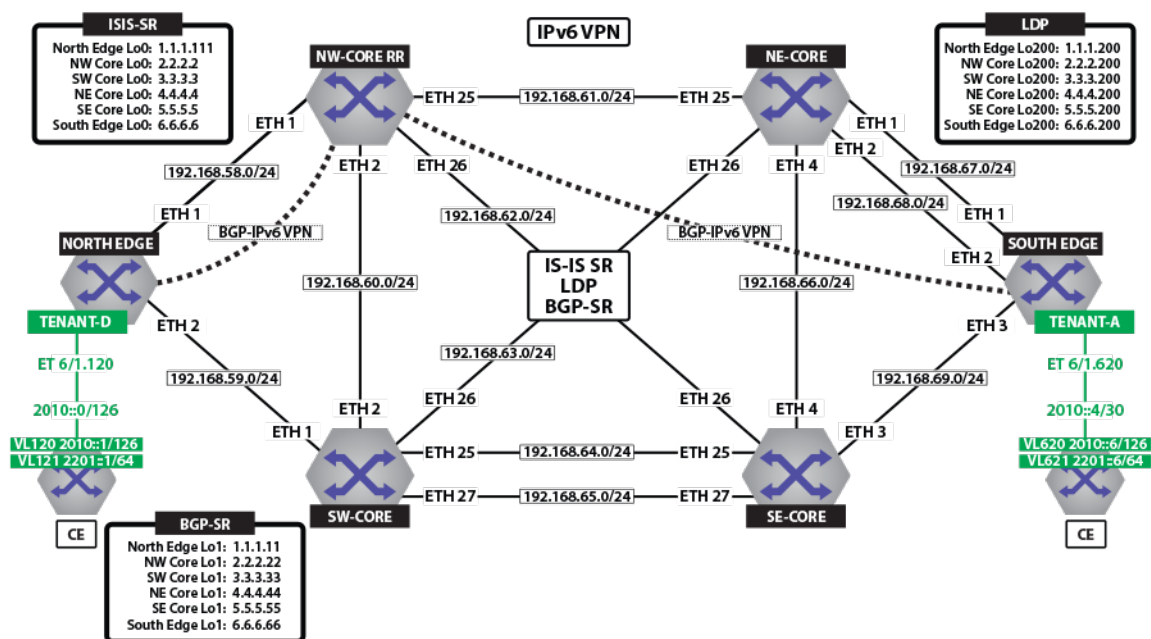

Figure 87: Tenant-D IPv6 VPN

### 17.4.1 LDP

The figure below illustrates how LDP neighbor relationships are built. First each router sends a discovery to a destination multicast address (TTL=1) 224.0.0.2 on port 646. This discovery contains the router-id and the transport IPv4 address the router wants to use. The second stage is building the TCP peering session using the transport IP addresses specified. This is normally loopback to loopback.

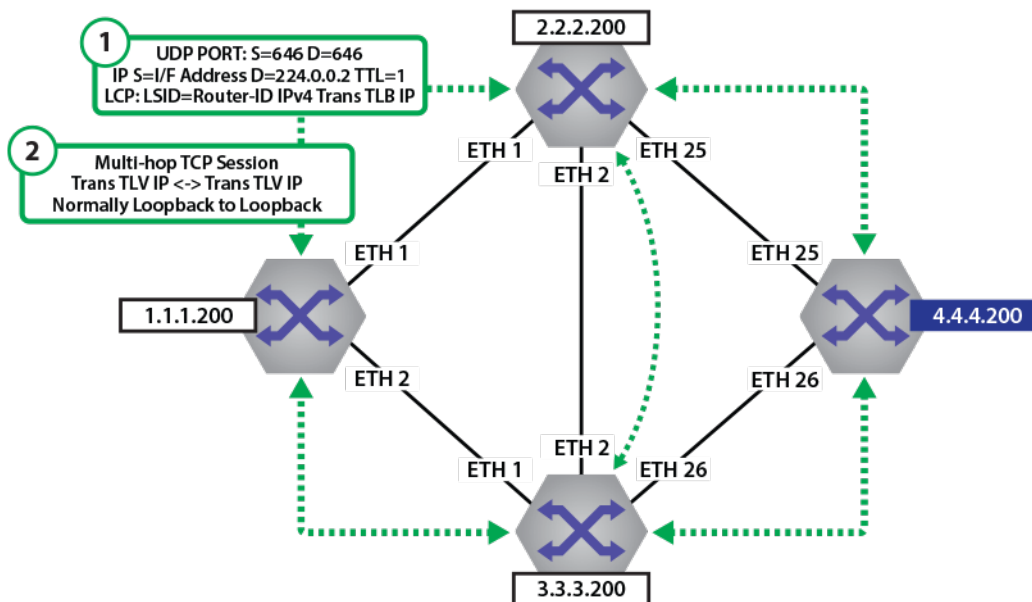

Figure 88: LDP Peering Establishment

### Examples

- The `show mpls ldp neighbor` command on the North Edge router displays more detail on TCP session establishment, and the local addresses of the LDP neighbor for which it is binding a label.

**Note:** All connected interfaces are advertised as bound. However, EOS currently advertised labels for /32 addresses, and FEC filter is configured to install only x.x.x.200/32 prefixes.

```

North Edge.17:51:17#show mpls ldp neighbor
Peer LDP ID: 2.2.2.200:0; Local LDP ID: 1.1.1.200:0
TCP Connection: 2.2.2.200:38395 - 1.1.1.200:646
State: oper; Msgs sent/rcvd: 46/46; downstream unsolicited
Uptime: 0:06:17
KeepAlive expires in: 20.27 sec
LDP discovery sources:
  Ethernet1/1
Addresses bound to peer:
  2.2.2.200          2.2.2.2          192.168.1.177
192.168.62.11
  192.168.1.181     192.168.58.12   192.168.60.11
192.168.61.11
Peer LDP ID: 3.3.3.200:0; Local LDP ID: 1.1.1.200:0
TCP Connection: 3.3.3.200:38510 - 1.1.1.200:646
State: oper; Msgs sent/rcvd: 42/42; downstream unsolicited
Uptime: 0:05:51
KeepAlive expires in: 20.02 sec
LDP discovery sources:
  Ethernet2/1
Addresses bound to peer:
  192.168.65.11     192.168.59.12   3.3.3.200
192.168.60.12
  192.168.63.11     3.3.3.3         192.168.64.11

```

- The `show mpls lfib route 116384` command on the North Edge router displays the label POP and swap operations for any traffic traversing North Edge. As can be seen if traffic came in with label 116384 it would be swapped to the labels seen in the tunnel table.

```

North Edge.23:38:28(config)#show mpls lfib route 116384

```

```

## 17.4.2 ISIS-SR

The figure below illustrates how ISIS-SR distributes the SID index information in the ISIS TLVs and sub-TLVs

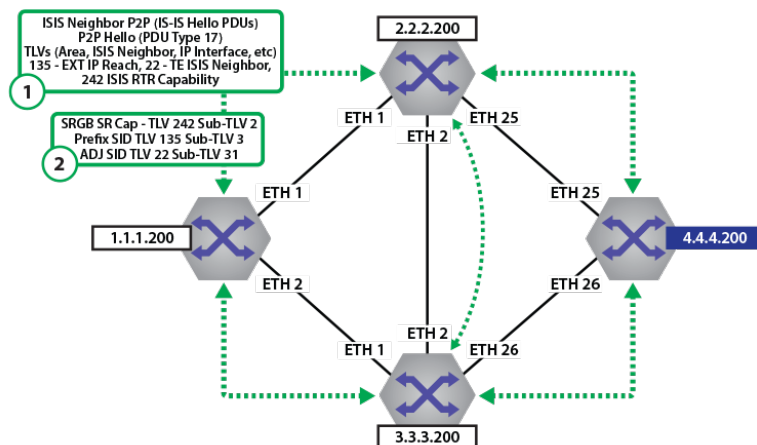

Figure 89: ISIS Neighbor Adj and TLVs

The Prefix SID index, SRGB, and ADJ SID values are populated in the sub-TLVs in the ISIS neighbor updates. Each router then builds its own database of Node (Prefix) segments (Labels) and locally assigned ADJ labels.

### Examples

- The `show isis neighbors detail` command on the North Edge router displays the detailed information of all ISIS neighbors.

```

north-edge#show isis neighbors detail

### 17.4.3 BGP-LU (BGP-SR)

BGP-LU Label Distribution illustrates how BGP-LU distributes the label information in BGP.

**Figure 90: BGP-LU Label Distribution**

BGP-SR Index and SRGB Distribution illustrates how BGP-LU distributes the Label SRGB and SID index information in BGP. This is known as BGP-SR.

**Figure 91: BGP-SR Index and SRGB Distribution**

The Prefix SID index, and SRGB values are populated in the TLVs in the BGP neighbor updates. Each router then builds its own database of Node (Prefix) segments (Labels).

---

## Examples

- The `show bgp neighbor` command displays BGP-SR neighbors.

```
north-edge#show bgp neighbor | include BGP neighbor|Multiprotocol IPv4
MplsLabel

BGP neighbor is 192.168.2.10, remote AS 64512, internal link
  Multiprotocol IPv4 MplsLabel: received
BGP neighbor is 192.168.3.9, remote AS 64512, internal link
  Multiprotocol IPv4 MplsLabel: advertised and received and
  negotiated
BGP neighbor is 192.168.3.10, remote AS 64512, internal link
  Multiprotocol IPv4 MplsLabel: advertised
BGP neighbor is 192.168.58.12, remote AS 2, external link
  Multiprotocol IPv4 MplsLabel: advertised and received and
  negotiated
BGP neighbor is 192.168.59.12, remote AS 3, external link
```

- The `show ip bgp labeled-unicast 6.6.6.66/32 detail` command displays the detailed information of BGP labeled routes unicast with 6.6.6.66/32.

```
north-edge(config-if-Et2/1)#show ip bgp labeled-unicast 6.6.6.66/32

## 17.5 EVPN Type-5 Routes: IP Prefix Advertisement

The EVPN type 2 routes can be used to advertise IP prefixes by making use of the optional IP address and IP address length fields in the route, however they are explicitly linked to the MAC address advertised within the route. The EVPN type-5 route defined within the draft <https://tools.ietf.org/html/draft-ietf-bess-evpn-prefix-advertisement-04>, provides the ability to decouple the advertisement of an IP prefix from any specific MAC address, providing the ability to support floating IP address, optimize the mechanism for advertising external IP prefixes, and reduce the churn when withdrawing IP prefixes.

The figure below displays the format of the new type-5 IP-prefix route.

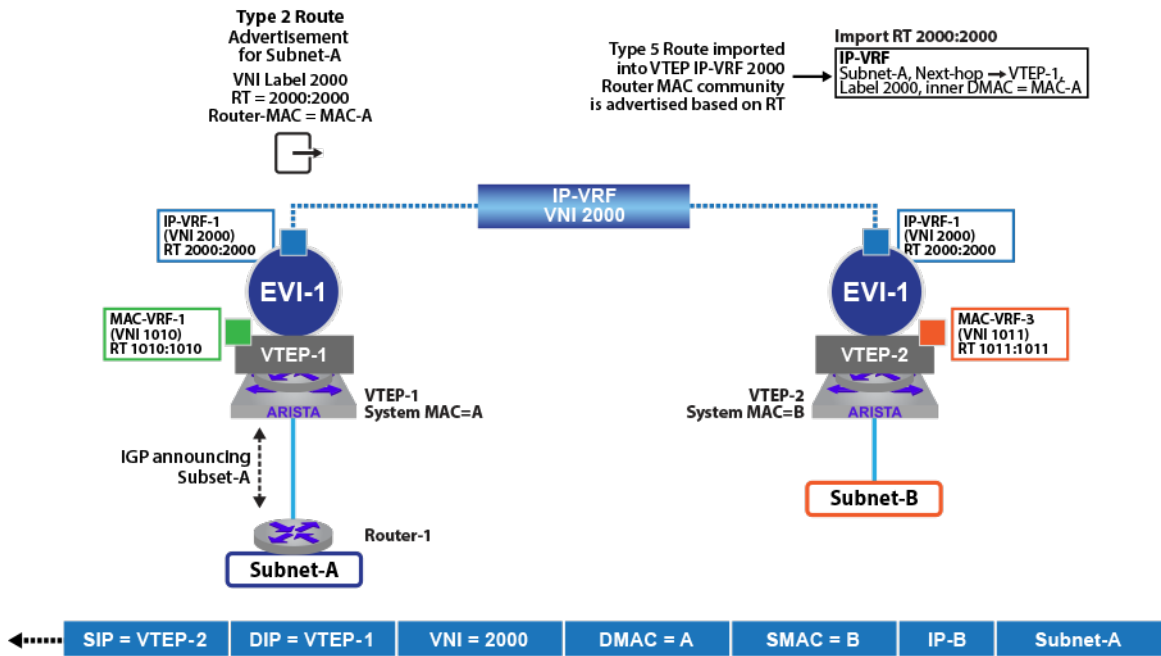

**Figure 92: EVPN Route Type-5, for Advertisement of IP Prefixes**

The IP prefix draft defines a number of specific use cases for the type-5 route, which consequently affect the format and content of the fields within the route. The different deployment scenarios and use cases defined within the draft are summarized below.

- Advertising of IP prefixes behind an appliance, when the appliance is not running a routing protocol and only supporting static routes. This could be the typical use case for a Virtual Firewall with a number of local subnets directly attached, but the firewall is only supporting static routes into the associated EVI.
- Support for active-standby deployment of appliances using a shared floating IP model. This is an extension of the previous case where there is now a virtual IP (or VIP) for clustering the appliances, rather than a dedicated physical IP address on the appliance.
- Support for Layer 2 appliances, acting as a “bump in the wire” with no physical IP addresses configured, where instead of the appliances having an IP next-hop there is only a MAC next-hop.
- IP-VRF to IP-VRF model, which is similar to inter-subnet forwarding for host routes (detailed in the symmetric/asymmetric section), except only Type-5 routes and IP prefixes are advertised, allowing announcement of IP prefixes into a tenant’s EVI domain for external connectivity outside the domain.

### Interface-less

In interface-less mode, the IP prefixes within the type-5 route, whether they are local or learned from a connected router are advertised to remote peers via the shared IP-VRF, as illustrated in the figure below. The IP-VRF to IP-VRF model, is further divided in the draft into three distinct use cases.

**Figure 93: EVPN Route Type-5, Interface-less Update**

As illustrated above, the IP prefix (subnet-A) residing behind the router (Rtr-1) is learned via an IGP in EVI-1 on VTEP-1. The prefix is announced and learned by the remote VTEPs residing in the same EVI, via the type-5 route announcement. The type-5 route, is advertised along with the prefix, with a route-target (2000:2000) and a VNI label (2000) equal to the IP-VRF which interconnects the VTEPs in the EVI, the router-mac extended community of the route is used to define the inner DMAC (equal to system MAC of VTEP-1) for any VXLAN frame destined to advertised IP prefix.

From a forwarding perspective, host residing on subnet-B communicating with a host on subnet-A, will send traffic to their default gateway which is the IRB interface on VTEP-2 in VLAN 11/VNI 1011. VTEP-2 performs a route lookup for the destination subnet-A), which has been learned in the IP-VRF with a next-hop of VTEP-1 and VNI label of 2000. The packet is thus VXLAN encapsulated with VNI label of 2000 an inner DMAC of A (VTEP-1 system/router MAC), and routed to VTEP-1, which is the next-hop for the prefix. Receiving the frame, VTEP-1 de-encapsulates the packet, with an inner DMAC of the VTEPs router MAC, it performs a local route lookup for the destination subnet-A), which has been learned with a next-hop of rtr-1. The frame is forwarded directly to rtr-1, which subsequently routes the packet to the local host on subnet-A. The format of the type-5 route in interface-less mode is illustrated in figure below.

|                                                                     |
|---------------------------------------------------------------------|
| Path Attribute MP_REACH_NLRI<br>Next-hop IP for the prefix = VTEP-1 |
| <b>Type 5 Route</b>                                                 |
| Route Distinguisher (RD)                                            |
| Ethernet Segment ID = 0                                             |
| Ethernet TAG = 0 for <u>vlan</u> -based service                     |
| IP Address Length = IP prefix mask                                  |
| IP address = Subnet-A                                               |
| Gateway IP address = 0                                              |
| VNI Label = IP-VRF (2000)                                           |
| Router Target extended community<br>IP-VRF Route-Target 2000:2000   |
| Router MAC extended community<br>MAC-A                              |
| Tunnel-encapsulation extended community<br>(VXLAN)                  |

**Figure 94: EVPN Type-5 Route Format for Interface-less Mode**

In this model, the VTEPs forming the EVI are interconnected via an IP-VRF, meaning there is no IRB interface (MAC and IP) created for the interconnection on each of the VTEPs, hence the term “interface-less”. With no IRB interface the gateway IP address within the type-5 route is set to zero, traffic is routed to the prefix based on the next-hop of the route (VTEP IP) as well as MAC address conveyed within the Router MAC extended community, which represents the inner destination MAC of the VXLAN encapsulated frame.

## 17.6 Inter-VRF Local Route Leaking

Inter-VRF local route leaking allows the leaking of routes from one VRF (the source VRF) to another VRF (the destination VRF) on the same router. Inter-VRF routes can exist in any VRF (including the default VRF) on the system. Routes can be leaked using the following methods:

- [Inter-VRF Local Route Leaking using BGP VPN](#)
- [Inter-VRF Local Route Leaking using VRF-leak Agent](#)

### 17.6.1 Inter-VRF Local Route Leaking using BGP VPN

Inter-VRF local route leaking allows the user to export and import routes from one VRF to another on the same device. This is implemented by exporting routes from a VRF to the local VPN table using route target extended community list and then importing the same route target extended community lists from the local VPN table into the target VRF. VRF route leaking is supported on VPN-IPv4, VPN-IPv6, and EVPN types.

**Figure 95: Inter-VRF Local Route Leaking using Local VPN Table**

### Accessing Shared Resources Across VPNs

To access shared resources across VPNs, all the routes from the shared services VRF must be leaked into each of the VPN VRFs and customer routes must be leaked into the shared services VRF for return traffic. Accessing shared resources allows one to export the route target of the shared services VRF into all customer VRFs, and allows the shared services VRF to import route targets from customers A and B. The figure below shows how to provide customers, corresponding to multiple VPN domains, access to services like DHCP available in the shared VRF.

Route leaking across the VRFs is supported on VPN-IPv4, VPN-IPv6, and EVPN.

**Figure 96: Accessing Shared Resources Across VPNs**

#### 17.6.1.1 Configuring Inter-VRF Local Route Leaking

Inter-VRF local route leaking is configured using VPN-IPv4, VPN-IPv6, and EVPN. Prefixes can be exported and imported using any of the configured VPN types. Ensure that the same VPN type that is exported is used while importing.

Leaking unicast IPv4 or IPv6 prefixes is supported and achieved by exporting prefixes locally to the VPN table and importing locally from the VPN table into the target VRF on the same device as shown in the figure titled **Inter-VRF Local Route Leaking using Local VPN Table** using the `route-target` command.

Exporting or importing the routes to or from the EVPN table is accomplished with the following two methods:

- Using VXLAN for encapsulation
- Using MPLS for encapsulation

### Using VXLAN for Encapsulation

To use VXLAN encapsulation type, ensure that VRF to VNI mapping is present and the interface status for the VXLAN interface is up. This is the default encapsulation type for EVPN.

Example:

- The configuration for VXLAN encapsulation type is as follows:

```
switch(config)#router bgp 65001
switch(config-router-bgp)#address-family evpn
switch(config-router-bgp-af)#neighbor default encapsulation vxlan next-
hop-self source-interface Loopback0

switch(config)#hardware tcam
switch(config-hw-tcam)#system profile vxlan-routing
switch(config-hw-tcam)#interface Vxlan1
switch(config-hw-tcam-if-Vx1)#vxlan source-interface Loopback0
switch(config-hw-tcam-if-Vx1)#vxlan udp-port 4789
switch(config-hw-tcam-if-Vx1)#vxlan vrf vrf-blue vni 20001
switch(config-hw-tcam-if-Vx1)#vxlan vrf vrf-red vni 10001
```

### Using MPLS for Encapsulation

To use MPLS encapsulation type to export to the EVPN table, MPLS needs to be enabled globally on the device and the encapsulation method needs to be changed from default type, that is VXLAN to MPLS under the EVPN address-family sub-mode.

Example:

```
switch(config)#router bgp 65001
switch(config-router-bgp)#address-family evpn
switch(config-router-bgp-af)#neighbor default encapsulation mpls next-
hop-self source-interface Loopback0
```

#### 17.6.1.2 Route-Distinguisher

Route-Distinguisher (RD) is used to uniquely identify routes from a particular VRF. Route distinguisher is configured for every VRF from which routes are exported from or imported into.

The following commands are used to configure route distinguisher for a VRF.

```
Switch(config-router-bgp)#vrf vrf-services
Switch(config-router-bgp-vrf-vrf-services)#rd 1.0.0.1:1

Switch(config-router-bgp)#vrf vrf-blue
Switch(config-router-bgp-vrf-vrf-blue)#rd 2.0.0.1:2
```

#### 17.6.1.3 Exporting Routes from a VRF

Use the `route-target export` command to export routes from a VRF to the local VPN or EVPN table using the route target extended community list.

## Examples

- These commands export routes from vrf-red to the local VPN table.

```
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4
10:10
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6
10:20
```

- These commands export routes from vrf-red to the EVPN table.

```
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export evpn 10:1
```

### 17.6.1.4 Importing Routes into a VRF

Use the `route-target import` command to import the exported routes from the local VPN or EVPN table to the target VRF using the route target extended community list.

## Examples

- These commands import routes from the VPN table to vrf-blue.

```
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4
10:10
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6
10:20
```

- These commands import routes from the EVPN table to vrf-blue.

```
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn 10:1
```

### 17.6.1.5 Exporting and Importing Routes using Route Map

To manage VRF route leaking, control the prefixes that are exported and imported with route-map export or import commands. The route map is effective only if the VRF paths or the VPN paths are already candidates for export or import. It is mandatory to have the route-target export or import command configured first. Setting BGP attributes using route maps is effective only on the export end.

 **Note:** Prefixes that are leaked are not re-exported to the VPN table from the target VRF.

## Examples

- These commands export routes from vrf-red to the local VPN table.

```
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4
10:10
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6
10:20
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4
route-map EXPORT_V4_ROUTES_TO_VPN_TABLE
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6
route-map EXPORT_V6_ROUTES_TO_VPN_TABLE
```

- These commands export routes to from vrf-red to the EVPN table.

```
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export evpn 10:1
switch(config-router-bgp-vrf-vrf-red)#route-target export evpn route-
map EXPORT_ROUTES_TO_EVPN_TABLE
```

- These commands import routes from the VPN table to vrf-blue.

```
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 1:1
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4
10:10
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6
10:20
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4
route-map IMPORT_V4_ROUTES_VPN_TABLE
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6
route-map IMPORT_V6_ROUTES_VPN_TABLE
```

- These commands import routes from the EVPN table to vrf-blue.

```
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn 10:1
switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn route-
map IMPORT_ROUTES_FROM_EVPN_TABLE
```

## 17.6.2 Inter-VRF Local Route Leaking using VRF-leak Agent

Inter-VRF local route leaking allows the leaking of routes from one VRF to another using route map as a VRF-leak agent. VRFs are leaked based on the preferences assigned to each VRF.

### 17.6.2.1 Configuring Route Maps

Use **router general** command to configure route maps to leak routes from one VRF to another. Routes in VRF “VRF1” that match the policy “RM1” are considered for leaking into VRF “VRF2”. If two

---

or more policies specify leaking the same prefix to the same destination VRF, then the route with a higher (post-set-clause) distance and preference is chosen.

### Example

These commands configure a route-map to leak routes from “VRF1” to “VRF2” using a route-map “RM1”.

```
switch(config)#router general
switch(config-router-general)#vrf VRF2
switch(config-router-general-vrf-VRF2)#leak routes source-vrf VRF1
subscribe-policy RM1
```

## 17.7 Configuring EVPN

### 17.7.1 Configuring BGP-EVPN and VCS on CVX

#### 17.7.1.1 Configuring BGP-EVPN

##### Configuring VNI Bundle

A VNI-aware-bundle represents a MAC-VRF that contains Layer 2 route entries from all VXLAN Network Identifiers (VNI) available across multiple DCs. Use the **vni-aware-bundle** command available on CVX to create a MAC-VRF.

**Note:** This command is not available on switches.

##### Example

```
cvx(config)#router bgp 100
cvx(config-router-bgp)#vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)#
```

##### Configuring RD and RT in VNI Bundle

Use the **rd** (Router-BGP VRF and VNI Configuration Modes) command to add a Route Distinguisher (RD) for uniquely identifying Layer 2 routes for the VNI bundle. Use the **route-target** command to configure a well-known extended community that is attached to the routes exported by BGP-EVPN; and to import routes with the specified well-known extended community into the MAC-VRF that corresponds to the VNI bundle.

##### Example

```
cvx(config)#router bgp 100
cvx(config-router-bgp)#vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)# rd 530:12
cvx(config-macvrf-bundle1)# route-target both 530:12
```

##### Enabling Redistribution of Bridging Information

After the VNI aware bundle is created, use the **redistribute service vxlan** command to redistribute the Layer 2 bridging information received from VCS.

## Example

```
cvx(config) #router bgp 100
cvx(config-router-bgp) #vni-aware-bundle bundle1
cvx(config-macvrf-bundle1) #redistribute service vxlan
```

## Disabling Next-Hop Resolution in BGP-EVPN

When BGP-EVPN module receives a route from its BGP peer, it generally tries to resolve the next-hop indicated in the route. However in the DCI topology, the routes coming from a CVX in another DC contains next-hops (VTEP addresses) that may not be reachable from the CVX receiving the route. Use the `next-hop resolution disabled` command to disable the next-hop resolution on routes received from BGP-EVPN peers.

**Note:** CVX is a part of the control plane and it is only connected to the VTEPs in its own DC. It does not have IP connectivity to the VTEPs in a different DC.

## Example

```
cvx(config) #router bgp 100
cvx(config-router-bgp) #address-family evpn
cvx(config-router-bgp-af) #next-hop resolution disabled
```

### 17.7.1.2 Configuring VCS

#### Enabling Redistribution of BGP-EVPN Routes

Use the `redistribute bgp evpn vxlan` command to redistribute BGP-EVPN routes to VCS, which, in turn advertises them to all VTEPs within the DC.

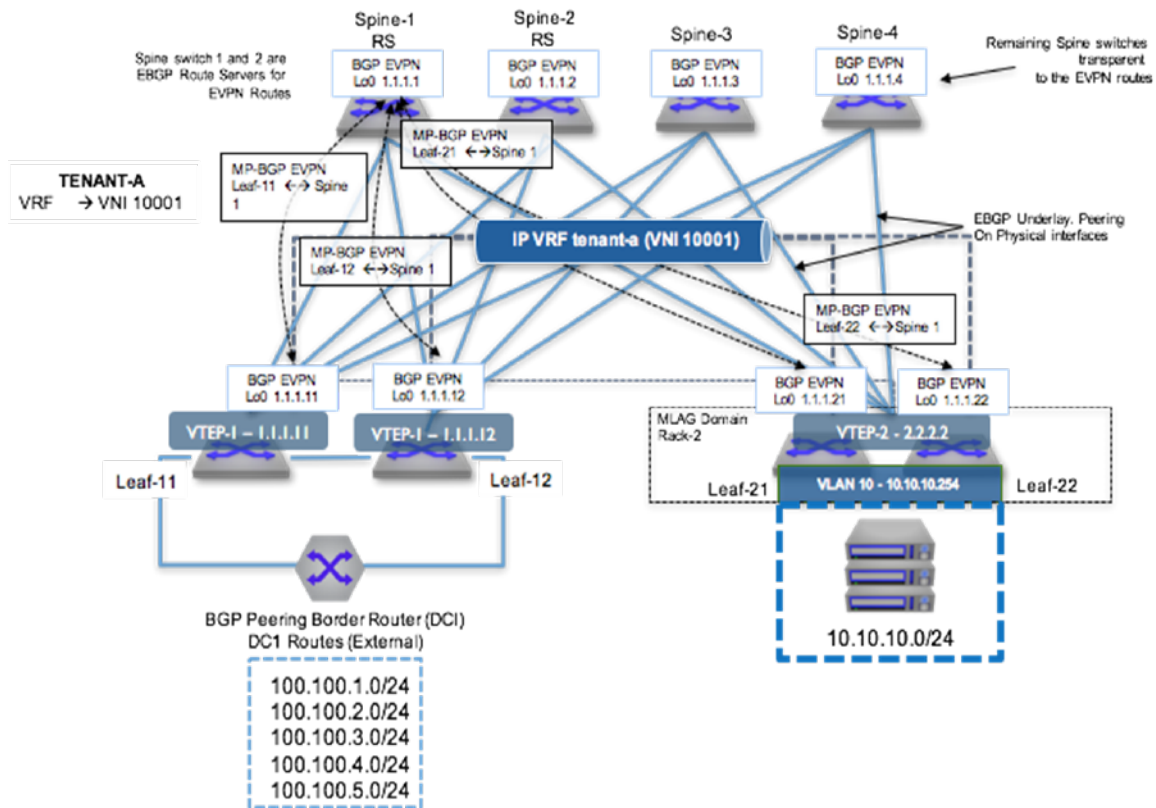

## Example

```
cvx(config) #cvx
cvx(config-cvx) #no shutdown
cvx(config-cvx) #service vxlan
cvx(config-cvx-vxlan) #no shutdown
cvx(config-cvx-vxlan) #redistribute bgp evpn vxlan
```

## 17.8 Sample Configurations

### 17.8.1 EVPN VXLAN IRB Sample Configuration

In the topology below, we are connecting a Layer 2 site with a Layer 3 site using Layer 3 EVPN (type-5 route). Right side leaves are MLAG leaves and have SVI 10 in VRF-Blue. A number of directly connected hosts are simulated behind the right side leaf. The left side leaves are individual leaves that connect with a remote switch in `vrf` VRF-Blue to learn Layer 3 routes using BGP. The left side leaves are configured as two independent Layer 3 only VTEPs.

**Figure 97: Layer 3 EVPN Configuration**

To provide VXLAN routing and bridging between the two MLAG domains, each leaf switch is EVPN peering with the four spine switches via a loopback interface.

### eBGP Underlay Configuration: Leaf-11

Underlay configuration is straightforward and all neighbors are eBGP. Since all leaves share the same AS number, the `allows-in` command was added in the leaf.

```
interface Ethernet1
  description Spine-1-et1/1
  mtu 9214
  no switchport
  ip address 172.168.1.1/31

interface Ethernet8/1
  description ck428-et8/1
  speed forced 40gfull
  no switchport
  ip address 172.168.1.10/31

interface Loopback0
  ip address 1.1.1.11/32

ip prefix-list loopback
  seq 10 permit 1.1.1.0/24 ge 24
!
route-map loopback permit 10
  match ip address prefix-list loopback

router bgp 65004
  neighbor SPINE peer-group
```

```

neighbor SPINE remote-as 65001
neighbor SPINE allowas-in 1
neighbor SPINE soft-reconfiguration inbound all
neighbor SPINE send-community
neighbor 172.168.1.0 peer-group SPINE
neighbor 172.168.1.11 remote-as 65003
redistribute connected route-map loopback

```

### eBGP Underlay Configuration: Spine-1

```

interface Ethernet1/1
  description Leaf-11-et1
  mtu 9214
  no switchport
  ip address 172.168.1.0/31

interface Loopback0
  ip address 1.1.1.1/32
!
ip prefix-list loopback
  seq 10 permit 1.1.1.0/24 ge 24
!
route-map loopback permit 10
  match ip address prefix-list loopback
!
router bgp 65001
  neighbor 172.168.1.1 remote-as 65004
  redistribute connected route-map loopback

```

### VRF Configuration: Leaf-11

VRF-Blue is configured on all the left leaves. The left leaves have pure Layer 3 interfaces and the right side has SVI 10.

```

vrf instance VRF-Blue

ip routing vrf VRF-Blue

interface Ethernet36
  no switchport
  vrf VRF-Blue
  ip address 172.168.1.9/31

router bgp 65004
  vrf VRF-Blue
    neighbor 172.168.1.8 remote-as 65005

```

### VRF Configuration: Leaf-21

```

vlan 10

vrf instance VRF-Blue

ip routing vrf VRF-Blue

interface Vlan10
  vrf VRF-Blue
  ip address virtual 10.10.10.1/24

ip virtual-router mac-address 00:aa:aa:aa:aa:aa

```

```
interface Port-Channel3
  switchport mode trunk
  mlag 3
```

### VXLAN Configuration: Leaf-11

Make sure all VTEPs have unique loopback0 addresses to represent unique VTEP identifiers. For every VNI that EVPN receives, a dynamic VLAN is allocated, so it is a good practice to keep the same VNI.

```
interface Vxlan1
  vxlan source-interface Loopback0
  vxlan udp-port 4789
  vxlan vrf VRF-Blue vni 10001
```

### VXLAN Configuration: Leaf-21

```
interface Vxlan1
  vxlan source-interface Loopback0
  vxlan udp-port 4789
  vxlan vrf VRF-Blue vni 10001
```

### EVPN Configuration: Leaf-11

Leaf establishes the EVPN neighborship with all 4 spines for redundancy. EVPN neighborship is on the loopback address and the **multihop** keyword is used. Make sure to disable the IPv4 address family for EVPN neighbors.

Since the spine is acting like a route-reflector for EVPN routes, make sure to configure the next-hop-unchanged.

```
router bgp 65004
  neighbor SPINE_EVPN peer-group
  neighbor SPINE_EVPN remote-as 65001
  neighbor SPINE_EVPN update-source Loopback0
  neighbor SPINE_EVPN ebgp-multihop 3
  neighbor SPINE_EVPN send-community extended
  neighbor SPINE_EVPN maximum-routes 12000
  neighbor 1.1.1.1 peer-group SPINE_EVPN
  !
  address-family evpn
    neighbor SPINE_EVPN activate
  !
  address-family ipv4
    no neighbor SPINE_EVPN activate
```

### EVPN Configuration: Leaf-21

```
router bgp 65002
  neighbor SPINE_EVPN peer-group
  neighbor SPINE_EVPN remote-as 65001
  neighbor SPINE_EVPN update-source Loopback0
  neighbor SPINE_EVPN allowas-in 1
  neighbor SPINE_EVPN ebgp-multihop 3
  neighbor SPINE_EVPN send-community extended
  neighbor SPINE_EVPN maximum-routes 12000
  neighbor 1.1.1.1 peer-group SPINE_EVPN
  !
```

```

address-family evpn
  neighbor SPINE_EVPN activate
!
address-family ipv4
  no neighbor SPINE_EVPN activate

```

### EVPN Configuration: Spine-1

```

router bgp 65004
  neighbor SPINE_EVPN peer-group
  neighbor SPINE_EVPN remote-as 65001
  neighbor SPINE_EVPN update-source Loopback0
  neighbor SPINE_EVPN ebgp-multihop 3
  neighbor SPINE_EVPN send-community extended
  neighbor SPINE_EVPN maximum-routes 12000
  neighbor 1.1.1.1 peer-group SPINE_EVPN
!
address-family evpn
  neighbor SPINE_EVPN activate
!
address-family ipv4
  no neighbor SPINE_EVPN activate

```

### Advertise VRF Routes in EVPN: Leaf-11

By configuring VRF under **router-bgp**, you are advertising routes from that VRF into EVPN using the RD/RT. The remote end can install the route by importing the RT.

Leaf-11 has routes in VRF-Blue learned through eBGP with the neighbor down south. Since the routes are already in BGP VRF table, we don't to configure the **redistribute** command.

```

router bgp 65004
  neighbor SPINE_EVPN peer-group
  neighbor SPINE_EVPN remote-as 65001
  neighbor SPINE_EVPN update-source Loopback0
  neighbor SPINE_EVPN ebgp-multihop 3
  neighbor SPINE_EVPN send-community extended
  neighbor SPINE_EVPN maximum-routes 12000
  neighbor 1.1.1.1 peer-group SPINE_EVPN
!
address-family evpn
  neighbor SPINE_EVPN activate
!
address-family ipv4
  no neighbor SPINE_EVPN activate

```

### Advertise VRF Routes in EVPN: Leaf-21

On the other hand Leaf-21 wants to export the connected SVI into EVPN and hence require **redistribute connected** command.

```

router bgp 65002
  neighbor SPINE_EVPN peer-group
  neighbor SPINE_EVPN remote-as 65001
  neighbor SPINE_EVPN update-source Loopback0
  neighbor SPINE_EVPN allowas-in 1
  neighbor SPINE_EVPN ebgp-multihop 3
  neighbor SPINE_EVPN send-community extended
  neighbor SPINE_EVPN maximum-routes 12000
  neighbor 1.1.1.1 peer-group SPINE_EVPN

```

```

!
address-family evpn
  neighbor SPINE_EVPN activate
!
address-family ipv4
  no neighbor SPINE_EVPN activate

```

## 17.8.2 Multi-Tenant EVPN VXLAN IRB Sample Configuration

The following configuration example shows a deployment using both symmetric and asymmetric IRB with VLAN-based and VLAN-aware bundle services; and eBGP overlay and underlay.

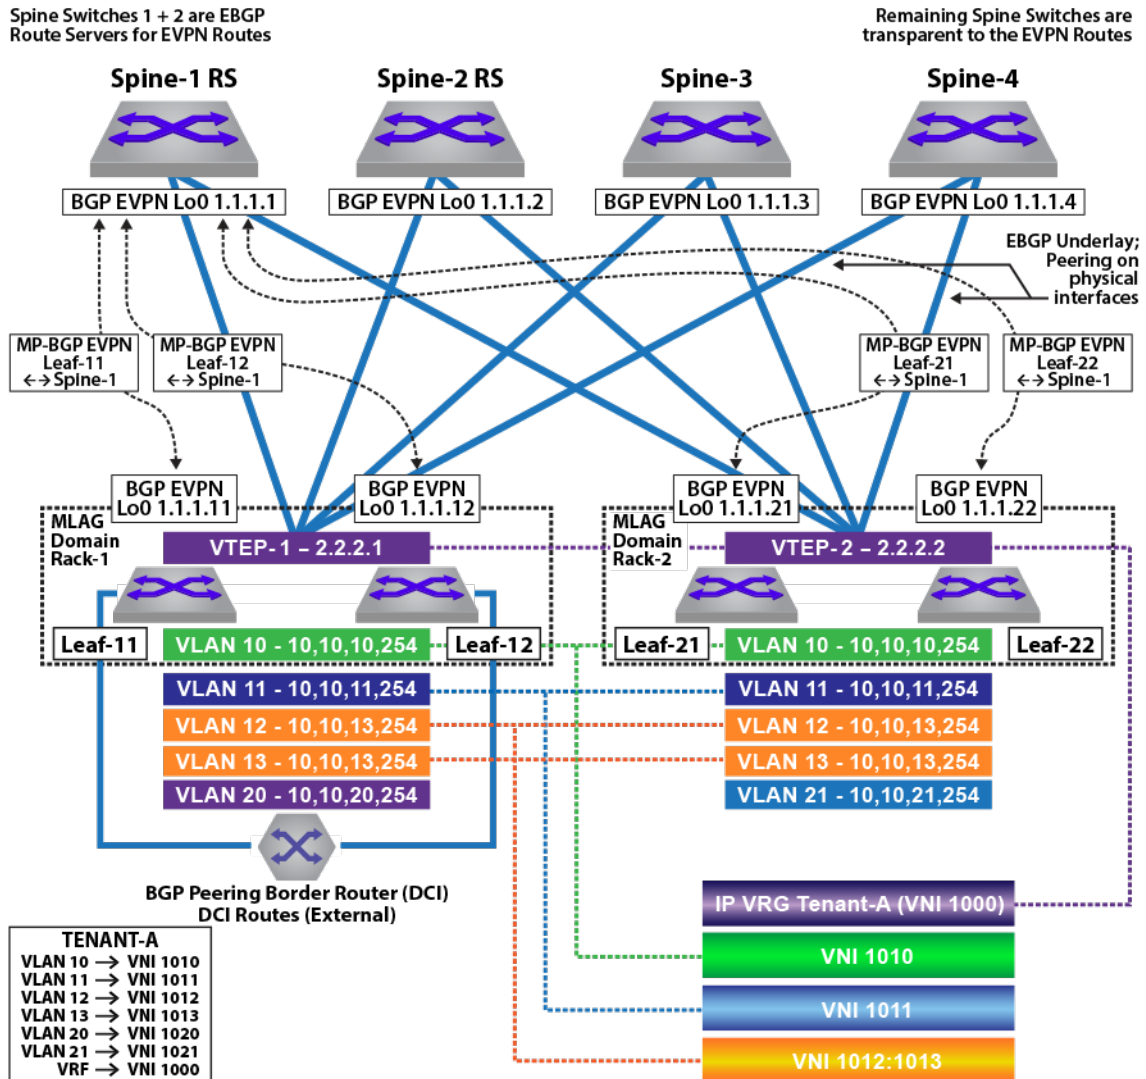

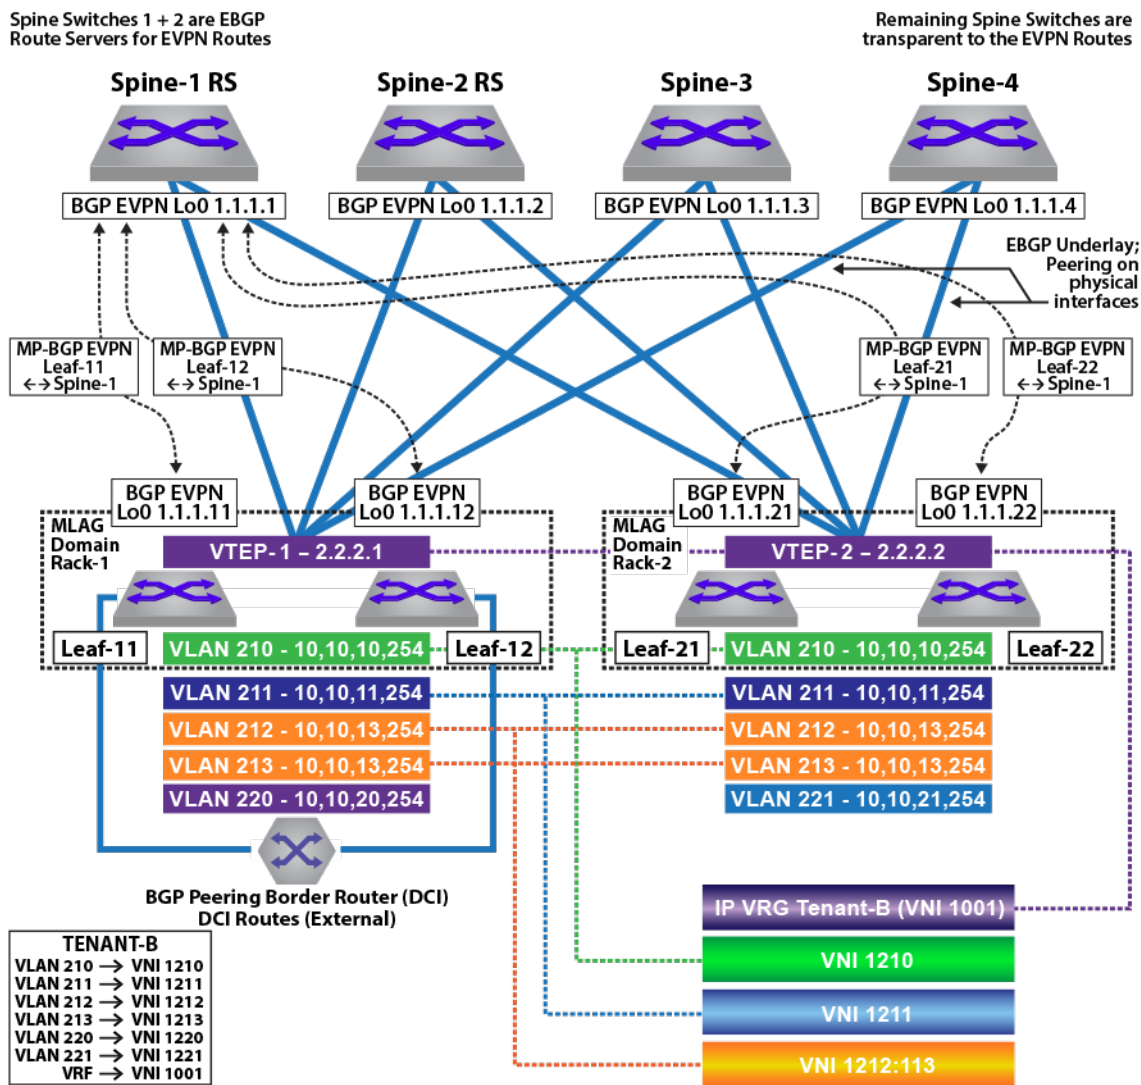

Figure 98: Tenant-A: Symmetric IRB

**Figure 99: Tenant-B: Asymmetric IRB**

In the symmetric and asymmetric IRB configurations illustrated in the figures above, for Tenant-A, four subnets are stretched across the two MLAG domains with two subnets (VLAN 10, 10.10.10.0/24 and VLAN 11, 10.10.11.0/24) configured as a VLAN-based service, and two other subnets (VLAN 12, 10.10.12.0/24 and VLAN 13, 10.10.13.0/24) as a VLAN-aware bundle service.

For Tenant-B, four subnets are stretched across the two MLAG domains with two subnets (VLAN 210, 10.10.10.0/24 and VLAN 211, 10.10.11.0/24) configured as a VLAN-based service, and two other subnets (VLAN 212, 10.10.12.0/24 and VLAN 213, 10.10.13.0/24) as a VLAN-aware bundle service.

In addition each MLAG domain has a single local subnet (Rack-1 subnet 10.10.20.0/24 and Rack-2 subnet 10.10.21.0/24) for the tenant. To provide direct distributed routing, each leaf switch is configured with the same virtual IP address for the four stretched subnets. For the local-only subnets, the virtual IP address is configured in both physical leaf switches of the relevant MLAG domain.

For each MLAG domain, a logical VTEP is created with the same shared loopback address. For Rack-1, the logical VTEP IP is 2.2.2.1 and for the Rack-2, the logical VTEP IP is 2.2.2.2. Directly connected to each leaf switch is a host, which is a member of one of the two IP subnets. To provide Layer 2 connectivity across the racks, VXLAN bridging is enabled by mapping VLAN to VNIs as detailed in the diagram.

---

To provide IP connectivity across all subnets both stretched and directly connected, an IP-VRF is shared between the two MLAG domains for the tenant. This is used as a transit network for announcing and forwarding the locally attached subnets. Each leaf switch is EVPN peering with the four spine switches via a loopback interface on the leaf and again on the spine switches. To provide external connectivity, Leaf-11 and Leaf-12 are eBGP peering via the tenants' VRFs with the border routers. Both core routers are advertising external prefixes for Internet and any remote site connectivity (default route and IP prefixes from the other DC for the tenant). To provide connectivity within the EVPN domain, the leaf switches (Leaf-21 and Leaf-22) re-advertise the prefixes into the tenant's VRF via a type-5 route advertisement, with a next-hop equal to the advertising VTEP.

### 17.8.2.1 MLAG Configuration: Leaf-11 and Leaf-12

#### Leaf-11 MLAG Configuration

```
spanning-tree mode mstp
no spanning-tree vlan-id 4093-4094
!
ip virtual-router mac-address mlag-peer
!
vlan 4094
  name MLAG_PEER
  trunk group MLAG
!
vlan 4093
  name LEAF_PEER_L3
  trunk group LEAF_PEER_L3
!
interface Vlan4094
  ip address 172.168.10.1/30
!
interface Port-Channel100
  description port-channel to access switch
  switchport trunk allowed vlan 10-13,20,210-213,220
  switchport mode trunk
  mlag 1
!
interface Port-Channel1000
  switchport mode trunk
  switchport trunk group LEAF_PEER_L3
  switchport trunk group MLAG
!
mlag configuration
  domain-id Rack-1
  local-interface Vlan4094
  peer-address 172.168.10.2
  peer-link Port-Channel1000
```

#### Leaf-12 MLAG Configuration

```
spanning-tree mode mstp
no spanning-tree vlan-id 4093-4094
!
ip virtual-router mac-address mlag-peer
!
vlan 4094
  name MLAG_PEER
  trunk group MLAG
!
vlan 4093
  name LEAF_PEER_L3
```

```

    trunk group LEAF_PEER_L3
!
interface Vlan4094
    ip address 172.168.10.2/30
!
interface Port-Channel100
    description port-channel to access switch
    switchport trunk allowed vlan 10-13,20,210-213,220
    switchport mode trunk
    mlag 1
!
interface Port-Channel1000
    switchport mode trunk
    switchport trunk group LEAF_PEER_L3
    switchport trunk group MLAG
!
mlag configuration
    domain-id Rack-1
    local-interface Vlan4094
    peer-address 172.168.10.1
    peer-link Port-Channel1000

```

### 17.8.2.2 MLAG Configuration: Leaf-21 and Leaf-22

#### Leaf-21 MLAG Configuration

```

spanning-tree mode mstp
no spanning-tree vlan-id 4093-4094
!
ip virtual-router mac-address mlag-peer
!
vlan 4094
    name MLAG_PEER
    trunk group MLAG
!
vlan 4093
    name LEAF_PEER_L3
    trunk group LEAF_PEER_L3
!
interface Vlan4094
    ip address 172.168.10.1/30
!
interface Port-Channel100
    description port-channel to access switch
    switchport trunk allowed vlan 10-13,21,210-213,220-221
    switchport mode trunk
    mlag 1
!
interface Port-Channel1000
    switchport mode trunk
    switchport trunk group LEAF_PEER_L3
    switchport trunk group MLAG
!
mlag configuration
    domain-id Rack-1
    local-interface Vlan4094
    peer-address 172.168.10.2
    peer-link Port-Channel1000

```

## Leaf-22 MLAG Configuration

```
spanning-tree mode mstp
no spanning-tree vlan-id 4093-4094
!
ip virtual-router mac-address mlag-peer
!
vlan 4094
    name MLAG_PEER
    trunk group MLAG
!
vlan 4093
    name LEAF_PEER_L3
    trunk group LEAF_PEER_L3
!
interface Vlan4094
    ip address 172.168.10.2/30
!
interface Port-Channel100
    description port-channel to access switch
    switchport trunk allowed vlan 10-13,21,210-213,220-221
    switchport mode trunk
    mlag 1
!
interface Port-Channel1000
    switchport mode trunk
    switchport trunk group LEAF_PEER_L3
    switchport trunk group MLAG
!
mlag configuration
    domain-id Rack-1
    local-interface Vlan4094
    peer-address 172.168.10.1
    peer-link Port-Channel1000hannel1000
```

### 17.8.2.3 VLAN and Distributed IP Address Configuration: Leaf-11 and Leaf-21

VLAN and interface configuration for VLAN 10 (virtual IP address 10.10.10.254) and VLAN 11 (virtual IP address 10.10.11.254), along with SVIs 12, 13 and 20, are similarly configured. To provide multi-tenancy, the two tenant VLANs are placed in a dedicated VRF, named “Tenant-A.” A further five tenant VLANs are configured and assigned to VRF “Tenant-B.”

The other VLANs are for peering, MLAG, and a unique VLAN SVI. These VLANs do not use virtual IP addresses.

The tenants’ stretched subnets (Tenant-A: VLANs 10,11,12 and 13; Tenant-B: VLANs 210, 211, 211, 212 and 213) are mapped to unique overlay VXLAN VNIs. The tenants’ IP-VRF (Tenant-A and Tenant-B) is associated with a VNI using the `vxlan vrf` command under the VXLAN interface. In the forwarding model for symmetric IRB, this VNI will be used as the transit VNI for routing to subnets which are not locally configured on the VTEP.

As a standard MLAG configuration, both leaf switches in each MLAG domain share the same logical VTEP IP address. Thus MLAG domain, Rack-1 (Leaf-11 + Leaf-12) has a shared logical VTEP IP of 2.2.2.1 and Rack-2 (Leaf-21 + Leaf-22) has a shared logical VTEP IP of 2.2.2.2

### Leaf-11 VLAN and Distributed IP Address Configuration

```
!
ip virtual-router mac-address 00:aa:aa:aa:aa:aa
!
vlan 10-11,20,210-211,220,111,2111
```

```
!  
vlan 12-13  
    name VLAN-AWARE-BUNDLE-TENANT-A  
!  
vlan 212-213  
    name VLAN-AWARE-BUNDLE-TENANT-B  
!  
vrf instance tenant-a  
!  
vrf instance tenant-b  
!  
interface lan10  
    mtu 9164  
    vrf tenant-a  
    ip address virtual 10.10.10.254/24  
!  
interface Vlan11  
    mtu 9164  
    vrf tenant-a  
    ip address virtual 10.10.11.254/24

```

#### 17.8.2.4 VXLAN Interface Configuration: Leaf-11 and Leaf-21

The tenants' VLANs are mapped to unique overlay VXLAN VNIs. VLAN 10 is mapped to VNI 1010 on both MLAG domains, and VLAN 11 is mapped to VNI 1011. As standard MLAG configuration, both leaf switches in each MLAG domain share the same logical VTEP IP address. Thus MLAG domain Rack-1 (Leaf-11 + Leaf-12) has a shared logical VTEP IP of 2.2.2.1 and Rack-2 (Leaf-21 + Leaf-22) has a shared logical VTEP IP of 2.2.2.2. Also configured is the VRF-to-VXLAN mapping for Tenant-A.

#### Leaf-11 VXLAN Interface Configuration

```

!
interface Loopback1
  ip address 2.2.2.1/32
!
interface Vxlan1
  vxlan source-interface Loopback1
  vxlan udp-port 4789
  vxlan vlan 10 vni 1010
  vxlan vlan 11 vni 1011
  vxlan vlan 12 vni 1012
  vxlan vlan 13 vni 1013
  vxlan vlan 20 vni 1020
  vxlan vlan 210 vni 1210
  vxlan vlan 211 vni 1211
  vxlan vlan 212 vni 1212
  vxlan vlan 213 vni 1213
  vxlan vlan 220 vni 1220
  vxlan vrf tenant-a vni 1000

```

```
vxlan vrf tenant-b vni 1001
```

### Leaf-21 VXLAN Interface Configuration

```
!  
interface Loopback1  
  ip address 2.2.2.2/32  
!  
interface Vxlan1  
  vxlan source-interface Loopback1  
  vxlan udp-port 4789  
  vxlan vlan 10 vni 1010  
  vxlan vlan 11 vni 1011  
  vxlan vlan 12 vni 1012  
  vxlan vlan 13 vni 1013  
  vxlan vlan 21 vni 1021  
  vxlan vlan 210 vni 1210  
  vxlan vlan 211 vni 1211  
  vxlan vlan 212 vni 1212  
  vxlan vlan 213 vni 1213  
  vxlan vlan 221 vni 1221  
  vxlan vrf tenant-a vni 1000  
  vxlan vrf tenant-b vni 1001
```

**Note:** This configuration uses VXLAN routing. For single-chip T2 and TH platforms, recirculation must be enabled. For R-Series platforms, the following configuration commands must be added:

```
hardware tcam
```

```
system profile vxlan-routing
```

Refer to diagrams for VLAN and SVI assignment to tenant; Leaf-11 also has peering out to the border router in addition to the connected SVIs.

#### 17.8.2.5 eBGP Underlay Configuration on the Leaf Switches

The leaf switches for the underlay network peer with each spine on the physical interface. For EVPN route advertisement, the BGP EVPN session is between loopback addresses.

In this case, the underlay is all eBGP, and peering is on the physical interfaces. The MLAG leaves also peer with each other in the underlay to retain BGP EVPN connectivity (loopback reachability) in the very unlikely case that all spine links are down. This is a failover configuration that can be implemented if there is ever the chance a leaf could be “core isolated.” The configuration can be viewed on each leaf using the command **show running-configuration section bgp**.

The examples below show the underlay configuration on all four leaf switches, and also on two of the spine switches as an example of the underlay configuration on the spine.

The configuration uses the following peer groups:

**SPINE** configuration inherited for underlay (eBGP) peering to the spines

**SPINE\_EVPN** overlay eBGP peering between spine and leaf, using loopbacks

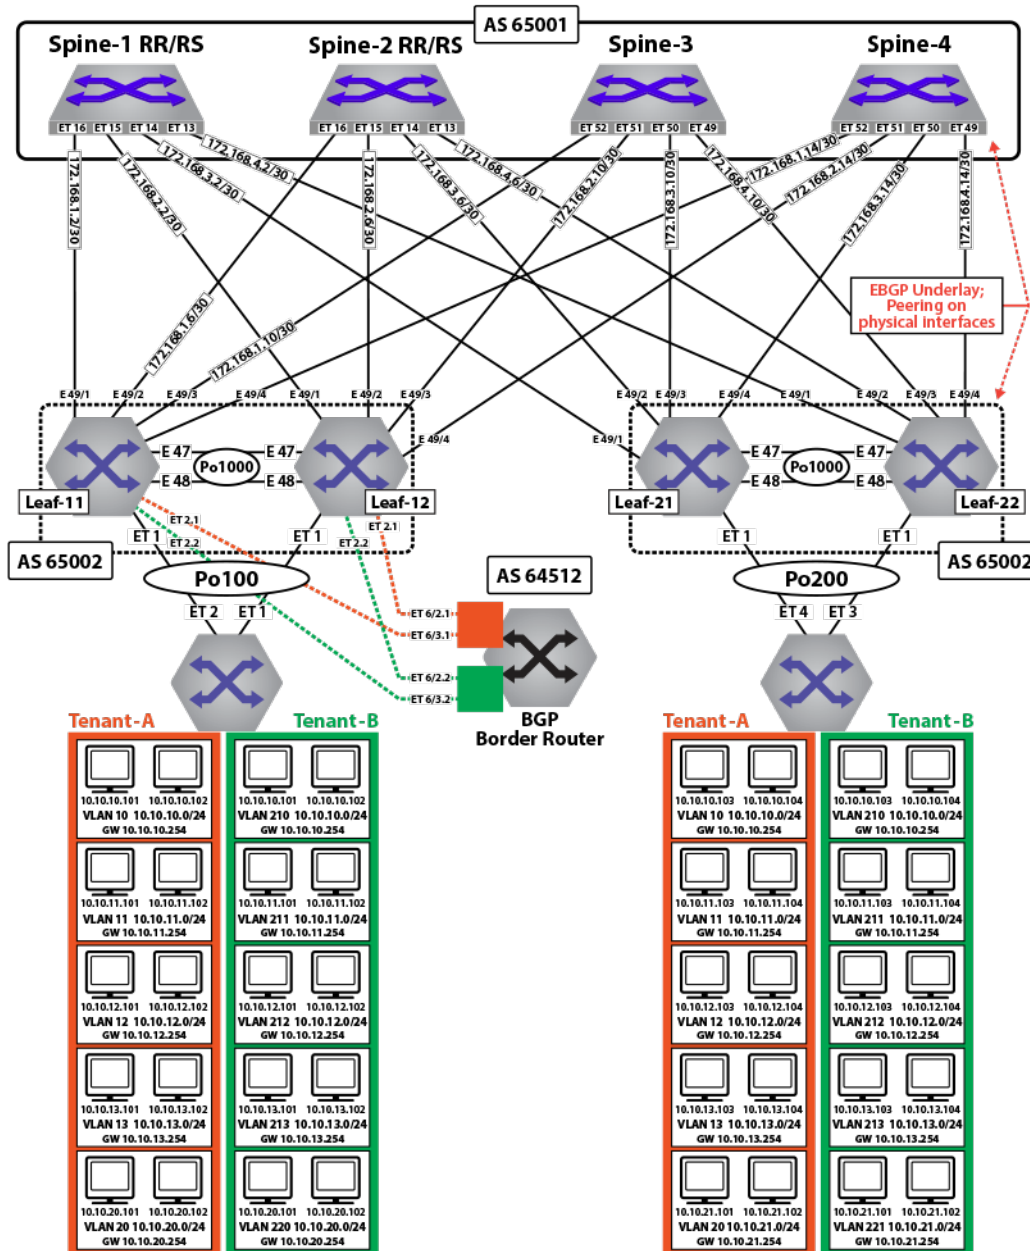

Figure 100: Physical Underlay Topology

### 17.8.2.7 eBGP Overlay on Leaf Switches

The MAC VRFs and IP VRF for the tenants' subnets are created in the BGP router context with unique Route-Distinguishers (RD) and Route-Targets (RT) attached to each MAC-VRF and IP-VRF. The RDs provide support for overlapping MAC and IP addresses across tenants, while the RTs allow control of the routes imported and exported between MAC VRFs.

To ensure all routes are correctly imported between VTEPs sharing the same Layer-2 domain, the import and export RTs are equal across the two MLAG domains. The **redistribute learned** statement under each MAC VRF ensures any locally learned MACs in the VLAN are automatically announced as type-2 routes.

The IP VRF (Tenant-A) is created on all leaf switches which have subnets attached to the tenant's VRF with the same route target ensuring that routes are correctly imported and exported between VTEPs in the VRF. On Leaf-21 and Leaf-22, to import the external routes an eBGP session with the BGP peering router is created under the IP VRF (Tenant-A) context, and a peering from each to the other is created on the overlay.

**Note:** All MAC VRFs are unique, and each has its own RT, matched by the other leaves in the DC. The “tenants” as such are defined at layer 3 by assigning SVIs to the appropriate VRF. To view this assignment, use the **show ip route vrf <tenant> connected** command. Note below that VLANs 12-13 and 212-213 (shown in bold) are configured as a bundle-aware EVPN service. Also note the peering from Leaf-11 to the BGP border router in each tenant VRF.

        no neighbor LEAF_EVPN activate
!

```

### 17.8.2.9 Symmetric IRB Configuration (Tenant-A)

In symmetric IRB, the host routes are generated by advertising type-2 routes with both the MAC VRF VNI and the routing (or VRF) VNI. On Leaf-11, the MAC VRFs for Tenant-A are left in their default configuration (i.e., redistributing host routes). The example below shows the configuration for the MAC VRF.

#### MAC VRF Configuration for Tenant-A: Leaf-11

The **redistribute learned** commands below cause type-2 routes to be advertised with two labels: in VLAN 10, 1010 and 1000; in VLAN 11, 1011 and 1000; in VLAN 21, 1021 and 1000.

```

vlan 10
    rd 1.1.1.11:1010
    route-target both 1010:1010
    redistribute learned
!
    vlan 11
        rd 1.1.1.11:1011
        route-target both 1011:1011
        redistribute learned
!
    vlan 21
        rd 1.1.1.11:1021
        route-target both 1021:1021
        redistribute learned
!

```

With this configuration, any locally learned MAC-IP binding on a leaf switch will be advertised as a type-2 route with two labels. For example, on switches Leaf-21 and Leaf-22, any MAC-IP binding locally learned on subnets 10.10.10.0/24, 10.10.11.0/24, or 10.10.21.0/24 will be advertised as type-2 routes with two labels (the MAC VRF of 1010, 1011, or 1021 and the IP VRF of 1000) and two route targets equal to the relevant MAC VRF for the host and IP VRF for the tenant (1000:1000). The remote leaf switches (Leaf-11 and Leaf-12), will now learn the host route in the IP VRF.

In addition to advertising the type-2 routes with dual labels, the switch will still advertise type-5 routes. This ensures connectivity to the remote subnet even when no host on the subnet has been learned. With both a layer-2 route and layer-3 host route for Server-3 learned on the MAC VRF(1010) and the IP VRF (1000) on Leaf-11, traffic ingressing on Leaf-11 from the local subnet 10.10.10.103 (i.e., VLAN 10) will be VXLAN bridged based on the MAC VRF entry. Traffic ingressing from outside the subnet (i.e., VLAN 11, 12, 13, or 20) will be routed to the host via the IP VRF host route.

The VLAN-aware bundle VLAN type-2 routes are advertised with the VNI ID within the update.

The type-5 routes are advertised with the IP VRF Route Distinguisher and the VNI label, signifying that the forwarding path for the prefix would be the IP VRF. The imported routes from the eBGP peering with the BGP border router in Leaf-11 and Leaf-12 are imported by both switches respectively and redistributed via type-5 advertisements to Leaf-21 and Leaf-22.

### 17.8.2.10 Asymmetric IRB Configuration (Tenant-B)

In asymmetric IRB, the host routes are generated by advertising type-2 routes with just the MAC VRF VNI. On leaf 11, the MAC VRFs for Tenant-B are configured with no redistribute host route within the MAC VRF configuration. The example below shows the configuration for the MAC VRF.

---

## MAC VRF Configuration for Tenant-B: Leaf-11

The `no redistribute host-route` commands below cause type-2 routes to be advertised with a single label: in VLAN 210, 1110; in VLAN 211, 1211; in VLAN 220, 1220; and in the VLAN-aware bundle (Tenant-B-VLAN-212-213), 1212 and 1213.

```
vlan 210
  rd 1.1.1.11:1210
  route-target both 1210:1210
  redistribute learned
  no redistribute host-route
!
vlan 211
  rd 1.1.1.11:1211
  route-target both 1211:1211
  redistribute learned
  no redistribute host-route
!
vlan 220
  rd 1.1.1.11:1220
  route-target both 1220:1220
  redistribute learned
  no redistribute host-route
!
vlan-aware-bundle Tenant-B-VLAN-212-213
  rd 1.1.1.11:21213
  route-target both 212:213
  redistribute learned
  no redistribute host-route
  vlan 212-213
!
```

With this configuration, any locally learned MAC-IP binding on a leaf switch will be advertised as a type-2 route with a single label. For example, on Leaf-11 and Leaf-12, any MAC-IP binding locally learned on subnets 10.10.10.0/24, 10.10.11.0/24, or 10.10.21.0/24 will be advertised as type-2 routes with a single label, the MAC VRF (1210,1211,1220,1212,1213 or 21111). The IP VRF (1001) still advertises the type-5 prefix routes. This ensures connectivity to the remote subnet even when no host on the subnet has been learned.

The VLAN-aware bundle VLAN type-2 routes are advertised with the VNI ID within the update.

### 17.8.3 EVPN MPLS Sample Configuration

This section describes configuring and verifying BGP VPN which has steps similar to the EVPN VXLAN demonstration. Here, we examine BGP EVPN layer 3 VPN over LDP, Segment Routing (ISIS-SR), and BGP-SR transport LSPs. This highlights the difference between the transport and the VPN overlay service.

#### 17.8.3.1 Layer 3 VPN Over ISIS-SR

The following figures illustrate the overview of combined control and data planes.

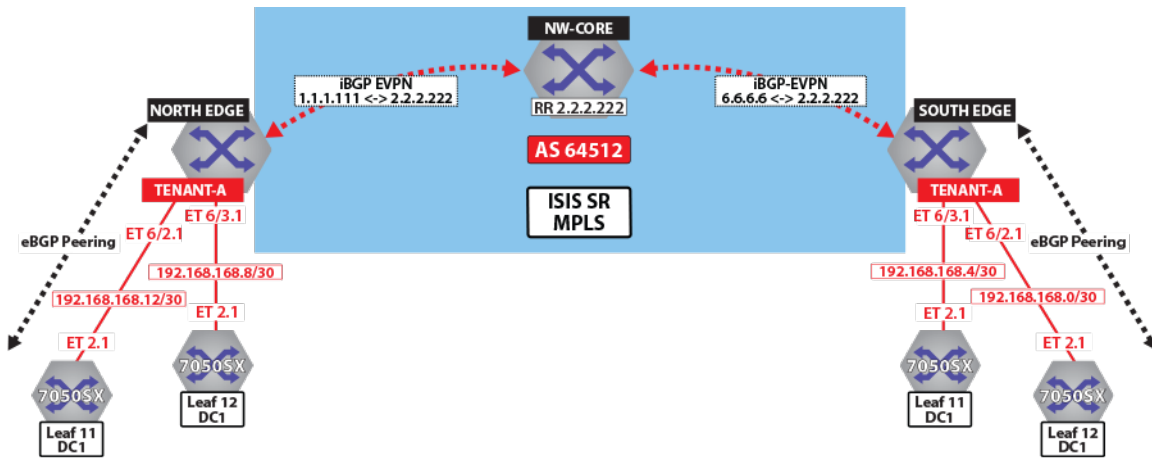

Figure 101: Control Plane Tenant-A Over ISIS-SR

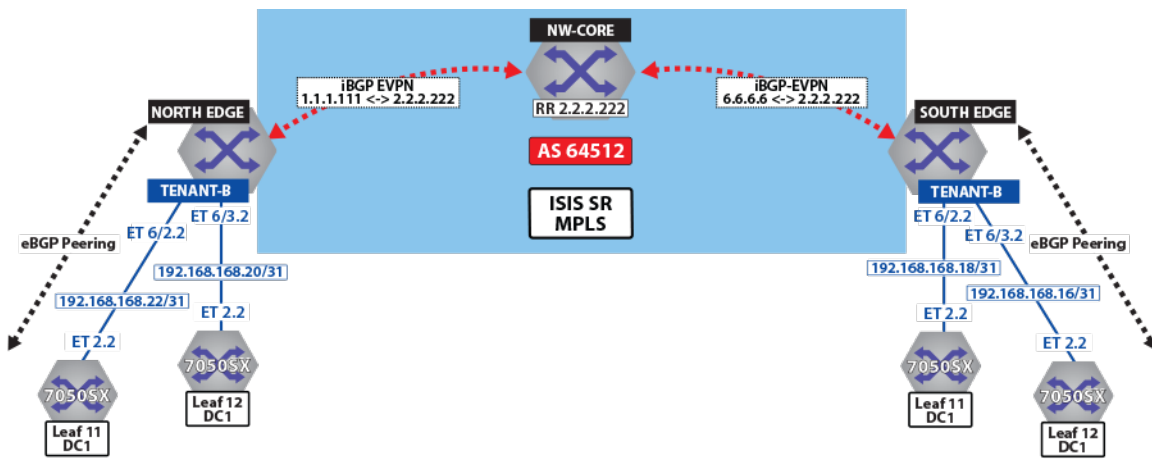

Figure 102: Control Plane Tenant-B Over ISIS-SR

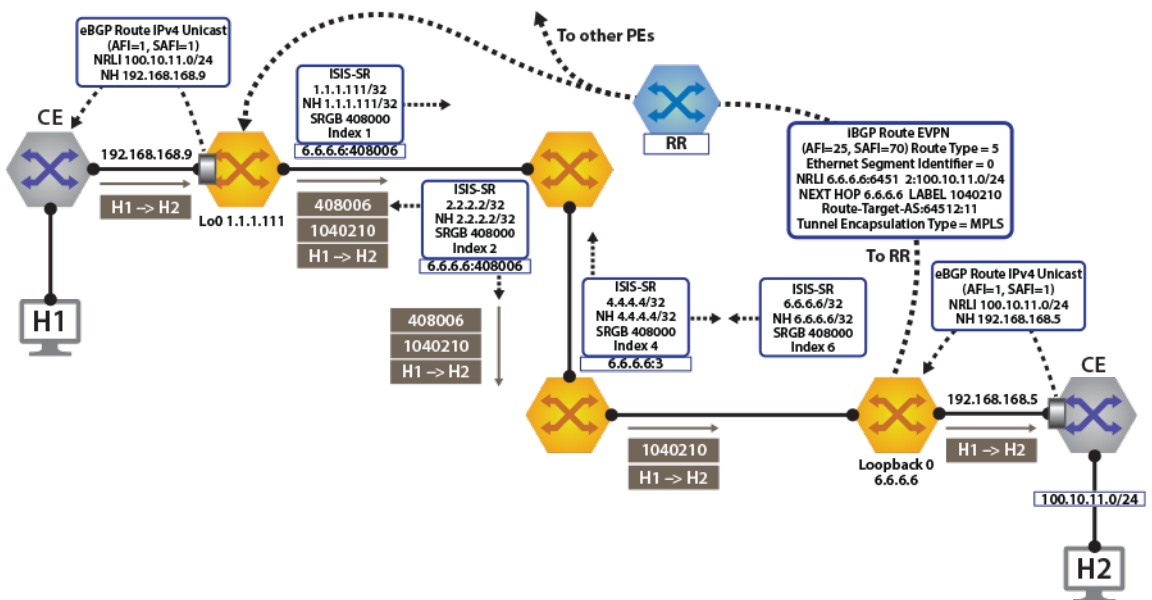

Figure 103: Control Plane & Forwarding Tenant-a Over ISIS-SR

---

The North Edge router has an eBGP peering session out to leaf-11 and leaf-12 in DC1, while the South Edge router has peerings to leaf-11 and leaf-12 in DC2. Tenant-a has few additional local interfaces used for testing.

### Example

The `show ip route vrf tenant-a connected` command displays the interfaces assigned to the tenant-a of North Edge router.

```
north-edge#show ip route vrf tenant-a connected

VRF: tenant-a
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route

C      192.168.168.8/30 is directly connected, Ethernet6/3.1
C      192.168.168.12/30 is directly connected, Ethernet6/2.1
```

### Activating EVPN

In all scenarios, the EVPN must be activated under BGP and neighbors configured to exchange Layer 2 VPN/EVPN NLRI. The tenant's VRF (tenant-a and tenant-b) is associated with a dynamically assigned label by BGP.

An activated EVPN provides the following functionalities:

- Enables the multi-agent routing protocol model, which is required for EVPN support.
- Sets the local autonomous system number to 64512 and configures IBGP neighbors that are activated for the Layer 2 VPN/EVPN address family.
- Sets the EVPN encapsulation type to MPLS.
- Specifies that Loopback0 will be used as the next-hop for all advertised EVPN routes. The underlay configuration must provide MPLS LSPs from remote PEs to this loopback interface address.

### Example

The `service routing protocols model multi-agent` command activates EVPN on the north edge router.

```
service routing protocols model multi-agent

router bgp 64512
  router-id 1.1.1.111
  maximum-paths 128 ecmp 128
  neighbor 2.2.2.222 remote-as 64512
  neighbor 2.2.2.222 update-source Loopback0
  neighbor 2.2.2.222 fall-over bfd
  neighbor 2.2.2.222 send-community extended
  !
  address-family evpn
    neighbor default encapsulation mpls next-hop-self source-interface
    Loopback0
    neighbor default graceful-restart
    neighbor 2.2.2.222 activate
```

!

### Layer 3 Overlay Configuration

Distribution of layer 3 routes over BGP is enabled by configuring one or more IP VRFs under the router `bgp` configuration mode. Additionally, IP routing must be enabled in the VRF.

The VRF is assigned a unique Route-Distinguisher (RD). The RD allows the PE to advertise EVPN routes for the same IP prefix that have been exported by different VRFs. The NLRI RouteKey of a route exported from the VRF's IPv4 table into EVPN consists of both the RD and the original IP prefix.

The Route-Target (RT) extended communities for the VRF. The RTs are associated with all routes exported from the VRF. Received EVPN type-5 routes carrying at least one RT matching the VRFs configuration are imported into the VRF. The route target directives are configured under the IPv4 or IPv6 address- family.

### Example

The `vrf tenant-a` and `vrf tenant-b` commands define overlay VRFs (tenant-a and tenant-b) on the VTEP of North Edge router and enables IPv4 routing within them.

```
vrf tenant-a
  rd 1.1.1.1:64512
  route-target import evpn 64512:11
  route-target export evpn 64512:11
  router-id 1.1.1.111
  neighbor 192.168.168.10 remote-as 65002
  neighbor 192.168.168.10 local-as 64512 no-prepend replace-as
  neighbor 192.168.168.10 default-originate
  neighbor 192.168.168.10 maximum-routes 12000
  neighbor 192.168.168.14 remote-as 65002
  neighbor 192.168.168.14 local-as 64512 no-prepend replace-as
  neighbor 192.168.168.14 default-originate
  neighbor 192.168.168.14 maximum-routes 12000
  redistribute connected
  redistribute static
!
vrf tenant-b
  rd 1.1.1.1:64513
  route-target import evpn 64513:11
  route-target export evpn 64513:11
  router-id 1.1.1.111
  neighbor 192.168.168.20 remote-as 65002
  neighbor 192.168.168.20 local-as 64513 no-prepend replace-as
  neighbor 192.168.168.20 maximum-routes 12000
  neighbor 192.168.168.22 remote-as 65002
  neighbor 192.168.168.22 local-as 64513 no-prepend replace-as
  neighbor 192.168.168.22 maximum-routes 12000
  redistribute connected
  redistribute static
!
```

### Verifying BGP EVPN Layer 3 VPN

Show commands are executed in the North Edge router to view routes to the South Edge router. Execute the same commands in the South Edge router to view vice-versa routes.

## Examples

- The **show bgp evpn summary** command displays the status of EVPN peers in North Edge router.

```
north-edge#show bgp evpn summary
BGP summary information for VRF default
Router identifier 1.1.1.111, local AS number 64512
Neighbor Status Codes: m - Under maintenance
Neighbor      V AS      MsgRcvd  MsgSent  InQ  OutQ  Up/Down  State
PfxRcd PfxAcc
2.2.2.222    4  64512    195      127    0    0 01:13:31  Estab  78    78
```

- The **show bgp evpn route-type ip-prefix ipv4 next-hop 6.6.6.6** command displays all BGP EVPN ip prefix routes received from the South Edge router (6.6.6.6). Not all are advertised via the RR 2.2.2.222.

### Note:

Each entry in the table represents a BGP path. The path specific information includes Route-Distinguisher and IP prefix. Paths are either received from EVPN peers or exported from local VRFs.

```
north-edge#show bgp evpn route-type ip-prefix ipv4 next-hop 6.6.6.6
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E -
  ECMP head, e - ECMP
                  S - Stale, c - Contributing to ECMP, b - backup
                  % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link
  Local Nexthop

- The **show bgp evpn route-type ip-prefix 100.10.11.0/24 detail** command displays a detailed view of the IP prefix route for 100.10.11.0/24. The output again includes the RD and IP

prefix identifying the route. As seen above the route is received from the route reflector, and the VPN label for tenant-a is 958810.

```
north-edge#show bgp evpn route-type ip-prefix 100.10.11.0/24 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512

B E   223.255.255.252/30 [200/0] via 192.168.168.22, Ethernet6/2.2
                        via 192.168.168.20, Ethernet6/3.2

```

**Note:** If we look at the routes in the VRF for tenant-b, we see that the VPN label has now changed, whilst the transport label for NH 6.6.6.6 is the same. The only difference seen in tenant-b, aside from the different VPN label, is that there are no host-routes in tenant-b because within each DC tenant-b is running in asymmetric mode, therefore no host routes are generated/installed in the IP VRF.

### 17.8.3.2 Layer 3 EVPN Over LDP

The following figures illustrate an overview of the combines control and data planes.

Figure 104: Control Plane Tenant-A Over LDP

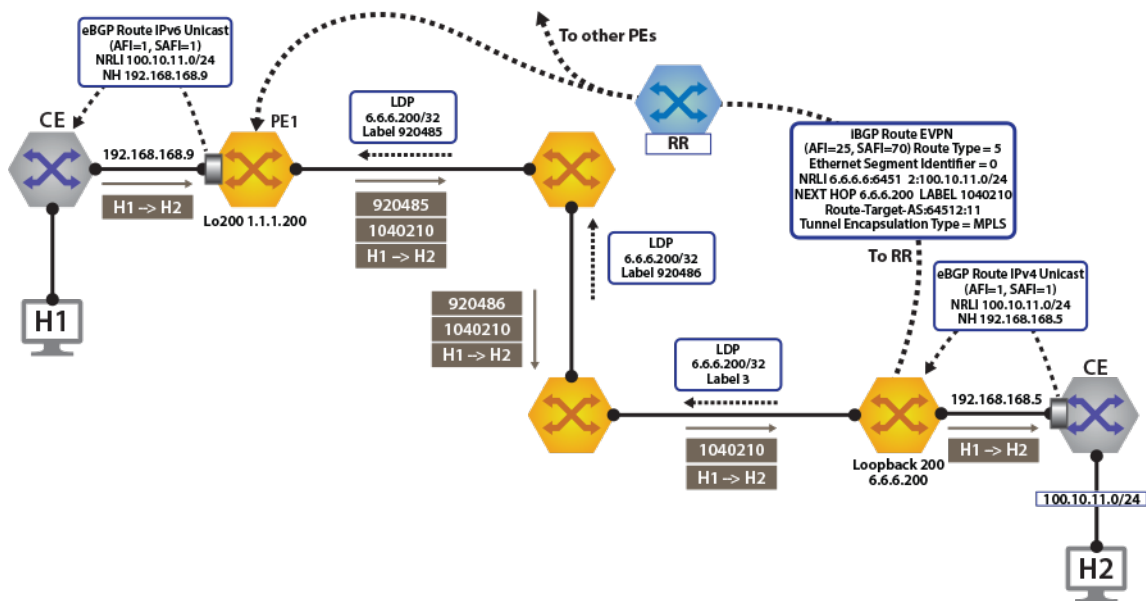

Figure 105: Control Plane Tenant-B over LDP

**Figure 106: Control Plane & Forwarding Tenant-a Over LDP**

To switch to using the MPLS LDP transport, we simply need to change the next-hop advertised for EVPN routes. As illustrated above, the next hop needs to be set to loopback 200 to use the LDP LSP.

This is simply achieved by configuring the next-hop for EVPN routes on both North Edge and South Edge routes. The output again includes the RD and IP prefix identifying the route. As seen in the output, we now have the NH set to 6.6.6.200 for tenant-a and tenant-b.

```
router bgp 64512
!
  address-family evpn
    neighbor default encapsulation mpls next-hop-self source-interface
    Loopback200
```

Once this is configured, we can check the BGP updates and the routes in the VRF.

```
north-edge#show bgp evpn route-type ip-prefix 100.10.11.0/24 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for ip-prefix 100.10.11.0/24, Route Distinguisher: 6.6.6.6:64512
  Paths: 1 available
  65006
    6.6.6.200 from 2.2.2.222 (2.2.2.222)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
      Extended Community: Route-Target-AS:64512:11 TunnelEncap:tunnelTypeMpls
      MPLS label: 958810
BGP routing table entry for ip-prefix 100.10.11.0/24, Route Distinguisher: 6.6.6.6:64513
  Paths: 1 available
  65006
    6.6.6.200 from 2.2.2.222 (2.2.2.222)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
      Extended Community: Route-Target-AS:64513:11 TunnelEncap:tunnelTypeMpls
      MPLS label: 953372
```

**Note:** Again, we have the same route in tenant-a and tenant-b in DC2. Hence, the two other routes with RD 6.6.6.6:64513 and RT 64513:11. The VPN label has not changed, reinforcing the fact that the BGP VPN label is orthogonal to the transport label.

Finally, let us look at the routes in the VRF tenant-a.

```
north-edge#show ip route vrf tenant-a
VRF: tenant-a
```

```

Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,

                                via 192.168.168.10, Ethernet6/3.1
B I    100.10.10.103/32 [200/0] via 6.6.6.200/32, LDP tunnel index 1, label 958810
                                via 192.168.58.12, Ethernet1/1, label 904097
                                via 192.168.59.12, Ethernet2/1, label 904098

B I    192.168.168.4/30 [200/0] via 6.6.6.200/32, LDP tunnel index 1, label 958810
                                via 192.168.58.12, Ethernet1/1, label 904097
                                via 192.168.59.12, Ethernet2/1, label 904098

C      192.168.168.8/30 is directly connected, Ethernet6/3.1
C      192.168.168.12/30 is directly connected, Ethernet6/2.1
B I    223.255.254.248/30 [200/0] via 6.6.6.200/32, LDP tunnel index 1, label 958810
                                via 192.168.58.12, Ethernet1/1, label 904097
                                via 192.168.59.12, Ethernet2/1, label 904098
B I    223.255.254.252/30 [200/0] via 6.6.6.200/32, LDP tunnel index 1, label 958810
                                via 192.168.58.12, Ethernet1/1, label 904097
                                via 192.168.59.12, Ethernet2/1, label 904098
B E    223.255.255.248/30 [200/0] via 192.168.168.14, Ethernet6/2.1
                                via 192.168.168.10, Ethernet6/3.1
B E    223.255.255.252/30 [200/0] via 192.168.168.14, Ethernet6/2.1
                                via 192.168.168.10, Ethernet6/3.1

```

**Note:** As can be seen from the highlighted route above the label stack, the route has the same VPN route 958810, but the transport labels are now 904097 and 904098 on top (this is the ECMP label path to reach NH 6.6.6.200).

As a comparison, let us look at the routes for tenant-b.

```

north-edge#show ip route vrf tenant-b

VRF: tenant-b
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route

Gateway of last resort:

B E 223.255.255.252/30 [200/0] via 192.168.168.22, Ethernet6/2.2

```

**Note:** The only difference apart from the missing host routes (no host-route inject for this tenant), is the VPN label.

### 17.8.3.3 Layer 3 EVPN Over BGP-SR

The following figures illustrate an overview of the combined control and data planes.

Figure 107: Control Plane Tenant-a Over BGP-SR

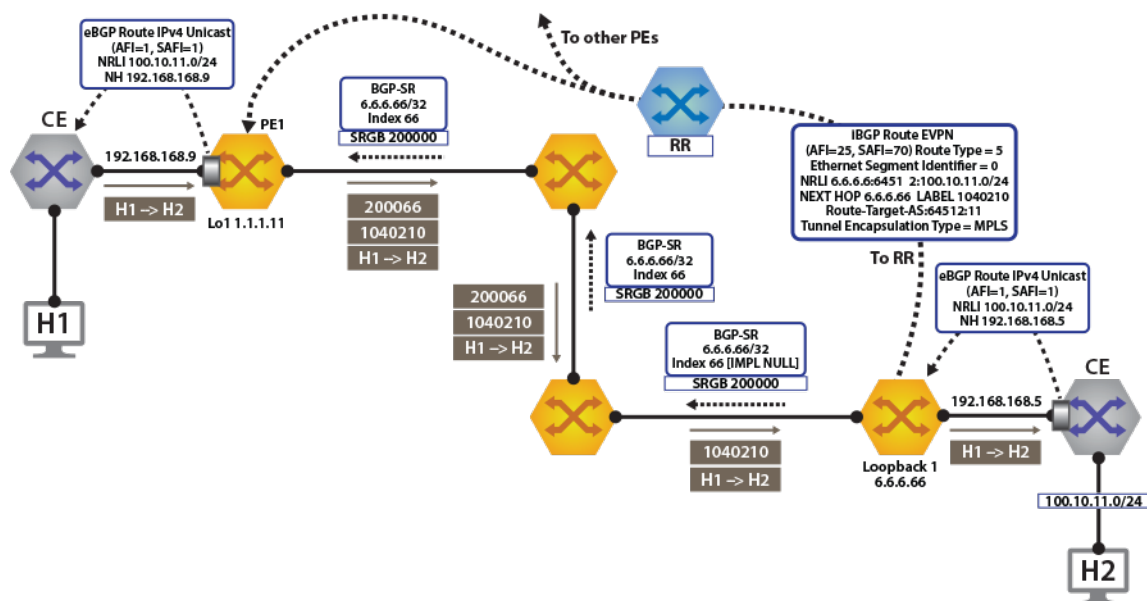

Figure 108: Control Plane Tenant-b Over BGP-SR

**Figure 109: Control Plane & Forwarding Tenant-a Over BGP-SR**

To switch to using the MPLS BGP-SR transport, we simply need to change the next-hop advertised for the EVPN routes. As shown in Control Plane Tenant-b Over BGP-SR, the next hop needs to be set to loopback 1 for using the BGP-SR LSP. This is achieved by configuring the next-hop for the EVPN routes.

```
router bgp 64512
!
 address-family evpn
  neighbor default encapsulation mpls next-hop-self source-interface
  Loopback1
```

Once the next-hop for the EVPN routes are configured, we can check the BGP updates and the routes in the VRF. The output again includes the RD and IP prefix identifying the route. As seen in the output, we now have the NH set to 6.6.6.66 for tenant-a and tenant-b.

```
North Edge.17:52:30#show bgp evpn route-type ip-prefix 100.10.11.0/24
detail

north-edge(config-if-Et2/1)#show bgp evpn route-type ip-prefix

B E    223.255.255.252/30 [200/0] via 192.168.168.14, Ethernet6/2.1
                                via 192.168.168.10, Ethernet6/3.1

```

As can be seen from the highlighted route above the label stack, the route are the transport labels 958810 and 200066 on top (this is the ECMP label path to reach NH 6.6.6.66), with the tenant-a VPN label 958810 next in the stack, identifying the route as belonging to tenant-a.

As a comparison, let us look at the routes for tenant-b. As seen in the output, the VPN label assigned to tenant-b is 953372.

```

north-edge#

```

If we now look at the routes in the VRF for tenant-b, we see that the VPN label has now changed, while the transport label (for NH 6.6.6.66 is the same). The only difference seen in tenant-b, aside from the different VPN label, is that there are no host-routes in tenant-b because within each DC tenant-b is running in asymmetric mode; therefore, no host routes are generated/installed in the IP VRF.

```

north-edge#show ip route vrf tenant-b

#### 17.8.4 IP VPNs Sample Configuration

Here, we examine BGP EVPN layer 3 VPN over an LDP, ISIS-SR, and BGP-SR transport LSPs. This highlights the separation between the transport and the VPN overlay service.

The following figures illustrate the sample VPN Physical Topology.

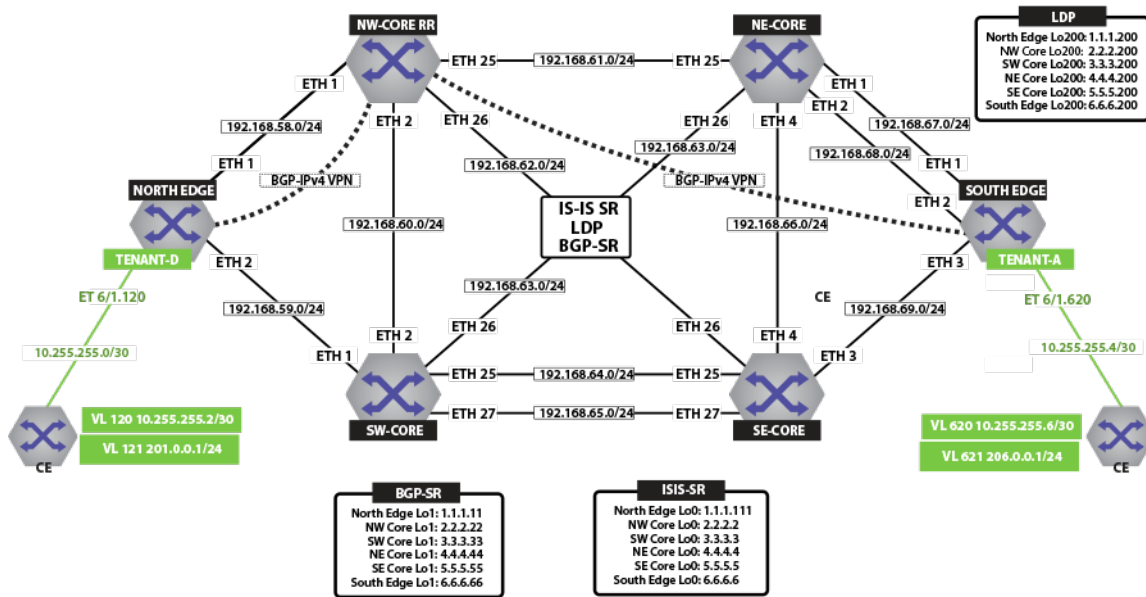

Figure 110: IPv4 VPN Physical Topology

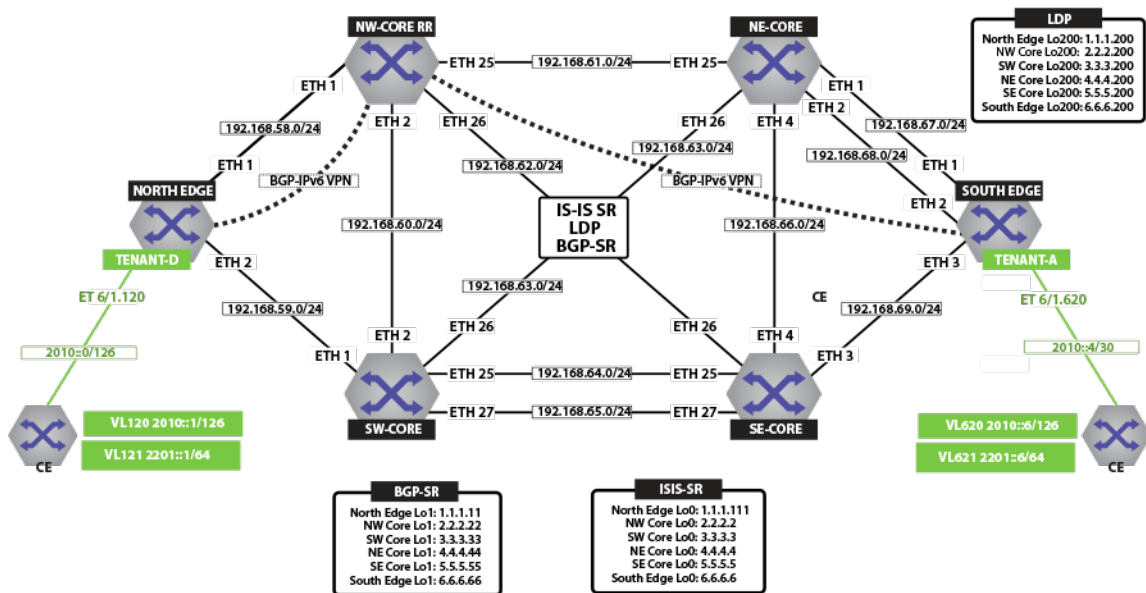

Figure 111: IPv6 VPN Physical Topology

### 17.8.4.1 IP VPN over ISIS-SR

The figure below illustrates an overview of the combined control and data planes.

**Figure 112: IPv4 VPN and IPv6 VPN Over IS-IS SR MPLS**

The next two figures illustrate the forwarding path and control plane for both IP traffic over IS-IS MPLS segment routing.

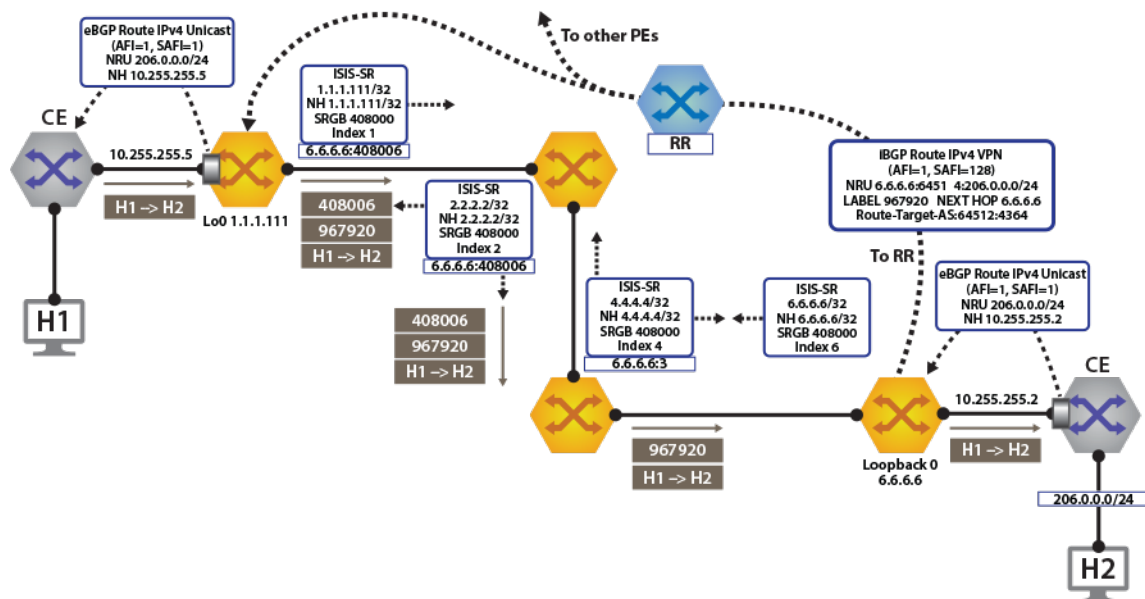

Figure 113: IPv4 VPN Forwarding Over ISIS-SR MPLS

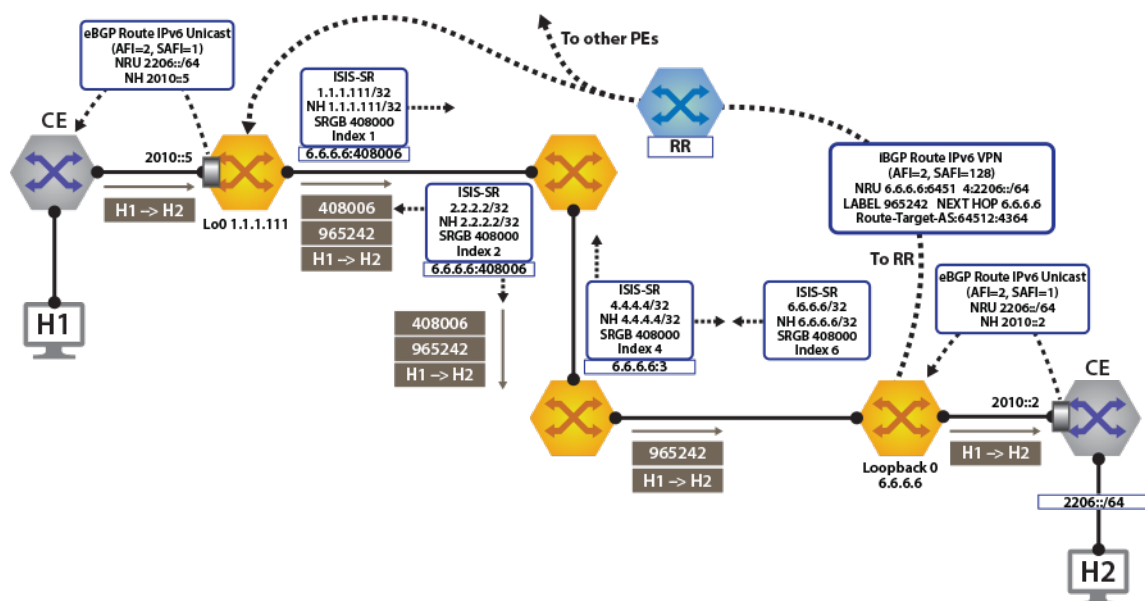

Figure 114: IPv6 VPN Forwarding Over ISIS-SR MPLS

### View IPv4 and IPv6 Routes in the VRF

Both North Edge and South Edge routers have an eBGP peering session out to the CE; and learning routes from CE and remote PE.

- The `show ip route vrf tenant-d` command displays IPv4 Routes in the VRF of North Edge.

## Activating IP VPN

In all scenarios, the IP VPN must be activated under BGP and neighbors configured to exchange the IP VPN NLRI's. The tenant's VRF (tenant-d) is associated with a dynamically assigned label by BGP.

## North Edge

```

    neighbor 2.2.2.222 activate
    neighbor default encapsulation mpls next-hop-self source-interface
Loopback0
  !
```

The configuration above provides the following:

- It enables the multi-agent routing protocol model, which is required for BGP VPN support.
- It sets the local autonomous system number to 64512 and configured the route-reflector for both IPv4 VPN and IPv6 VPN capabilities.
- It sets the IP VPN encapsulation type to MPLS (default).
- It specifies that Loopback0 will be used as the next-hop for all advertised VPN routes. The underlay configuration must provide MPLS LSPs from remote PEs to this loopback interface address.

## Layer 3 Overlay Configuration

Distribution of Layer 3 routes over BGP is enabled by configuring one or more IP VRFs under the router bgp configuration mode. Additionally, either IPv4 or IPv6 routing must be enabled in the VRF.

- Configure IP VRF in the North Edge router.

```
vrf definition tenant-d
ip routing vrf tenant-d
ipv6 unicast-routing vrf tenant-d
!
router bgp 64512
  vrf tenant-d
    rd 1.1.1.1:64514
    route-target import vpn-ipv4 64512:4364
    route-target import vpn-ipv6 64512:4364
    route-target export vpn-ipv4 64512:4364
    route-target export vpn-ipv6 64512:4364
    neighbor 10.255.255.6 remote-as 65011
    neighbor 10.255.255.6 maximum-routes 12000
    neighbor 2010::6 remote-as 65011
    neighbor 2010::6 maximum-routes 12000
  !
  address-family ipv6
    neighbor 2010::6 activate
    redistribute connected
  !
```

- Configure IP VRF in the South Edge router.

```
vrf definition tenant-d
ip routing vrf tenant-d
ipv6 unicast-routing vrf tenant-d
!
router bgp 64512
  vrf tenant-d
    rd 6.6.6.6:64514
    route-target import vpn-ipv4 64512:4364
    route-target import vpn-ipv6 64512:4364
    route-target export vpn-ipv4 64512:4364
    route-target export vpn-ipv6 64512:4364
    neighbor 10.255.255.2 remote-as 65010
    neighbor 10.255.255.2 maximum-routes 12000
    neighbor 2010::2 remote-as 65010
    neighbor 2010::2 maximum-routes 12000
  !
  address-family ipv6
    neighbor 2010::2 activate
  redistribute connected
  !
```

These IP VRF configurations provide the following functionalities:

- It defines overlay VRFs (tenant-d) on the PE and enables IP unicast routing.
- The VRF is assigned a unique Route-Distinguisher (RD). The RD allows the PE to advertise VPN routes for the same IP prefix that have been exported by different VRFs. The NLRI RouteKey of a route exported from the VRFs IPv4 table into VPN consists of both the RD and the original IP prefix.
- The Route-Target (RT) extended communities for the VRF. The RTs are associated with all routes exported from the VRF. Received VPN routes carrying at least one RT matching the VRFs configuration are imported into the VRF.

### Verifying IP VPNs over ISIS-SR

- The **show bgp vpn-ipv4 summary** command displays the status of the VPN IP peers in the North Edge router with the BGP VPN enabled.

```
north-edge#show bgp vpn-ipv4 summary
BGP summary information for VRF default
Router identifier 1.1.1.111, local AS number 64512
Neighbor Status Codes: m - Under maintenance

|         |                   | -                       | -      | 100     | 0      |
| 65011 i |                   |                         |        |         |        |
| * >     | RD: 6.6.6.6:64514 | IPv6 prefix 2206::/64   |        |         |        |
|         |                   | 6.6.6.6                 | -      | 100     | 0      |
| 65010 i | Or-ID: 6.6.6.6    | C-LST: 2.2.2.222        |        |         |        |

 **Note:** Each entry in the table represents a BGP path. The path specific information includes the Route-Distinguisher and the IP prefix. Paths are either received from VPN peers or exported from local VRFs.

- The **show bgp vpn-ipv4 206.0.0.0/24 detail** and **show bgp vpn-ipv6 2206::/64 detail** commands display detailed view of the IP prefix route for 206.0.0.0/24 and 2206::/64 of the North Edge router.

```
north-edge#show bgp vpn-ipv4 206.0.0.0/24 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for IPv4 prefix 206.0.0.0/24, Route
Distinguisher: 6.6.6.6:64514
Paths: 1 available
```

```

65010
  6.6.6.6 from 2.2.2.222 (2.2.2.222)
    Origin IGP, metric -, localpref 100, weight 0, valid, internal,
  best
    Extended Community: Route-Target-AS:64512:4364
    MPLS label: 967920

north-edge#show bgp vpn-ipv6 2206::/64 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for IPv6 prefix 2206::/64, Route Distinguisher:
6.6.6.6:64514
Paths: 1 available
  65010
    6.6.6.6 from 2.2.2.222 (2.2.2.222)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal,
    best
      Extended Community: Route-Target-AS:64512:4364
      MPLS label: 965242

```

 **Note:** The output includes the RD and IP prefix identifying the route. As seen in the output, the IPv4 VPN route is received from 2.2.2.222 because it is set-up to be a route-reflector, but the next hop is 6.6.6.6. Both are advertised with tenant VPN label 967920 and 965242 and an RT.

- The `show ip bgp vrf tenant-d` command displays the BGP table for the VRF containing the imported EVPN routes.

```

north-edge#show ip bgp vrf tenant-d
BGP routing table information for VRF tenant-d
Router identifier 1.1.1.1, local AS number 64512
Route status codes: s - suppressed, * - valid, > - active, # - not
  installed, E - ECMP head, e - ECMP
                   S - Stale, c - Contributing to ECMP, b - backup, L
  - labeled-unicast
                   % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL
  Nexthop - Link Local Nexthop

```

| Path    | Network                         | Next Hop     | Metric | LocPref | Weight |

| * >Ec   | 206.0.0.0/24                    | 6.6.6.6      | -      | 100     | 0      |
| 65010 i | Or-ID: 6.6.6.6 C-LST: 2.2.2.222 |              |        |         |        |
| * ec    | 206.0.0.0/24                    | 6.6.6.6      | -      | 100     | 0      |
| 65010 i | Or-ID: 6.6.6.6 C-LST: 2.2.2.222 |              |        |         |        |

 **Note:** Each entry in the table represent a BGP path that is either locally redistributed and received into the VRF or imported from the IPv4 VPN table. VPN routes are received from router 2.2.2.222 C-List (cluster list - basically identifying this route as from a route-reflector) with originating router being 6.6.6.6.

Finally, let us look at the routes in the VRF tenant-d.

```

VRF: tenant-d
Codes: C - connected, S - static, K - kernel,

```

O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,  
 E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,  
 N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,  
 R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,  
 O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,  
 NG - Nexthop Group Static Route, V - VXLAN Control Service,  
 DH - DHCP client installed default route, M - Martian,  
 DP - Dynamic Policy Route

Gateway of last resort is not set

```

B I    10.255.255.0/30 [200/0] via 6.6.6.6/32, IS-IS SR tunnel index 6,
label 967920
                                     via 192.168.58.12, Ethernet1/1, label
408006
C      10.255.255.4/30 is directly connected, Ethernet6/1.120
B E    201.0.0.0/24 [200/0] via 10.255.255.6, Ethernet6/1.120
B I    206.0.0.0/24 [200/0] via 6.6.6.6/32, IS-IS SR tunnel index 6,
label 967920
                                     via 192.168.58.12, Ethernet1/1, label
408006
  
```

 **Note:** As displayed in the highlighted route above the label stack, the route is the transport label 408006 on top (this is the label to reach NH 6.6.6.6), with the tenant-a VPN label 967920 next in the stack, identifying the route as belonging to tenant-d.

A check of the Tunnel FIB confirms that 408006 is the ISIS-SR LSP.

```

north-edge#show mpls tunnel fib
! 'show mpls tunnel fib' has been deprecated. Please use 'show tunnel fib
[options]' moving forward.

```

### 17.8.4.2 IP VPNs Over LDP

The following figures illustrate an overview of the combined control and data planes.

Figure 115: IPv4 VPN and IPv6 VPN Over LDP MPLS

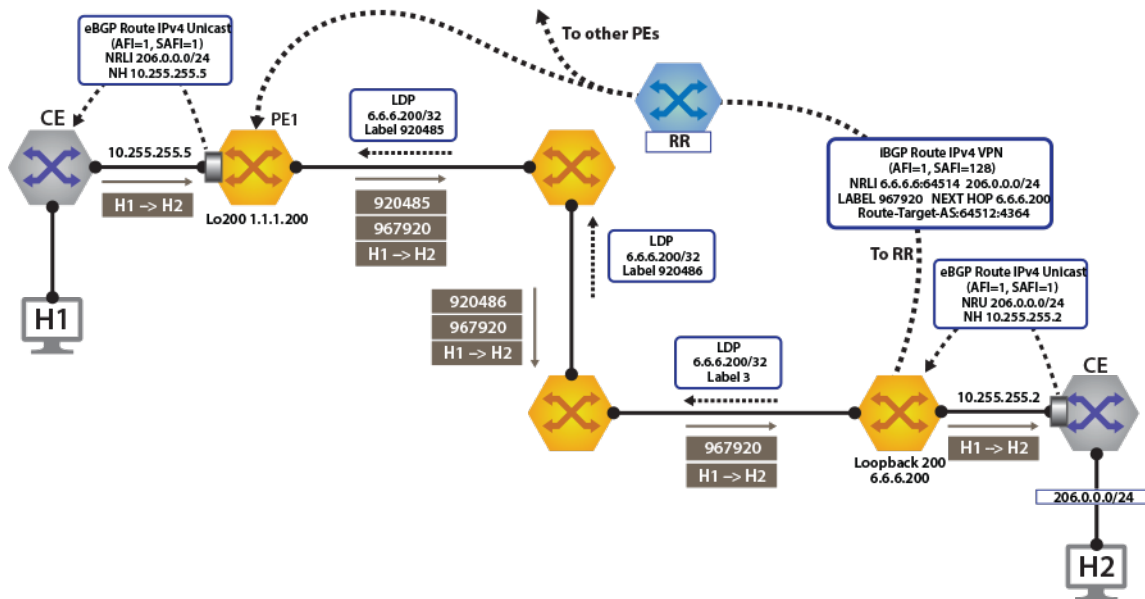

Figure 116: IPv4 VPN Forwarding Over LDP MPLS

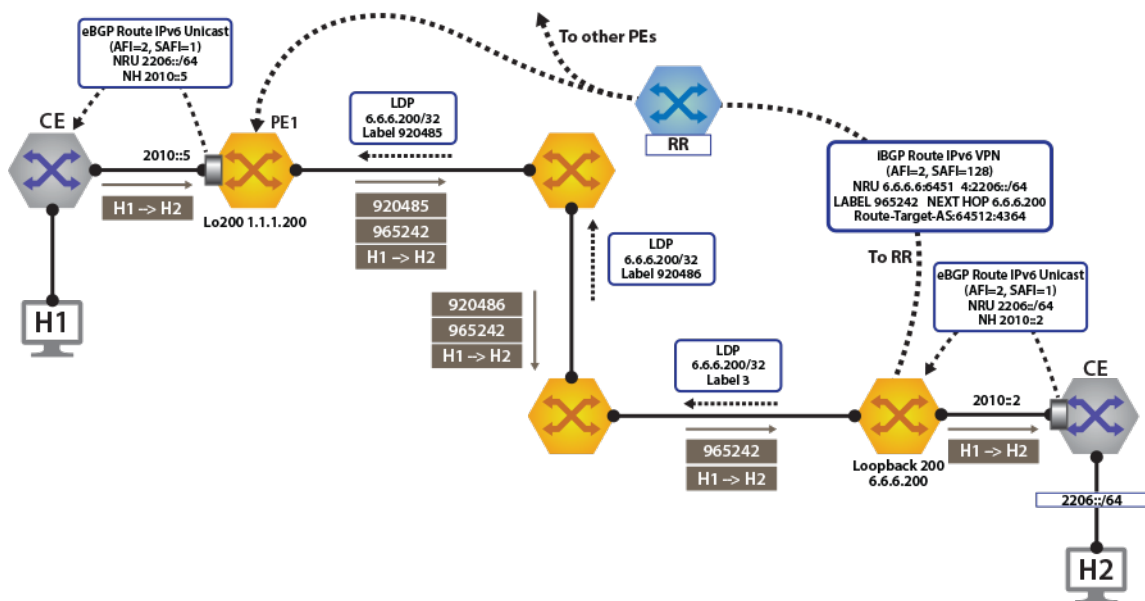

Figure 117: IPv6 VPN Forwarding Over LDP MPLS

To switch to using the MPLS LDP transport, we just need to change the next-hop we advertised for the VPN routes. As shown above, the next hop needs to be set to loopback 200 for using the LDP LSP.

This is achieved by configuring the next-hop for the EVPN routes on both north and south edge routers.

```
router bgp 64512
!
  address-family evpn
    neighbor default encapsulation mpls next-hop-self source-interface
    Loopback200
```

Once this is configured, we can check the BGP updates and the routes in the VRF. The output again includes the RD and IP prefix identifying the route. We now have the NH set to 6.6.6.200 for tenant-d.

```
north-edge#show bgp vpn-ipv4 206.0.0.0/24 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512

     via 192.168.58.12, Ethernet1/1, label 408006

```

**Note:** As seen from the highlighted route above the label stack, the route are the transport label 904097 on top (this is the label path to reach NH 6.6.6.200), with the tenant-d VPN label 967920 next in the stack, and identifying the route as belonging to tenant-a.

A capture of the dataplane on North-Edge matching on the LDP transport label confirms the encapsulated traffic on the wire. 904097:976920:[Source IP Address][Destination IP Address].

### 17.8.4.3 IP VPNs Over BGP-SR

The following figures illustrate an overview of the combined control and data planes.

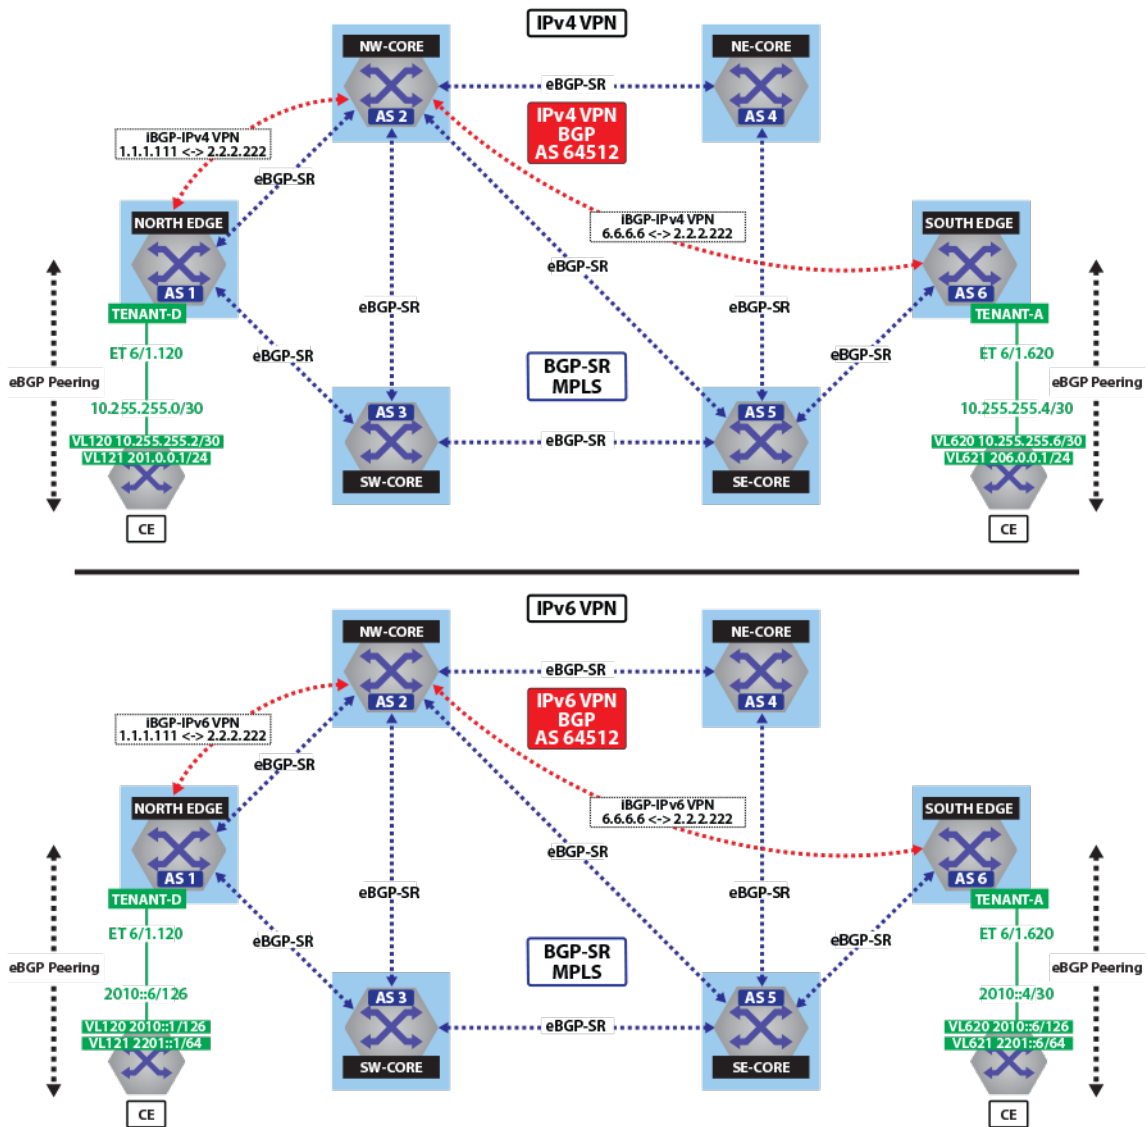

Figure 118: IPv4 VPN and IPv6 VPN Over BGP-SR MPLS

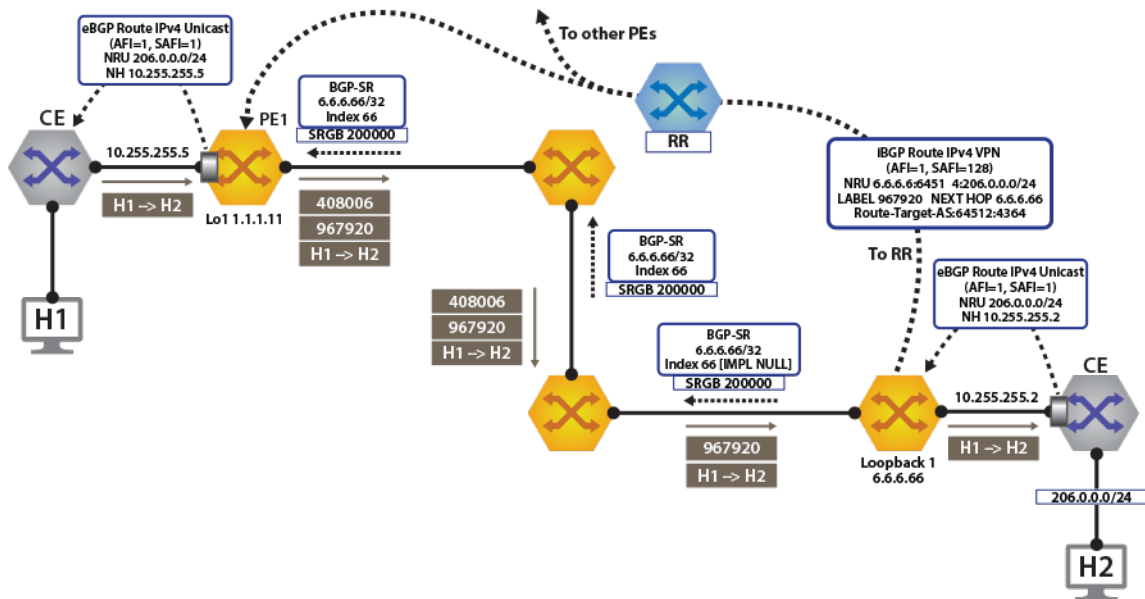

Figure 119: IPv4 VPN Forwarding Over BGP-SR MPLS

Figure 120: IPv6 VPN Forwarding Over BGP-SR MPLS

To switch to using the MPLS BGP-SR transport, we just need to change the next-hop we advertised for the VPN routes. As shown above, the next hop needs to be set to loopback 1 for using the BGP-SR LSP.

This is achieved by configuring the next-hop for EVPN routes.

```
router bgp 64512
!
 address-family evpn
  neighbor default encapsulation mpls next-hop-self source-interface
  Loopback1
```

Once this is configured, we can check the BGP updates and the routes in the VRF. The output again includes the RD and IP prefix identifying the route. As seen in the output, we now have the NH set to 6.6.6.66 for tenant-d.

```

## 17.9 EVPN and VCS Commands

### Router BGP Configuration Mode

- `next-hop resolution disabled`
- `redistribute service vxlan`
- `route-target`
- `route-target export`
- `route-target import`
- `route-target route-map`
- `vni-aware-bundle`

### VCS Commands

- `redistribute bgp evpn vxlan`

### Display Commands

- `show bgp evpn`
- `show ip bgp vrf`
- `show ip route vrf`
- `show ipv6 bgp vrf`
- `show ipv6 route vrf`
- `show service vxlan address-table`
- `show vrf leak flapping`

---

## 17.9.1 next-hop resolution disabled

The `next-hop resolution disabled` command disables the next-hop resolution in routes received from BGP-EVPN peers.

The `no next-hop resolution disabled` and the `default next-hop resolution disabled` commands enable the next-hop resolution in routes received from BGP-EVPN peers.

### Command Mode

Router-BGP Address-Family Configuration

### Command Syntax

```
next-hop resolution disabled
```

### Example

This command disables the next-hop resolution in routes received from BGP-EVPN peers.

```
cvx(config) #router bgp 65002  
cvx(config-router-bgp) #address-family evpn  
cvx(config-router-bgp-af) #next-hop resolution disabled  
cvx(config-router-bgp-af) #
```

## 17.9.2 redistribute bgp evpn vxlan

The **redistribute bgp evpn vxlan** command enables BGP-EVPN routes to be redistributed to VCS which in turn advertises them to all VTEPs within the DC.

The **no redistribute bgp evpn vxlan** and the default **redistribute bgp evpn vxlan** commands disable the redistribution of BGP-EVPN routes to VCS.

### Command Mode

CVX-VXLAN Configuration

### Command Syntax

```
redistribute bgp evpn vxlan
```

### Example

This command enables redistribution of BGP-EVPN routes to VCS.

```
cvx(config)#cvx  
cvx(config-cvx)#no shutdown  
cvx(config-cvx)#service vxlan  
cvx(config-cvx-vxlan)#no shutdown  
cvx(config-cvx-vxlan)#redistribute bgp evpn vxlan
```

---

### 17.9.3 redistribute service vxlan

The **redistribute service vxlan** command enables BGP to redistribute the Layer 2 bridging information received from VCS.

The **no redistribute service vxlan** and the **default redistribute service vxlan** commands disable the redistribution of the bridging information received from VCS.

#### Command Mode

Router-BGP VNI Configuration

#### Command Syntax

```
redistribute service vxlan
```

#### Example

This command enables redistribution of the Layer 2 bridging information received from VCS.

```
cvx(config) #router bgp 100  
cvx(config-router-bgp) #vni-aware-bundle bundle1  
cvx(config-macvrf-bundle1) #redistribute service vxlan
```

## 17.9.4 router general

The **router general** command configures a route-map to leak routes from one VRF to another VRF using a route-map named “RM1”.

The **no router general** and **default router general** commands disable the router general configuration from the running-config.

### Command Mode

Router General Configuration

### Command Syntax

```
router general
```

```
no router general
```

```
default router general
```

### Examples

- These commands configure a route-map to leak routes from “VRF1” to “VRF2” using a route-map “RM1”.

```
switch(config)#router general
switch(config-router-general)#vrf VRF2
switch(config-router-general-vrf-VRF2)#leak routes source-vrf VRF1
subscribe-policy RM1
```

- These commands configure a route-map with the prefix 10.0.0.0/8 and the administrative distance to 10 in the destination VRF.

```
switch(config)#ip prefix-list PL1
switch(config-ip-pfx)#permit 10.0.0.0/8
switch(config)#ip route-map RM1
switch(config-route-map-RM1)#match ip address prefix-list PL1
switch(config-route-map-RM1)#set distance 10
```

---

## 17.9.5 route-target export

The **route-target export** command allows the user to export routes from a VRF to the local VPN table using the route target extended community list.

The **no route-target export** and **default route-target export** commands remove the routes from the VPN table.

### Command Mode

Router-BGP VNI Configuration

### Syntax

```
route-target export [evpn | vpn-ipv4 | vpn-ipv6] <RT>
```

```
no route-target export
```

```
default route-target export
```

### Parameters

- *evpn* EVPN address family.
- *vpn-ipv4* MPLS L3 VPN IPv4 unicast address family.
- *vpn-ipv6* MPLS L3 VPN IPv6 unicast address family.
- *RT* route-target extended community.

### Examples

- These commands export routes from vrf-red to the VPN table.

```
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4
10:10
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6
10:20
```

- These commands export routes from vrf-red to the EVPN table.

```
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export evpn 10:1
```

## 17.9.6 route-target import

The `route-target import` command allows the user to import route target extended community lists from the local VPN table to the target VRF.

The `no route-target import` and `default route-target import` commands remove the routes from the VPN table.

### Command Mode

Router-BGP VNI Configuration

### Syntax

```
route-target import [evpn | vpn-ipv4 | vpn-ipv6] <RT>
```

```
no route-target import
```

```
default route-target import
```

### Parameters

- `evpn` EVPN address family.
- `vpn-ipv4` MPLS L3 VPN IPv4 unicast address family.
- `vpn-ipv6` MPLS L3 VPN IPv6 unicast address family.
- `RT` route-target extended community.

### Examples

- These commands import routes from the VPN table to `vrf-blue`.

```
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4
10:10
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6
10:20
```

- These commands import routes from the EVPN table to `vrf-blue`.

```
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn 10:1
```

## 17.9.7 route-target route-map

The `route-target route-map` command allows the user to export and import route target extended community lists from one VRF to another using route maps.

The `no route-target route-map` and `default route-target route-map` commands remove the routes from the VPN table.

### Command Mode

Router-BGP VNI Configuration

### Syntax

```
route-target {import | export} [evpn | vpn-ipv4 | vpn-ipv6] route-map RM
```

```
no route-target route-map
```

```
default route-target route-map
```

### Parameters

- *evpn* EVPN address family.
- *vpn-ipv4* MPLS L3 VPN IPv4 unicast address family.
- *vpn-ipv6* MPLS L3 VPN IPv6 unicast address family.
- *RM* route-map extended community.

### Examples

- These commands export routes from vrf-red to the VPN table.

```
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4
10:10
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6
10:20
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4
route-map EXPORT_V4_ROUTES_TO_VPN_TABLE
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6
route-map EXPORT_V6_ROUTES_TO_VPN_TABLE
```

- These commands export routes from vrf-red to the EVPN table.

```
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export evpn 10:1
switch(config-router-bgp-vrf-vrf-red)#route-target export evpn route-
map EXPORT_ROUTES_TO_EVPN_TABLE
```

- These commands import routes from the VPN table to vrf-blue.

```
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 1:1
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4
10:10
```

```
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6
10:20
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4
route-map IMPORT_V4_ROUTES_VPN_TABLE
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6
route-map IMPORT_V6_ROUTES_VPN_TABLE
```

- These commands import routes from the EVPN table to *vrf-blue*.

```
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn 10:1
switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn route-
map IMPORT_ROUTES_FROM_EVPN_TABLE
```

---

## 17.9.8 route-target

The **route-target** command configures a well-known extended community that is used by BGP-EVPN to export routes from or import routes into MAC-VRF.

The **no route-target** and **default route-target** commands delete the route-target configuration.

### Command Mode

Router-BGP VNI Configuration

### Syntax

```
route-target {export | import | both} rt
```

```
no route-target
```

```
default route-target
```

### Parameters

- **export** configures a well-known extended community that is attached to the routes exported by BGP-EVPN.
- **import** configures a well known extended community that identifies the received routes that need to be imported into the MAC-VRF specified by the VNI bundle.
- **both** configures the same extended community for import and export of routes.
- **rt** route-target extended community.

### Example

This command configures a well-known extended community for import and export of routes.

```
cvx(config)#router bgp 100  
cvx(config-router-bgp)#vni-aware-bundle bundle1  
cvx(config-macvrf-bundle1)#route-target both 503:12  
cvx(config-macvrf-bundle1)#
```

## 17.9.9 show bgp evpn

The `show bgp evpn` command displays information about the BGP-EVPN routes of the switch.

### Command Mode

Global Configuration

### Command Syntax

```
show bgp evpn [community | detail | esi esid | extcommunity | host-flap | instance | large-community
AS:nn:nn | next-hop | rt | admin:local-assignment | route-type | summary | vni vni_num]
```

### Parameters

- <no parameters> displays all routes of the switch.
- community displays routes filtered by the specified community. Options include:
  - GSHUT well known GSHUT community.
  - aa:nn AS and network number, separated by colon. The value ranges from 1 to 4294967295.
  - internet advertises route to the Internet community.
  - local-as advertises route only to local peers.
  - no-advertise does not advertise the route to any peer.
  - no-export advertises route only within the BGP-EVPN AS boundary
  - comm\_num community number. Values range from 1 to 4294967040.
- detail displays detailed information of routes.
- esi esid displays routes filtered by the specified Ethernet Segment Identifier (ESI).
- extcommunity displays routes that match with BGP or VPN extended community list. Options include:
  - esi-label esid displays routes filtered by the specified value of ESI label. The value ranges from 0 to 16777215.
  - mac-mobility displays routes filtered by the specified MAC mobility.
  - rt displays routes filtered by the specified route target.
  - tunnel-encap vxlan displays routes filtered by the VXLAN tunnel encapsulation.
  - router-mac H.H.H displays routes filtered by the specified router MAC address.
- host-flap displays routes that contains MAC addresses that are blacklisted due to duplication.
- instance displays routes with EVPN instances.
- large-community **AS:nn:nn** displays routes filtered by the specified large community.
- next-hop displays routes filtered by next-hop IPv4 or IPv6 addresses of remote VTEP.
- rd admin:local-assignment displays routes filtered by the specified Route Distinguisher (RD).
- route-type displays routes filtered by NLRI route type.
- summary displays summary of routes.
- vni vni\_num displays routes filtered by the specified VXLAN Network Identifier (VNI). Value ranges from 1 to 4294967294.

### Examples

- This command displays BGP-EVPN routes filtered by the *VNI 3011*.

```
cvx(config-router-bgp-af)#show bgp evpn vni 3011
BGP routing table information for VRF default
Router identifier 2.0.2.2, local AS number 65002
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP
head, e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup
                    % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local

## 17.9.10 show ip bgp vrf

The `show ip bgp vrf` command displays the type of VPN from the imported route. It shows an indication that the IPv4 route has been leaked and source VRF information is displayed.

### Command Mode

Global Configuration

### Command Syntax

```
show ip bgp vrf {vrf_name | all | default}
```

### Parameters

- `vrf_name` name of the VRF.
- `all` displays summary of all VRFs.
- `default` **default virtual routing and forwarding instance.**

### Example

This command displays the leaked and source VRF information.

```
switch(config)#show ip bgp 13.0.0.0/24 vrf vrf-blue
BGP routing table information for VRF vrf-blue
Router identifier 5.0.0.2, local AS number 65001
BGP routing table entry for 130.110.61.0/24
  4.0.0.3 from 4.0.0.3 (52.0.0.1), imported EVPN route, RD 400:1
    Origin IGP, metric -, localpref 100, weight 0, valid, external,best
    Extended Community: Route-Target-AS:4000:1 TunnelEncap:t
unnelTypeVxlan
EvpnRouterMac:74:83:ef:0b:70:f3
  Leaked from VRF vrf-red
```

## 17.9.11 show ip route vrf

The `show ip route vrf` command displays leaked prefixes with the label “L” in the output that indicates that the IPv4 route has been leaked. It also displays information about the source VRF from which these prefixes have been leaked.

### Command Mode

Global Configuration

### Command Syntax

```
show ip route vrf {vrf_name | all}
```

### Parameters

- `vrf_name` name of the VRF.
- `all` displays summary of all VRFs.

### Example

These commands display the OSPF or OSPFV3 leaked routes as “redistribute ospf” and “redistribute ospfv3” are configured on the source VRF vrf-red.

```
switch(config)#show ip route vrf vrf-blue
VRF: vrf-blue
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
       R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
       O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
       NG - Nexthop Group Static Route, V - VXLAN Control Service,
       DH - DHCP client installed default route, M - Martian,
       DP - Dynamic Policy Route, L - VRF Leaked
Gateway of last resort is not set
C      5.0.0.2/31 is directly connected, Ethernet14
B L    57.0.0.3/32 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11

B L    52.0.0.1/32 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L   120.0.0.0/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L   130.0.0.0/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L   130.0.1.0/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L   130.0.2.0/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L   130.0.3.0/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
```

## 17.9.12 show ipv6 bgp vrf

The `show ipv6 bgp vrf` command displays the type of VPN from the imported route. It shows an indication that the IPv6 route has been leaked and source VRF information is displayed.

### Command Mode

Global Configuration

### Command Syntax

```
show ipv6 bgp vrf {vrf_name | all | default}
```

### Parameters

- `vrf_name` name of the VRF.
- `all` displays summary of all VRFs.
- `default` default virtual routing and forwarding instance.

### Example

This command displays the leaked and source VRF information.

```
switch(config)#show ipv6 bgp 2001:10:1:0::102/64 vrf default
BGP routing table information for VRF default
Router identifier 218.218.218.218, local AS number 34

- ECMP head, e - ECMP
                    S - Stale, c - Contributing to ECMP, b - backup, L -
labeled-unicast
                    % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop -
Link Local Nexthop

      Network                Next Hop                Metric  LocPref  Weight  Path
* >  2000:0:14:120::/64      2001:db8:1111:9000::   -        100      109     i
*    2000:0:14:120::/64      2001:db8:156:1010::2   -        100       0     i
*    2000:0:14:120::/64      2001:db8:152:1010::2   -        100       0     i
*    2000:0:14:120::/64      2001:db8:203:1010::2   -        100       0     i
```

---

## 17.9.13 show ipv6 route vrf

The `show ipv6 route vrf` command displays leaked prefixes with the label “L” in the output that indicates that the IPv6 route has been leaked. It also displays information about the source VRF from which these prefixes have been leaked.

### Command Mode

Global Configuration

### Command Syntax

```
show ipv6 route vrf{vrf_name | all}
```

### Parameters

- `vrf_name` name of the VRF.
- `all` displays summary of all VRFs.

### Example

These commands display the OSPF or OSPFV3 leaked routes as “redistribute ospf” and “redistribute ospfv3” are configured on the source VRF `vrf-red`.

```
switch(config)#show ipv6 route vrf vrf-blue
VRF: vrf-blue
Displaying 802 of 802 IPv6 routing table entries
Codes: C - connected, S - static, K - kernel, O3 - OSPFv3, B - BGP, R -
RIP, A B - BGP Aggregate, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
DH - DHCP, NG - Nexthop Group Static Route, M - Martian, DP - Dynamic
Policy Route, L - VRF Leaked
  B L   18::1/128 [200/0] (source VRF vrf-red)
        via 4::3, Ethernet11
  B L   6::2/127 [200/0] (source VRF vrf-red)
        via fe80::7683:efff:fe0b:963d, Ethernet11
  B L   45::1/128 [200/0] (source VRF vrf-red)
        via fe80::7683:efff:fe0b:963d, Ethernet11
  B L   130::/64 [200/0] (source VRF vrf-red)
        via fe80::7683:efff:fe0b:963d, Ethernet11
  B L   130:0:0:1::/64 [200/0] (source VRF vrf-red)
        via fe80::7683:efff:fe0b:963d, Ethernet11
  B L   130:0:0:2::/64 [200/0] (source VRF vrf-red)
        via fe80::7683:efff:fe0b:963d, Ethernet11
  B L   130:0:0:3::/64 [200/0] (source VRF vrf-red)
```

## 17.9.14 show service vxlan address-table

The `show service vxlan address-table` command displays route entries in the MAC forwarding table that are added through the CVX.

### Command Mode

CVX Global Configuration

### Command Syntax

```
show service vxlan address-table {advertised | received}[address H.H.H | evpn | hsc | mss |
switch [Word | all] | vni vnid | vtep A.B.C.D]
```

### Parameters

- `advertised` displays the advertised route entries in the MAC forwarding table.
- `received` displays the received route entries in the MAC forwarding table.
- `address H.H.H` displays route entries that are filtered by the specified MAC addresses.
- `evpn` displays route entries filtered by BGP-EVPN.
- `hsc` displays route entries filtered by Hardware Switch Controller (HSC).
- `mss` displays route entries filtered by Macro Segmentation Service (MSS).
- `switch` displays route entries that are filtered by the specified switch or all switches. Options include:
  - `Word` Hostname, IP address or ID of the switch.
  - `all` all switches
- `vni vnid` displays route entries filtered by the specified VXLAN Network Identifier (VNI). Value ranges from 1 to 4294967294.
- `vtep A.B.C.D` displays route entries filtered by the specified IP address of the remote Virtual Tunnel End Point (VTEP).

### Examples

- This command displays the route entries in MAC forwarding table advertised to BGP-EVPN peers.

```
cvx#show service vxlan address-table advertised evpn
```

```
Advertised Mac Address Table
```

```
-----
VNI           Mac Address      VTEP           Moves
-----
1000          02:01:62:01:00:00 10.0.0.1       1
Total Mac Addresses for this criterion: 1
```

```
Advertised Flood Table
```

```
-----
VNI           Mac Address      VTEP(s)
-----
1000          00:00:00:00:00:00 10.0.0.1      10.0.0.2
Total Mac Addresses for this criterion: 1
cvx#
```

- This command displays the route entries in MAC forwarding table received from BGP-EVPN peers.

```
cvx#show service vxlan address-table received evpn
```

```
Received Mac Address Table
```

```
-----
Source       VNI           Mac Address      VTEP           Moves
-----
EVPN         1000          02:01:62:02:00:00 10.0.0.3       1
Total Mac Addresses for this criterion: 1
```

---

Received Flood Table

```
-----  
Source          VNI      Mac Address      VTEP  
-----  
EVPN            1000     00:00:00:00:00:00 10.0.0.3  
EVPN            1000     00:00:00:00:00:00 10.0.0.4  
Total Mac Addresses for this criterion: 2  
cvx#
```

### 17.9.15 show vrf leak flapping

The **show vrf leak flapping** command displays the flapping prefixes of the routes leaked from one VRF to another VRF. Routes that are detected as “flapping” are blocked considering the future leaking policy execution.

#### Command Mode

EXEC

#### Command Syntax

```
show vrf leak flapping
```

#### Parameters

- **destination** displays flapping prefixes destined to a VRF.
- **prefix** displays flapping routes for a prefix.
- **source** displays flapping prefixes sourced from a VRF.
- **vrf** displays flapping prefixes associated with a VRF

#### Example

This command displays the flapping prefixes of the leaked routes.

```
switch#show vrf leak flapping  
  
Age          Source VRF      Destination VRF      Prefix              Created At  
-----  
141         VRF1            VRF2                 10.0.2.0/24        3357281.40992
```

## 17.9.16 vni-aware-bundle

The **vni-aware-bundle** command configures a BGP MAC-VRF containing Layer 2 routes from a group of VXLAN Network Identifiers (VNI).

### Command Mode

Router BGP Configuration

### Command Syntax

```
vni-aware-bundle vni_bundle_name
```

### Parameter

*vni\_bundle\_name* VNI bundle name.

### Example

This command configures MAC-VRF BGP to support VNI bundle1.

```
cvx(config) #router bgp 100  
cvx(config-router-bgp) #vni-aware-bundle bundle1  
cvx(config-macvrf-bundle1) #
```

## Multiprotocol Label Switching (MPLS)

---

Tunneling protocols encapsulate packets of a different protocol as the payload of a larger frame for delivery within networks utilizing the encapsulating protocol. Tunneling facilitates the delivery of payload over an incompatible delivery network and creates a secure path through an untrusted network. Protocols that this chapter describes include MPLS, Decap Groups, and NextHop Groups.

Sections in this chapter include:

- [MPLS](#)
- [BGP/MPLS L3 VPN](#)
- [MPLS Commands](#)

### 18.1 MPLS

These sections describe the Arista MPLS implementation:

- [MPLS Description](#)
- [MPLS Configuration](#)

#### 18.1.1 MPLS Description

##### 18.1.1.1 MPLS Overview

Multiprotocol Label Switching (MPLS) is a networking process that replaces complete network addresses with short path labels for directing data packets to network nodes. The labels identify virtual links (paths) between distant nodes rather than endpoints. MPLS is scalable and protocol-independent. Data packets are assigned labels, which are used to determine packet forwarding destinations without examining the packet.

Arista switches utilize MPLS to improve efficiency and control from servers through data centers and to the WAN. The MPLS implementation supports static MPLS tunneling that is manually configured on each switch or established over a network by an SDN controller. The configuration is specified by a set of rules that filter packets based on matching criteria. Each rule applies MPLS-related actions to packets that match the rule's criteria. Each rule includes a metric that the switch uses to select an action when multiple rules match a packet.

##### 18.1.1.2 MPLS Implementation

MPLS static rule parameters contain the following:

- A 20-bit value that is compared to the top header label of each MPLS packet. Other rule parameters may be applied to packets whose top label match this value.
- A nexthop location that specifies the packet's next destination (IPv4 or IPv6) and the interface through which the switch forwards the packet.
- An MPLS label stack management action that is performed on filtered packets:
  - pop-payload: removes the top label from stack; this terminates an LSP (label-switched path).
  - swap-label: replaces top label with a specified new label; this passes a packet along an LSP.
- A rule metric that the switch uses to select a rule when multiple rules match an MPLS packet.

Packets that do not match any MPLS rules are dropped.

### 18.1.1.3 MPLSoGRE Filtered Mirroring

In MPLS over Generic Routing Encapsulation (MPLSoGRE) filtered mirroring, IPv4 over MPLS over GRE (IPv4oMPLSoGRE) and IPv6 over MPLS over GRE (IPv6oMPLSoGRE) packets that enter a GRE tunnel endpoint on which MPLS lookup is performed, are selected for mirroring based on the destination IP address field in the inner IPv4 or IPv6 header.

**Note:** These packets are not selected for mirroring if they are forwarded based on either the L2 or outer L3 header destination address.

the image below shows the header format of the packets that are selected for mirroring.

Figure 121: Header Format of Packets

When mirroring to a GRE tunnel, the payload of the outgoing GRE packet contains the payload of the incoming source packet starting from the MPLS header. L2 and outer L3 headers are stripped from the mirror copy. When the MPLS lookup fails, the packet is still eligible for mirroring based on the selection criteria defined in the ACL.

### 18.1.2 MPLS Configuration

MPLS routing is enabled through the `mpls ip` command.

- This command enables MPLS routing.

```
switch(config)#mpls ip
switch(config)#show running-config mpls ip
!
end
switch(config)#
```

MPLS rules are created by the `mpls static` command. MPLS static rules identify a set of MPLS packets by a common top label and defines the method of handling these packets.

These commands create an MPLS rule that matches packets with a top label value of 3400 and causes the removal of the top label from the header stack. The nexthop destination of the IPv4 payload is IP address 10.14.4.4 through Ethernet interface 3/3/3. This rule has a metric value of 100.

```
switch(config)#mpls static top-label 3400 ethernet 3/3/3
10.14.4.4 pop
payload-type ipv4
switch(config)#show running-config
```

```

!
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-
type ipv4
!

end
switch(config)#

```

These commands create a backup rule that forwards the packet through Ethernet interface 4/3. This rule's metric value of 150 assigns it backup status prior to the first rule.

```

switch(config)#mpls static top-label 3400 ethernet 4/3 10.14.4.4
pop payload-type
ipv4 metric 150
switch(config)#show running-config

!
mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type
  ipv4 metric 150
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-
type ipv4
!

end
switch(config)#

```

These commands create an MPLS rule that forwards the packet to the nexthop address through any interface.

```

switch(config)#mpls static top-label 4400 10.15.46.45 pop
payload-type ipv4
switch(config)#show running-config

!
mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type
  ipv4 metric 150
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-
type ipv4
mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
!

end
switch(config)#

```

This command configures a static tunnel for the tunnel endpoint 64.0.0.1 and pushes a label 11111 to it.

```

switch(config)#mpls static STATIC 64.0.0.1/32 54.0.0.1 Port-
Channel7 label-stack 11111

```

The switch's MPLS static rule configuration for specified routes and rules is displayed by `show mpls route`.

This command displays the MPLS rule configuration.

```
switch>show mpls config route
In-Label  Out-Label  Metric  Payload  NextHop
3400      pop        100     ipv4     10.14.4.4,Et3/3/3
3400      pop        150     ipv4     10.14.4.4,Et4/3
switch>
```

Statistics about the configuration and implementation of MPLS rules are displayed by the `show mpls route summary` command.

This command displays a summary of MPLS rule implementation.

```
switch>show mpls route summary
Number of Labels: 1 (1 unprogrammed)
Number of adjacencies in hardware: 0
Number of backup adjacencies: 2
switch>
```

### 18.1.2.1 Egress IPv4/IPv6 over MPLS ACLs

IPv4/IPv6 over MPLS packets are now eligible for ACLs at the egress stage by default, applicable only to IPv4/IPv6 over MPLS packets that are MPLS label popped (such as if the label is at the bottom of stack). The user can override this behavior if required, thereby disabling egress ACLs for certain MPLS labels by configuration. No special configuration is required to enable egress ACLs on IPv4/IPv6 over MPLS packets.

- This command disables egress ACLs for MPLS top-label 12000 on the egress interface `120.1.1.1` nexthop address.

```
switch(config)#no mpls static top-label 12000 120.1.1.1 pop
payload-type ipv6
switch(config)#
```

- This command enables egress ACLs for MPLS top-label 12000 on the egress interface `120.1.1.1` nexthop address.

```
switch(config)#mpls static top-label 12000 120.1.1.1 pop
payload-type ipv6
switch(config)#
```

### 18.1.2.2 Configuring MPLSoGRE Filtered Mirroring

The filtered mirroring of terminated MPLSoGRE packets is configured by creating an IPv4 access-list, and then attaching the IPv4 access-list to a monitor session source where a tunnel decap group has been configured. This IPv4 access-list has rules that match to either inner IPv4 or IPv6 destination addresses.

## Enabling the TC-Counters TCAM Profile

The following limitations are applicable to MPLSoGRE filtered mirroring in tc-counters TCAM profile:

- Security ACLs are not enforced on IPv4oMPLSoGRE and IPv6oMPLSoGRE terminated packets.
- The rules of a mirroring-ACL are set to match either inner IPv4 or inner IPv6 header fields, but not both.

The ACLs containing rules to match both inner IPv4 and inner IPv6 header fields are not applicable to a single source interface in multiple mirroring sessions. In other words, all ACLs applied to a shared source interface must contain either inner IPv4 rules or inner IPv6 rules.

The commands below switch to the tc-counters TCAM profile in the running configuration.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#system profile tc-counters
switch(config-hw-tcam)#exit
```

## Defining Two IPv4 Access-Lists

The `ip access-list` command places the switch in ACL configuration mode, which is a group change mode that modifies an IPv4 access control list. The command specifies the name of the IPv4 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending till the end of the session.

The `permit (Role)` command configures one access-list to match the inner IPv4 address, and the other access-list to match the inner IPv6 address.

```
switch(config)#ip access-list dIPv4
switch(config)#10 permit ip any any inner ip any host 5.5.5.5
switch(config)#exit

switch(config)#ip access-list dIPv6
switch(config)#10 permit ip any any inner ipv6 any host 55::55
switch(config)#exit
```

## Attaching Access-Lists

The `monitor session source` and `monitor session destination` commands allow to attach two access-lists to two different monitor session sources.

```
switch(config)#monitor session sess1 source et1 rx ip access-group dIPv4
switch(config)#monitor session sess1 destination tunnel mode gre source 1.1.1.1
destination 2.2.2.2
switch(config)#monitor session sess2 source et2 rx ip access-group dIPv6
switch(config)#monitor session sess2 destination tunnel mode gre source 3.3.3.3
destination 4.4.4.4
switch(config)#show monitor session

Session sess1
-----
Source Ports:

Rx Only:      Et1 (IP ACL: dIPv4)
```

```

Destination Ports:
      status   source   dest   TTL   DSCP   proto   VRF   fwd-drop
Gre1 : active   1.1.1.1  2.2.2.2 128   0      0x88be default no

Session sess2
-----

Source Ports:
      Rx Only:      Et2 (IP ACL: dIPv6), Et5 (IP ACL: dIPv6)

Destination Ports:
      status   source   dest   TTL   DSCP   proto   VRF   fwd-drop
Gre2 : active   3.3.3.3  4.4.4.4 128   0      0x88be default no

switch(config)#

```

## 18.2 BGP/MPLS L3 VPN

Border Gateway Protocol/ Multiprotocol Label Switching (BGP/MPLS) L3 Virtual private Network (VPN) allows a Service Provider (SP) or an Enterprise to provide the service of interconnecting geographically dispersed customer sites. This type of service can be provided to multiple customers over the common network backbone infrastructure of the Service Provider, while:

- Maintaining privacy of each customer
- Allowing for overlapping IP addresses among customers
- Having constrained route distribution – such as, only those routers in the Service Provider’s network that need the customer routes, have them.

Achieve the above through the extensions to BGP as defined in RFC 4364 for IPv4 and RFC 4659 for IPv6, and the use of VPN Routing and Forwarding Tables (VRFs), Route Distinguishers (RDs), and Route Targets (RTs).

BGP/MPLS L3 VPN is available when configuring BGP in the multi-agent routing protocol model.

|---------|----------|--------|-------|----------|--|

## 18.2.2 Operation

A Virtual Private Network, or VPN, is a set of geographically dispersed sites attached to the Service Provider's (SP) backbone, with IP interconnectivity amongst the sites. Using this scenario, the customer can obtain "VPN service" from the SP. The SP will provide a VPN service to multiple customers, using this common backbone network infrastructure. The sample VPN topology diagram below illustrates three sites where a customer is being interconnected over the SP backbone network.

At each site, the Customer Edge router (CE) attaches to the Provider's Edge router (PE). The CE can attach to more than one PE, and in these cases the CE is said to be "multi-homed". The routers in the SP core network, those which do not attach to any CE, are referred to as "P" routers. The "P" routers do not need to know about the customer routes.

**Figure 122: MPOLS Enabled Core Schematic**

The CE attaches to PE in a VRF. The routes learned from the CE are programmed in the corresponding VRF and the PE then distributes the routes to other PEs as "VPN routes" using MP-BGP. This is done by using two new BGP address families, VPN-IPv4 (AFI=1, SAFI=128) and VPN-IPv6 (AFI=2, SAFI=128).

On the PEs, corresponding to the VPN, VRFs configure with the RD and one or more import and export RTs. The RD attaches to the customer route to create a VPN route. By picking a unique RD for each VRF and attaching it to the customer route, the VPN route is unique. This allows for customers with overlapping IP addresses to be managed by the Service Provider. This unique VPN route is advertised to other PEs along with the configured export RT and the VPN label. The PE router allocates a VPN label per VRF and address family. The PE router programs its Label FIB (LFIB) with this label information. When the PE router receives an incoming MPLS packet with the VPN label as the topmost label, it pops the label and does an IP lookup in the associated VRF. The PE router also maintains a mapping of import RTs to the corresponding VRFs. This mapping is used later when deciding into which VRFs a received VPN route should be imported into.

The PE learns customer routes from the CE through the PE-CE routing protocol, which could be Static routing, EBGP, OSPF, or ISIS. The PE will install those customer routes in the associated VRF, with the CE as the next hop. The customer routes in the VRF are exported into the BGP VPN table as VPN routes, along with the VPN label and the configured export RTs as BGP path attributes. These VPN routes are then advertised to other PEs which have been activated for the VPN address-families (VPN-IPv4/VPN-IPv6). The PE then sets itself as the next hop while advertising the VPN routes. The PE which receives those VPN routes strips out the RD and import them as IPv4 or IPv6 routes into

---

the VRFs. The list of VRFs into which the route is imported is determined based on the mapping of import RTs to VRFs. These routes will be programmed into the FIB along with the VPN label and the remote PE as the nexthop. Once these routes are installed in the VRF, the CE connected to that VRF will learn those routes (based on the PE-CE routing protocol) and make it available in the customer network that it is attached to. This way the geographically dispersed customer sites learn of each other's networks and IP reachability is established between the them.

- [Forwarding](#)

### 18.2.2.1 Forwarding

In the Service Provider's core network there should be MPLS LSPs between the PEs. That is, the connection to the VPN next-hop should be over an MPLS tunnel. The MPLS LSPs in the core could be setup using RSVP-TE or LDP in conjunction with OSPF/ISIS or ISIS-SR.

When the PE receives an IP packet from the CE destined to the remote site, it does an IP lookup in the VRF to which the CE is connected. This lookup provides the VPN label to be used and the nexthop, which would be the remote-PE. The VPN label is imposed on the IP packet and the resulting MPLS packet is then tunneled through the MPLS LSP to the remote PE. As result of penultimate hop popping, the MPLS packet arrives at the remote PE with the VPN label as the topmost label. The label lookup results in the VPN label being popped and an IP lookup will be done in the associated VRF. Note that the PE would have programmed this label action when it allocated the label to start with. That IP lookup will result in the IP packet being forwarded out to the CE.

### 18.2.3 Configuration

Configuring BGP/MPLS L3 VPN involves enabling the SP core for MPLS and then configuring the PEs with the required BGP configuration.

It is assumed that the SP core network is enabled for MPLS. This involves configuring an IGP (OSPF/ISIS) followed by a label distribution protocol such as LDP, RSVP-TE or ISIS-SR. Typically, loopback interfaces are configured on all the PE and the P routers and the IGP's exchange reachability to those loopback interfaces. And then the MPLS Label Distribution Protocol will set up MPLS LSPs/tunnels between all those loopbacks.

This section includes the following topics:

- [Enabling BGP to Exchange the Routing Tables with the Peer](#)
- [Configuring the VRF Information](#)
- [Configuring the Route Distinguisher](#)
- [Configuring Route Targets](#)
- [Configuring Import / Export Route-maps](#)
- [VPN Next-hop](#)

Enabling MPLS and LDP on the PE involves the following steps:

1. Configure terminal.

```
switch#configure terminal
```

2. Enter the **Loopback0** interface config mode.

```
switch(config)#interface Loopback0
```

3. Enter destination IP address.

```
switch(config)#ip address 11.0.0.1/32
```

4. Enable MPLS routing.

```
switch(config)#mpls ip
```

5. Configure MPLS LDP.

```
switch(config)#mpls ldp
```

6. Configure the router ID interface.

```
switch(config-mpls-ldp)#router-id interface Loopback0
```

7. Configure for no shutdown.

```
switch(config-mpls-ldp)#no shutdown
```

**Example:**

```
switch#configure terminal
switch(config)#interface Loopback0
switch(config-if)#ip address 11.0.0.1/32
switch(config)#mpls ip
switch(config)#mpls ldp
switch(config-mpls-ldp)#router-id interface Loopback0
switch(config-mpls-ldp)#no shutdown
```

### 18.2.3.1 Enabling BGP to Exchange the Routing Tables with the Peer

- Enabling the send-community extended knob on the neighbor. This essentially enables BGP to exchange the RTs with the peer.
  - Activating the peer (the remote PE) under the `address-family VPN-IPv4` and `address-family VPN-IPv6` modes enables BGP to negotiate the MPLS L3 VPN address families.
  - Specify the address for the VPN next-hop using the command, `neighbor default encapsulation mpls next-hop-self source-interface Loopback0`.

In the preceding configuration example, the system uses the address `11.0.0.1` from interface `Loopback0` as the nexthop in the VPN route advertisements.

### 18.2.3.2 Configuring the VRF Information

First, the VRF must be configured in the global mode and IPv4 and IPv6 routing must be enabled in the VRF. After that, under the router bgp mode, we need to configure the VRF and provide the information related to RD and import and export RTs.

1. Configure terminal.

```
switch#configure terminal
```

2. Enable IP routing.

```
switch(config)#ip routing
```

3. Enable IP routing for the VRF.

```
switch(config)#ip routing vrf vrf1
```

#### 4. Enable IPv6 routing for the VRF.

```
switch(config)#ipv6 unicast-routing vrf vrf1
```

```
switch#configure terminal
switch(config)#ip routing
switch(config)#ip routing vrf vrf1
switch(config)#ipv6 unicast-routing vrf vrf1
```

The VRF configuration under router BGP mode is shown below.

```
switch(config-router-bgp-vrf-vrf1)#show active
router bgp 300
  vrf vrf1
    rd 11.0.0.1:0
    route-target import vpn-ipv6 300:0
    route-target import vpn-ipv4 300:0
    route-target import vpn-ipv4 300:0
    route-target import vpn-ipv4 300:0
    route-target export vpn-ipv6 300:0
    route-target export vpn-ipv4 300:0
    redistribute connected
    redistribute static
switch(config-router-bgp-vrf-vrf1)#
```

#### 18.2.3.3 Configuring the Route Distinguisher

The Route Distinguisher (RD) is structured such that it can be easily configured and managed. It is configured by specifying two fields separated by a colon, as in administrative-subfield: assigned-number-subfield.

The administrative subfield could contain either an IP address, as shown in the example (the PEs loopback address), or the AS number. The assigned-number-subfield can be any number which is determined by the SP. The primary requirement of the RD is that it must be unique per VRF. It is possible to have overlapping address space between VRFs, the intent of the RD is to ensure that a VPN route can be uniquely identified as it is received by a remote PE. However, the identification of which VRF(s) the received VPN route should be imported into is handled by the import RTs configured on the remote PE.

#### 18.2.3.4 Configuring Route Targets

Next is the import and export Route Target configuration. The RTs are structured similar to the RDs. They too are made up of administrative-subfield: assigned-number-subfield. In the example shown, the AS number has been used as the administrative subfield. And the value 0 has been used for the assigned number subfield. It is the RT that plays an important role in identifying the VPN.

- Received VPN routes with the import RT as path attributes will be imported into the VRF will have RTs has extended-community BGP path attributes. They will be imported into VRFs which import RT configuration for RTs in the received VPN route.
- And while advertising the routes from the VRF as VPN routes, the export RT will be attached to the route as an extended-community BGP attribute.
  1. In the example, the connected and static routes in the VRF are redistributed into BGP. And these routes will be exported as VPN routes.
  2. It is also possible to have a BGP session with the CE. In that case, routes received over that session are exported as VPN routes. And imported routes are advertised to the CE.

### 18.2.3.5 Configuring Import / Export Route-maps

The routes that are imported into a VRF can be further controlled by applying an import route-map. And the routes that are exported from the VRF can be controlled by applying an export route-map.

Complete the following steps:

1. Configure terminal.

```
switch#configure terminal
```

2. Configure BGP. In this example, BGP is configured AS *4274781899*.

```
switch(config)#router bgp 4274781899
```

3. Configure the VRF under router bgp mode.

```
switch(config-router-bgp)#vrf vrf1
```

4. Select the BGP route distinguisher. In this example, *36351:268450419* is selected.

```
switch(config-router-bgp-vrf-vrf1)#rd 36351:268450419
```

5. Configure the import route-target VPN-IPv4, unicast address family. In this example, *36351:1001* is selected.

```
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 36351:1001
```

6. Configure another import route-target for VPN-IPv4 unicast address family. In this example, *36351:268450419* is selected.

```
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 36351:268450419
```

7. Configure the export route-target for VPN-IPv4 unicast address family. In this example, *36351:268450419* is selected.

```
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 36351:268450419
```

8. Configure the import route-map. In this example, the import router-map name is *BGP-IMPORT-VRF-SERVICES*.

```
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 route-map BGP-IMPORT-VRF-SERVICES
```

9. Configure the export route-map. In this example, the export route-map name is *BGP-EXPORT-VRF-VRF1*.

```
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 route-map BGP-EXPORT-VRF-VRF1
```

10. Optionally, redistribute connected routes in the VRF into BGP, with the associated route-map *BGP-ANNOUNCE-CONNECTED*.

```
switch(config-router-bgp-vrf-vrf1)#redistribute connected route-map BGP-ANNOUNCE-CONNECTED
```

11. Optionally, redistribute static routes in the vrf into BGP, with associated route-map *BGP-ANNOUNCE-STATIC*.

```
switch(config-router-bgp-vrf-vrf1)#redistribute static route-map BGP-ANNOUNCE-STATIC
```

12. The import and export route-maps should be separately configured. The configuration snippet below shows the configuration of the same route-map *BGP-IMPORT-VRF-SERVICES*.

```
switch(config-router-bgp-vrf-vrf1)#route-map BGP-IMPORT-VRF-SERVICES permit 10  
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)#match extcommunity SERVICES  
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)#match ip address prefix-list SERVICES
```

#### Example:

```
switch#configure terminal  
switch(config)#router bgp 4274781899  
switch(config-router-bgp)#vrf vrf1  
switch(config-router-bgp-vrf-vrf1)#rd 36351:268450419  
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 36351:1001  
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 36351:268450419  
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 36351:268450419  
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 route-map BGP-IMPORT-VRF-SERVICES  
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 route-map BGP-EXPORT-VRF-VRF1  
switch(config-router-bgp-vrf-vrf1)#redistribute connected route-map BGP-ANNOUNCE-CONNECTED  
switch(config-router-bgp-vrf-vrf1)#redistribute static route-map BGP-ANNOUNCE-STATIC  
switch(config-router-bgp-vrf-vrf1)#route-map BGP-IMPORT-VRF-SERVICES permit 10  
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)#match extcommunity SERVICES  
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)#match ip address prefix-list SERVICES
```

### 18.2.3.6 VPN Next-hop

By default, the system uses the source address of the BGP session as the nexthop in the VPN advertisements. This source address is determined by the system while establishing the TCP session between the PEs. If the SP want to use a different address as the VPN next-hop, then an interface with that address must be specified under the BGP address-family VPN-IPv4 or address-family VPN-IPv6 configuration modes. For example,

```
switch(config-router-bgp)#address-family vpn-ipv4  
switch(config-router-bgp-af)#neighbor 10.0.0.2 activate  
switch(config-router-bgp-af)#neighbor default encapsulation mpls next-hop-self source-interface Loopback0
```

```
switch(config-router-bgp) #address-family vpn-ipv6
switch(config-router-bgp-af) #neighbor 10.0.0.2 activate
switch(config-router-bgp-af) #neighbor default encapsulation mpls next-
hop-self
source-interface Loopback0
```

In the previous example, the interface **Loopback 0** has been specified. The system picks the VPN next-hop address from the interface based on the following rules:

- For VPN-IPv4, the IPv4 address from the interface is picked.
- For VPN-IPv6,
  - For an IPv4 peer,
    - Pick the IPv4 address from the interface.
    - If the interface does not have a IPv4 address, pick the IPv6 address.
  - For an IPv6 peer,
    - Pick the IPv6 address from the interface.
    - If the interface does not have an IPv6 address, pick the IPv4 address.

For VPN-IPv6, when an IPv4 address is picked as the next-hop, it is encoded as a IPv4-mapped IPv6 address in the VPN route advertisement. This is as per RFC 4659.

## 18.2.4 Show Commands

Use the **show bgp instance vrf vrf1** command to show the BGP instance status for a specific VRF to verify the route-targets and import/export route-maps being used. The command also displays the locally allocated MPLS label that the system has allocated for IPv4 and IPv6.

```
switch#show bgp instance vrf vrf1
BGP instance information for VRF vrf1
BGP Local AS: 4274781899, Router ID: 169.254.156.10
Total peers: 0
  Static peers: 0
  Dynamic peers: 0
  Disabled peers: 0
  Established peers: 0
Four Octet ASN mode enabled
Graceful restart helper mode disabled
Graceful restart mode disabled
Graceful restart timer timeout: 00:05:00
End of rib timer timeout: 00:05:00
Attributes of the reflected routes are not preserved
UCMP mode: disabled
Peer mac resolution timeout: 00:00:00
BGP IPv4 Listen Port Status: listening on port 179
BGP IPv6 Listen Port Status: listening on port 179
BGP Convergence information:
  BGP has converged: yes, Time taken to converge: 00:00:31
  Outstanding EORs: 0, Outstanding Keepalives: 0
  Convergence timeout: 00:05:00
BGP Convergence timer is inactive
BGP Convergence based update synchronization is disabled
BGP Convergence slow-peer timeout: 00:01:30
Address-family IPv4 Unicast:
  Redistributed routes into BGP:
    Static
    Connected
Route Distinguisher: 36351:268450419
Route targets to import:
```

```

```

Use the **show bgp vpn-ipv4 summary** command to show the status of VPN-IPv4 peers. While the examples below are with respect to VPN-IPv4, the same set of commands are applicable to VPN-IPv6.

```

switch#show bgp vpn-ipv4 summary
BGP summary information for VRF default
Router identifier 0.0.0.1, local AS number 300
Neighbor Status Codes: m - Under maintenance
Neighbor  V AS  MsgRcvd  MsgSent  InQ  OutQ  Up/Down  State  PfxRcd  PfxAcc
10.0.0.2  4 300 3379    60      0    0    1d23h  Estab  1      1

```

Use the **show bgp vpn-ipv4** command to show how the VPN-IPv4 routes sent and received.

```

switch#show bgp vpn-ipv4
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
Route status codes: s - suppressed, * - valid, > - active, # - not
installed, E -
ECMP head, e - ECMP
                S - Stale, c - Contributing to ECMP, b - backup
                % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes:Or-ID - Originator ID,C-LST - Cluster List,LL Nexthop-
Link
Local Nexthop
      Network                Next Hop                Metric  LocPref  Weight  Path
* >   RD: 11.0.0.1:0 IPv4 prefix 20.0.0.0/24
      -                      -                      -      -        0      i
* >   RD: 11.0.1.1:0 IPv4 prefix 20.0.1.0/24
      11.0.1.1              -                      100    0        0      i

```

Each entry in the output represent a VPN path in the VPN table. For each VPN path, the RD and actual prefix along with the nexthop information is shown. Paths in the VPN table are either received from other VPN-IPv4 peers (other PEs) or exported from local VRFs.

In the above output, **20.0.0.0/24** is a local route that has been exported. Notice that it has been prepended with the RD **11.0.0.1:0** to make it a VPN-IPv4 route. And the prefix of **20.0.1.0/24** has been

received from another PE. It has the RD of **11.0.1.1:0** with a nexthop of **11.0.1.1**. Looking at each of those prefixes in detail:

**20.0.0.0/24** is a local route from one of the VRFs that has been exported. Notice that along with the prefix, the RD, the export RT and the MPLS label information is displayed. In this case, the MPLS label is a locally allocated label.

```
switch#show bgp vpn-ipv4 20.0.1.0/24
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
BGP routing table entry for IPv4 prefix 20.0.1.0/24, Route Distinguisher
:
11.0.1.1:0
  Paths: 1 available
    Local
      11.0.1.1 from 10.0.0.2 (0.0.1.1)
        Origin IGP, metric -, localpref 100, weight 0, valid, internal,
        best
        Extended Community: Route-Target-AS:300:0
        MPLS label: 100123
```

**20.0.1.0/24** is a prefix that has been received from the VPN-IPv4 peer, **10.0.0.2**. The next-hop in this case is **11.0.1.1**. This VPN route is imported into a VRF based on the import RT configuration matching the RT received in the VPN route (**300:0**).

**Note:** Route-Distinguishers for the non-default VRFs must be configured under the **router bgp** mode. Route-Distinguisher configured under the VRF definition mode are ignored.

The route is installed in the VRF only when the VPN next-hop is reachable through an MPLS tunnel. The presence of such an MPLS tunnel can be verified using the **show tunnel fib** command. The output below shows that there is an MPLS tunnel setup by LDP to the VPN nexthop **11.0.1.1**.

```
switch#show tunnel fib
Type 'LDP', index 1, endpoint 11.0.1.1/32, forwarding None
  via 10.0.0.2, 'Ethernet6'
  label stack 3
```

Use the **show ip bgp vrf vrf1** command to show the BGP table for the VRF which contains the imported VPN-IPv4 route.

```
switch#show ip bgp vrf vrf1
BGP routing table information for VRF vrf1
Router identifier 11.0.0.1, local AS number 300
Route status codes:s-suppressed,*-valid,>-active,#-not installed, E-ECMP
  head,e-ECMP
      S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
      % - Pending BGP convergence
Origin codes: i-IGP, e-EGP, ?-incomplete
AS Path Attributes: Or-ID-Originator ID, C-LST-Cluster List, LL Nexthop-
Link Local Nexthop

   Network          Next Hop        Metric  LocPref  Weight  Path
* >  20.0.0.0/24      -                -        -         0       i
* >  20.0.1.0/24     11.0.1.1        -        100       0       i
```

Each entry in the table represents a path either locally redistributed/received into the VRF (from a BGP peer) or imported from the VPN table.

Use the `show ip bgp 20.0.1.0/24 vrf vrf1` command for a more detailed view of the imported IP prefix **20.0.1.0/24**:

```
switch#show ip bgp 20.0.1.0/24 vrf vrf1
BGP routing table information for VRF vrf1
Router identifier 11.0.0.1, local AS number 300
BGP routing table entry for 20.0.1.0/24
  Paths: 1 available
    Local
      11.0.1.1 from 10.0.0.2 (0.0.1.1), imported VPN-IPv4 route, RD
11.0.1.1:0
  Origin IGP, metric -, localpref 100, weight 0, valid, internal,
best
  Extended Community: Route-Target-AS:300:0
  Remote MPLS label: 100123
```

Use the `show ip route vrf vrf1` command to view the prefix installed in route table of the VRF:

```
switch#show ip route vrf vrf1
VRF: vrf1
Codes: C - connected, S - static, K - kernel,
        O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
        E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
        N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
        R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
        O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
        NG - Nexthop Group Static Route, V - VXLAN Control Service,
        DH - DHCP client installed default route, M - Martian,
        DP - Dynamic Policy Route
Gateway of last resort is not set
C      20.0.0.0/24 is directly connected, Ethernet5
B I    20.0.1.0/24 [200/0] via 11.0.1.1/32,LDP tunnel index 1,label
100123
                                     via 10.0.0.2,Ethernet3,label imp-null(3)
```

The output displays both the VPN label, as well as the underlay tunnel (LDP) information.

## 18.2.5 Syslog Messages

While transmitting an update, if there is no valid next-hop that could be sent, then the `%BGP-3-VPN-DROP_TXUPDATE` Syslog is generated. In the case of MPLS L3 VPN, it can occur in the following scenarios:

- When BGP is attempting to advertise a received VPN route to an eBGP and next-hop-unchanged is not configured for that peer. The resolution is to configure next-hop-unchanged for that eBGP peer.
- When next-hop-self is configured on the Route-Reflector and the RR is trying to reflect the received.

## 18.2.6 Limitations

- While configuring a BGP Route-Reflector for the VPN-IPv4/VPN-IPv6 address families, the route-reflector must have transport MPLS LSPs to reach the PE nexthop addresses. Even though the route-reflector may not be in the data path and does not use the transport LSPs to forward traffic, the LSPs are required in order for the BGP nexthops to be considered as reachable valid candidates in the bestpath computation.
- When configuring eBGP peers, which receive routes over an eBGP session and re-advertise the same to a different eBGP peer, next-hop-unchanged knob must be configured, so that the original nexthop is retained.
- With iBGP route-reflector topology, next-hop-self knob must not be configured.

- 
- Even with directly connected PEs, the VPN nexthops should be the loopback on the directly connected PEs with an MPLS tunnel between them.
    - For a VPN route to be installed in the VRF, the VPN nexthop must resolve over a MPLS tunnel.
  - With OSPF as the PE-CE protocol, RFC 4576, setting of the DN bit in the LSA, is not supported.
  - Internal BGP (iBGP) as the PE-CE protocol, RFC 6368, is not supported.

## 18.3 MPLS Commands

### MPLS Commands

- [mpls ip](#)
- [mpls static](#)
- [show mpls route](#)
- [show mpls route summary](#)

---

## 18.3.1 mpls ip

The `mpls ip` command enables MPLS routing. Multiprotocol Label Switching (MPLS) is a networking process that avoids complex lookups in a routing table by replacing complete network addresses with short path labels for directing data packets to network nodes. MPLS data paths are serviced through a tunnel encapsulation data structure that adds four-byte label headers to packets.

The `no mpls ip` and `default mpls ip` commands disable MPLS routing by removing the `mpls ip` command from *running-config*. When MPLS routing is disabled, routed MPLS packets are dropped and all MPLS routes and adjacencies are removed. MPLS routing is disabled by default.

### Command Mode

Global Configuration

### Command Syntax

```
mpls ip
```

```
no mpls ip
```

```
default mpls ip
```

### Examples:

- This command enables MPLS routing. Previous commands enabled IP routing and configured MPLS static routes.

```
switch(config)#mpls ip
switch(config)#show running-config

! Command: show running-config

!
ip routing
!
mpls ip
!
mpls static top-label 3400 10.14.4.4 pop payload-type ipv4
mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
!

!
end
switch(config)#
```

- This command disables MPLS routing.

```
switch(config)#no mpls ip
switch(config)#show running-config

! Command: show running-config
<-----OUTPUT OMITTED FROM EXAMPLE----->

!
ip routing
!
mpls static top-label 3400 10.14.4.4 pop payload-type ipv4
mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
!

!
end
switch(config)#
```

---

## 18.3.2 mpls static

The `mpls static` command creates an MPLS rule that specifies the method of handling of inbound MPLS traffic. Multiprotocol Label Switching (MPLS) is a networking process that replaces complete network addresses with short path labels for directing data packets to network nodes.

Static rules specify these parameters:

- **MPLS filter:** The top-label parameter specifies the 20-bit value that the MPLS packet's top header label must match to be handled by the rule.
- **Nexthop location:** Specifies the destination nexthop address (IPv4 or IPv6) and the interface through which the switch forwards the packet.
- **MPLS action:** Specifies the MPLS label stack management action performed on the packet:
  - **pop-payload:** removes the top label from stack; this terminates an LSP (label-switched path).
  - **swap-label:** replaces top label with a specified new label; this passes a packet along an LSP.
- **Rule priority:** Specifies the rule to be used when an MPLS packet matches multiple rules.

The `no mpls static` and `default mpls static` commands delete the specified MPLS rule from *running-config*.

- Commands that include only a top label tag remove all MPLS rules with the matching top label.
- Commands with no **PRIORITY** parameter remove all matching routes of every metric value.

### Command Mode

Global Configuration

### Command Syntax

```
mpls static top-label top_tag [DEST_INTF] NEXTHOP_ADDR ACTION [PRIORITY]
```

```
no mpls static top-label top_tag
```

```
no mpls static top-label top_tag [DEST_INTF] NEXTHOP_ADDR ACTION [PRIORITY]
```

```
default mpls static top-label top_tag
```

```
default mpls static top-label top_tag [DEST_INTF] NEXTHOP_ADDR ACTION [PRIORITY]
```

### Parameters

- **top\_tag** Top header's label field contents. Value ranges from 0 to 1048575 (20 bits).
- **DEST\_INTF** Specifies interface through which **NEXTHOP\_ADDR** is accessed. Options include:
  - **<no parameter>** Any interface.
  - **ethernet e\_num** Ethernet interface specified by **e\_num**.
  - **loopback l\_num** Loopback interface specified by **l\_num**.
  - **management m\_num** Management interface specified by **m\_num**.
  - **port-channel p\_num** Port-channel interface specified by **p\_num**.
  - **vlan v\_num** VLAN interface specified by **v\_num**.
  - **vxlan vx\_num** VXLAN interface specified by **vx\_num**.
- **NEXTHOP\_ADDR** Nexthop address for MPLS for filtered MPLS packets. Options include:
  - **ipv4\_addr** IPv4 address.
  - **ipv6\_addr** IPv6 address.
- **ACTION** MPLS header stack management action performed on packet. Options include:
  - **pop payload-type ipv4** Removes top layer from stack. Payload is handled as IPv4 packet.
  - **pop payload-type ipv6** Removes top layer from stack. Payload is handled as IPv6 packet.
  - **swap-label <0 to 1048575>** Replaces header label with specified label value (20 bits).
- **PRIORITY** Specifies rule priority when multiple rules match a packet. Options include:

- **<no parameter>** Assigns a metric value of 100 to the rule.
- **metric <1 to 255>** Lower values denote higher priority. Value ranges from 1 to 255.

The `mpls static` command does not support push label actions.

#### Examples:

- These commands create an MPLS rule that matches packets with a top label value of 3400 and causes the removal of the top label from the header stack. The nexthop destination of the IPv4 payload is IP address 10.14.4.4 through Ethernet interface 3/3/3. This rule has a metric value of 100.

```
switch(config)#mpls static top-label 3400 ethernet 3/3/3 10.14.4.4 pop
payload-type ipv4
switch(config)#show running-config

!
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type
  ipv4
!

end
switch(config)#
```

- These commands create a backup rule that forwards the packet through Ethernet interface 4/3. This rule's metric value of 150 assigns it backup status prior to the first rule.

```
switch(config)#mpls static top-label 3400 ethernet 4/3 10.14.4.4 pop
payload-type
ipv4 metric 150
switch(config)#show running-config

!
mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4
  metric 150
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type
  ipv4
!

<-----OUTPUT OMITTED FROM EXAMPLE----->

end
switch(config)#
```

- These commands create an MPLS rule that forwards the packet to the nexthop address through any interface.

```
switch(config)#mpls static top-label 4400 10.15.46.45 pop payload-type
ipv4
switch(config)#show running-config

<-----OUTPUT OMITTED FROM EXAMPLE----->

!
mpls static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4
  metric 150
mpls static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type
  ipv4
mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
!

end
```

---

```
switch(config)#
```

### 18.3.3 show mpls route summary

The `show mpls route summary` command displays statistics about the configuration and implementation of MPLS rules.

#### Command Mode

EXEC

#### Command Syntax

```
show mpls route summary
```

#### Example:

This command displays a summary of MPLS rule implementation.

```
switch>show mpls route summary
Number of Labels: 1 (1 unprogrammed)
Number of adjacencies in hardware: 0
Number of backup adjacencies: 2
switch>
```

## 18.3.4 show mpls route

The `show mpls config route` command displays the switch's MPLS static rule configuration for the specified routes and rules.

### Command Mode

EXEC

### Command Syntax

```
show mpls [INFO_LEVEL] route [header_label]
```

### Parameters

- **INFO\_LEVEL** Specifies the filters that are used to select the routes to display. Options include:
  - **<no parameter>** Displays routes published by the forwarding agent.
  - **config** Displays all configured routes.
  - **lfib** Displays routes stored to the Label Forwarding Information Base (LFIB).
- **header\_label** Filters routes by MPLS top header label. Options include:
  - **<no parameter>** Displays routes for all header values.
  - **<0 to 1048575>** Specifies header for which command displays information.

### Example:

This command displays the MPLS rule configuration.

```
switch>show mpls config route
In-Label  Out-Label  Metric  Payload  NextHop
3400      pop        100     ipv4     10.14.4.4,Et3/3/3
3400      pop        150     ipv4     10.14.4.4,Et4/3
switch>
```

## Visibility and Monitoring Services

---

The Visibility and Monitors Services chapter contains the following sections:

- [Test Access Point \(TAP\) Aggregation](#)
- [Latency Analyzer \(LANZ\)](#)
- [Sampled Flow Tracking](#)
- [sFlow](#)
- [SNMP](#)
- [VM Tracer](#)
- [MapReduce Tracer](#)

### 19.1 Test Access Point (TAP) Aggregation

This section describes test access point (TAP) aggregation and the data structures that it requires. Topics in this section include:

- [TAP Aggregation Introduction](#)
- [TAP Aggregation Description](#)
- [TAP Aggregation Configuration](#)
- [TAP Aggregation Traffic Steering](#)
- [TAP Aggregation GUI](#)
- [TAP Aggregation Keyframe and Timestamp Configuration](#)
- [TAP Aggregation Commands](#)

Port mirroring is described in [Test Access Point \(TAP\) Aggregation](#).

#### 19.1.1 TAP Aggregation Introduction

Ethernet-based switches are commonly deployed in dedicated networks to support tool access point (TAP) and mirror port traffic toward one or more analysis applications. Ports configured to mirror data can simultaneously switch traffic to its primary destination while directing a copy of that traffic to analysis or test devices. TAP ports are typically part of a dedicated environment that allows for the aggregation of data streams from multiple sources that can be directed to multiple destinations.

Arista switches support port mirroring and TAP aggregation and the data structures required by these functions.

#### 19.1.2 TAP Aggregation Description

These sections describe TAP aggregation, timestamps, and keyframes:

- [TAP Aggregation](#)
- [Timestamps and Keyframes](#)

##### 19.1.2.1 TAP Aggregation

Tool access point (TAP) aggregation is the accumulation of data streams and the subsequent dispersal of these streams to devices and applications that analyze, test, verify, parse, detect, or store data. TAP

---

aggregation requires an environment free from switching operations. Arista switches operate in one of two device modes:

- **Switching mode:** the switch performs normal switching and routing operations. Data mirroring is supported in switching mode. Tap aggregation is not available in switching mode.
- **TAP aggregation mode:** The switch is a data-monitoring device and does not provide normal switching and routing services. Data mirroring is not available in tap aggregation mode.

Access control lists, port channels, LAGs, QoS, and VLANs function normally in both modes.

Ethernet and port channel interfaces are configured as **TAP** and **tool** ports to support tap aggregation.

- **TAP ports:** a tap port is an interface that receives a data stream that two network ports exchange. TAP ports prohibit egress traffic. MAC learning is disabled. All control plane interaction is prevented. Traps for inbound traffic are disabled. Tap ports are in STP forwarding mode.
- **Tool ports:** A tool port is an interface that replicates data streams received by one or more tap ports. Tool ports connect to devices that process the monitored data streams.

Tool ports prohibit ingress traffic. MAC learning is disabled. All control plane interaction is prevented. Tool ports are in STP forwarding mode.

TAP and tool ports are configured with the **switchport mode** command. These ports are active when the switch is in tap aggregation mode and error-disabled when the switch is in switching mode.

TAP and tool ports are designated through switchport mode commands and act similar to trunk ports, in that they can allow access to VLANs specified through allowed-VLAN lists. Tap ports also specify a native VLAN for handling untagged frames.

Access, trunk, and dot1q-tunnel mode ports are active when the switch is in switching mode and error-disabled when the switch is in tap aggregation mode.

TAP and tool mode ports are active when the switch is in TAP aggregation mode and error-disabled when the switch is in switching mode.

**TAP aggregation groups** are data structures that map a set of TAP ports to a set of tool ports. Both TAP and tool ports may belong to multiple TAP aggregation groups, and a TAP aggregation group may contain multiple TAP and tool ports.

### 19.1.2.2 Timestamps and Keyframes

FM6000 platform switches support packet timestamping of packets sent from any port at line rate. Timestamps are used to correlate network events and in performance analysis. Keyframes provide information to assist in the interpretation of timestamps.

The switch contains two 64-bit counters to maintain ASIC time and UTC time. ASIC time is based on an internal 350 MHz counter. UTC is absolute time that is maintained by a precision oscillator and synchronized through PTP.

Timestamps are derived from the least significant 31 bits of ASIC time. Based on the 350 MHz counter period and 31-bit resolution, timestamp values repeat every 6.135 seconds.

Keyframes are periodically inserted into the data stream to provide context for interpreting timestamps. Keyframes contain the 64-bit value of the ASIC time counter, the corresponding 64-bit value of the UTC time counter, and the elapsed time since the last PTP synchronization of the UTC counter. Inserting one keyframe every second into the data stream assures that the timestamp value in each egress packet can be associated with values of the complete 64-bit ASIC time counter and the corresponding UTC counter.

### 19.1.2.2.1 Timestamps

Timestamps are based on a frame's ingress time and applied to frames sent on egress ports, ensuring that timestamps on monitored traffic reflect ingress timing of the original frames. Timestamping is configured on the egress port where the timestamp is applied to the frame.

A timestamp consists of the least significant 31 bits of the ASIC time counter. The most significant bit of the least significant byte is a 0 pad, resulting in a 32-bit timestamp with 31 bits of data. The keyframe mechanism provides recovery of the most significant 33 bits of the ASIC counters and a map to UTC time. Applications use this mechanism to determine the absolute time of the frame timestamp.

The switch supports three timestamp modes, which are configurable on individual Ethernet ports. The modes differ in the management of the egress frame's 32-bit frame check sequence (FCS):

- **Disabled:** timestamping is disabled.
- **FCS Replacement Mode:** the original FCS is discarded, and the ingress timestamp is appended to frame data, followed by a new FCS that is based on the appended timestamp. The result is a valid Ethernet frame, but the headers of all nested protocols are not updated to reflect the timestamp.
- **FCS Appending Mode:** the original FCS is discarded and replaced by the ingress timestamp. The size of the original frame is maintained without any latency impact, but the FCS is not valid.

### 19.1.2.2.2 Keyframes

Keyframes contain routable IP packets that provide information to relate timestamps with the complete ASIC counter and absolute UTC time. Keyframes have valid L2 and L3 headers. Keyframes contain these header fields:

- MAC fields (12 bytes):
  - Source MAC address is the address of the egress interface transmitting the keyframe.
  - Destination MAC address is configured through a CLI command.
- IP Header (20 bytes):
  - Source IP address is configured through CLI; default is management interface IP address.
  - Destination IP address is configured through a CLI command.
  - TTL is set to 64.
  - TOS is set to 0.
  - Protocol field is set to 253.
  - IP header's ID field is set to 0.

Keyframes contain these payload fields:

- **ASIC time:** (64 bits) ASIC time counter. (2.857 ns resolution).
- **UTC time:** (64 bits) Unix time that corresponds to ASIC time (ns).
- **Last sync time:** (64 bits) ASIC time of most recent PTP synchronization.
- **Keyframe time:** (64 bits) ASIC time of the keyframe's egress (ns).
- **Egress interface drops:** (64 bits) Number of dropped frames on keyframe's egress interface.
- **Device ID:** (16 bits) device ID (user defined).
- **Egress interface:** (16 bits) Keyframe's egress switchport.
- **FCS type (8 bits):** Timestamping mode configured on keyframe's egress port.
  - **0:** timestamping disabled.
  - **1:** timestamp is appended to payload; new FCS is added to the frame.
  - **2:** timestamp overwrites the existing FCS.
- **Reserved (8 bits):** reserved for future use.
- **Skew numerator/skew denominator:** form a ratio indicating the ASIC clock skew. If the ratio is greater than 1, the clock is skewed fast; if the ratio is less than 1, the clock is skewed slow.

Last sync time equals 0 when there was no previous synchronization or the time since the last synchronization is greater than 8 hours.

The 31-bit frame timestamp provides high-resolution timing, rolling over about every 6.135 seconds (31 bits at 2.857ns per tick). To obtain the full ASIC time and to correlate the timestamp to an absolute UTC time, the switch sends keyframes. Each keyframe contains the current ASIC time and UTC time; hence an application can compute the high order bits of the ASIC time (for precise, relative timing) from the ASIC to UTC time mapping, and then determine absolute time.

ASIC to UTC time conversion is not quite immediate, so the UTC time in the frame will not be the current time. A keyframe timestamp is provided for this purpose. The frame also includes the timestamping mode (FCS type) so applications can dynamically determine the timestamp's byte offset. Each field is shown in the following table.

**Table 66: Keyframe Payload**

|                    |          |                  |
|--------------------|----------|------------------|
| 0 7                | 8 15     | 16 31            |
| ASIC time          |          |                  |
| UTC time           |          |                  |
| Last sync time     |          |                  |
| Skew numerator     |          |                  |
| Skew denominator   |          |                  |
| Keyframe timestamp |          |                  |
| Drop count         |          |                  |
| Device ID          |          | Egress interface |
| FCS type           | Reserved |                  |

### 19.1.3 TAP Aggregation Configuration

These sections describe TAP aggregation configuration tasks:

- [Enabling Tap Aggregation Mode](#)
- [Tap Aggregation Mixed Mode](#)
- [Tap Port Configuration](#)
- [Tool Port Configuration](#)
- [Per-linecard TCAM Profile Configuration](#)
- [Two-Way Ports for Tap Aggregation](#)
- [Tap Aggregation QoS Handling on Tap Ports](#)
- [Identity VLAN Tagging](#)
- [Tap Aggregation Group Configuration](#)

#### 19.1.3.1 Enabling Tap Aggregation Mode

The switch supports switching mode and TAP aggregation mode. In switching mode, normal switching and routing functions are supported while TAP aggregation functions are disabled. In TAP aggregation mode, TAP aggregation functions are enabled while normal switching and routing functions are disabled. By default, the switch is in switching mode.

A ports switchport status depends on its switchport mode and the switch's TAP aggregation mode.

- Tap aggregation mode enabled: TAP and tool ports are enabled. Switching ports are errdisabled.
- Tap aggregation mode disabled: TAP and tool ports are errdisabled. Switching ports are enabled.

To enable the switch to carry out TAP aggregation, first enter TAP aggregation configuration mode using the `tap aggregation` command, then set the mode to exclusive.

**Note:** The switch can also perform TAP aggregation in mixed mode. See [Mixed Mode Configuration](#).

### Example

- These commands enter TAP aggregation configuration mode, then place the switch in TAP aggregation exclusive mode.

```
switch(config)#tap aggregation
switch(config-tap-agg)#mode exclusive
switch(config-tap-agg)#show active
tap aggregation
  mode exclusive
switch(config-tap-agg)#
```

To return the switch to switching mode, remove the `mode` command from *running-config*.

### Examples

- These commands enter TAP aggregation configuration mode, then place the switch in switching mode.

```
switch(config)#tap aggregation
switch(config-tap-agg)#no mode
switch(config-tap-agg)#show active
switch(config-tap-agg)#
```

- These commands enter switching mode and remove all TAP aggregation configuration mode statements.

```
switch(config)#no tap aggregation
switch(config)#
```

## 19.1.3.2 TAP Aggregation Mixed Mode

On a modular switch, the user can configure TAP Aggregation on some linecards and leave other linecards to operate normally. This is referred to as TAP aggregation mixed mode.

- [Mixed Mode Platform Compatibility](#)
- [Mixed Mode Configuration](#)

### 19.1.3.2.1 Mixed Mode Platform Compatibility

The following platforms support TAP Aggregation Mixed Mode.

- DCS-7500R
- DCS-7500R2

### 19.1.3.2.2 Mixed Mode Configuration

Complete the following steps to configure Linecard 3 as a TAP aggregation linecard in mixed mode.

1. Enable the switch for configuration.

```
switch>configure terminal
```

2. Enable TAP aggregation.

```
switch(config)#tap aggregation
```

3. Enable TAP aggregation mixed mode, selecting the targeted linecard module using the TAP aggregation default.

```
switch(config-tap-agg)#mode mixed module linecard 3 tap-aggregation-default
```

**Note:** Changing modes may affect available functionality. Unsupported configuration elements will be ignored.

The profile selection in mixed mode is the same as in exclusive mode. The user can configure multiple linecards for TAP aggregation in mixed mode.

The user can check TAP Aggregation Mixed Mode status by executing the following show commands:

```
switch(config)#show running-config section tap
tap aggregation
  mode mixed module linecard 3 profile tap-aggregation-default
switch(config)#show hardware tcam profile
Linecard4          Configuration      Status
Linecard3          default           tap-aggregation-default
Linecard6          default           default
switch(config)#
```

### 19.1.3.3 TAP Port Configuration

TAP ports function when the switch is in TAP aggregation mode. TAP ports receive traffic for replication to one or more tool ports. In TAP aggregation mode, TAP ports are in STP forwarding state and prohibit egress traffic. MAC learning, control plane interaction and traps for inbound traffic are disabled.

TAP mode ports are configured through switchport mode commands. TAP mode command settings persist in *running-config* without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP aggregation mode.

This section describes the following tap port configuration steps.

- [Configuring an Interface as a TAP Mode Port](#)
- [TAP Port Allowed VLAN List Configuration](#)
- [TAP Port Native VLAN](#)
- [TAP Port Packet Truncation](#)

#### Configuring an Interface as a Tap Mode Port

Ethernet and port-channel interfaces are configured as TAP ports with the `switchport mode` command.

##### Example

- These commands configure Ethernet interfaces 41 through 43 as TAP mode ports.

```
switch(config)#interface ethernet 41-43
```

```

switch(config-if-Et41-43)#switchport mode tap
switch(config-if-Et41-43)#show interface ethernet 41-43 tap
Port          Configured      Status      Native   Id
Truncation    Default
              Mode              Vlan      Vlan
-----
-----
Et41          tap             tap         1        1        0
---
Et42          tap             tap         1        1        0
---
Et43          tap             tap         1        1        0
---
switch(config-if-Et41-43)#

```

### TAP Port Allowed VLAN List Configuration

By default, TAP mode interfaces handle tagged traffic for all VLANs. The `switchport tap allowed vlan` command creates or modifies the set of VLANs for which a TAP port handles tagged traffic.

#### Example

These commands create TAP-mode allowed VLAN lists for Ethernet interfaces 41 through 43.

```

switch(config)#interface ethernet 41
switch(config-if-Et41)#switchport tap allowed vlan 401-410
switch(config-if-Et41)#interface ethernet 42
switch(config-if-Et42)#switchport tap allowed vlan 411-420
switch(config-if-Et41)#interface ethernet 41-42
switch(config-if-Et41-42)#show active
interface Ethernet41
  switchport mode tap
  switchport tap allowed vlan 401-410
interface Ethernet42
  switchport mode tap
  switchport tap allowed vlan 411-420
switch(config-if-Et41-42)#

```

### TAP Port Native VLAN

Tap mode Interfaces associate untagged frames with the tap mode native VLAN. The `switchport tap native vlan` command specifies the TAP-mode native VLAN for the configuration-mode interface. The default TAP-mode native VLAN for all interfaces is VLAN 1.

#### Example

These commands assign VLAN 400 as the TAP-mode native VLAN for Ethernet interface 41.

```

switch(config)#interface ethernet 41
switch(config-if-Et41)#switchport tap native vlan 400
switch(config-if-Et41)#show interface ethernet 41-43 tap

```

| Port    | Configured | Status | Native | Id   | Truncation |
|---------|------------|--------|--------|------|------------|
| Default | Mode       |        | Vlan   | Vlan |            |
| Group   |            |        |        |      |            |
| Et41    | tap        | tap    | 400    | 1    | 0          |
| Et42    | tap        | tap    | 1      | 1    | 0          |
| Et43    | tap        | tap    | 1      | 1    | 0          |

```
switch(config-if-Et41)#
```

### TAP Port Packet Truncation

TAP ports can be configured to truncate inbound packets. The `switchport tap truncation` command configures the configuration-mode interface, as a TAP port, to truncate inbound packets to the specified packet size. By default, TAP ports do not truncate packets.

**Examples**

- These commands configure Ethernet interface 41 to truncate packets to 150 bytes.

```
switch(config)#interface ethernet 41
switch(config-if-Et41)#switchport tap truncation 150
switch(config-if-Et41)#show interface ethernet 41-43 tap
```

| Port    | Configured | Status | Native | Id   | Truncation |
|---------|------------|--------|--------|------|------------|
| Default | Mode       |        | Vlan   | Vlan |            |
| Group   |            |        |        |      |            |
| Et41    | tap        | tap    | 400    | 1    | 150        |
| Et42    | tap        | tap    | 1      | 1    | 0          |
| Et43    | tap        | tap    | 1      | 1    | 0          |

```
switch(config-if-Et41)#
```

- These commands configure Ethernet interface 41 to send complete packets for replication.

```
switch(config-if-Et41)#no switchport tap truncation
switch(config-if-Et41)#show interface ethernet 41 tap
```

| Port    | Configured | Status | Native | Id   | Truncation |
|---------|------------|--------|--------|------|------------|
| Default | Mode       |        | Vlan   | Vlan |            |
| Group   |            |        |        |      |            |
| Et41    | tap        | tap    | 400    | 1    | 0          |

```
switch(config-if-Et41)#
```

### 19.1.3.4 Tool Port Configuration

Tool ports replicate traffic received by TAP ports. Tool ports are mapped to the TAP ports through TAP aggregation groups. A tool port may belong to multiple aggregation groups and an aggregation group may contain multiple tool ports.

Tool ports function when the switch is in TAP aggregation mode. In this switch mode, tool ports are in STP forwarding state and ingress traffic is prohibited. MAC learning, control plane interaction, and traps for inbound traffic are disabled. All control plane interaction is prevented and L2 agents do not send PDUs to tool-mode interfaces. When the switch is in switching mode, tool ports are error-disabled.

Tool-mode ports are configured through switchport commands. Tool-mode command settings persist in **running-config** without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP aggregation mode.

This section describes the following tool port configuration steps.

- [Configuring an Interface as a Tool-mode Port](#)
- [Tool Port Allowed VLAN List Configuration](#)
- [Tool Port Packet Truncation](#)

#### Configuring an Interface as a Tool-mode Port

Ethernet and port channel interfaces are configured as tool ports with the `switchport mode` command.

#### Example

These commands configure port-channel interfaces 101 through 103 as tool-mode ports and display the result.

```
switch(config)#interface port-channel 101-103
switch(config-if-Po101-103)#switchport mode tool
switch(config-if-Po101-103)#show interface port-channel 101-103
tool
```

| Port      | Configured | Status | Allowed | Id  |
|-----------|------------|--------|---------|-----|
| Timestamp | Mode       |        | Vlans   | Tag |
| Mode      | -----      |        |         |     |
| Po101     | tool       | tool   | All     | Off |
| ---       |            |        |         |     |
| Po102     | tool       | tool   | All     | Off |
| ---       |            |        |         |     |
| Po103     | tool       | tool   | All     | Off |
| ---       |            |        |         |     |

```
switch(config-if-Po101-103)#
```

#### Tool Port Allowed VLAN List Configuration

By default, tool mode interfaces handle tagged traffic for all VLANs. The `switchport tool allowed vlan` command creates or modifies the set of VLANs for which a tool port handles tagged traffic.

#### Example

These commands create tool mode allowed VLAN lists for port-channel interfaces 101 through 103.

```
switch(config)#interface port-channel 101-103
switch(config-if-Po101-103)#switchport tool allowed vlan
1010-1020
switch(config-if-Po101-103)#interface port-channel 101
switch(config-if-Po101)#switchport tool allowed vlan add
1001-1009
switch(config-if-Po103)#interface port-channel 102
switch(config-if-Po102)#switchport tool allowed vlan remove
1016-1020
switch(config-if-Po102)#interface port-channel 103
switch(config-if-Po103)#switchport tool allowed vlan add
1021-1030
switch(config-if-Po103)#show interface port-channel 101-103 tool
Port      Configured      Status      Allowed      Id
Timestamp
Mode      Mode            Vlans      Tag
-----
-----
Po101     tool           tool       1001-1020   Off
---
Po102     tool           tool       1010-1015   Off
---
Po103     tool           tool       1010-1030   Off
---
switch(config-if-Po103)#
```

### Tool Port Packet Truncation

Tool ports can be configured to truncate outbound packets. The `switchport tool truncation` command configures the configuration-mode interface, as a tool port, to truncate outbound packets to 160 bytes. By default, tool ports do not truncate packets.

Tool port packet truncation is supported only on the 7150 series platform.

#### Examples

- These commands configure Ethernet interface 41, as a tool port, to truncate packets on egress to 160 bytes.

```
switch(config)#interface ethernet 41
switch(config-if-Et41)#switchport mode tool
switch(config-if-Et41)#switchport tool truncation 160
switch(config-if-Et41)#
```

- These commands configure Ethernet interface 41 to send complete packets.

```
switch(config-if-Et41)#no switchport tool truncation
switch(config-if-Et41)#
```

### 19.1.3.5 Per-linecard TCAM Profile Configuration

This feature gives the ability to specify different profiles for different linecards in mixed mode. The following platforms support per-linecard TCAM profile configuration:

- DCS-7500
- DCS-7500R
- DCS-7500R2

To enable the TAP aggregation mode and configure a TCAM profile for a linecard set, complete the following steps:

1. Enable the switch for configuration.

```
switch>configure terminal
```

2. Enable TAP aggregation mode.

```
switch(config)#tap aggregation
```

3. Configure the TCAM profile for a linecard set.

```
switch(config-tap-agg)#mode mixed module linecard 3,4 profile tap-
aggregation-default
switch(config-tap-agg)#mode mixed module linecard 5,6 profile tap-
aggregation-extended
switch(config-tap-agg)#
```

To disable TAP aggregation on a linecard set, complete the following steps:

1. Enable the switch for configuration.

```
switch>configure terminal
```

2. Enable TAP aggregation mode.

```
switch(config)#tap aggregation
```

3. Disable TAP aggregation for a linecard set.

```
switch(config-tap-agg)#no mode mixed module linecard 3,4
switch(config-tap-agg)#
```

**Note:** If a TAP is a port-channel, its members must all come from linecards using the same profile.

### 19.1.3.6 Two-Way Ports for TAP Aggregation

While in TAP aggregation mode, there is support for traffic only in one direction through either TAP ports that receive packets from mirroring, or through optical TAP or tool ports that send out packets to customer devices. Two-way ports for TAP aggregation allow bidirectional transmit and receive capability on a single port in TAP aggregation mode. Using the TAP-tool switchport mode enables both TAP and tool configurations simultaneously on an interface.

- [Two-Way Ports Platform Compatibility](#)
- [Two-Way Ports Configuration](#)

#### 19.1.3.6.1 Two-Way Ports Platform Compatibility

The following platforms support two-way ports for TAP aggregation.

- DCS-7280R
- DCS-7280R2
- DCS-7500R
- DCS-7500R2

### 19.1.3.6.2 Two-Way Ports Configuration

To enable a two-way port, use the **tap-tool** option of the `switchport mode` command.

#### Example

The following commands configure Ethernet interface 4/1 as a two-way port, allowing it to function as both a TAP and a tool port.

```
switch(config)#interface ethernet 4/1
switch(config-if-Et4/1)#switchport mode tap-tool
switch(config-if-Et4/1)#
```

Additional configurations for TAP and tool functionality on the interface remain the same. Once the user enables the TAP-tool switchport mode on the interface, they can use the existing TAP and tool mode commands to enable their respective configurations.

Arista recommends using this feature with unidirectional send-receive enabled on the interface, which allows the receiver and transmitter for the interface to operate independently. If one goes down, the other remains active. To enable unidirectional send-receive on an interface, use the **unidirectional send-receive** command.

#### Example

These commands enable unidirectional send-receive on Ethernet interface 4/1.

```
switch(config)#interface ethernet 4/1
switch(config-if-Et4/1)#unidirectional send-receive
switch(config-if-Et4/1)#
```

### 19.1.3.7 TAP Aggregation QoS Handling on TAP Ports

Before EOS 4.20.5F, QoS behavior was not enforced for TAP aggregation ports, meaning that QoS behavior for packets passing through the device was not changed.

- [QoS Handling Platform Compatibility](#)
- [QoS Handling Configuration](#)
- [Displaying QoS Handling Status](#)

#### 19.1.3.7.1 QoS Handling Platform Compatibility

The following platforms support QoS handling on TAP ports.

- DCS-7280E
- DCS-7280R
- DCS-7500E
- DCS-7500R
- DCS-7280R2

**Note:** QoS is not available on TAP aggregation ports on the DCS-7150.

### 19.1.3.7.2 QoS Handling Configuration

#### Trust Mode of TAP Ports

TAP ports are in QoS untrusted mode by default. This means that the QoS marking of an incoming packet is not trusted when determining the QoS attributes of the packet. Therefore, the default QoS handling takes place. Consider the default CoS to traffic class mapping in the following example.

```
switch(config)#show qos maps
[...]
Cos-tc map:
  cos:  0  1  2  3  4  5  6  7
  -----
  tc:   1  0  2  3  4  5  6  7
[...]
```

The Class of Service (CoS) field of incoming packets is ignored and is assumed to be zero. In this example, all packets are assigned to traffic class 1 when using the above mapping.

To override the default trust mode behavior on a TAP port, use the `qos trust` command.

#### Example

The following commands override the default trust mode behavior on Ethernet port 1, configuring it to use Class of Service (CoS) trust mode instead so that incoming packets will be placed in their CoS-marked classes.

```
switch(config-if-Et1)#qos trust cos
switch(config-if-Et1)#
```

#### Class of Service Rewrite of TAP Ports

By default, TAP ports do not override the existing Class of Service (CoS) field of incoming packets. In other words, the CoS marking of steered packets is not changed in any way.

However, the CoS field of added tags may change according to the traffic class to CoS mapping. For example, the identity tag added by TAP ports may have the CoS value from the global traffic class to CoS mapping. Consider the following mapping:

```
switch(config)#show qos maps
[...]
Tc-cos map:
  tc:   0  1  2  3  4  5  6  7
  -----
  cos:  1  7  2  3  4  5  6  0
[...]
```

Using this mapping, the added tag CoS field of packets assigned to traffic class 1 may be set to 7.

### 19.1.3.7.3 Displaying QoS Handling Status

Use the [Displaying QoS Handling Status](#) to see the active QoS mappings.

## Example

This command displays the QoS maps that are configured on the switch.

```
switch#show qos maps
Number of Traffic Classes supported: 8
Number of Transmit Queues supported: 8
Cos Rewrite: Disabled
Dscp Rewrite: Disabled

Cos-tc map:
cos:  0  1  2  3  4  5  6  7
-----
tc:   1  0  2  3  4  5  6  7

Dscp-tc map:
d1 :  d2 0  1  2  3  4  5  6  7  8  9
-----
0 :    1  1  1  1  1  1  1  1  0  0
1 :    0  0  0  0  0  0  2  2  2  2
2 :    2  2  2  2  3  3  3  3  3  3
3 :    3  3  4  4  4  4  4  4  4  4
4 :    5  5  5  5  5  5  5  5  6  6
5 :    6  6  6  6  6  6  7  7  7  7
6 :    7  7  7  7

Tc-cos map:
tc:   0  1  2  3  4  5  6  7
-----
cos:  1  0  2  3  4  5  6  7

Tc-dscp map:
tc:   0  1  2  3  4  5  6  7
-----
dscp: 8  0 16 24 32 40 48 56

Tc - tx-queue map:
tc:           0  1  2  3  4  5  6  7
-----
tx-queue: 0  1  2  3  4  5  6  7

switch#
```

### 19.1.3.8 Identity VLAN Tagging

By default, tool port output packets are identical to the replicated packets they receive from the tap ports to which they are associated. Identity tagging modifies packets sent by tool ports by adding a dot1q VLAN tag that identifies the originating TAP port. Each TAP port is associated with an identity number. Tool ports that are configured to add an identity tag append the originating TAP port's identity number in the outer layer (or s-VLAN) tag.

The following sections describe identity VLAN tagging on TAP and tool ports.

- [Tap Port Identity Value Configuration](#)
- [Tool Port Identity Tag Configuration](#)

### Tap Port Identity Value Configuration

The `switchport tap identity` command configures the TAP port identity value for the configuration-mode interface. The default identity value for all TAP ports is 1.

#### Example

These commands configure 1042 as the identity value for Ethernet interface 42 and display the result.

```
switch(config)#interface ethernet 42
switch(config-if-Et42)#switchport tap identity 1042
switch(config-if-Et42)#show interface ethernet 41-43 tap
```

| Port    | Configured | Status | Native | Id   | Truncation |
|---------|------------|--------|--------|------|------------|
| Default | Mode       |        | Vlan   | Vlan |            |
| Group   |            |        |        |      |            |
| Et41    | tap        | tap    | 400    | 1    | 0          |
| Et42    | tap        | tap    | 1      | 1042 | 0          |
| Et43    | tap        | tap    | 1      | 1    | 0          |

```
switch(config-if-Et42)#
```

### Tool Port Identity Tag Configuration

The `switchport tool identity` command configures the configuration-mode interface to include a tier-1 VLAN tag (dot1q) in packets it transmits. The VLAN number on the dot1q tag is the identity value configured for the TAP port that supplies the packets. By default, tool ports do not encapsulate packets with the tier-1 VLAN tag.

#### Example

These commands configure port channel 102 to include the identity tag in packets it transmits.

```
switch(config)#interface port-channel 102
switch(config-if-Po102)#switchport tool identity dot1q
switch(config-if-Po102)#show interface port-channel 101-103 tool
```

| Port      | Configured | Status | Allowed   | Id  |
|-----------|------------|--------|-----------|-----|
| Timestamp | Mode       |        | Vlans     | Tag |
| Mode      |            |        |           |     |
| Po101     | tool       | tool   | 1001-1020 | Off |
| Po102     | tool       | tool   | 1010-1015 | On  |
| Po103     | tool       | tool   | 1010-1030 | Off |

```
switch(config-if-Po102)#
```

### 19.1.3.9 TAP Aggregation Group Configuration

TAP aggregation groups associate a set of TAP ports with a set of tool ports. A tool port replicates packets it receives from TAP ports that are in the aggregation groups to which it belongs. A TAP port can be configured to send data to multiple TAP aggregation groups. Tool ports may belong to multiple TAP aggregation groups. TAP aggregation groups may contain multiple TAP ports and multiple tool ports.

The following sections describe the configuration of TAP aggregation groups:

- [Assigning a Tool Port to a TAP Aggregation Group](#)
- [Assigning TAP Ports to a TAP Aggregation Group](#)
- [Viewing TAP Aggregation Group Assignments](#)
- [LAGs in Tool Groups](#)

#### Assigning a Tool Port to a TAP Aggregation Group

Tool ports are assigned to a TAP aggregation group through the `switchport tool group` command. Each command either creates a list or alters the existing list of groups to which a tool port belongs.

#### Examples

- These commands create the list of TAP aggregation groups for port-channel interface 101.

```
switch(config)#interface port-channel 101
switch(config-if-Po101)#switchport tool group set analyze1
analyze2 analyze3
switch(config-if-Po101)#show active
interface Port-Channel101
  switchport mode tool
  switchport tap identity 2101
  switchport tool allowed vlan 1001-1020
  switchport tap default group tag-9
  switchport tool group set analyze3 analyze1 analyze2
switch(config-if-Po101)#
```

- These commands remove “analyze-1” from port channel 101’s TAP aggregation group list.

```
switch(config-if-Po101)#switchport tool group remove analyze1
switch(config-if-Po101)#show active
interface Port-Channel101
  switchport mode tool
  switchport tap identity 2101
  switchport tool allowed vlan 1001-1020
  switchport tap default group tag-9
  switchport tool group set analyze3 analyze2
switch(config-if-Po101)#
```

#### Assigning TAP Ports to a TAP Aggregation Group

TAP ports are assigned to a TAP aggregation group using the `switchport tap default group` command. Multiple ports are added to a group by entering the command in interface configuration mode for each port.

### Example

These commands assign Ethernet interfaces 41 through 43 to TAP aggregation groups “analyze2” (41 and 42) and “analyze3” (43).

```
switch(config)#interface ethernet 41-42
switch(config-if-Et41-42)#switchport tap default group analyze2
switch(config-if-Et41-42)#interface ethernet 43
switch(config-if-Et43)#switchport tap default group analyze3
switch(config-if-Et43)#show interface ethernet 41-43 tap
Port          Configured      Status          Native   Id   Truncation
  Default
  Mode
  Vlan   Vlan
-----
Et41     tap           tap            400     1   0
analyze2
Et42     tap           tap             1     1042 0
analyze2
Et43     tap           tap             1       1   0
analyze3
switch(config-if-Et43)#
```

### Viewing TAP Aggregation Group Assignments

TAP aggregation group membership is displayed by `show tap aggregation groups`. Options allow the display of individual groups or of all configured groups. The command displays active tool and TAP ports by default, and provides an option to display configured ports that are not active.

### Example

This command displays the contents of all configured TAP aggregation groups.

```
switch#show tap aggregation groups
Group Name                               Tool Members
-----
analyze2                                 Po101, Po102
analyze3                                 Po101, Po103

Group Name                               Tap Members
-----
analyze2                                 Et41, Et42
analyze3                                 Et43
switch#
```

### LAGs in Tool Groups

Link Aggregation Groups (LAGs) can be included in tool groups for load balancing. A tool group can contain both LAGs and regular ports. Each member of a tool group receives one copy of the traffic destined to the group. Traffic is replicated to tool group members using multicast replication. The traffic replicated to LAGs is then load balanced to their members as per load-balance policies configured on the system.

---

If a tool group has no more than 60 members with at least one hardware LAG, then the replication mode of the tool group is set to ingress-only. Otherwise, the replication mode of the tool group is set to the configured system default multicast replication mode. See [platform sand multicast replication default](#) for more information on configuration of the system default replication mode.

#### Example

The following command changes the system-wide default multicast replication mode to ingress.

```
switch(config)#platform sand multicast replication default
  ingress
switch(config)#
```

### 19.1.4 TAP Aggregation Traffic Steering

Traffic steering is a TAP aggregation process that uses class maps and policy maps to direct data streams at tool ports that are not otherwise associated to the ingress TAP port. A policy map is a data structure that filters data streams upon which identity VLAN tagging or TAP aggregation group assignment is implemented.

TAP-aggregation class maps and policy maps are similar to QoS and control-plane maps. However, policy maps and their components are not interchangeable among function types.

#### 19.1.4.1 TAP Aggregation Policies

A policy map filters data packets by using classes and match rules. Each class contains an eponymous class map and a traffic resolution command. Each match rule contains packet content descriptors and a traffic resolution parameter.

- A class map uses ACLs that identify packets that comprise a specified data stream
- Packet content descriptors specify packet field values that are compared to inbound packets.
- A traffic resolution command or parameter specifies data handling methods for filtered traffic.

Each data packet entering an entity to which a policy map is assigned is managed as defined by the traffic resolution command of the highest priority class or rule that matches the packet.

Class maps are user-created and can be edited or deleted. They filter traffic with IPv4 ACLs and are listed in **running-config**. TAP aggregation traffic resolution commands do one the following:

- specify a TAP aggregation group to direct the packet.
- specify a VLAN number for identity tagging the packet.

TAP aggregation policy maps do not define an implicit deny statement. Packets that do not match a policy map class or rule are replicated and sent out tool ports specified by the default aggregation group assigned to the ingress TAP port. If no default group is selected, these packets are dropped.

#### 19.1.4.2 Configuring TAP Aggregation Traffic Policies

TAP aggregation traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port-channel interfaces.

##### Creating Class Maps

A class map is an ordered list of IPv4 access control lists (ACLs). Each ACL is assigned a sequence number that specifies its priority in the class map. TAP aggregation class maps utilize ACL permit rules to pass packets and deny rules to drop packets.

Class maps are created and modified in class-map configuration mode, which is entered using the **class-map type tapagg**. The **match (class-map (tapagg))** command inserts a specified ACL into the class map, assigning it a sequence number that denotes its placement.

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The **show active** command displays the saved version of class map. The **exit** command returns the switch to global configuration mode and saves pending class-map changes. The **abort** command returns the switch to global configuration mode and discards pending changes.

### Examples

- This command creates a TAP aggregation class map named **t-class\_1** and places the switch in class-map configuration mode.

```
switch(config)#class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#
```

- These commands add two IPv4 ACLs (**tacl-1** and **tacl-2**) to the **t-class\_1** class map. The commands use the default method of assigning sequence numbers to the ACLs.

```
switch(config-cmap-t-class_1)#match ip access-group tacl-1
switch(config-cmap-t-class_1)#match ip access-group tacl-2
switch(config-cmap-t-class_1)#
```

- These commands exit class-map configuration mode, store pending changes to **running-config**, then display the class map.

```
switch(config-cmap-t-class_1)#exit
switch(config)#class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#show active
class-map type tapagg match-any t-class_1
10 match ip access-group tacl-1
20 match ip access-group tacl-2
switch(config-cmap-t-class_1)#
```

### Creating Policy Maps

Policy maps are created and modified in policy-map configuration mode. A policy map is an ordered list of classes and match rules. Policy maps are edited by adding or removing map elements. Data packets are managed by commands of the highest priority class or rule that matches the packet.

#### Classes

Each class contains a class map, a set command, and a sequence number:

- The **class map** identifies a data stream by using an ordered list of ACLs. Class maps are configured in class-map (tapagg) configuration mode.
- The **set** command specifies the replication method for filtered data packets, either through an associated aggregation group or identity VLAN tagging.
- The **sequence number** specifies the class's priority within the policy map. Lower sequence numbers denote higher priority.

#### Matching Rules

Each rule contains a filter list, an action, and a sequence number:

- The **filter list** identifies a data stream by using a set of packet field values.
- The action, (**SET\_VALUE** parameter) specifies the replication method of filtered data packets, either through an associated aggregation group or identity VLAN tagging.

- The **sequence number** specifies the rule's priority within the policy map. Lower sequence numbers denote higher priority.

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** and **show pending** commands display the saved and modified policy map versions respectively.

The **class (policy-map (tapagg))** command enters policy-map configuration mode.

### Example

This command creates the TAP aggregation policy map named **t-policy\_1** and places the switch in policy-map configuration mode.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#
```

The **class (policy-map (tapagg))** command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode for adding a traffic resolution command to the class. The **set (policy-map-class (tapagg))** command specifies the data replication method for traffic filtered by the associated class map in the configuration-mode policy map. The **set** command performs one of the following replication actions for filtered data packets.

- specifies an aggregation group.
- specifies a VLAN identity tag for replicated packets.
- specifies an aggregation group and a VLAN identity tag.

### Examples

- These commands add the **t-class\_1** class map to the **t-policy\_1** policy map, associate a set statement with the class, then save the policy map by exiting the modes. Packets filtered by the class map are identity tagged with **VLAN 444** and replicated as specified by the **t-grp** aggregation group.

```
switch(config-pmap-t-policy_1)#class t-class_1
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group
t-grp id-tag 444
switch(config-pmap-c-t-policy_1-t-class_1)#exit
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
10 class t-class_1
set aggregation-group t-group id-tag 444
switch(config-pmap-t-policy_1)#
```

The **match (policy-map (tapagg))** command adds a match rule to the configuration-mode TAP aggregation policy map.

- This command enters policy-map configuration mode for **t-policy\_1**, then creates a match rule for the policy map that filters OSPF packets and replicates them as specified by **t-grp** TAP aggregation group.

```
switch(config-pmap-t-policy_1)#match ip ospf any any set
aggregation-group t-grp
switch(config-pmap-t-policy_1)#
```

### Applying Policy Maps to an Interface

The **service-policy type tapagg (Interface mode)** command applies a specified policy map to the configuration-mode interface.

## Example

These commands apply the *t-policy\_1* policy map to *interface ethernet 17*.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#service-policy type tapagg input tpolicy_1
switch(config-if-Et17)#
```

## Stripping VLAN Tags

The traffic-steering policies in tap aggregation mode allows steering traffic from tap ports to tool ports using `set (policy-map-class (tapagg))` command, while the 'set id-tag' tags the traffic with the specified VLAN ID in the dot1q format. The `class (policy-map (tapagg))` command allows removing VLAN tags from the steered traffic. It supports all traffic types that the traffic steering policies support such as IPv4, IPv6, and MAC.

A tap port is an interface that receives a data stream where two network ports exchange.

A tool port is an interface that replicates data streams received by one or more tap ports. Tool ports connect to the devices that process monitored data streams.

## Example

These commands place the switch in policy-map-class to add the t-class\_1 class map to the t-policy\_1 policy map. The first, second, or both of the 2 outer-most VLAN tags are stripped.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#class t-class_1
switch(config-pmap-t-policy_1-t-class_1)#set aggregation-group t-group
  remove dot1q outer 1-2
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-group
  id-tag 10
switch(config-pmap-c-t-policy_1-t-class_1)#set id-tag 10 remove dot1q
  outer 1
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-group
switch(config-pmap-c-t-policy_1-t-class_1)#set id-tag 10
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-group
  id-tag 10 remove dot1q outer 1-2
```

## 19.1.5 TAP Aggregation GUI

The switch provides a graphical user interface (GUI) for creating and viewing a TAP aggregation configuration and displaying LANZ traffic statistics.

All commands available on the GUI are accessible through the CLI. The TAP aggregation configuration created through either the CLI or the GUI can be viewed and modified through either medium.

This section provides a brief description of the TAP aggregation GUI.

### 19.1.5.1 Accessing the TAP Aggregation GUI

The URL for the TAP aggregation GUI is: <https://hostname/apps/TapAgg/index.html> where the hostname is the switch's configured hostname. The "TAP Aggregation GUI Initial Panel" displays the initial TAP aggregation GUI panel for the switch with the hostname "ro402."

The TAP aggregation panel contains two sections:

- The **configuration section** displays the TAP aggregation configuration, including the TAP interfaces, tool interfaces, and aggregation groups. Links are displayed to indicate interface group membership.

- The component section displays information and control buttons for the active configuration entity. When an entity is not selected, the section displays information for the switch (device).

The configuration section displays TAP aggregation components only when the switch is in TAP aggregation mode. To enter TAP aggregation mode, click the TAP Aggregation icon in the component section for the device. The icon is a toggle mechanism; clicking it again disables TAP aggregation mode.

Figure 123: TAP Aggregation GUI Initial Panel

### 19.1.5.2 Viewing TAP Aggregation Component Details

“[TAP Aggregation GUI Panel with TAP Aggregation Mode Enabled](#)” displays the TAP aggregation panel when the switch is in TAP aggregation mode. The configuration section indicates that the TAP aggregation configuration consists of three tool interfaces, one TAP interface, and four aggregation groups. Ethernet port 10 is the active component; configuration control and traffic information for this interface is available in the component section.

The active component is changed by clicking on the desired component in the configuration section. To display device (switch) information, click on any configuration section outside of any component.

### 19.1.5.3 Modifying a TAP Aggregation Configuration

The TAP aggregation configuration can be modified only when the switch is in TAP aggregation mode, (see [Accessing the TAP Aggregation GUI](#)). The following is a partial list of configuration tasks that are available from the GUI:

- **adding a TAP or tool interface:** begin typing the interface name in the desired add-interface data entry area to access a drop-down list of available interfaces. Select the desired interface and press the **Add** button.
- **removing an interface from the configuration:** select the desired interface in the configuration section and click the deconfigure button in that interface’s component section.
- **adding an aggregation group:** type the desired name of the new group in the data entry area and press the **Add** button. The TAP aggregation group name can consist of alphanumeric characters and specific special characters (- \_ [ ] { } :) only.

- **adding an interface to an aggregation group:** select the desired interface in the configuration section, then press the icon of the group in the group membership area of the interface's component section.

Group icons are toggle buttons; clicking the icon of a group to which the interface belongs removes that interface from the group.

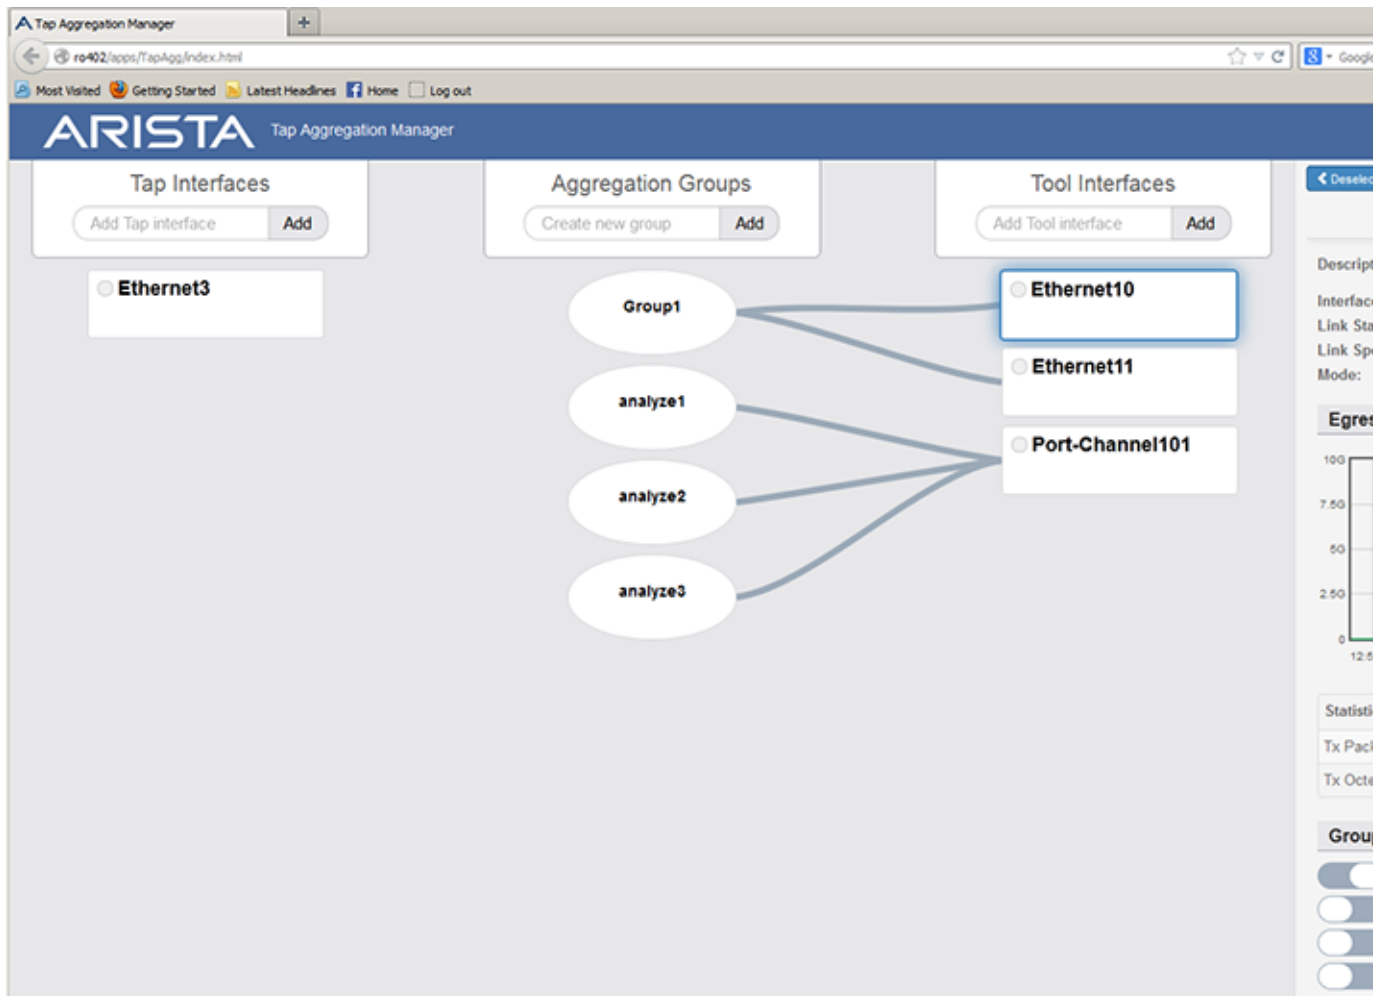

Figure 124: TAP Aggregation GUI Panel with TAP Aggregation Mode Enabled

## 19.1.6 TAP Aggregation Keyframe and Timestamp Configuration

This section contains the following topics:

- [TAP Aggregation Keyframe and Timestamp Configuration](#)
- [Enabling Timestamp Insertion on an Interface](#)

### 19.1.6.1 TAP Aggregation Keyframe Generation

Keyframes contain routable IP packets that provide information to relate timestamps with the complete ASIC counter and absolute UTC time. The switch supports a maximum of ten keyframes, which are distinguished by their name label. Each keyframe can egress from every Ethernet port.

Keyframe generation is enabled by the `platform fm6000 keyframe` command. Command options specify ports that transmit keyframes along with the destination MAC address and IP address in the keyframe's header. Other keyframe commands specify the transmission rate and the frame's source:

- the `platform fm6000 keyframe rate` command configures the keyframe's transmission rate.

- the `platform fm6000 keyframe source` command configures the source IP address that is placed in each keyframe's header. The management interface IP address is the default source address.

The source MAC address is the MAC address of the egress interface transmitting the keyframe.

- the `platform fm6000 keyframe device` command configures the 16-bit number that keyframes list as the device ID in their payload.
- the `platform fm6000 keyframe fields skew` command enables the inclusion of clock skew fields in the keyframe.
- the `show platform fm6000 keyframe` command displays keyframe configuration information.

### Examples

- This command enables the generation of a keyframe named "key-1" and configures it to egress from Ethernet interfaces 11 through 15 with a source IP address of 10.21.1.4 and a MAC address of 10.4E21.9F11.

```
switch(config)#platform fm6000 keyframe key-1 interface
ethernet 11-15 10.21.1.4 10.4E21.9F11
switch(config)#
```

- This command configures the generation rate for the keyframe of 10 frames per second on each of the five interfaces that it is configured to egress.

```
switch(config)#platform fm6000 keyframe key-1 rate 10
switch(config)#
```

- This command enables the generation of a keyframe named "key-1" and configures 100 as the value that is placed in the keyframe's device ID field.

```
switch(config)#platform fm6000 keyframe key-1 device 100
switch(config)#
```

- This command enables the inclusion of clock skew fields in the keyframe named "key-1."

```
switch(config)#platform fm6000 keyframe key-1 fields skew
switch(config)#
```

- This command displays configuration information for keyframe "key-1."

```
switch(config)#show platform fm6000 keyframe

Keyframe key-1
-----
Egress Interface(s): Ethernet11, Ethernet12, Ethernet13,
Ethernet14, Ethernet15
Source IP: 172.22.30.142
Destination IP: 10.21.1.4
Destination MAC: 00:10:4e:21:9f:11
Device ID: 100
Rate: 10 packet(s) per second

switch(config)#
```

### 19.1.6.2 Enabling Timestamp Insertion on an Interface

Timestamps are based on a frame's ingress time and applied to frames sent on egress ports, ensuring that timestamps on monitored traffic reflect ingress timing of the original frames. Time-stamping is configured on the egress port where the timestamp is applied to the frame.

When timestamping is enabled on an egress interface, packets leave the interface with timestamps that were applied in hardware when the packet arrived at the switch. This is facilitated by applying a hardware timestamp to all frames arriving on all interfaces when timestamping is enabled on any interface, then removing timestamps on packets egressing interfaces where timestamping is not enabled.

The `mac timestamp` command enables time-stamping on the configuration-mode interface. The switch supports two timestamp modes, which differ in managing the egress frame's 32-bit frame check sequence (FCS):

- **before-fcs:** the switch discards the original FCS, appends the ingress timestamp at the end of the frame data, recalculates a new FCS based on the appended timestamp, then appends the new FCS to the end of the frame. This creates a valid Ethernet frame but does not update headers of any nested protocols.
- **replace-fcs:** the switch replaces the original FCS with the timestamp. This mode maintains the size of the original frame without any latency impact, but the FCS is not valid.

#### Examples

- These commands enable timestamping in before-fcs mode on Ethernet interface 44.

```
switch(config)#interface ethernet 44
switch(config-if-Et44)#mac timestamp before-fcs
switch(config-if-Et44)#show active
interface Ethernet44
    mac timestamp before-fcs
switch(config-if-Et44)#
```

- These commands disable timestamping on Ethernet interface 44.

```
switch(config-if-Et44)#no mac timestamp
switch(config-if-Et44)#show active
interface Ethernet44
switch(config-if-Et44)#
```

---

## 19.1.7 TAP Aggregation Commands

### Global Configuration Commands

- platform fm6000 keyframe
- platform fm6000 keyframe device
- platform fm6000 keyframe fields skew
- platform fm6000 keyframe rate
- platform fm6000 keyframe source
- platform sand multicast replication default
- platform sand multicast replication ingress maximum
- tap aggregation

### Interface Configuration Commands

- mac timestamp
- switchport tap allowed vlan
- switchport tap default group
- switchport tap identity
- switchport tap native vlan
- switchport tap truncation
- switchport tool allowed vlan
- switchport tool group
- switchport tool identity

### Tap Aggregation Configuration Mode

- mode (tap-agg configuration mode)
- mode exclusive no-errdisable (tap-agg configuration mode)

### Tap Aggregation Traffic Steering

- class-map type tapagg
- match (class-map (tapagg))
- match (policy-map (tapagg))
- resequence (class-map (tapagg))
- resequence (policy-map (tapagg))
- service-policy type tapagg (Interface mode)
- set (policy-map-class (tapagg))

### Display Commands EXEC Mode

- show interfaces tap
- show interfaces tool
- show platform fm6000 keyframe
- show platform sand mcast capacity
- show tap aggregation groups

### 19.1.7.1 class (policy-map (tapagg))

The `class (policy-map (tapagg))` command places the switch in policy-map-class (TAPagg) configuration mode, which is a group-change mode that defines a TAP aggregation class by associating the class's eponymous class-map to a `set` statement. Upon exiting the policy-map-class mode, the class is placed in the policy-map as specified by an assigned sequence number.

A policy map is an ordered list of classes and match rules. Each class contains a class map, a `set` command, and a sequence number:

- The class map identifies a data stream by using an ordered list of ACLs. Class maps are configured in class-map (tapagg) configuration mode. Data packets are managed by commands of the highest priority class or rule that matches the packet.
- `set` commands specify the replication method of filtered data packets, either through an associated aggregation group or identity VLAN tagging.
- Sequence numbers specify the class's priority within the policy map. Lower sequence numbers denote higher priority.

The `exit` command returns the switch to policy-map configuration mode. However, saving policymap-class changes also requires an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to **running-config** and returns the switch to global configuration mode. The `abort` command discards pending changes and returns the switch to global configuration mode.

The `no class` and `default class` commands remove the class assignment from the configuration mode policy map by deleting the corresponding class configuration from **running-config**.

#### Command Mode

Policy-Map (tapagg) Configuration accessed through `class (policy-map (tapagg))`

#### Command Syntax

```
[SEQ_NUM] class class_name
default [SEQ_NUM] class class_name
no [SEQ_NUM] class class_name
```

#### Parameters

- **SEQ\_NUM** priority of the class within the policy map. Lower numbers denote higher priority.
  - **<no parameter>** number is derived by adding 10 to number of the map's last class or rule.
  - **1 to 4294967295** number assigned to class.
- **class\_name** name of the class.

#### Guidelines

When a class is not associated with a `set (policy-map-class (tapagg))` command, the filtered traffic is managed as specified by the TAP port's default aggregation group.

#### Commands Available in Policy-map-class (tapagg) Configuration Mode

- `set (policy-map-class (tapagg))` assigns VLAN identity tag or tap aggregation group to class.
- `exit` returns the switch to parent policy map configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.

#### Related Commands

- `class (policy-map (tapagg))` places the switch in policy-map (tapagg) configuration mode.
- `match (policy-map (tapagg))` assigns a match rule to a TAP aggregation policy map.

#### Example

---

These commands place the switch in policy-map-class and add the **t-class\_1** class map to the **tpolicy\_1** policy map. Packets filtered by the class map are identity tagged with **VLAN 444**.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#class t-class_1
switch(config-pmap-c-t-policy_1-t-class_1)#set id-tag 444
switch(config-pmap-c-t-policy_1-t-class_1)#exit
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
10 class t-class_1
set id-tag 444
switch(config-pmap-t-policy_1)#
```

These commands place the switch in policy-map-class to add the t-class\_1 class map to the t-policy\_1 policy map. The first, second, or both of the 2 outer-most VLAN tags are stripped.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#class t-class_1
switch(config-pmap-t-policy_1-t-class_1)#set aggregation-group t-group
remove dot1q outer 1-2
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-group
id-tag 10
switch(config-pmap-c-t-policy_1-t-class_1)#set id-tag 10 remove dot1q
outer 1
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-group
switch(config-pmap-c-t-policy_1-t-class_1)#set id-tag 10
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-group
id-tag 10 remove dot1q outer 1-2
```

### 19.1.7.2 class-map type tapagg

The **class-map type tapagg** command places the switch in class-map (tapagg) configuration mode, which is a group change mode that modifies a tapagg class map. A tapagg class map is a data structure that uses access control lists (ACLs) to define a data stream by specifying characteristics of data packets that comprise the stream. Tapagg policy maps use class maps to specify traffic that is managed by policy map criteria.

The **exit** command saves pending class map changes to **running-config**, then returns the switch to global configuration mode. Class map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes and returns the switch to global configuration mode.

The **no class-map type tapagg** and **default class-map type tapagg** commands delete the specified class map by removing the corresponding class-map type qos command and its associated configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
class-map type tapagg match-any class_name
```

```
no class-map type tapagg match-any class_name
```

```
default class-map type tapagg match-any class_name
```

#### Parameters

**class\_name** name of class map.

#### Commands Available in Class-Map (tapagg) Configuration Mode

- [match \(class-map \(tapagg\)\)](#)
- [resequence \(class-map \(tapagg\)\)](#)

#### Related Commands

[class \(policy-map \(tapagg\)\)](#)

#### Example

This command creates a TAP aggregation class map named **t-class\_1** and places the switch in class-map configuration mode.

```
switch(config)#class-map type tapagg match-any t-class_1  
switch(config-cmap-t-class_1)#
```

---

### 19.1.7.3 mac timestamp

The **mac timestamp** command enables timestamping on the configuration mode interface.

When timestamping is enabled on an egress interface, packets leave the interface with timestamps that were applied in hardware upon arriving at the switch. This is facilitated by applying a hardware timestamp to all frames arriving on all interfaces when timestamping is enabled on any interface, then removing timestamps on packets egressing interfaces where timestamping is not enabled.

The switch supports two timestamp modes, which differ in managing the egress frame's 32-bit frame check sequence (FCS):

- **before-fcs**: the switch discards the original FCS, appends the ingress timestamp at the end of the frame data, recalculates a new FCS based on the appended timestamp, then appends the new FCS to the end of the frame. This creates a valid Ethernet frame but does not update headers of any nested protocols.
- **replace-fcs**: the switch replaces the original FCS with the timestamp. This mode maintains the size of the original frame without any latency impact, but the FCS is not valid.

The **no mac timestamp** and **default mac timestamp** commands restore the default behavior of disabling timestamping on the configuration mode interface by removing the corresponding **mac timestamp** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
mac timestamp TS_PROPERTY
```

#### Parameters

- **TS\_PROPERTY** specifies the timestamp insertion mode. Options include:
  - **before-fcs** the ingress timestamp is appended to the frame and the FCS is recalculated.
  - **replace-fcs** the ingress timestamp replaces the original FCS.

#### Examples

- These commands enable timestamping in before-fcs mode on Ethernet interface 44.

```
switch(config)#interface ethernet 44
switch(config-if-Et44)#mac timestamp before-fcs
switch(config-if-Et44)#show active
interface Ethernet44
    mac timestamp before-fcs
switch(config-if-Et44)#
```

- These commands disable timestamping on Ethernet interface 44.

```
switch(config-if-Et44)#no mac timestamp
switch(config-if-Et44)#show active
interface Ethernet44
switch(config-if-Et44)#
```

### 19.1.7.4 match (class-map (tapagg))

The **match** command adds an ACL to the configuration-mode class map and associates a sequence number to the ACL. A class map is an ordered list of ACLs that define a data stream; the sequence number specifies an ACL's priority within the list. A class map is used by policy maps to filter data packets. Tapagg class maps utilize ACL permit rules to pass packets and deny rules to drop packets.

Class map (tapagg) configuration mode is a group change mode. **Match** statements are not saved to **running-config** until the edit session is completed by exiting the mode.

The **no match** and **default match** commands remove the specified **match** statement from the configuration-mode class map by deleting the corresponding **match** command from **running-config**.

#### Command Mode

Class-map (tagagg) Configuration accessed through **class-map type tapagg** command.

#### Command Syntax

```
[SEQ_NUM] match ip access-group list_name
no SEQ_NUM] match ip access-group list_name
default SEQ_NUM] match ip access-group list_name
```

#### Parameters

- SEQ\_NUM sequence number assigned to the ACL. Options include:
  - <no parameter> number is derived by adding 10 to the number of the map's last ACL.
  - **1 to 4294967295** number assigned to ACL.
- list\_name name of ACL assigned to class map.

#### Guidelines

**match** statements accept IPv4 ACLs.

#### Related Commands

- **class-map type tapagg** places the switch in Class-Map configuration mode.
- **exit** saves pending class map changes, then returns the switch to global configuration mode.
- **abort** discards pending class map changes, then returns the switch to global configuration mode.
- **class (policy-map (tapagg))** assigns a class map to a policy map.

#### Example

These commands add two IPv4 ACLs ("tacl-1" and "tacl-2") to the "t-class\_1" class map, save the command by exiting class-map mode, and re-enter the mode to display the added ACLs.

```
switch(config)#class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#match ip access-group tacl-1
switch(config-cmap-t-class_1)#match ip access-group tacl-2
switch(config-cmap-t-class_1)#exit
switch(config)#class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#show active
  class-map type tapagg match-any t-class_1
    10 match ip access-group tacl-1
    20 match ip access-group tacl-2
switch(config-cmap-t-class_1)#
```

### 19.1.7.5 match (policy-map (tapagg))

The **match** command adds a rule to the configuration-mode TAP aggregation policy map. A policy map is an ordered list of classes and rules. Each rule contains a filter list, an action, and a sequence number:

- The filter list identifies a data stream through a set of packet field values.
- The action, (**SET\_VALUE** parameter) specifies the replication method of filtered data packets, either through an associated aggregation group or identity VLAN tagging.
- The sequence number specifies the rule's priority within the policy map.

The **no match** and **default match** commands remove the **match** rule from the configuration-mode policy by deleting the corresponding statement from *running-config*.

#### Command Mode

Policy-Map (tapagg) Configuration accessed through [class \(policy-map \(tapagg\)\)](#).

#### Command Syntax

```
[SEQ_NUM] match [VLAN_TAG] SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT]
[PROTOCOL] [FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log]
SET_VALUE
```

```
no match [VLAN_TAG] SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT]
[PROTOCOL] [FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log]
SET_VALUE
```

```
default match [VLAN_TAG] SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT]
[PROTOCOL] [FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log]
SET_VALUE
```

**Note:** Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a permit rule.

#### Parameters

- SEQ\_NUM priority of the rule within the policy map. Lower numbers denote higher priority.
  - <no parameter> number derived by adding 10 to number of the map's last class or rule.
  - <1 to 4294967295> number assigned to class.
- VLAN\_TAG VLAN field filter. Options include:
  - <no parameter> packets are not filtered by VLAN field.
  - vlan <1 to 4094> <0 to 4095> VLAN ID and mask.
  - vlan inner <1 to 4094> <0 to 4095> VLAN ID and mask.
  - vlan <1 to 4094> <0 to 4095> inner <1 to 4094> <0 to 4095> VLAN ID and mask.
- PROTOCOL protocol field filter. Values include:
  - <no parameter> packets are not filtered by host name.
  - ahp authentication header protocol (51).
  - icmp internet control message protocol (1).
  - igmp internet group management protocol (2).
  - ip internet protocol IPv4 (4).
  - ospf open shortest path first (89).
  - pim protocol independent multicast (103).
  - tcp transmission control protocol (6).
  - udp user datagram protocol (17).
  - vrrp virtual router redundancy protocol (112).
  - *protocol\_num* integer corresponding to an IP protocol. Values range from 0 to 255.

- SOURCE\_ADDR and DEST\_ADDR source and destination address filters. Options include:
  - *network\_addr* subnet address (CIDR or address-mask).
  - any packets from all addresses are filtered.
  - host *ip\_addr* IP address (dotted decimal notation).

Source and destination subnet addresses support discontinuous masks.

- SOURCE\_PORT and DEST\_PORT source and destination port filters. Options include:
  - any all ports.
  - *eq port-1 port-2 ... port-n* a list of ports. Maximum list size is 10 ports.
  - *neq port-1 port-2 ... port-n* the set of all ports not listed. Maximum list size is 10 ports.
  - *gt port* the set of ports with larger numbers than the listed port.
  - *lt port* the set of ports with smaller numbers than the listed port.
  - *range port\_1 port\_2* the set of ports whose numbers are between the range.
- fragments filters packets with FO bit set (indicates a non-initial fragment packet).
- FLAGS flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
- MESSAGE message type filters (ICMP packets). Use CLI syntax assistance (?) to display options.
- tracked rule filters packets in existing ICMP, UDP, or TCP connections.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.
- DSCP\_FILTER rule filters packet by its DSCP value. Values include:
  - *<no parameter>* rule does not use DSCP to filter packets.
  - *dscp dscp\_value* packets match if DSCP field in packet is equal to *dscp\_value*.
- TTL\_FILTER rule filters packet by its TTL (time-to-live) value. Values include:
  - *<no parameter>* rule does not use TTL field to filter packets.
  - *ttl eq ttl\_value* packets match if ttl in packet is equal to *ttl\_value*.
  - *ttl gt ttl\_value* packets match if ttl in packet is greater than *ttl\_value*.
  - *ttl lt ttl\_value* packets match if ttl in packet is less than *ttl\_value*.
  - *ttl neq ttl\_value* packets match if ttl in packet is not equal to *ttl\_value*.
- log triggers an informational log message to the console about the matching packet.
  - Valid in ACLs applied to the control plane.
  - Validity in ACLs applied to data plane varies by switch platform.
- SET\_VALUE specifies the replication method for filtered packets.
  - *set aggregation group agg\_group* replication specified by aggregation group.
  - *set id-tag <1 to 4094>* packet is identity tagged with specified VLAN number.
  - *set aggregation group agg\_group id-tag <1 to 4094>* assigns agg group and identity tag.

### Related Commands

- [policy-map type tapagg](#) places the switch in policy-map (tapagg) configuration mode.
- [class \(policy-map \(tapagg\)\)](#) assigns a class to the configuration-mode policy map.

### Example

This command creates a match rule for the “t-policy\_1” policy map that filters OSPF packets and replicates them as specified by the “t-group” tap aggregation group.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#match ip ospf any any set aggregation-g
roup t-group
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
```

---

```
policy-map type tapagg t-policy_1
  10 match ip ospf any any set aggregation-group t-group
switch(config-pmap-t-policy_1)#
```

### 19.1.7.6 mode (tap-agg configuration mode)

The **mode** command configures the switch's TAP aggregation mode. The **mode exclusive** command enables TAP aggregation. When TAP aggregation is enabled, TAP and tool ports are enabled, switching mode is disabled, and switching ports are errdisabled. TAP aggregation is disabled by default.

The **no mode** and **default mode** commands disable TAP aggregation mode and enable switching mode by removing the **mode** command from *running-config*.

#### Command Mode

TAP Aggregation Configuration

#### Command Syntax

```
mode exclusive
```

```
no mode exclusive
```

```
default mode exclusive
```

#### Parameters

**exclusive** TAP aggregation is enabled.

#### Related Command

[tap aggregation](#) places the switch in TAP-aggregation configuration mode.

#### Examples

- These commands place the switch in TAP-aggregation configuration mode, enable TAP aggregation mode, and display the results.

```
switch(config)#tap aggregation
switch(config-tap-agg)#mode exclusive
switch(config-tap-agg)#show active
tap aggregation
  mode exclusive
switch(config-tap-agg)#
```

- These commands disable TAP-aggregation mode by removing the **mode** command from *running-config*, then display the results.

```
switch(config)#tap aggregation
switch(config-tap-agg)#no mode
switch(config-tap-agg)#show active
switch(config-tap-agg)#
```

---

### 19.1.7.7 mode exclusive no-errdisable (tap-agg configuration mode)

The **mode exclusive no-errdisable** command configures the specified interface to remain enabled, regardless of its switchport mode, when TAP aggregation is enabled. This command is used primarily to configure a port to support PTP functions while the switch operates as a TAP aggregator.

Each command configures one Ethernet or port-channel interface. Subsequent **mode exclusive no-errdisable** commands add to the list of ports that remain enabled when TAP aggregation is enabled.

The **no mode exclusive no-errdisable** and **default mode exclusive no-errdisable** commands configure the specified interface to be error-disabled when programmed in access, trunk, or dot1q-tunnel switching mode (when TAP aggregation is enabled) by removing the corresponding **mode exclusive no-errdisable** command from *running-config*.

#### Command Mode

TAP Aggregation Configuration

#### Command Syntax

```
mode exclusive no-errdisable INT_NAME
```

#### Parameters

- INT\_NAME interface type and number. Options include:
  - ethernet *e\_num* Ethernet interface specified by *e\_num*.
  - port-channel *p\_num* port-channel interface specified by *p\_num*.

#### Related Commands

- [tap aggregation](#) places the switch in TAP-aggregation configuration mode.
- [mode \(tap-agg configuration mode\)](#) configures the switch's TAP-aggregation mode.

#### Guidelines

In order for a TAP-aggregation switch to receive PTP traffic, the upstream device to which it is connected should be set to statically send PTP multicast traffic to the connected port on the switch.

Since IGMP snooping is disabled on TAP-aggregation switches and with no configuration to support sending upstream join messages in such a state, the messages are transmitted statically from the upstream device. Once the upstream messages are received, the port will move to the slave state and follow the standard PTP mechanism.

#### Example

These commands place the switch in TAP-aggregation configuration mode and place Ethernet interface 21/3 in no-errdisable mode.

```
switch(config)#tap aggregation
switch(config-tap-agg)#mode exclusive
switch(config-tap-agg)#mode exclusive no-errdisable ethernet 21/4
switch(config-tap-agg)#
```

### 19.1.7.8 platform fm6000 keyframe device

The **platform fm6000 keyframe device** command configures the 16-bit number that the specified keyframe lists as the device ID in its payload. By default, the device value placed in the specified keyframes is 0.

The **no platform fm6000 keyframe device** and **default platform fm6000 keyframe device** commands restore the default device ID insertion value of 0 for the specified keyframe by removing the corresponding **platform fm6000 keyframe device** command from **running-config**. The **no platform fm6000 keyframe device** command also removes the corresponding **platform fm6000 keyframe device** command from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform fm6000 keyframe kf_name device device_id
no platform fm6000 keyframe kf_name device
default platform fm6000 keyframe kf_name device
```

#### Parameters

- *kf\_name* keyframe name.
- *device\_id* value inserted in keyframe's device ID field. Values range from 0 to 65535. Default is 0.

#### Example

These commands enable the generation of a keyframe named "key-1," then configure 100 as the value that is placed in the keyframe's device ID field.

```
switch(config)#platform fm6000 keyframe key-1 interface ethernet 11-15
10.21.1.4 10.4E21.9F11
switch(config)#platform fm6000 keyframe key-1 device 100
switch(config)#
```

---

### 19.1.7.9 platform fm6000 keyframe fields skew

Keyframes may optionally include skew numerator and skew denominator fields. These skew fields form a ratio indicating the ASIC clock skew. If the ratio is greater than 1, the clock is skewed fast; if the ratio is less than 1, the clock is skewed slow. Clock skew fields are omitted by default.

The **platform fm6000 keyframe fields skew** command enables the inclusion of clock skew fields in the keyframe.

The **no platform fm6000 keyframe fields skew** and **default platform fm6000 keyframe fields skew** commands remove the clock skew fields from the keyframe.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform fm6000 keyframe kf_name fields skew
```

#### Parameters

*kf\_name* keyframe name.

#### Example

This command enables the inclusion of clock skew fields in the keyframe named “key-1.”

```
switch(config)#platform fm6000 keyframe key-1 fields skew
switch(config)#
```

### 19.1.7.10 platform fm6000 keyframe rate

The `platform fm6000 keyframe rate` command specifies the transmission rate for the specified keyframe from each interface from which it is configured to egress. By default, one keyframe is sent per second.

The `no platform fm6000 keyframe rate` and `default platform fm6000 keyframe rate` commands restore the default transmission rate for the specified keyframe of one per second by removing the corresponding `platform fm6000 keyframe rate` command from *running-config*. The `no platform fm6000 keyframe` and `default platform fm6000 keyframe` command also removes the corresponding `platform fm6000 keyframe rate` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform fm6000 keyframe kf_name rate tx_rate
```

#### Parameters

- *kf\_name* the keyframe's name.
- *tx\_rate* keyframe transmission rate (frames per second). Values range from 1 to 100. Default value is 1.

#### Example

These commands enable the generation of a keyframe named "key-1," then configure the generation rate for the keyframe of 10 frames per second on each of the five interfaces that it is configured to egress.

```
switch(config)#platform fm6000 keyframe key-1 interface ethernet 11-15
10.21.1.4
10.4E21.9F11
switch(config)#platform fm6000 keyframe key-1 rate 10
switch(config)#
```

---

### 19.1.7.11 platform fm6000 keyframe source

The **platform fm6000 keyframe source** command configures the source IP address that the specified keyframe lists in its IP header. By default, keyframes use the IP address of the management interface as their source address.

The **no platform fm6000 keyframe source** and **default platform fm6000 keyframe source** commands restore the management interface IP address as the specified keyframe's source IP address by removing the corresponding **platform fm6000 keyframe source** command from **running-config**. The **no platform fm6000 keyframe** and **default platform fm6000 keyframe** command also removes the corresponding **platform fm6000 keyframe source** command from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform fm6000 keyframe kf_name source ip ipv4_addr
```

```
no platform fm6000 keyframe
```

```
kf_name source ip
```

```
default platform fm6000 keyframe kf_name source ip
```

#### Parameters

- *kf\_name* keyframe's name.
- *ipv4\_addr* keyframe's source IPv4 address (dotted decimal notation).

#### Example

These commands enable the generation of a keyframe named "key-1," then sets the keyframe source IP address to 10.1.1.101.

```
switch(config)#platform fm6000 keyframe key-1 interface ethernet 11-15
10.21.1.4 10.4E21.9F11
switch(config)#platform fm6000 keyframe key-1 source 10.1.1.101
switch(config)#
```

### 19.1.7.12 platform fm6000 keyframe

The **platform fm6000 keyframe** command enables keyframe generation for data streams transmitted from specified ethernet interfaces. Keyframes are routable IP packets that the switch inserts into a data stream to provide contextual information that correlate timestamps inserted into data packets with absolute UTC time and the switch's complete ASIC time counter.

The switch supports a maximum of ten keyframes. The keyframe name is the label that distinguishes different keyframes. Each keyframe can egress from every ethernet port. Command options specify the destination MAC address and IP address in the keyframe's header. Other keyframe commands specify the transmission rate and the frame's source.

The **no platform fm6000 keyframe** and **default platform fm6000 keyframe** commands disable generation of the specified keyframe by deleting the corresponding platform fm6000 keyframe command from **running-config**. These command also remove all supporting **platform fm6000 keyframe** commands for the specified keyframe.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform fm6000 keyframe kf_name interface ethernet e_range ipv4_addr mac_addr
no platform fm6000 keyframe kf_name
default platform fm6000 keyframe kf_name
```

#### Parameters

- *kf\_name* the keyframe's name.
- *e\_range* Ethernet interface range over which the keyframe egresses. Valid formats include number, range, or comma-delimited list of numbers and ranges.
- *ipv4\_addr* destination IPv4 address inserted into keyframes (dotted decimal notation).
- *mac\_addr* destination MAC address inserted into keyframes (48-bit dotted hex notation).

#### Guidelines

Subsequent issuance of this command for a specified keyframe replaces the existing command in **running-config**. Ethernet interfaces are inserted into an existing keyframe only by issuing the complete command that identifies all interfaces through which the keyframe is transmitted.

#### Example

This command enables the generation of a keyframe named "key-1." This keyframe egresses from Ethernet interfaces 11 through 15 and specifies a source IP address of 10.21.1.4 and a MAC address of 10.4E21.9F11.

```
switch(config)#platform fm6000 keyframe key-1 interface ethernet 11-15
10.21.1.4 10.4E21.9F11
switch(config)#
```

---

### 19.1.7.13 platform sand multicast replication default

The **platform sand multicast replication default** command configures the default replication mode on Sand platform switches. The factory default replication mode differs in various scenarios as follows:

- The default replication mode on switches with fabric is **fabric-egress** mode.
- The default replication mode on switches with single Fabric Access Processor (FAP) systems is **ingress** mode.
- The default replication mode on switches without fabric barring single FAP systems is **ingress-egress** mode.
- If a tool group with less than 60 LAGs has at least one hardware LAG, then the default replication mode of the tool group is **ingress-only** mode. Else the default replication mode of the tool group is the one configured across all LAGs in the tool group.

The **default platform sand multicast replication default** and **no platform sand multicast replication default** commands revert the current state to the factory default behavior.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform sand multicast replication default {fabric-egress | ingress}
no platform sand multicast replication default
default platform sand multicast replication default
```

#### Parameters

- fabric-egress configures the replication mode to use fabric-egress VoQ buffers.
- ingress configures the replication mode to use ingress VoQ buffers.

#### Guidelines

This command is supported on Sand platforms only.

#### Related Commands

- [platform sand multicast replication ingress maximum](#)
- [show platform sand mcast capacity](#)

#### Example

This command configures the default replication mode to ingress.

```
switch(config)#platform sand multicast replication default ingress
switch(config)#
```

### 19.1.7.14 platform sand multicast replication ingress maximum

The `platform sand multicast replication ingress maximum` command configures maximum members for ingress-only replication.

The `default platform sand multicast replication ingress maximum` command reverts the maximum members for ingress-only replication to the default value.

The `no platform sand multicast replication ingress maximum` command deletes the maximum member value for ingress-only replication.

#### Command Mode

Global Configuration

#### Command Syntax

```
platform sand multicast replication ingress maximum max_value
```

```
no platform sand multicast replication ingress maximum
```

```
default platform sand multicast replication ingress maximum
```

#### Parameters

***max\_value*** specifies the maximum number of members for ingress-only replication. Values range from 1 to 64. The default value is 64.

**Note:** *max\_value* for a single FAP Jericho system ranges from 1 to 4096.

#### Guidelines

This command is supported on Sand platforms only.

#### Related Commands

- `platform sand multicast replication default`
- `show platform sand mcast capacity`

#### Example

This command specifies a maximum of sixty-three members for ingress-only replication.

```
switch(config)#platform sand multicast replication ingress maximum 63  
switch(config)#
```

---

### 19.1.7.15 policy-map type tapagg

The **policy-map type tapagg** command places the switch in policy-map (tapagg) configuration mode, which is a group-change mode that modifies a TAP-aggregation policy map. A TAP-aggregation policy map is a data structure that consists of class maps and match statements that filter a specific data stream. Packets in that data stream are either managed as specified by a TAP aggregation group or modified to add a VLAN identity tag. Policy maps manage traffic when applied to an Ethernet or port-channel interface.

The **exit** command saves pending policy map changes to **running-config** and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The **abort** command discards pending changes, returning the switch to global configuration mode.

The **no policy-map type tapagg** and **default policy-map type tapagg** commands delete the specified policy map by removing the corresponding **policy-map type tapagg** command and the associated policy map statements from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
policy-map type tapagg map_name
no policy-map type tapagg map_name
default policy-map type tapagg map_name
```

#### Parameters

**map\_name** name of policy map.

#### Commands Available in Policy-Map Configuration Mode

- [class \(policy-map \(tapagg\)\)](#)
- [match \(policy-map \(tapagg\)\)](#)

#### Related Commands

- [class-map type tapagg](#)
- [service-policy type tapagg \(Interface mode\)](#)

#### Example

This command creates the TAP-aggregation policy map named “t-policy\_1” and places the switch in policy-map configuration mode.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#
```

### 19.1.7.16 resequence (class-map (tapagg))

The **resequence** command assigns sequence numbers to access control lists (ACLs) in the configuration mode TAP-aggregation class map. Sequence numbers denote an ACL's priority within the class map. Command parameters specify the number of the first ACL and the numeric interval between consecutive ACLs.

Maximum rule sequence number is 4294967295.

#### Command Mode

Class-map (tapagg) Configuration

accessed with the [class-map type tapagg](#) command

#### Command Syntax

```
resequence [start_num [inc_num]]
```

#### Parameters

- **start\_num** sequence number assigned to the first rule. Default is 10.
- **inc\_num** numeric interval between consecutive rules. Default is 10.

#### Example

These commands display a policy map whose entities were entered with default sequence numbers, then renumber the contents.

```
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
  10 match ip ospf any any set aggregation-group t-group
  20 class fred
    set aggregation-group t-group id-tag 444
  30 class t-class_2
    set id-tag 500
  40 class t-class_3
    set id-tag 600
  50 class t-class_4
    set id-tag 700
switch(config-pmap-t-policy_1)#resequence 100 20
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
  100 match ip ospf any any set aggregation-group t-group
  120 class fred
    set aggregation-group t-group id-tag 444
  140 class t-class_2
    set id-tag 500
  160 class t-class_3
    set id-tag 600
  180 class t-class_4
    set id-tag 700
switch(config-pmap-t-policy_1)#
```

### 19.1.7.17 resequence (policy-map (tapagg))

The **resequence** command assigns sequence numbers to classes and rules in the configuration mode TAP-aggregation policy map. Sequence numbers denote the priority of a class or rule within the policy map. Command parameters specify the number of the first policy map entity and the numeric interval between consecutive entities.

Maximum rule sequence number is 4294967295.

#### Command Mode

Policy-Map (tapagg) Configuration

accessed with the [class \(policy-map \(tapagg\)\)](#) command

#### Command Syntax

```
resequence [start_num [inc_num]]
```

#### Parameters

- **start\_num** sequence number assigned to the first rule. Default is 10.
- **inc\_num** numeric interval between consecutive rules. Default is 10.

#### Example

These commands display a policy map whose entities were entered with default sequence numbers, then use the **resequence** command to renumber the contents.

```
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
  10 match ip ospf any any set aggregation-group t-group
  20 class fred
    set aggregation-group t-group id-tag 444
  30 class t-class_2
    set id-tag 500
  40 class t-class_3
    set id-tag 600
  50 class t-class_4
    set id-tag 700
switch(config-pmap-t-policy_1)#resequence 100 20
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
  100 match ip ospf any any set aggregation-group t-group
  120 class fred
    set aggregation-group t-group id-tag 444
  140 class t-class_2
    set id-tag 500
  160 class t-class_3
    set id-tag 600
  180 class t-class_4
    set id-tag 700
switch(config-pmap-t-policy_1)#
```

### 19.1.7.18 service-policy type tapagg (Interface mode)

The **service-policy type tapagg** command applies a specified TAP-aggregation policy map to the configuration-mode interface. A policy map is a data structure that identifies data traffic through class maps and match rules, then specifies the method of replicating the traffic. This command is active only when TAP aggregation mode is enabled on the switch.

The **no service-policy type tapagg** and **default service-policy type tapagg** commands remove the policy map assignment from the configuration mode interface by deleting the corresponding **service-policy tapagg** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
service-policy type tapagg input polycymap_name
```

#### Parameters

- input policy map applies to inbound packet streams. This is the only option.
- **map\_name** name of policy map.

#### Guidelines

A policy map that is attached to a port-channel interface takes precedence for member interfaces of the port channel over their individual Ethernet interface configuration. Members that are removed from a port channel revert to the policy-map implementation specified by its Ethernet interface configuration.

#### Related Commands

[class \(policy-map \(tapagg\)\)](#) places the switch in policy-map configuration mode to create a policy map.

#### Example

These commands apply the “t-policy\_1” policy map to Ethernet interface 17.

```
switch(config)#interface ethernet 17  
switch(config-if-Et17)#service-policy type tapagg input t-policy_1  
switch(config-if-Et17)#
```

### 19.1.7.19 set (policy-map-class (tapagg))

The **set** command specifies the data replication method for traffic filtered by the associated class map in the configuration-mode policy map. The **set** command specifies one of these replication actions for filtered data packets:

- specifies an aggregation group.
- specifies a VLAN identity tag for replicated packets.
- specifies an aggregation group and a VLAN identity tag.

The **no set** and **default set** commands remove the specified set command data action from the configuration-mode class by deleting the associated **set** command from *running-config*.

#### Command Mode

Policy-map-class (tapagg) Configuration

accessed using the [class \(policy-map \(tapagg\)\)](#) command

#### Command Syntax

```
set SET_VALUE
```

```
no set SET_VALUE
```

```
default set SET_VALUE
```

#### Parameters

- SET\_VALUE specifies the replication method for filtered packets. Options include:
  - aggregation group *agg\_group* replication specified by aggregation group.
  - id-tag *VLAN\_number* packet is identity tagged with specified VLAN number. VLAN numbers range from 1 to 4094.
  - aggregation group *agg\_group* id-tag *VLAN\_number* assigns aggregation group and identity tag (VLAN number). VLAN numbers range from 1 to 4094.

#### Related Commands

- [policy-map type tapagg](#) places the switch in policy-map (tapagg) configuration mode.
- [class \(policy-map \(tapagg\)\)](#) assigns a class to the policy-map configuration mode.
- [match \(policy-map \(tapagg\)\)](#) assigns a rule to the policy-map configuration mode.

#### Guidelines

When a class is not associated with a **set** command, the filtered traffic is managed as specified by the TAP port's default aggregation group.

#### Example

These commands place the switch in policy-map-class to add the "t-class\_1" class map to the "t-policy\_1" policy map. Packets filtered by the class map are identity tagged with VLAN 444 and replicated as specified through the "t-group" aggregation group.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#class t-class_1
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-group
id-tag
444
switch(config-pmap-c-t-policy_1-t-class_1)#exit
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
  10 class t-class_1
    set aggregation-group t-group id-tag 444
```

```
switch(config-pmap-t-policy_1) #
```

### 19.1.7.20 show interfaces tap

The **show interfaces tap** command displays TAP-port configuration information for the specified interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] tap [INFO_LEVEL]
```

#### Parameters

- **INTERFACE** interface type and numbers. Options include:
  - <no parameter> all interfaces.
  - ethernet *e\_range* Ethernet interface range specified by *e\_range*.
  - management *m\_range* management interface range specified by *m\_range*.
  - port-channel *p\_range* port-channel interface range specified by *p\_range*.

Valid *e\_range*, *m\_range*, and *p\_range* formats include number, number range, or comma-delimited list of numbers and ranges.
- **INFO\_LEVEL** amount of information that is displayed. Options include:
  - <no parameter> command displays table that summarizes TAP data.
  - detail command displays TAP data summary table and a list of ACLs applied to TAP ports.

#### Examples

- This command displays TAP-port configuration information for Ethernet interfaces 36 through 40.

```
switch#show interface ethernet 31-35 tap
Port      Configured  Status      Native  Id  Truncation
Default
Mode                               Vlan    Vlan    Group
-----
Et31      tap         tap         301     31   0       tag_1
Et32      tap         tap         1       132  0       tag_1
Et33      tap         tap         303     233  0       tag_1
Et34      tap         tap         1       334  0       tag_3
Et35      tap         tap         1       345  0       tag_3
switch#
```

- This command displays detailed TAP-port configuration information for Ethernet interface 31.

```
switch#show interface ethernet 31 tap detail
Port      Configured  Status      Native  Id  Truncation
Default
Mode                               Vlan    Vlan    Group
-----
Et31      tap         tap         301     31   0       tag_1

Port      ACLs Applied
-----
switch#
```

### 19.1.7.21 show interfaces tool

The `show interfaces tool` command displays tool port configuration information for the specified interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show interfaces [INTERFACE] tool
```

#### Parameters

- INTERFACE interface type and numbers. Options include:
  - <no parameter> all interfaces.
  - ethernet *e\_range* Ethernet interface range specified by *e\_range*.
  - management *m\_range* management interface range specified by *m\_range*.
  - port-channel *p\_range* port-channel interface range specified by *p\_range*.

Valid *e\_range*, *m\_range*, and *p\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

#### Example

This command displays tool port configuration information for Ethernet interfaces 36 through 40.

```
switch#show interface ethernet 36-40 tool
Port      Configured      Status      Allowed      Id
Timestamp
Mode
-----
Et36      tool            tool        201-205      Off  None
Et37      tool            tool        201-205      Off  None
Et38      tool            tool        201-205      Off  None
Et39      access          errdisabled All           Off  None
Et40      tool            tool        All           On   None

switch#
```

---

### 19.1.7.22 show platform fm6000 keyframe

The **show platform fm6000 keyframe** command displays configured information for the specified keyframes. Keyframes are routable IP packets that the switch inserts into a data stream to provide contextual information that correlate timestamps inserted into data packets with the absolute UTC time and the switch's complete ASIC time counter.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
show platform fm6000 keyframe [KEYFRAME_ID]
```

#### Parameters

- **KEYFRAME\_ID** specifies keyframes that the command displays. Options include:
  - <no parameter> command displays all configured keyframes.
  - **kf\_name** specifies a single keyframe to display information for.

#### Example

This command displays information concerning the three keyframes that the switch sends.

```
switch#show platform fm6000 keyframe
Keyframe key-2
-----
Egress Interface(s): Ethernet17, Ethernet18, Ethernet19, Ethernet20,
 Ethernet21
Source IP: 10.22.30.144
Destination IP: 10.21.1.14
Destination MAC: 00:09:00:09:00:09
Device ID: 0
Rate: 5 packet(s) per second

Keyframe key-1
-----
Egress Interface(s): Ethernet11, Ethernet12, Ethernet13, Ethernet14,
 Ethernet15
Source IP: 10.22.30.146
Destination IP: 10.21.1.4
Destination MAC: 00:10:4e:21:9f:11
Device ID: 0
Rate: 2 packet(s) per second

switch#
```

### 19.1.7.23 show platform sand mcast capacity

The `show platform sand mcast capacity` command displays the usage details of hardware resources on Sand platform switches.

#### Command Mode

EXEC

#### Command Syntax

`show platform sand mcast capacity [threshold threshold_value]`

#### Parameters

threshold *threshold\_value* displays the list of resources whose usage percentage is greater than or equal to the specified threshold value. Values range from 0 to 100. The default value is 100.

#### Guidelines

This command is supported on Sand platforms only.

#### Examples

This command displays the usage details of hardware resources on a Sand platform switch.

```
switch#show platform sand mcast capacity

Multicast Resources
-----
'*' - Applies to all Modules
'-' - Not applicable

-----
TCAM Resources
-----
Resource                Module                Total    Used    Used%
-----
v4 MC TCAM              Linecard3-Jericho3/0  4096     2      0.0
v4 MC TCAM              Linecard5-Jericho5/0  4096    506    12.4

-----
Replication Table Resources
-----
Resource                Module                Total    Used    Used%
-----
Multicast Table Row
Linecard3-Jericho3/0.0  262143    10586    4.0
Linecard3-Jericho3/1.0  262143    10576    4.0
Linecard3-Jericho3/0.1  262143    10586    4.0
Linecard3-Jericho3/1.1  262143    10576    4.0
Linecard6-Jericho6/2.0  262143    10576    4.0

switch#
```

---

### 19.1.7.24 show tap aggregation groups

The **show tap aggregation groups** command displays the TAP and tool port members of the specified TAP aggregation groups.

#### Command Mode

EXEC

#### Command Syntax

```
show tap aggregation groups [INFO_LEVEL] [GROUP_NAMES]
```

#### Parameters

- **INFO\_LEVEL** port information to display. Options include:
  - `<no parameter>` displays active TAP and tool ports.
  - `detail` displays all configured TAP and tool ports, including inactive ports.
- **GROUP\_NAMES** TAP aggregation groups. Options include:
  - `<no parameter>` displays information for all TAP aggregation groups.
  - `group_list` displays information for the specified TAP aggregation group list.

Valid *group\_list* format is a space-delimited list of one or more TAP aggregation group names.

#### Example

This command displays the contents of all configured TAP aggregation groups.

```
switch#show tap aggregation groups
Group Name                               Tool Members
-----
analyze2                                 Po101, Po102
analyze3                                 Po101, Po103

Group Name                               Tap Members
-----
analyze2                                 Et41, Et42
analyze3                                 Et43
switch#
```

### 19.1.7.25 switchport tap allowed vlan

The **switchport tap allowed vlan** command creates or modifies the list of VLANs for which the configuration mode interface, in TAP mode, handles tagged traffic. By default, interfaces handle tagged traffic for all VLANs. Command settings persist in **running-config** without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP aggregation mode.

The **no switchport tap allowed vlan** and **default switchport tap allowed vlan** commands restore the TAP mode default allowed VLAN setting of all by removing the corresponding **switchport tap allowed vlan** statement from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
switchport tap allowed vlan EDIT_ACTION
```

#### Parameters

- EDIT\_ACTION modifications to the VLAN list. Options include:
  - *v\_range* creates VLAN list from range of VLANs specified by *v\_range*.
  - **add** *v\_range* adds specified VLANs to current list.
  - **all** VLAN list contains all VLANs.
  - **except** *v\_range* VLAN list contains all VLANs except those specified by *v\_range*.
  - **none** VLAN list is empty (no VLANs).
  - **remove** *v\_range* removes VLANs specified by *v\_range* from current list.

Valid *v\_range* formats include number (1 to 4094), range, or comma-delimited list of numbers and ranges.

#### Example

These commands create the TAP mode allowed VLAN list of 26-30 for Ethernet interface 20.

```
switch(config)#interface ethernet 20
switch(config-if-Et20)#switchport tap allowed vlan 26-30
eswitch(config-if-Et20)#show active
interface Ethernet20
    switchport mode tap
    switchport tap allowed vlan 26-30
switch(config-if-Et20)#
```

### 19.1.7.26 switchport tap default group

The **switchport tap default group** command assigns the configuration-mode interface to the specified tool group as a TAP port member. TAP aggregation groups associate a set of TAP ports with a set of tool ports. Both TAP ports and tool ports may belong to multiple TAP aggregation groups.

The **no switchport tap default group** and **default switchport tap default group** commands remove the configuration-mode interface from the TAP aggregation group to which it is assigned by deleting the corresponding **switchport tap default group** statement from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-port Channel Configuration

#### Command Syntax

```
switchport tap default group group_name
```

```
no switchport tap default group
```

```
default switchport tap default group
```

#### Parameters

*group\_name* tool group name.

#### Restriction

This command is only available on FM6000 platform switches.

#### Example

These commands assign port channel 101 to TAPs aggregation group "tag-1."

```
switch(config)#interface port-channel 101
switch(config-if-Po101)#switchport tap default group tag-1
switch(config-if-Po101)#show interfaces port-channel 101 tap
Port          Configured   Status      Native   Id   Truncation  Default
              Mode
-----
Po101        access      notconnect   1        1    0           tag-1
switch(config)#
```

### 19.1.7.27 switchport tap identity

The **switchport tap identity** command associates a VLAN number to the configuration mode TAP interface. Tool ports that are configured to encapsulate packets with an dot1q-style tag enter the number specified by this command as the s-VLAN (tier 1) for packets received from this TAPs port. The default identity value is 1.

The **no switchport tap identity** and **default switchport tap identity** commands restore VLAN 1 as the configuration-mode ports's identity VLAN by removing the corresponding **switchport tap identity** command from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
switchport tap identity port_id
no switchport tap identity
default switchport tap identity
```

#### Parameters

*port\_id* port's identity VLAN. Values range from 1 to 4094. Default is 1.

#### Related Commands

[switchport tool identity](#) configures a tool port to encapsulate packets received from TAP ports.

#### Restriction

This command is available only on FM6000 platform switches.

#### Example

These commands 171 as the identity value for Ethernet interface 17.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#switchport tap identity 171
switch(config-if-Et17)#show active
interface Ethernet17
  switchport tap identity 171
switch(config-if-Et17)#show interfaces ethernet 17 tap
```

| Port | Configured Mode | Status    | Native Vlan | Id Vlan | Truncation | Default Group |
|------|-----------------|-----------|-------------|---------|------------|---------------|
| Et17 | access          | connected | 1           | 171     | 0          |               |

```
switch(config-if-Et17)#
```

### 19.1.7.28 switchport tap native vlan

The **switchport tap native vlan** command specifies the TAP-mode native VLAN for the configuration-mode interface. Interfaces in TAP mode associate untagged frames with the native VLAN. The default native VLAN for all interfaces is VLAN 1. Command settings persist in **running-config** without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP mode.

The **no switchport tap native vlan** and **default switchport tap native vlan** commands restore VLAN 1 as the TAP-mode native VLAN to the configuration-mode interface by removing the corresponding **switchport tap native vlan** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
switchport tap native vlan v_num
no switchport tap native vlan
default switchport tap native vlan
```

#### Parameters

**v\_num** TAP-mode native VLAN ID. Values range from 1 to 4094. Default is 1.

#### Restriction

This command is available only on FM6000 platform switches.

#### Example

These commands assign VLAN 25 as the TAP-mode native VLAN for Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#switchport tap native vlan 25
switch(config-if-Et7)#show interface ethernet 7 tap
Port          Configured      Status          Native   Id   Truncation  Default
              Mode                               Vlan    Vlan
-----
Et7           tool           connected       25      1    0           ---
switch(config-if-Et7)#
```

### 19.1.7.29 switchport tap truncation

The **switchport tap truncation** command configures the configuration-mode interface, as a TAP port, to truncate inbound packets to the specified packet size. This command is in effect when the port is in TAP mode and the switch is in TAP aggregation mode. Command settings persist in **running-config** without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP mode. By default, TAP ports do not truncate inbound packets.

The **no switchport tap truncation** and **default switchport tap truncation** commands restore the default behavior of not truncating packets received by the configuration-mode interface by removing the corresponding **switchport tap truncation** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
switchport tap truncation packet_size
```

```
no switchport tap truncation
```

```
default switchport tap truncation
```

Parameters

*packet\_size* size of truncated packets (bytes). Values range from 100 to 9236. Default value of 0 corresponds to not truncating packets.

#### Restriction

This command is available only on FM6000 platform switches.

#### Examples

- These commands configure Ethernet interface 38 to truncate packets to 150 bytes.

```
switch(config)#interface ethernet 38
switch(config-if-Et38)#switchport tap truncation 150
switch(config-if-Et38)#show interface ethernet 38 tap
Port      Configured      Status      Native  Id  Truncation
  Default
          Mode
-----
Et38      access         notconnect   1       1   150       ---
switch(config-if-Et38)#
```

- These commands configure Ethernet interface 38 to send complete packets to tool ports in its TAP aggregation group.

```
switch(config-if-Et38)#no switchport tap truncation
switch(config-if-Et38)#show interface ethernet 38 tap
Port      Configured      Status      Native  Id  Truncation
  Default
          Mode
-----
Et38      access         notconnect   1       1   0         ---
switch(config-if-Et38)#
```

### 19.1.7.30 switchport tool allowed vlan

The `switchport tool allowed vlan` command creates or modifies the list of VLANs for which the configuration-mode interface, in tool mode, handles tagged traffic. By default, interfaces handle tagged traffic for all VLANs. Command settings persist in *running-config* without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP aggregation mode.

The `no switchport tool allowed vlan` and `default switchport tool allowed vlan` commands restore the tool mode default allowed VLAN setting of all by removing the corresponding `switchport tool allowed vlan` statement from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
switchport tool allowed vlan EDIT_ACTION
```

#### Parameters

- EDIT\_ACTION modifications to the VLAN list. Options include:
  - `v_range` creates VLAN list from `v_range`.
  - `add v_range` adds specified VLANs to current list.
  - all VLAN list contains all VLANs.
  - `except v_range` VLAN list contains all VLANs except those specified.
  - none VLAN list is empty (no VLANs).
  - `remove v_range` removes specified VLANs from current list.

Valid `v_range` formats include number, range, or comma-delimited list of numbers and ranges.

#### Example

These commands create the tool mode allowed VLAN list of 16-20 for Ethernet interface 38.

```
switch(config)#interface ethernet 38
switch(config-if-Et38)#switchport tool allowed vlan 16-20
switch(config-if-Et38)#show interfaces ethernet 38 tool
```

| Port      | Configured | Status     | Allowed | Id  |      |  |
|-----------|------------|------------|---------|-----|------|--|
| Timestamp | Mode       |            | Vlans   | Tag | Mode |  |
| Et38      | access     | notconnect | 16-20   | Off | None |  |

```
switch(config-if-Et38)#
```

### 19.1.7.31 switchport tool group

The **switchport tool group** command modifies the configuration-mode interface's tool port membership in the specified TAP aggregation groups. Tool ports may belong to multiple TAP aggregation groups. Command options for configuring a port's TAP aggregation group membership include:

- specifying the groups to which the port belongs (supersedes the port's previous group memberships).
- adding to the list of groups to which the port belongs.
- deleting from the list of groups to which the port belongs.

TAP aggregation groups associate a set of TAP ports with a set of tool ports. A TAP port can belong to a maximum of one default TAP aggregation group.

The **no switchport tool default group** and **default switchport tool default group** commands remove the configuration-mode interface from all TAP aggregation groups to which it is assigned as a tool port by modifying the corresponding statements in *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
switchport tool group EDIT_ACTION
```

#### Parameters

- **EDIT\_ACTION** specifies changes to the list of groups to which the port belongs
  - *add group\_list* specifies additional groups to which the port belongs.
  - *remove group\_list* removes interface as a tool port member from specified groups.
  - *set group\_list* specifies groups to which interface belongs as a tool port.

Valid *group\_list* format is a space-delimited list of one or more TAP aggregation group names.

#### Restriction

This command is available only on FM6000 platform switches.

#### Examples

- These commands associate interface Ethernet 40 with three TAP aggregation groups.

```
switch(config)#interface ethernet 40
switch(config-if-Et40)#switchport tool group set tag-1 tag-2 tag-3
switch(config-if-Et40)#show active
interface Ethernet40
    switchport tool group set tag-3 tag-2 tag-1
switch(config-if-Et40)#
```

- These commands add tag-7 to the tap aggregation groups to which Ethernet interface 40 belongs.

```
switch(config-if-Et40)#switchport tool group add tag-7
switch(config-if-Et40)#show active
interface Ethernet40
    switchport tool group set tag-3 tag-7 tag-2 tag-1
switch(config-if-Et40)#
```

- These commands specify "tag-9" as the only group to which Ethernet interface 40 belongs.

```
switch(config-if-Et40)#switchport tool group set tag-9
switch(config-if-Et40)#show active
```

---

```
interface Ethernet40
  switchport tool group set tag-9
switch(config-if-Et40)#
```

### 19.1.7.32 switchport tool identity

The **switchport tool identity** command configures the configuration-mode interface to add a tier-1 VLAN tag (dot1q) to packets it receives from TAP ports. The VLAN number on the dot1q tag is specified by the **switchport tap identity** command configured for the TAP port that supplies the packets. By default, tool ports do not encapsulate packets with the tier-1 VLAN tag.

The **no switchport tool identity** and **default switchport tool identity** commands restore the default VLAN handling method for the configuration-mode interface by removing the corresponding **switchport tool identity** statement from *running-config*.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
switchport tool identity dot1q
no switchport tool identity dot1q
default switchport tool identity dot1q
```

#### Restriction

This command is available only on FM6000 platform switches.

#### Example

These commands configure Ethernet interface 40 to include a dot1q tag on egress packets.

```
switch(config)#interface ethernet 40
switch(config-if-Et40)#switchport tool identity dot1q
switch(config-if-Et40)#show active
interface Ethernet40
  switchport mode tool
  switchport tool identity dot1q
  switchport tool group set tag-9
switch(config-if-Et40)#
```

---

### 19.1.7.33 switchport tool truncation

The **switchport tool truncation** command configures the configuration-mode interface, as a tool port, to truncate outbound packets to 160 bytes. This command is in effect when the port is in tool mode and the switch is in TAP aggregation mode. Command settings persist in **running-config** without taking effect when the switch is not in TAP aggregation mode or the interface is not in tool mode. By default, tool ports do not truncate outbound packets.

The **no switchport tool truncation** and **default switchport tool truncation** commands restore the default behavior (not truncating packets that exit the configuration mode interface) by removing the corresponding **switchport tool truncation** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port Channel Configuration

#### Command Syntax

```
switchport tool truncation packet_size
```

```
no switchport tool truncation
```

```
default switchport tool truncation
```

#### Parameters

- *packet\_size* size of truncated packets in bytes. The only permitted value is 160.

#### Examples

- These commands configure Ethernet interface 38, as a tool port, to truncate packets on egress to 160 bytes.

```
switch(config)#interface ethernet 38  
switch(config-if-Et38)#switchport mode tool  
switch(config-if-Et38)#switchport tool truncation 160  
switch(config-if-Et38)#
```

- These commands configure Ethernet interface 38 to send complete packets.

```
switch(config)#interface ethernet 38  
switch(config-if-Et38)#no switchport tool truncation  
switch(config-if-Et38)#
```

### 19.1.7.34 tap aggregation

The **tap aggregation** command places the switch in TAP-aggregation configuration mode. The switch's TAP aggregation mode is enabled or disabled by the **mode** command in TAP-aggregation configuration mode.

When TAP aggregation mode is enabled, normal switching and routing operations are disabled. A port's switchport status depends on the switch's TAP aggregation mode and the port's switchport mode:

- **TAP aggregation mode enabled:** TAP and tool ports are enabled. Switching ports are errdisabled.
- **TAP aggregation mode disabled:** TAP and tool ports are errdisabled. Switching ports are enabled.

The **no tap aggregation** and **default tap aggregation** commands disable tap aggregation mode on the switch by removing all TAP-aggregation configuration mode commands from **running-config**.

TAP-aggregation configuration mode is not a group-change mode; **running-config** is changed immediately upon entering commands. Exiting TAP-aggregation configuration mode does not affect **running-config**. The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
tap aggregation
```

```
no tap aggregation
```

```
default tap aggregation
```

#### Commands Available in TAP-aggregation Configuration Mode

- **mode** (tap-agg configuration mode)

#### Related Commands

- **switchport mode**

#### Example

- These commands place the switch in TAP-aggregation configuration mode and enable TAP aggregation.

```
switch(config)#tap aggregation
switch(config-tap-agg)#mode exclusive
switch(config-tap-agg)#show active
tap aggregation
mode exclusive
switch(config-tap-agg)#
```

- This command disables TAP aggregation and removes all TAP-aggregation configuration mode commands from **running-config**.

```
switch(config)#no tap aggregation
switch(config)#
```

## 19.2 Latency Analyzer (LANZ)

Arista Networks' Latency Analyzer (LANZ) is a family of EOS features that provide enhanced visibility into network dynamics, particularly in areas related to the delay packets experience through the

---

network. The LANZ feature is available on the FM6000, Arad, Trident II, Trident 3, Jericho, Tomahawk and XP80 switch platforms.

This section describes the purpose, behavior, and configuration of LANZ features. Topics covered by this section include:

- [Introduction to LANZ](#)
- [LANZ Overview](#)
- [Configuring LANZ](#)
- [LANZ Commands](#)

## 19.2.1 Introduction to LANZ

LANZ tracks interface congestion and queuing latency with real-time reporting. With LANZ application layer event export, external applications can predict impending congestion and latency. This enables the application layer to make traffic routing decisions with visibility into the network layer.

With LANZ, network operations teams and administrators have near real-time visibility into the network, enabling early detection of microbursts. LANZ continually monitors congestion, allowing for rapid detection of congestion and sending of application layer messages.

## 19.2.2 LANZ Overview

LANZ monitors output queue lengths to provide congestion information for individual interfaces. This allows for more detailed analysis of congestion events, and allows identification of potential latency problems before they arise. On some platforms, LANZ also monitors global buffer usage.

Output queues for each port are monitored, and information about queue congestion events can be accessed in the form of system log messages, reports, or streaming.

### 19.2.2.1 LANZ Monitoring Mechanism

LANZ provides congestion data by continuously monitoring each port's output queue lengths. When the length of an output queue exceeds the upper threshold for that port, LANZ generates an over-threshold event.

#### 19.2.2.1.1 Notifying and Polling Modes

##### Notifying Mode

In Notifying Mode (available on all platforms), LANZ monitors congestions on all queues and generates Start, Update, and End events every five seconds or at user-configured intervals.

- **Start** event is generated when any queue on an interface exceeds the upper threshold.
- **Update** events are generated periodically while the congested queue remains above the lower threshold. The interval at which Update events are generated is configured using the [queue-monitor length update-interval](#) command.
- **End** event is generated when the congested queue drops below the lower threshold.

##### Polling Mode

Polling Mode is available only on Arad and Jericho switches. On these switches, LANZ can be configured to use Notifying Mode, but it operates in Polling Mode by default. In Polling Mode, LANZ polls the most congested queue in each ASIC and continues to report an over-threshold state every 800 microseconds until all queue lengths for the port pass below the lower threshold.

### 19.2.2.2 LANZ Logging

Over-threshold events generated by LANZ can be logged as system log messages. Log messages are generated for events on all ports, at a maximum rate of one message per second per interface. The interval between messages can be configured globally.

Log messages indicate the time of the event, the interface affected, the threshold set for that interface, and the actual number of entries in the port's queue.

### 19.2.2.3 LANZ Reporting

Detailed LANZ data can be viewed through the CLI or exported as a CSV-formatted report.

A circular FIFO event buffer is dynamically shared by all interfaces. When an interface begins generating LANZ over-threshold events it can fill all available buffer space. However, each interface is guaranteed sufficient resources for a minimum of 500 entries.

### 19.2.2.4 LANZ Streaming

On some platforms, external client applications can also receive congestion event information as a data stream. The switch can stream LANZ data to up to 100 clients via TCP through port 50001.

Streamed data is in Google protocol buffer format, and includes both over-threshold events and LANZ configuration information.

### 19.2.2.5 Platforms

The LANZ feature is available on the FM6000, Arad, Trident II, Trident 3, Jericho and Tomahawk switch platforms. To determine the switch platform from the CLI, enter `show platform ?` at the prompt.

Settings and capabilities differ slightly between the platforms:

- Arad chips measure threshold values in bytes; all others measure threshold values in segments:
  - **FM6000** 480-byte segments
  - **Trident II** and **Tomahawk** 208-byte segments
  - **Trident 3** 256-byte segments
- FM6000, Trident II, Trident 3, and Tomahawk chips allow configuration of both upper and lower threshold values.
- FM6000, Arad, Jericho, Trident II, Trident 3, and Tomahawk chips support LANZ data streaming.
- Only FM6000 chips support global buffer monitoring.
- While the FM6000, Trident II, Trident 3, Jericho and Tomahawk chips can monitor congestion events for all queues, the Arad chips only monitor the most congested queues.
- Polling Mode is available on Arad and Jericho platforms.
- LANZ is available on CPU ports on Arad, Jericho, Trident II and Tomahawk platforms.
- LANZ is available on fabric ports on Trident, Trident II, Trident 3, and Tomahawk platforms.

## 19.2.3 Configuring LANZ

LANZ is disabled by default and must be enabled to function. Upper and lower queue-length thresholds can be defined for individual interfaces.

These sections describe the basic LANZ configuration steps:

- [Enabling and Disabling LANZ](#)
- [Specifying the LANZ Mode on Jericho and Arad Switches](#)
- [Configuring LANZ Congestion Thresholds](#)
- [Setting LANZ Traffic Sampling](#)
- [Logging LANZ Congestion Events](#)

- [Viewing LANZ Data](#)
- [Streaming LANZ Data](#)

### 19.2.3.1 Enabling and Disabling LANZ

LANZ is enabled by default on Sand platform switches (those with Arad, Jericho, or Qumran chipsets), allowing the switch to collect and display latency information. LANZ is disabled by default on all other switches. If LANZ is disabled, the [queue-monitor length \(global configuration mode\)](#) command enables LANZ with the current settings, or with the default settings if none have been configured.

When LANZ is enabled, the switch monitors queue lengths on all front-panel ports, and on CPU and fabric ports on selected platforms. Queue length data is available in the following forms:

- syslog data (see [queue-monitor length log](#))
- CLI display or CSV-format output (see [show queue-monitor length](#))
- data stream (see [queue-monitor streaming](#))

To disable LANZ globally, enter the `no queue-monitor length` command in global configuration mode. Disabling LANZ globally also discards LANZ log data, but retains settings. To disable LANZ on an individual interface, enter the `no queue-monitor length` command in interface Ethernet configuration mode.

#### Examples

- This command enables LANZ on the switch.

```
switch(config)#queue-monitor length
switch(config)#
```

- This command disables LANZ on the switch.

```
switch(config)#no queue-monitor length
switch(config)#
```

- These commands disable LANZ on Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#no queue-monitor length
switch(config-if-Et7)#
```

### 19.2.3.2 Specifying the LANZ Mode on Jericho and Arad Switches

On Jericho and Arad switches, LANZ operates by default in Polling Mode, which provides congestion data for the most congested queue per ASIC. They also support Notifying Mode (the LANZ mode used on all other switches), which generates Start, Update, and End events for all queues.

Notifying Mode is enabled using the [queue-monitor length notifying](#) command.

#### Examples

- This command enables Notifying Mode on a Jericho or Arad switch.

```
switch(config)#queue-monitor length notifying
```

- This command disables Notifying Mode on a Jericho or Arad switch, returning LANZ to the default Polling Mode.

```
switch(config)#no queue-monitor length notifying
```

### 19.2.3.3 Configuring LANZ Congestion Thresholds

When LANZ is enabled on the switch, it generates over-threshold events when queue lengths on any monitored interface exceed the upper threshold value and continues generating them until all the queue lengths on that interface drop back below the lower threshold.

#### 19.2.3.3.1 Setting the Congestion Update Interval

The `queue-monitor length update-interval` command specifies the frequency with which congestion information is updated in microseconds.

- This command sets the time between congestion updates to 10 seconds.

```
switch(config)# queue-monitor length update-interval 10000000
switch(config)#
```

- This command resets the time between congestion updates to its default value of 5 seconds.

```
switch(config)# default queue-monitor length update-interval
switch(config)#
```

#### 19.2.3.3.2 Congestion Thresholds on FM6000, Trident II, Trident 3, and Tomahawk Switches

Queue lengths are measured in 480-byte segments on FM6000 switches, in 208-byte segments on Trident II and Tomahawk switches, and in 256-byte segments on Trident 3 switches. The default threshold values are 512 segments and 256 segments. To change the threshold values for a specific interface, use the `queue-monitor length thresholds` command.

FM6000 switches can also monitor global buffer usage. Global buffers are measured in 160-byte segments; the default threshold values are 10940 segments and 4376 segments. To enable global buffer monitoring, use the `queue-monitor length global-buffer` command. To change the threshold values for global buffer usage monitoring on the switch, use the `queue-monitor length global-buffer thresholds` command.

#### Examples

- These commands set the upper and lower queue-length thresholds on Ethernet interface 5 to 300 segments and 200 segments.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# queue-monitor length thresholds 300 200
switch(config-if-Et5)#
```

- These commands enable global buffer monitoring on the switch and set the upper and lower thresholds to 9000 segments and 4000 segments.

```
switch(config)# queue-monitor length global-buffer
switch(config)# queue-monitor length global-buffer thresholds 9000 4000
switch(config)#
```

#### 19.2.3.3.3 Congestion Thresholds on Arad Switches

Queue lengths are measured in bytes. The top threshold value can be between 2 and 52428800 bytes (the default value is 52428800 bytes). To change the upper threshold value for a specific interface, use the `queue-monitor length threshold (Arad/Jericho)` command.

---

## Example

These commands set the upper queue-length threshold on Ethernet interface 5 to 2614400 bytes.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#queue-monitor length thresholds 2614400
switch(config-if-Et5)#
```

### 19.2.3.3.4 CPU Port Congestion Thresholds

CPU port queue lengths are also monitored on selected platforms. All CPU ports share common threshold values, which are configured using the [queue-monitor length cpu thresholds](#) command. Individual CPU port congestion thresholds cannot be separately configured.

#### Examples

- This command sets the upper queue-length threshold for congestion monitoring on all CPU ports to 1000 segments and the lower limit to 300 segments.

```
switch(config)# queue-monitor length cpu thresholds 1000 300
switch(config)#
```

- This command resets the queue-length thresholds for CPU port congestion to the default values of 512 and 256.

```
switch(config)# default queue-monitor length cpu thresholds
switch(config)#
```

### 19.2.3.3.5 Fabric Port Congestion Thresholds

Fabric port queue lengths are also monitored on selected platforms. All fabric ports share common threshold values, which are configured using the [queue-monitor length fabric thresholds](#) command. Individual fabric port congestion thresholds cannot be separately configured.

#### Examples

- This command sets the upper queue-length threshold for congestion monitoring on all fabric ports to 1000 segments and the lower limit to 300 segments.

```
switch(config)# queue-monitor length fabric thresholds 1000 300
switch(config)#
```

- This command resets the queue-length thresholds for fabric port congestion to the default values of 512 and 256.

```
switch(config)# default queue-monitor length fabric thresholds
switch(config)#
```

### 19.2.3.4 Setting LANZ Traffic Sampling

The switch can be configured to automatically send congested traffic to either the CPU or an Ethernet egress interface destination when a queue threshold is crossed by enabling LANZ mirroring through the command [queue-monitor length mirror](#). The CPU or an egress interface mirror destination is then configured through the command [queue-monitor length mirror destination](#). LANZ traffic sampling includes exporting congested traffic to a packet capture device or another tool for analysis, or directly to the switch CPU for inspection through the command [tcpdump queue-monitor](#).

## Examples

- This command enables LANZ traffic sampling.

```
switch(config)#queue-monitor length mirror
switch(config)#
```

- This command disables LANZ traffic sampling.

```
switch(config)#no queue-monitor length mirror
switch(config)#
```

- This command configures LANZ traffic sampling for a CPU interface mirror destination.

```
switch(config)#queue-monitor length mirror destination cpu
switch(config)#
```

- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports 1 through 5.

```
switch(config)#queue-monitor length mirror destination Ethernet 1-5
switch(config)#
```

- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports 6, 10, and 12 through 14.

```
switch(config)#queue-monitor length mirror destination Ethernet
6,10,12-14
switch(config)#
```

- This command inspects traffic on the switch.

```
switch(config)#tcpdump queue-monitor
tcpdump: WARNING: lanz: no IPv4 address assigned
tcpdump: verbose output suppressed, use -v or -vv for full protocol
decode
listening on lanz, link-type EN10MB (Ethernet), capture size 65535
bytes
...
0 packets captured
0 packets received by filter
0 packets dropped by kernel
switch(config)#
```

### 19.2.3.5 Logging LANZ Congestion Events

To generate syslog messages when queue lengths on an interface exceed its upper threshold, enable logging with the [queue-monitor length log](#) command. When logging is enabled, a log message is generated each time one or more queues on an interface exceed the upper threshold value for that interface (see [queue-monitor length threshold \(Arad/Jericho\)](#) or [queue-monitor length thresholds](#)). Once an interface is over threshold, additional messages are generated at a maximum rate of one per interval as long as the queue length remains above the lower threshold for that interface. No syslog message is generated when queue length drops back under threshold.

Queue length information is not included in log messages, but can be accessed by displaying LANZ data or exporting reports.

On FM6000 platforms, log messages can also be created whenever global buffer usage exceeds its upper threshold value (see [queue-monitor length global-buffer thresholds](#)). To enable global buffer monitoring, use the [queue-monitor length global-buffer](#) command. To log over-threshold events for the global buffer, use the [queue-monitor length global-buffer log](#) command.

### Examples:

- This command enables queue-length over-threshold logging with a minimum interval of 10 seconds between messages for a given interface.

```
switch(config)#queue-monitor length log 10
```

- This command disables queue-length over-threshold logging on the switch.

```
switch(config)#queue-monitor length log 0
```

- This is an example of a queue-length log message.

```
Oct 27 12:48:22 switch QUEUE_MONITOR-6-LENGTH_OVER_THRESHOLD:
  Interface
  Ethernet6 queue length is over threshold of 512, current
  length is 1024.
```

- This command enables global buffer over-threshold logging on the switch with a minimum interval of 60 seconds between messages.

```
witch(config)#queue-monitor length global-buffer log 60
```

### 19.2.3.6 Viewing LANZ Data

LANZ status, and the data stored in the LANZ data buffer, can be viewed using the CLI. Output varies by switch platform, and can be limited to a specified number of records.

#### 19.2.3.6.1 Viewing LANZ Data on Arad Platform Switches

When LANZ is enabled on an Arad platform switch, the `show queue-monitor length` command displays a report of recent over-threshold events for a range of interfaces or for all interfaces. By default, the command displays data for all interfaces, limited to the last 1000 records, with the most recent events listed first. To view a subset of the LANZ data, limited to a specified number of records, use the `show queue-monitor length limit` command.

#### Example

This command displays the last 100 records for Ethernet interfaces 6 through 8.

```
switch#show queue-monitor length ethernet 6-8 limit 100
Report generated at 2010-01-01 12:56:13

Time                               Interface  Queue length (segments, 1 to 512 bytes)
-----
0:00:07.43393 ago                  Et6       1049
0:00:39.22856 ago                  Et7       2039
1 day, 4:33:23.12345 ago           Et6       1077
```

To view the current LANZ configuration for the switch and for each interface, use the `show queue-monitor length status` command.

#### Example

This command displays LANZ configuration and status information.

```
switch(config)#show queue-monitor length status
Per-Interface Queue Length Monitoring
-----
Queue length monitoring is enabled
```

```

Maximum queue length in bytes : 52428800
Port threshold in bytes:
Port      High threshold
Et3/1     5242880
Et3/2     5242880
Et3/3     5242880
Et3/4     5242880
Et3/5     5242880

```

### 19.2.3.6.2 Viewing LANZ Data on FM6000, Trident II, Trident 3, and Tomahawk Platform Switches

When LANZ is enabled on an FM6000, Trident II, Trident 3, or Tomahawk platform switch, the `show queue-monitor length` command displays a report of recent over-threshold events for a range of interfaces or for all interfaces. By default, the command displays data for all interfaces, limited to the last 1000 records, with the most recent events listed first. To view a subset of the LANZ data, limited to a specified number of records, use the `show queue-monitor length limit` command.

#### Example

This command displays the last 100 records for Ethernet interfaces 6 through 8.

```

switch#show queue-monitor length ethernet 6-8 limit 100
Report generated at 2010-01-01 12:56:13

Time                               Interface  Queue length (segments, 1 to 512 bytes)
-----
0:00:07.43393 ago                  Et6        1049
0:00:39.22856 ago                  Et7        2039
1 day, 4:33:23.12345 ago           Et6        1077

```

To view the current LANZ configuration for the switch and for each interface, use the `show queue-monitor length status` command.

#### Example

This command displays LANZ configuration and status information.

```

switch(config)# show queue-monitor length status
queue-monitor length enabled
Global Buffer Monitoring
-----
Global buffer monitoring is enabled
Segment size in bytes : 160
Total buffers in segments : 36864
High threshold : 10940
Low threshold : 4376

Per-Interface Queue Length Monitoring
-----
Queue length monitoring is enabled
Segment size in bytes : 480
Maximum queue length in segments : 3647
Port thresholds in segments:
Port      High threshold  Low threshold
Et1       512                256
Et2       512                256
Et3       512                256
Et4       512                256
Et5       512                256

```

To view all available LANZ records, use the `show queue-monitor length all` command.

#### Example

This command displays all available LANZ records.

```

switch> show queue-monitor length all

```

```

Report generated at 2013-04-01 13:23:13
E-End, U-Update, S-Start, TC-Traffic Class
GH-High, GU-Update, GL-Low
Segment size for E, U and S congestion records is 480 bytes
Segment size for GL, GU and GH congestion records is 160 bytes
* Max queue length during period of congestion
+ Period of congestion exceeded counter
-----

```

| Type | Time                     | Intf (TC) | Congestion duration (usecs) | Queue length (segments) | Time of Max Queue length relative to congestion start (usecs) |
|------|--------------------------|-----------|-----------------------------|-------------------------|---------------------------------------------------------------|
| E    | 0:00:00.07567 ago        | Et22 (7)  | >=71 mins                   | 20*                     | 30us                                                          |

```

switch>

```

On the FM6000, Trident II, Trident 3, and Tomahawk platforms, information is also available for the number of dropped packets (see [show queue-monitor length drops](#)) and transmission latency (see [show queue-monitor length tx-latency](#)); global buffer usage can also be viewed on FM6000 platforms (see [show queue-monitor length global-buffer](#)).

### 19.2.3.7 Streaming LANZ Data

To support analysis of latency conditions, the switch can be configured to stream LANZ congestion and configuration data. The switch streams LANZ data via TCP in Google protocol buffer format through port 50001 and through the management interface.

You must create a client application to receive the streaming data. By default, the switch will accept up to 10 client connections for streaming LANZ data. This limit can be configured up to a maximum of 100. Maximum connections can be configured when LANZ is disabled.

#### 19.2.3.7.1 Enabling and Disabling LANZ Data Streaming

LANZ data streaming is disabled by default. To enable streaming, issue the `no show queue-monitor streaming clients` command in queue-monitor streaming configuration mode. To disable streaming, use the `show queue-monitor streaming clients` command.

When streaming is disabled, a message is sent to any connected clients and the connections are closed.

To ensure client access to LANZ data, add a rule to any relevant ACL permitting traffic destined for the LANZ port (50001) before initiating a client connection for streaming from a remote host. A static rule (sequence number 130) in the default control plane ACL permits LANZ traffic, but a similar rule must be added to any user-created ACL.

#### Examples

- These commands enable the streaming of LANZ data from the switch.

```

switch(config)#queue-monitor streaming
switch(config-qm-streaming)#no shutdown
switch(config-qm-streaming)#

```

- These commands disable LANZ data streaming.

```
switch(config)#queue-monitor streaming
switch(config-qm-streaming)#shutdown
switch(config-qm-streaming)#
```

### 19.2.3.7.2 Configuring Maximum Connections

By default, the switch will accept a maximum of 10 client connections for LANZ data streaming. This maximum can be configured using the [max-connections](#) command. If a client connects to the switch after the limit has been reached, an error message is sent and the connection is closed.

#### Example

This command sets the maximum number of client connections for LANZ data streaming to 50.

```
switch(config-qm-streaming)#max-connections 50
```

### 19.2.3.7.3 LANZ Streaming Messages

When streaming is enabled, LANZ sends a message whenever a congestion event or a configuration event occurs. The messages are streamed in Google protocol buffer format.

#### Configuration Messages

A configuration message is sent whenever a change is made to the LANZ configuration settings on the switch. The switch also sends a configuration message when a new client connection is established.

The configuration message includes the following information:

- **timestamp** time of change in configuration in tens of microseconds (UTC).
- **lanzVersion** LANZ feature version.
- **numOfPorts** number of ports in the switch.
- **segmentSize** segment size.
- **maxQueueSize** maximum queue size in segments.
- **qLenInterval** frequency of updates.
- **intfName** name of the port.
- **switchId** ID of the chip on a multi-chip system.
- **portId** ID of the port.
- **internalPort** “true” if it is an internal port.
- **highThreshold** higher threshold value.
- **lowThreshold** lower threshold value.

#### Congestion Messages

A congestion message is sent whenever LANZ generates an over-threshold event.

The congestion message includes the following information:

- **timestamp** time of congestion in micro-seconds (UTC).
- **intfName** name of the port.
- **switchId** ID of the chip on a multi-chip system.
- **portId** ID of the port.
- **queueSize** queue size in segments at time of congestion.

---

#### 19.2.3.7.4 Creating the LANZ Client

For a client device to receive streaming data from the LANZ server, it must be running a client application designed to receive LANZ data. Client programs must be based on the Google protocol buffer schema file describing the structure of the congestion and configuration messages which LANZ streams.

##### Google Protocol Buffers

Google protocol buffers provide an efficient mechanism for serializing LANZ data for streaming. A protocol buffer package is needed in order to run a LANZ client.

The latest version of the Google protocol buffer source code is available at this address: <http://code.google.com/p/protobuf/downloads/list>

##### LANZ Message Schema

LANZ client applications must be designed based on the LANZ protocol buffer schema, which defines the format and contents of the streamed messages. The schema file is shown below, and is also available in the Extensions/LANZ directory on this page: <https://www.arista.com/en/support/software-download>

```
package LanzProtobuf;

message ConfigRecord {
  required uint64 timestamp = 1; // Time of change in configuration in
  micro-seconds (UTC)
  required uint32 lanzVersion = 2; // LANZ feature version
  required uint32 numOfPorts = 3; // Num of ports in the switch
  required uint32 segmentSize = 4; // Segment size
  required uint32 maxQueueSize = 5; // Maximum queue size in segments
  optional uint32 qLenInterval = 10; // Frequency of update
  message PortConfigRecord {
    required string intfName = 1; // Name of the port
    required uint32 switchId = 2; // Id of the chip on a multi-chip system
    required uint32 portId = 3; // Id of the port
    required bool internalPort = 4; // 'True' if it's an internal port
    required uint32 highThreshold = 5; // Higher threshold
    required uint32 lowThreshold = 6; // Lower threshold
  }

  repeated PortConfigRecord portConfigRecord = 6; // Lanz config details of
  each
  port
}

message CongestionRecord {
  required uint64 timestamp = 1; // Time of congestion in micro-seconds
  (UTC)
  required string intfName = 2; // Name of the port
  required uint32 switchId = 3; // Id of the chip on a multi-chip system
  required uint32 portId = 4; // Id of the port
  required uint32 queueSize = 5; // Queue size in segments at time of
  congestion
}

message ErrorRecord {
  required uint64 timestamp = 1; // Time of event in micro-seconds (UTC)
  required string errorMessage = 2; // Text message
}

message LanzRecord {
  optional ConfigRecord configRecord = 1;
  optional CongestionRecord congestionRecord = 2;
```

```
optional ErrorRecord errorRecord = 3;  
}
```

### Implementation Procedure

The following steps create and install a functional client to receive streamed LANZ data. This procedure assumes a functional Python programming environment.

1. Download the example client (lanz\_client.py) from the Arista website. It is available in the Extensions/LANZ directory on this page: <https://www.arista.com/en/support/software-download>
2. Decompress the GPB archive to a directory.
3. Run the GPB C++ compilation and install. With default flags using GCC on \*nix platforms, this will produce a binary called "protoc" in your /usr/local/bin directory.
4. From the archive root, **cd** to python, and run the following commands:

```
python setup.py build
```

```
python setup.py test
```

5. Next, use the protoc compiler to convert the Lanz.proto file into a Python program called Lanz\_pb2.py, used by the client. The command to do so is:

```
protoc --python_out=. Lanz.proto
```

The **--python\_out=.** flag drops the compiled Python program in the directory where you ran the command.

6. Run **lanz\_client.py -h** to activate the LANZ client.

---

## 19.2.4 LANZ Commands

### LANZ Commands: Global Configuration

- `clear queue-monitor length statistics`
- `queue-monitor length (global configuration mode)`
- `queue-monitor length cpu thresholds`
- `queue-monitor length fabric thresholds`
- `queue-monitor length global-buffer`
- `queue-monitor length global-buffer log`
- `queue-monitor length global-buffer thresholds`
- `queue-monitor length log`
- `queue-monitor length mirror`
- `queue-monitor length mirror destination`
- `queue-monitor length notifying`
- `queue-monitor length update-interval`
- `queue-monitor streaming`
- `tcpdump queue-monitor`

### LANZ Commands: Interface Ethernet Configuration Mode

- `queue-monitor length threshold (Arad/Jericho)`
- `queue-monitor length thresholds`

### LANZ Commands: Queue-Monitor Streaming Configuration Mode

- `max-connections`

### LANZ Display Commands

- `show queue-monitor length`
- `show queue-monitor length all`
- `show queue-monitor length cpu`
- `show queue-monitor length csv`
- `show queue-monitor length drops`
- `show queue-monitor length ethernet`
- `show queue-monitor length global-buffer`
- `show queue-monitor length limit`
- `show queue-monitor length drops`
- `show queue-monitor length statistics`
- `show queue-monitor length status`
- `show queue-monitor length tx-latency`
- `show queue-monitor streaming clients`

### 19.2.4.1 clear queue-monitor length statistics

The `clear queue-monitor length statistics` command resets the occurrences of all over-threshold events on the switch including global buffer information (if supported).

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear queue-monitor length statistics
```

#### Example

This command resets all over-threshold events and global buffer information on an FM6000 switch.

```
switch#clear queue-monitor length statistics  
switch#
```

---

### 19.2.4.2 max-connections

The max-connections command sets the maximum number of client connections the switch accepts for streaming LANZ data. The default maximum is 10 connections. To stream LANZ data, you must use the [queue-monitor streaming](#) command to enable LANZ data streaming.

#### Command Mode

Queue-Monitor-Streaming Configuration

#### Command Syntax

```
max-connections connections
```

#### Parameters

*connections* maximum number of simultaneous LANZ streaming client connections the switch will accept. Values range from 1 through 100.

#### Related Commands

[queue-monitor streaming](#) places the switch in queue-monitor-streaming configuration mode.

#### Example

This command sets the maximum number of client connections the switch accepts for LANZ data streaming to 50.

```
switch(config-qm-streaming) #max-connections 50  
switch(config-qm-streaming) #
```

### 19.2.4.3 queue-monitor length (global configuration mode)

The **queue-monitor length (global configuration mode)** command enables LANZ with the current settings, or with the default settings if LANZ has not yet been configured. LANZ is enabled by default on Sand platform switches (those with Arad, Jericho, or Qumran chipsets), and disabled by default on all other switches.

When LANZ is enabled, the switch monitors queue lengths on all ports and generates over-threshold events when an output queue becomes congested. Over-threshold event data is available in the following forms:

- syslog data (see [queue-monitor length log](#))
- CLI display or CSV-format output (see [show queue-monitor length](#))
- data stream (see [queue-monitor streaming](#))

The **no queue-monitor length** command entered in global configuration mode disables LANZ and discards LANZ log data, but retains settings. LANZ settings include:

- logging settings (see [queue-monitor length log](#))
- queue length thresholds (see [queue-monitor length threshold \(Arad/Jericho/Qumran\)](#) or [queue-monitor length thresholds](#)).
- data streaming settings (see [queue-monitor streaming](#)).

To disable LANZ on an interface, use the **no queue-monitor length** command in interface configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
queue-monitor length
no queue-monitor length
default queue-monitor length
```

#### Examples

- This command enables LANZ on the switch.

```
switch(config)#queue-monitor length
switch(config)#
```

- This command disables LANZ on the switch and discards LANZ data but maintains configurations.

```
switch(config)#no queue-monitor length
switch(config)#
```

- This command disables LANZ on Ethernet interface 3/30.

```
switch(config)#interface ethernet 3/30
switch(config-if-Et3/30)#no queue-monitor length
switch(config-if-Et3/30)#
```

---

#### 19.2.4.4 queue-monitor length cpu thresholds

The **queue-monitor length cpu thresholds** command sets the queue length threshold to define “congested” on all CPU ports for purposes of LANZ reporting. If LANZ is enabled (see [queue-monitor length \(global configuration mode\)](#)), an over-threshold event is generated when one or more queues on a CPU interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the [queue-monitor length log](#) command.) Different monitoring thresholds cannot be set for individual CPU ports.

The **no queue-monitor length cpu thresholds** and **default queue-monitor length cpu thresholds** commands reset thresholds to the default values (high: 512 segments; low: 256 segments).

##### Command Mode

Global Configuration

##### Command Syntax

```
queue-monitor length cpu thresholds upper_limit lower_limit
```

```
no queue-monitor length cpu thresholds
```

```
default queue-monitor length cpu thresholds
```

##### Parameters

- *upper\_limit* is the queue length in segments that triggers an over-threshold event. Values range from 8 to 16382. Default setting is 512. Segment size varies by platform.
- *lower\_limit* When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than *upper\_limit*. Values range from 1 to 16382. Default setting is 256.

##### Examples

- This command sets the upper queue-length threshold for congestion monitoring on all CPU ports to 1000 segments and the lower limit to 300 segments.

```
switch(config)#queue-monitor length cpu thresholds 1000 300  
switch(config)#
```

- This command resets the queue-length thresholds for CPU port congestion to the default values of 512 and 256.

```
switch(config)#default queue-monitor length cpu thresholds  
switch(config)#
```

### 19.2.4.5 queue-monitor length fabric thresholds

The **queue-monitor length fabric thresholds** command sets the [queue length threshold](#) to define “congested” on all fabric ports for purposes of LANZ reporting. If LANZ is enabled (see [queue-monitor length](#) (global configuration mode)), an over-threshold event is generated when one or more queues on a fabric interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the [queue-monitor length log](#) command.) Different monitoring thresholds cannot be set for individual fabric ports.

The **no queue-monitor length fabric thresholds** and **default queue-monitor length fabric thresholds** commands reset thresholds to the default values (high: 512 segments; low: 256 segments).

#### Command Mode

Global Configuration

#### Command Syntax

```
queue-monitor length fabric thresholds upper_limit lower_limit
```

```
no queue-monitor length fabric thresholds
```

```
default queue-monitor length fabric thresholds
```

#### Parameters

- *upper\_limit* is the queue length in segments that triggers an over-threshold event. Values range from 8 to 16382. Default setting is 512. Segment size varies by platform.
- *lower\_limit* When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than *upper\_limit*. Values range from 1 to 16382. Default setting is 256.

#### Examples

- This command sets the upper queue-length threshold for congestion monitoring on all fabric ports to 1000 segments and the lower limit to 300 segments.

```
switch(config)#queue-monitor length fabric thresholds 1000 300
switch(config)#
```

- This command resets the queue-length thresholds for fabric port congestion to the default values of 512 and 256.

```
switch(config)#default queue-monitor length fabric thresholds
switch(config)#
```

---

### 19.2.4.6 queue-monitor length global-buffer log

The `queue-monitor length global-buffer log` command enables logging of global buffer over-threshold events. When logging is enabled, a log message is generated each time the contents of the global buffer exceed the upper threshold value set for the switch (see [queue-monitor length global-buffer thresholds](#)). Once the global buffer is over the threshold, additional messages are generated at a maximum rate of one per interval as long as the buffer value remains above the lower threshold for the switch.

Global buffer logging is disabled by default.

Log messages do not include buffer usage or congestion information. To view this information, use the [show queue-monitor length global-buffer](#) command.

The `no queue-monitor length global-buffer log` and `default queue-monitor length global-buffer log` commands disable global buffer logging by removing the corresponding `queue-monitor length global-buffer log` command from *running-config*. The `queue-monitor length global-buffer log` command with an interval value of 0 also disables global buffer logging.

#### Command Mode

Global Configuration

#### Command Syntax

```
queue-monitor length global-buffer log interval
no queue-monitor length global-buffer log
default queue-monitor length global-buffer log
```

#### Parameters

- *interval* minimum interval in seconds between logged messages.
  - 0 global buffer logging is disabled on the switch (the default setting).
  - 1 to 65535 minimum logging interval (in seconds).

#### Guidelines

This command is available on FM6000 platform switches.

#### Examples

- This command enables global buffer logging with a minimum interval of 10 seconds between messages.

```
switch(config)#queue-monitor length global-buffer log 10
```

- This command disables global buffer logging on the switch.

```
switch(config)#no queue-monitor length global-buffer log
```

### 19.2.4.7 queue-monitor length global-buffer thresholds

The queue-monitor length global-buffer thresholds command sets global buffer thresholds for the switch. An over-threshold event is generated when usage of the global buffer exceeds the upper threshold, and over-threshold events continue to be generated until usage drops below the lower threshold. (To log these events, use the [queue-monitor length global-buffer log](#) command.)

The no queue-monitor length global-buffer and default queue-monitor length global-buffer commands disable global buffer reporting.

The no **queue-monitor length global-buffer thresholds** and **default queue-monitor length global-buffer thresholds** commands erase custom global buffer threshold settings.

#### Command Mode

Global Configuration

#### Command Syntax

```
queue-monitor length global-buffer thresholds max_segments min_segments
```

```
no queue-monitor length global-buffer log
```

```
default queue-monitor length global-buffer log
```

#### Parameters

- *max\_segments* upper threshold in 160-byte segments. Value ranges from 2 to 36864. Default is 10940.
- *min\_segments* lower threshold in 160-byte segments. Value ranges from 1 to 36864. Default is 4376.

#### Examples

- This command sets the upper and lower global buffer thresholds to *9000* segments and *3000* segments.

```
switch(config)#queue-monitor length global-buffer thresholds 9000
3000
switch(config)#
```

- This command resets the upper and lower global buffer thresholds to their default values.

```
switch(config)#no queue-monitor length global-buffer thresholds 9000
3000
switch(config)#
```

---

### 19.2.4.8 queue-monitor length global-buffer

The `queue-monitor length global-buffer` command includes global buffer usage in LANZ reporting.

When global buffer reporting is enabled, over-threshold events are generated when global buffer usage exceeds the upper threshold. To set the threshold value, use the [queue-monitor length global-buffer thresholds](#) command. Usage data may be viewed using the [show queue-monitor length global-buffer](#) command. To view status and threshold information, use the [show queue-monitor length status](#) command.

Global buffer usage is measured in segments of 160 bytes.

The `no queue-monitor length global-buffer` and `default queue-monitor length global-buffer` commands disable global buffer usage reporting by removing the corresponding `queue-monitor length global-buffer` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
queue-monitor length global-buffer
no queue-monitor length global-buffer
default queue-monitor length global-buffer
```

#### Guidelines

This command is available on FM6000 platform switches.

#### Examples

- This command enables global buffer monitoring on the switch.

```
switch(config)#queue-monitor length global-buffer
switch(config)#
```

- This command disables global buffer monitoring on the switch.

```
switch(config)#no queue-monitor length global-buffer
switch(config)#
```

### 19.2.4.9 queue-monitor length log

The `queue-monitor length log` command enables logging of queue-length over-threshold events when LANZ is enabled on the switch (see [queue-monitor length \(global configuration mode\)](#)). When logging is enabled, a log message is generated each time one or more queues on an interface exceed the upper threshold value for that interface (see [queue-monitor length threshold \(Arad/Jericho\)](#)). Once an interface is over threshold, additional messages are generated at a maximum rate of one per interval as long as the queue length remains above the lower threshold for that interface. No syslog message is generated when queue length drops back under threshold.

Logging is disabled by default.

Log messages do not include queue length information. To view queue length information, use the [show queue-monitor length](#) command.

The `queue-monitor length log` command with an interval value of 0 disables event logging.

#### Command Mode

Global Configuration

#### Command Syntax

```
queue-monitor length log interval
```

#### Parameters

- *interval* minimum interval in seconds between logged messages from a single interface.
  - 0 queue-length logging is disabled on the switch (the default setting).
  - 1 to 65535 minimum logging interval (in seconds).
    - 1 to 65535 minimum logging interval (in seconds).

#### Examples

- This command enables over-threshold logging with a minimum interval of 10 seconds between messages for a given interface.

```
switch(config)#queue-monitor length log 10
```

- This command disables queue-length over-threshold logging on the switch.

```
switch(config)#queue-monitor length log 0
```

- This is an example of a queue-length log message.

```
Oct 27 12:48:22 switch QUEUE_MONITOR-6-LENGTH_OVER_THRESHOLD: Interface
Ethernet6 queue length is over threshold of 512, current length is
1024.
```

---

#### 19.2.4.10 queue-monitor length mirror destination

The **queue-monitor length mirror destination** command results in automatically sending traffic experiencing congestion to either the CPU or an Ethernet egress interface destination, once a queue threshold is crossed. Before using this command, first enable LANZ mirroring through the command [queue-monitor length mirror](#).

##### Command Mode

Global Configuration

##### Command Syntax

```
queue-monitor length mirror destination cpu | Ethernet <ports 1-24>
```

##### Parameters

*ports* any combination of Ethernet ports 1 through 24.

##### Examples

- This command configures LANZ traffic sampling for a CPU interface mirror destination.

```
switch(config)#queue-monitor length mirror destination cpu  
switch(config)#
```

- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports 3, 11, and 15 through 20.

```
switch(config)#queue-monitor length mirror destination Ethernet  
3,11,15-20  
switch(config)#
```

### 19.2.4.11 queue-monitor length mirror

The **queue-monitor length mirror** command enables LANZ mirroring. As a result, the switch is configured to automatically send congested traffic to either the CPU or an Ethernet egress interface destination, once a queue threshold is crossed. To set the destination for the mirrored traffic, use the [queue-monitor length mirror destination](#) command.

#### Command Mode

Global Configuration

#### Command Syntax

```
queue-monitor length mirror
```

#### Examples

- This command enables LANZ traffic sampling.

```
switch(config)#queue-monitor length mirror  
switch(config)#
```

- This command disables LANZ traffic sampling.

```
switch(config)#no queue-monitor length mirror  
switch(config)#
```

---

### 19.2.4.12 queue-monitor length notifying

The **queue-monitor length notifying** command enables Notifying Mode on Arad and Jericho switches. By default, LANZ operates in Polling Mode on Arad and Jericho switches. On all other switches, LANZ operates only in Notifying Mode.

When Notifying Mode is enabled, the switch provides detailed congestion information including Start, Update, and End events, rather than only polling the most congested queue in each ASIC. Notifying Mode uses both upper and lower threshold values. Both can be set with the [queue-monitor length thresholds](#) command. While a queue is congested, the maximum queue size is updated every five seconds by default; this interval can be configured using the [queue-monitor length update-interval](#) command.

The **no queue-monitor length notifying** and **default queue-monitor length notifying** commands reset LANZ to the default Polling Mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
queue-monitor length notifying
no queue-monitor length notifying
default queue-monitor length notifying
```

#### Guidelines

- Polling mode is available only on Arad and Jericho platform switches.
- On Jericho platforms, LANZ will revert to Polling Mode if there are not enough counter resources to operate in Notifying Mode.
- On Arad platforms, Notifying Mode is incompatible with SSO. Enabling SSO while Notifying Mode is enabled will cause LANZ to revert to Polling Mode.
- On Arad platforms, Notifying Mode is not available for CPU queues. Use Polling Mode when monitoring congestion on CPU queues on Arad switches.
- If the switch is rebooted while Notifying Mode is enabled, queue threshold values may be lost.

#### Examples

- This command enables Notifying Mode on an Arad or Jericho switch.

```
switch(config)#queue-monitor length notifying
switch(config)#
```

- This command disables Notifying Mode on an Arad or Jericho switch, returning LANZ to the default Polling Mode.

```
switch(config)#no queue-monitor length notifying
switch(config)#
```

### 19.2.4.13 queue-monitor length threshold (Arad/Jericho/Qumran)

The **queue-monitor length threshold** command sets the upper queue-length threshold on Arad, Jericho, and Qumran platforms to define “congested” on the command-mode interface for purposes of LANZ reporting. If LANZ is enabled (see [queue-monitor length \(global configuration mode\)](#)), an over-threshold event is generated when one or more queues on the interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the [queue-monitor length log](#) command.)

Entering the **no queue-monitor length** command in interface configuration mode disables LANZ on the interface. Entering either the **queue-monitor length threshold** command or the **default queue-monitor length threshold** command enables LANZ on the interface by removing the **no queue-monitor length** command from the configuration.

The **no queue-monitor length threshold** and **default queue-monitor length threshold** commands erase custom queue length threshold settings for the interface.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
queue-monitor length threshold upper_limit
no queue-monitor length
default queue-monitor length
```

#### Parameters

*upper\_limit* is the queue length in bytes that triggers an over-threshold event. Values range from 40962 to 52428800 bytes. Default setting is 52428800.

#### Guidelines

On Arad, Jericho, and Qumran platforms, the queue length is measured in bytes. Only the upper threshold is configurable using this command, and it is set at a default value of 52428800 bytes. Both upper and lower thresholds can be set using the [queue-monitor length thresholds](#) command.

#### Examples

- These commands set the upper queue-length threshold on *Ethernet interface 3/30* to 40000000 bytes.

```
switch(config)#interface ethernet 3/30
switch(config-if-Et3/30)#queue-monitor length threshold 40000000
switch(config-if-Et3/30)#
```

- These commands reset the upper queue-length threshold on *Ethernet interface 3/30* to its default value of 52428800 bytes.

```
switch(config)#interface ethernet 3/30
switch(config-if-Et3/30)#default queue-monitor length threshold
switch(config-if-Et3/30)#
```

---

#### 19.2.4.14 queue-monitor length thresholds

The **queue-monitor length thresholds** command sets both upper and lower queue length thresholds to define “congested” on the command-mode interface for purposes of LANZ reporting. If LANZ is enabled (see [queue-monitor length \(global configuration mode\)](#)), an over-threshold event is generated when one or more queues on the interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the [queue-monitor length log](#) command.)

Entering the **no queue-monitor length** command in interface configuration mode disables LANZ on the interface. Entering either the **queue-monitor length** command or the **default queue-monitor length** command in interface configuration mode enables LANZ on the interface by removing the **no queue-monitor length** command from the configuration.

The **no queue-monitor length thresholds** and **default queue-monitor length thresholds** commands in interface configuration mode both erase custom queue length threshold settings for the interface.

##### Command Mode

Interface-Ethernet Configuration

##### Command Syntax

```
queue-monitor length thresholds upper_limit lower_limit
no queue-monitor length
default queue-monitor length
```

##### Parameters

- *upper\_limit* queue length in segments that triggers an over-threshold event. Must be higher than *lower\_limit*. The minimum value is 2. The maximum is the largest number of segments which can be queued before packets are dropped, and varies based on factors including flow control state and private buffer settings. Default setting is 512.
- *lower\_limit* lower queue length threshold in segments. When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than *upper\_limit*. Values range from 1 to 4806. Default setting is 256.

##### Guidelines

Queue lengths are measured in 480-byte segments on FM6000 switches, in 208-byte segments on Trident II and Tomahawk switches, in 256-byte segments on Trident 3 switches, and in bytes on Arad and Jericho switches. Default thresholds vary by platform. Both upper and lower thresholds are configurable.

##### Examples

- These commands set the upper and lower queue-length thresholds on *Ethernet interface 5* to 300 segments and 200 segments.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#queue-monitor length thresholds 300 200
switch(config-if-Et5)#
```

- These commands reset the upper and lower queue-length thresholds on *Ethernet interface 5* to their default values.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#default queue-monitor length thresholds
switch(config-if-Et5)#
```

### 19.2.4.15 queue-monitor length update-interval

The `queue-monitor length update-interval` command sets the interval between congestion updates when LANZ is in Notifying Mode.

The `no queue-monitor length update-interval` and `default queue-monitor length update-interval` commands reset the update interval to its default value of 5000000 (5 seconds).

#### Command Mode

Global Configuration

#### Command Syntax

```
queue-monitor length update-interval interval
```

```
no queue-monitor length
```

```
default queue-monitor length
```

#### Parameters

*interval* is the time in microseconds between congestion updates. Values range from 80-10000000; default setting is 5000000 (5 seconds).

#### Examples

- This command sets the time between congestion updates to 10 seconds.

```
switch(config)#queue-monitor length update-interval 10000000  
switch(config)#
```

- This command resets the time between congestion updates to its default value of 5 seconds.

```
switch(config)#default queue-monitor length update-interval  
switch(config)#
```

---

### 19.2.4.16 queue-monitor streaming

The **queue-monitor streaming** command places the switch in queue-monitor-streaming configuration mode. Queue-monitor-streaming configuration mode is not a group change mode; **running-config** is changed immediately upon command entry. The exit command does not affect **running-config**.

To enable LANZ data streaming on the switch, use the **no show queue-monitor streaming clients** command.

The **exit** command returns the switch to global configuration mode.

#### Command Mode

Global Configuration

#### Command Syntax

```
queue-monitor streaming
```

#### Commands Available in queue-monitor streaming Configuration Mode

- [max-connections](#)
- [show queue-monitor streaming clients](#)

#### Example

This command places the switch in queue-monitor streaming configuration mode.

```
switch(config)#queue-monitor streaming  
switch(config-qm-streaming)#
```

### 19.2.4.17 show queue-monitor length all

The **show queue-monitor length all** command displays all available over-threshold event records on the switch including global buffer information, with the most recent events listed first.

LANZ must be enabled to use this command (see [queue-monitor length \(global configuration mode\)](#)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

#### Command Mode

EXEC

#### Command Syntax

```
show queue-monitor length all
```

#### Guidelines

This command is available on FM6000 platform switches.

#### Example

This command displays all available LANZ records from the switch.

```
switch>show queue-monitor length all

## 19.2.4.18 show queue-monitor length cpu

The `show queue-monitor length cpu` command displays LANZ data for CPU ports on the switch. On Trident II and Tomahawk platforms, the “Interface” column identifies the CPU port by its card slot and chip index.

LANZ must be enabled to use this command (see [queue-monitor length \(global configuration mode\)](#)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

### Command Mode

EXEC

### Command Syntax

```
show queue-monitor length cpu
```

### Examples

- This command displays LANZ data for CPU ports on a Trident II or Tomahawk switch.

```
switch>show queue-monitor length cpu
Report generated at 2017-03-10 15:24:11
E-End, U-Update, S-Start, TC-Traffic Class
Segment size for E, U and S congestion records is 208 bytes
* Max queue length during period of congestion
+ Period of congestion exceeded counter
```

### 19.2.4.19 show queue-monitor length csv

The **show queue-monitor length csv** command displays LANZ records in comma-separated value (CSV) format with the oldest samples displayed first.

LANZ must be enabled to use this command (see [queue-monitor length \(global configuration mode\)](#)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

#### Command Mode

EXEC

#### Command Syntax

```
show queue-monitor length csv
```

#### Example

This command displays LANZ records in CSV format.

```
switch>show queue-monitor length csv

### 19.2.4.20 show queue-monitor length drops

The `show queue-monitor length drops` command displays a report of cumulative transmission drop totals for a range of interfaces or for all interfaces. Output can be limited to a specified number of seconds or records. The most recent events are listed first. By default, the command displays data for all interfaces, limited to the last 1000 records. Newest events are listed first.

LANZ must be enabled to use this command (see [queue-monitor length \(global configuration mode\)](#)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

#### Command Mode

EXEC

#### Command Syntax

```
show queue-monitor length [INTERFACES][FACTOR] drops
```

#### Parameters

- **INTERFACES** interface type and number for report. Values include:
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e-range` e-range formats include a number, number range, or comma-delimited list of numbers and ranges.
- **FACTOR** limiting parameter for report. Values include:
  - `<no parameter>` displays the last 1000 records.
  - `limit number samples` displays the last *number* records.
  - `limit number seconds` displays all records generated during the last *number* seconds.

Value of number ranges from 1 to 1000000.

#### Guidelines

This command is available on FM6000, Trident II, Trident 3, and Tomahawk platform switches.

#### Example

- This command displays the last 10 records of transmission drop data on an FM6000 switch.

```
switch>show queue-monitor length limit 10 samples drops

### 19.2.4.21 show queue-monitor length ethernet

The **show queue-monitor length ethernet** command displays a report of recent over-threshold events for a range of interfaces, with the newest events listed first.

LANZ must be enabled to use this command (see [queue-monitor length \(global configuration mode\)](#)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

#### Command Mode

EXEC

#### Command Syntax

show queue-monitor length ethernet *e-range*

#### Parameters

*e-range* the range of interfaces to be included in the report; formats include a number, number range, or comma-delimited list of numbers and ranges

#### Examples

- This command displays the last 1000 records for Ethernet interface 9 on an FM6000 platform switch.

```

switch>

```

**Note:** The non-sequential listing of ingress ports shown here is specific to Jericho switches; interfaces on Arad switches are always displayed sequentially.

### 19.2.4.22 show queue-monitor length global-buffer

The **show queue-monitor length global-buffer** command displays a report of recent high usage, low usage and update events for the global buffer. Newest events are listed first.

LANZ must be enabled to use this command (see [queue-monitor length \(global configuration mode\)](#)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

#### Command Mode

EXEC

#### Command Syntax

```
show queue-monitor length global-buffer
```

#### Guidelines

This command is available on FM6000 platform switches.

#### Example

- This command displays the global buffer event records for the switch.

```
switch>show queue-monitor length global buffer
Report generated at 2013-04-01 14:30:07
GH-High, GU-Update, GL-Low

GS 0:04:25.28201 ago          913        N/A          N/A
switch>
```

### 19.2.4.23 show queue-monitor length limit

The **show queue-monitor length limit** command displays a report of recent over-threshold events for a range of interfaces or for all interfaces, limited by a specified number of records.

LANZ must be enabled to use this command (see [queue-monitor length \(global configuration mode\)](#)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

#### Command Mode

EXEC

#### Command Syntax

```
show queue-monitor length limit [INTERFACES] number
```

#### Parameters

- INTERFACES** interface type and number for report. Values include:
  - <no parameter>* displays information for all interfaces.
  - ethernet e-range* e-range formats include a number, number range, or comma-delimited list of numbers and ranges
- number* number of records to display. Values range from 1 to 1000000.

---

## Example

This command displays the last 100 records for Ethernet interfaces 6 through 8.

```
switch>#show queue-monitor length ethernet 6-8 limit 100 samples
Report generated at 2010-01-01 12:56:13
Time                Interface      Queue length (segments, 1 to 512 bytes)
-----
0:00:07.43393 ago   Et6           1049
0:00:39.22856 ago   Et7           2039
1 day, 4:33:23.12345 ago Et6           1077
switch>
```

#### 19.2.4.24 show queue-monitor length statistics

The **show queue-monitor length statistics** command displays LANZ statistics for all interfaces, showing the traffic class and number of recorded congestion events for each interface.

LANZ must be enabled to use this command (see [queue-monitor length \(global configuration mode\)](#)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

##### Command Mode

EXEC

##### Command Syntax

```
show queue-monitor length statistics
```

##### Example

This command displays LANZ statistics for all interfaces on the switch.

```
switch> show queue-monitor length statistics

Report generated at 2016-02-09 22:59:56
Interface          Traffic Class  Count
-----
Et29                11             1
```

### 19.2.4.25 show queue-monitor length status

The **show queue-monitor length status** command displays the current LANZ configuration for the switch and for each interface. On certain platforms, the status of global buffer monitoring and per-linecard LANZ mode are displayed.

#### Command Mode

EXEC Global Configuration

#### Command Syntax

```
show queue-monitor length status
```

#### Guidelines

On FM6000 platform switches, this command includes status information about global buffer monitoring.

On Arad and Jericho based linecards, if LANZ is globally enabled (using the [queue-monitor length](#) command), the command displays the monitoring mode per-linecard.

On Arad and Jericho switches, even when all linecards are configured in Notifying Mode (using the [queue-monitor length notifying](#) command), some linecards may still run LANZ in Polling Mode under the following circumstances:

- On Arad-based linecards, LANZ falls back to Polling Mode when SSO redundancy mode is configured on the card (here, the mode is shown as “polling due to SSO configured”).
  - On Jericho-based linecards, LANZ may run in Polling Mode when many features that use the switch’s statistic capabilities have been configured (here, the mode is shown as “polling due to counters exhausted”).

#### Examples

- This command displays the current LANZ configuration on an FM6000 device.

```
switch#show queue-monitor length status
queue-monitor length enabled
queue-monitor length packet sampling is disabled
queue-monitor length update interval in micro seconds: 5000000
Global Buffer Monitoring
-----

#### 19.2.4.26 show queue-monitor length tx-latency

The **show queue-monitor length tx-latency** command displays the latency data of recent LANZ events for a range of interfaces or for all interfaces. Output can be limited to a specified number of seconds or records. The most recent events are listed first. By default, the command displays data for all interfaces, limited to the last 1000 records. Newest events are listed first.

LANZ must be enabled to use this command (see [queue-monitor length \(global configuration mode\)](#)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

#### Command Mode

EXEC

#### Command Syntax

```
show queue-monitor length [INTERFACES][FACTOR] tx-latency
```

#### Parameters

- **INTERFACES** interface type and number for report. Values include:
  - *<no parameter>* displays information for all interfaces.
  - **ethernet e-range** e-range formats include a number, number range, or comma-delimited list of numbers and ranges.
- **FACTOR** limiting parameter for report. Values include:
  - *<no parameter>* displays the last 1000 records.
  - **limit number samples** displays the last *number* records.
  - **limit number seconds** displays all records generated during the last *number* seconds.

Value of number ranges from 1 to 1000000.

#### Guidelines

This command is available on FM6000, Trident II, Trident 3, and Tomahawk platform switches.

#### Example

This command displays transmission latency data for the last 1000 LANZ events on the switch.

```
switch>show queue-monitor length tx-latency

```

### 19.2.4.27 show queue-monitor length

The **show queue-monitor length** command displays a report of recent over-threshold events for all interfaces, limited to the last 1000 records, with the newest events listed first.

LANZ must be enabled to use this command (see [queue-monitor length \(global configuration mode\)](#)). If LANZ is disabled, the command displays “queue-monitor is disabled.”

To limit the output to a specified number of seconds and/or records, use the [show queue-monitor length limit](#) command.

#### Command Mode

EXEC

#### Command Syntax

```
show queue-monitor length
```

#### Examples

- This command displays the last 1000 LANZ records on an Arad or Jericho platform switch in Polling Mode.

```
switch>show queue-monitor length

```

### 19.2.4.28 show queue-monitor streaming clients

The **show queue-monitor streaming clients** command displays the number of presently connected clients through LANZ streaming, and also displays their host-names. Ensure that both LANZ and LANZ streaming are enabled in order to use this command.

#### Command Mode

EXEC

#### Command Syntax

```
show queue-monitor streaming clients
```

#### Example

This command displays the number of clients connected to LANZ streaming.

```
switch#show queue-monitor streaming clients  
Number of clients connected: 3  
-----  
172.20.63.161:6565  
172.24.17.58:42  
172.38.54.142:333
```

---

#### 19.2.4.29 shutdown (queue-monitor-streaming configuration)

The **shutdown** command disables the streaming of LANZ data to external clients. The **no shutdown** command enables LANZ data streaming. Streaming is disabled by default.

##### Command Mode

Queue-Monitor-Streaming Configuration

##### Command Syntax

**shutdown**

**no shutdown**

##### Example

These commands enable the streaming of LANZ data on the switch.

```
switch(config)#queue-monitor streaming  
switch(config-qm-streaming)#no shutdown  
switch(config-qm-streaming)#
```

### 19.2.4.30 tcpdump queue-monitor

The `tcpdump queue-monitor` command exports congested traffic to a packet capture device or another tool for analysis, or directly to the switch CPU for inspection.

#### Command Mode

Global Configuration

#### Command Syntax

```
tcpdump queue-monitor
```

```
tcpdump queue-monitor [file | filecount | filter | lookup-names | max-file-size | packet-count | size | verbose]
```

#### Parameters

- *file* output file.
  - *certificate:* certificate file.
    - *file:* standard file.
    - *flash:* flash file.
    - *sslkey:* sslkey file.
    - *usb1:* usb1 file.
- *filecount* specify the number of output files: 1 to 100.
- *filter* set the filtering expression to select which packets will be dumped.
- *lookup-names* enable reverse DNS lookups.
- *max-file-size* specify the maximum file size by entering 1 to 100 million bytes.
- *packet-count* specify 1 to 10000 packets to capture.
- *size* specify the maximum number of bytes to dump per packet with a size of 1 to 65536 bytes.
- *verbose* enable verbose mode.

#### Example

This command inspects traffic on the switch.

```
switch(config)#tcpdump queue-monitor
tcpdump: WARNING: lanz: no IPv4 address assigned
tcpdump: verbose output suppressed, use -v or -vv for full protocol
decode
listening on lanz, link-type EN10MB (Ethernet), capture size 65535 bytes
...
0 packets captured
0 packets received by filter
0 packets dropped by kernel
switch(config)#
```

## 19.3 Sampled Flow Tracking

This chapter describes Arista's implementation of sampled flow tracking, including configuration instructions and command descriptions. Topics covered by this chapter include:

- [Sampled Flow Tracking Overview](#)
- [Configuring Sampled Flow Tracking](#)
- [Sampled Flow Tracking Configuration Examples](#)
- [Sampled Flow Tracking Commands](#)

---

## 19.3.1 Sampled Flow Tracking Overview

Network administrators require access to flow information that passes through various network elements to analyze and monitor networks. Sampled flow tracking provides access to IP flow information by sampling traffic flows in ingress direction on the interfaces on which it is configured. The samples are then used to create flow records that are exported to the configured collectors in the Internet Protocol Flow Information Export (IPFIX) format.

Sampled flow tracking terminology:

- Flow tracker: It is a collection of interfaces that collect samples and create flow records. The flow tracker has one or more exporters.
- Exporter: It sends flow records to one or more collectors.
- Collector: It receives flow records from one or more exporters.
- Data record: It contains values of the parameters corresponding to a template record.
- Template record: It defines the structure and interpretation of fields in a data record. It is an ordered sequence of type and length pairs.
- Options template record: It is a type of template record that defines the structure and interpretation of fields in a data record, including how to scope the applicability of the data record.

Data records are created based on the following flow key fields: source IP address, destination IP address, IP protocol, source port, destination port, VRF, and VLAN. These records support IPv4 flow data record and IPv6 flow data record.

Sampled flow tracking supports the following options data records:

- VRF record: mapping of VRF ID to VRF name.
- Interface record: mapping of interface ID to interface name.
- Flow key indicator record: mapping of template ID to flow key indicator.
- Flow tracker record: contains information about configured flow tracker.

### 19.3.1.1 Sampled Flow Tracking Limitations

The limitations of Sampled flow tracking are:

- Sampled flow tracking is active only when sFlow is disabled on the device.
- Sampled flow tracking does not support export of IPFIX messages over ECMP paths.
- Sampled flow tracking route simulation is not supported for ECMP paths.

## 19.3.2 Configuring Sampled Flow Tracking

These sections describe sampled flow tracking configurations.

### Configuring Sampled Flow Tracking

Use the `flow tracker sampled` command to enable sampled flow tracking on a tracker. Each tracker should have a minimum of one exporter configured.

#### Example

This command enables sampled flow tracking on an interface Eth1 and the flow tracker ftr1.

```
switch(config)# interface Eth1
switch(config-if-Et1)# flow tracker sampled ftr1
```

Use the `sample` command to enable the sample rate for a specific sampled flow tracker. The default sample rate is 1048576.

#### Example

These commands configure a sample rate of 1024 for the sampled flow tracker.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#sample 1024
```

### 19.3.2.1 Configuring the Sampled Flow Tracker

Use the `tracker` command to configure a sampled flow tracker for a device.

#### Example

This command configures a sampled flow tracker named `ftr1`.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
```

Use the `record export on interval` command to configure the interval at which active flow records are exported. The default interval is 300000 milliseconds.

#### Example

These commands configure an active record interval of 7000 for the exporter `exp1`.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#record export on interval
7000
```

Use the `record export on inactive timeout` command to configure the interval at which timed-out inactive flow records are exported. The default interval is 15000 milliseconds.

These commands configure an inactive record interval of 4000 for the exporter `exp1`.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#record export on inactive
timeout
4000
```

### 19.3.2.2 Configuring Exporter for Sampled Flow Tracker

Use the `exporter` command to configure or unconfigure an exporter for a specific tracker.

#### Example

This command configures exporter `exp1` for the specific tracker `ftr1`.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
```

Use the `collector` command to configure the collector for the specific exporter.

#### Example

These commands configure a collector for the IPv4 address 192.0.2.0 and collector port number 10.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
```

```
switch(config-ftr-sampled-tr-ftrl-exp-exp1)#collector 192.0.2.0 port 10
```

Use the `local interface` command to configure the local source interface for the specific exporter.

### Example

These commands configure the local source interface Ethernet1 for the exporter exp1.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftrl
switch(config-ftr-sampled-tr-ftrl)#exporter exp1
switch(config-ftr-sampled-tr-ftrl-exp-exp1)#local interface Ethernet1
```

Use the `dscp` command to configure the DSCP value for the specific exporter. The default DSCP value is 0.

### Example

These commands configure a DSCP value of 10 for the exporter exp1.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftrl
switch(config-ftr-sampled-tr-ftrl)#exporter exp1
switch(config-ftr-sampled-tr-ftrl-exp-exp1)#dscp 10
```

Use the `format ipfix version` command to configure the IPFIX version and maximum packet size for the specific exporter. The default IPFIX version is 10 and the default maximum packet size is 9152.

### Example

These commands configure an IPFIX version of 10 and a maximum packet size of 854 for the exporter exp1.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftrl
switch(config-ftr-sampled-tr-ftrl)#exporter exp1
switch(config-ftr-sampled-tr-ftrl-exp-exp1)#format ipfix version 10
max-packet-size 854
```

Use the `template interval` command to configure the interval at which templates are exported for the specific exporter. The default template interval is 3600000 milliseconds.

### Example

This command configures the interval of 3400000 milliseconds for the exporter exp1.

```
switch(config-ftr-sampled-tr-exp-ftrl-exp1)# template interval 3400000
```

## 19.3.3 Sampled Flow Tracking Configuration Examples

This section describes the command configurations required to configure sampled flow tracking.

### 19.3.3.1 Sampled Flow Tracking Basic Configuration

The following commands enable a basic configuration.

1. Enable configuration mode for the sampled flow tracking on a device.

```
switch(config)#flow tracking sampled
```

2. Configure a sampled flow tracker for a device.

```
switch(config-flow-tracking-sampled)# tracker ftr1
```

3. Configure an exporter for the specific tracker.

```
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
```

4. Configure the collector for the specific exporter.

```
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#collector 172.31.22.131
```

5. Configure the local source interface Ethernet1 for the specific exporter.

```
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#local interface Ethernet1
```

6. Enable sampled flow tracking.

```
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#no shutdown
```

7. Configure the interface Ethernet2 for the specific exporter.

```
switch(config)#interface Ethernet2
```

8. Configure the sampled flow tracker on the interface Ethernet2.

```
switch(config)#interface Ethernet2  
switch(config-if-Et2)# flow tracker sampled ftr1
```

---

## 19.3.4 Sampled Flow Tracking Commands

This section contains descriptions of Sampled flow tracking commands.

### Configuration Commands

- [collector](#)
- [dscp](#)
- [exporter](#)
- [flow tracking sampled](#)
- [format ipfix version](#)
- [local interface](#)
- [record export on inactive timeout](#)
- [record export on interval](#)
- [sample](#)
- [shutdown \(sampled flow tracking\)](#)
- [template interval](#)
- [tracker](#)

### Interface Configuration Command

- [flow tracker sampled](#)

### Privileged EXEC Command

- [clear flow tracking sampled counters](#)

### Sampled Flow Tracking Display Commands

- [show flow tracking sampled](#)
- [show flow tracking sampled counters](#)
- [show flow tracking sampled flow-table](#)
- [show flow tracking sampled ipfix options-table](#)
- [show flow tracking sampled ipfix template](#)

### 19.3.4.1 clear flow tracking sampled counters

The **clear flow tracking sampled counters** command clears the flow tracking counters for all trackers, a specified tracker, or a specified tracker and exporter.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear flow tracking sampled counters [ tracker tracker_name [ exporter exporter_name ]]
```

#### Parameters

- tracker *tracker\_name* Specifies the flow tracker.
- exporter *exporter\_name* Specifies the exporter.

#### Example

- This command clears the flow counters for the tracker *ftr1* and exporter *exp1*.

```
switch#clear flow tracking sampled counters tracker ftr1 exporter exp1  
switch#
```

---

### 19.3.4.2 collector

The **collector** command configures a collector to receive flow records from a specified exporter.

The **no collector** and **default collector** commands remove the configured collector from *running-config*.

#### Command Mode

Sampled Flow Tracking Exporter Configuration

#### Command Syntax

```
collector { ipv4_address | ipv6_address } [ port port_number ]
```

```
no collector { ipv4_address | ipv6_address } [ port port_number ]
```

```
default collector { ipv4_address | ipv6_address } [ port port_number ]
```

#### Parameters

- *ipv4\_address* Specifies the IPv4 address of the collector.
- *ipv6\_address* Specifies the IPv6 address of the collector.
- **port port\_number** Specifies the port number for the collector. Values range from 1 to 65535. The default value is 4739.

#### Example

- These commands configure a collector for the IPv4 address 192.0.2.0 and collector port number 10.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#collector 192.0.2.0 port 10
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#exit
switch(config-ftr-sampled-tr-ftr1)#exit
switch(config-flow-tracking-sampled)#exit
switch(config)#
```

### 19.3.4.3 dscp

The **dscp** command configures the Differentiated Services Code Point (DSCP) value for a specific exporter.

The **no dscp** and **default dscp** commands reset the DSCP value to the default of 0.

#### Command Mode

Sampled Flow Tracking Exporter Configuration

#### Command Syntax

**dscp** *dscp\_value*

**no dscp** *dscp\_value*

**default dscp** *dscp\_value*

#### Parameters

- *dscp\_value* the DSCP value assigned to the exporter. Value ranges from 0 to 63. Default value is 0.

#### Example

- These commands configure a DSCP value of 10 for the exporter `10.10.10.10`.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#dscp 10
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#exit
switch(config-ftr-sampled-tr-ftr1)#exit
switch(config-flow-tracking-sampled)#exit
switch(config)#
```

---

#### 19.3.4.4 exporter

The **exporter** command places the switch in sampled flow tracking exporter configuration mode for the specified exporter and creates the exporter if it does not yet exist.

The **no exporter** and **default exporter** commands remove the specific exporter from *running-config*.

##### Command Mode

Sampled Flow Tracking Tracker Configuration

##### Command Syntax

**exporter** *exporter\_name*

**no exporter** *exporter\_name*

**default exporter** *exporter\_name*

##### Parameters

- *exporter\_name* the name of the exporter.

##### Example

- These commands create exporter exp1 for the flow tracker ftr1 and place the switch in configuration mode for that exporter.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#
```

### 19.3.4.5 flow tracker sampled

The **flow tracker sampled** command configures an interface to be part of a flow tracker. An interface can belong to only one flow tracker.

The **no flow tracker sampled** and **default flow tracker sampled** commands remove the specified interface from the specified tracker.

#### Command Mode

Interface-Ethernet Configuration

#### Command Syntax

```
flow tracker sampled tracker_name
```

```
no flow tracker sampled tracker_name
```

```
default flow tracker sampled tracker_name
```

#### Parameters

- *tracker\_name* the name of the flow tracker to which the interface is to be added.

#### Example

- This command configures Ethernet interface 1 to participate in the flow tracker `ftr1`.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# flow tracker sampled ftr1
switch(config-if-Et1)#
```

---

### 19.3.4.6 flow tracking sampled

The **flow tracking sampled** command places the switch in sampled flow tracking configuration mode. Sampled flow tracking configuration mode is a group-change mode; changes made in a group-change mode are saved by exiting the mode.

The **no flow tracking sampled** and **default flow tracking sampled** commands remove all sampled flow tracking configuration from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
flow tracking sampled
```

```
no flow tracking sampled
```

```
default flow tracking sampled
```

#### Commands Available in Sampled Flow Tracking Configuration Mode

- **abort** exits mode without saving changes
- **exit** exits mode and saved changes
- **sample** configures sample parameters
- **shutdown (sampled flow tracking)** enables or disables sampled flow tracking
- **tracker** configures a flow tracker

#### Example

- This command places the switch in sampled flow tracking configuration mode.

```
switch(config)# flow tracking sampled  
switch(config-flow-tracking-sampled)#
```

### 19.3.4.7 format ipfix version

The **format ipfix version** command configures the IPFIX version and maximum packet size for a specific exporter.

The **no format ipfix version** and **default format ipfix version** commands remove the previously configured IPFIX version and the maximum packet size value from **running-config**.

#### Command Mode

Sampled Flow Tracking Configuration

#### Command Syntax

```
format ipfix version ipfix_version [ max-packet-size max-packet-size value ]
```

```
no format ipfix version ipfix_version [ max-packet-size ]
```

```
default format ipfix version ipfix_version [ max-packet-size ]
```

#### Parameters

- *ipfix\_version* the IPFIX version. Default value is 10.
- *max-packet-size max-packet-size value* the IPFIX maximum packet size. Value ranges from 512 to 65472. Default value is 9152.

#### Example

- These commands configure an IPFIX version of 10 and a maximum packet size of 854 for the exporter *exp1*.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# format ipfix version 10
max-packet-size 854
```

---

### 19.3.4.8 local interface

The `local interface` command configures the local source interface for the specific exporter.

The `no local interface` and `default local interface` commands remove the local interface for the specific exporter from *running-config*.

#### Command Mode

Sampled Flow Tracking Configuration

#### Command Syntax

```
local interface interface
```

```
no local interface
```

```
default local interface
```

#### Parameters

- *interface* Interface type and numbers. Options include:
  - Ethernet *eth\_num* displays the information of the specified Ethernet interface. The value ranges from 1 to 64.
  - Loopback *lb\_num* displays the information of the specified loop back interface. The value ranges from 0 to 2100.
  - Management *m\_num* displays the information of the specified Management interface. The management port number ranges from 1 to 2.
  - Port-Channel *pc\_num* displays the interface or sub-interface information of the specified port channel. The interface and sub-interface values of port channel ranges from <1-1000> and <1-2000>.<1-4094> respectively.
  - Tunnel *t\_num* displays the information of the specified tunnel. The value ranges from 0 to 255.
  - Vlan *vlan\_num* displays the information of the specified VLAN interface. The value ranges from 1 to 4094.

#### Example

- These commands configure the local source interface Ethernet1 for the exporter *exp1*.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# local interface Ethernet1
```

### 19.3.4.9 record export on inactive timeout

The `record export on inactive timeout` command configures the interval at which inactive flow records time out and are exported for a flow tracker.

The `no record export on inactive timeout` and `default record export on inactive timeout` commands remove the timeout interval from *running-config*.

#### Command Mode

Sampled Flow Tracking Configuration

#### Command Syntax

```
record export on inactive timeout timeout_value
```

```
no record export on inactive timeout
```

```
default record export on inactive timeout
```

#### Parameters

- *timeout\_value* the flow record inactive export timeout value in milliseconds. Value ranges from 3000 to 900000. The default value is 15000 milliseconds.

#### Example

- These commands configure an inactive record interval of 6000 for the exporter exp1.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# record export on inactive
timeout
6000
```

---

### 19.3.4.10 record export on interval

The **record export on interval** command configures the interval at which active flow records are exported for a flow tracker.

The **no record export on interval** and **default record export on interval** commands remove the interval from *running-config*.

#### Command Mode

Sampled Flow Tracking Configuration

#### Command Syntax

```
record export on interval interval_value
```

```
no record export on interval
```

```
default record export on interval
```

#### Parameters

- *interval\_value* the flow record export interval in milliseconds. Value ranges from 5000 to 36000000. The default value is 300000 milliseconds.

#### Example

- These commands configure an active record interval of 9000 for the exporter *exp1*.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# record export on interval
9000
```

### 19.3.4.11 sample

The **sample** command enables the sample rate for a specific sampled flow tracker.

The **no sample** and **default sample** commands remove the sample rate configured for a specific sampled flow tracker from **running-config**.

#### Command Mode

Sampled Flow Configuration

#### Command Syntax

```
sample sample_rate
```

```
no sample
```

```
default sample
```

#### Parameters

- *sample\_rate* the sample flow tracking rate to be assigned for a sampled flow tracker. Value ranges from 1024 to 16777216. Default value is 1048576.

#### Example

- These commands configure a sample rate of 2056 for the sampled flow tracker.

```
switch(config)# flow tracking sampled  
switch(config-flow-tracking-sampled)# sample 2056
```

---

### 19.3.4.12 show flow tracking sampled counters

The **show flow tracking sampled counters** command displays information about the flow tracking counters of a specific tracker and the counters of a specified exporter within that tracker.

#### Command Mode

EXEC

#### Command Syntax

```
show flow tracking sampled counters [ tracker tracker_name [ exporter exporter_name ]]
```

#### Parameters

- tracker *tracker\_name* the specific flow tracker.
- exporter *exporter\_name* the specific exporter within the tracker.

#### Examples

- This command displays the flow tracking counter information of the tracker ftr1 and the exporter exp1.

```
switch# show flow tracking sampled counters tracker ftr1 exporter
exp1
Tracker: ftr1
  1 flows, 22 RX packets
  Flows created: 1, expired: 0
  Group: IPv4
  1 flows, 22 RX packets
  Group: IPv6
  0 flows, 0 RX packets
  Exporter: exp1 (IPFIX)
  Collector: 172.31.24.133 port 4739
  52 messages, last sent 0:00:27 ago
  0 flow records
  2350 options data records, last sent 0:00:27 ago
  6 templates, last sent 0:12:27 ago
  Collector: 172.31.22.131 port 4739
  52 messages, last sent 0:00:27 ago
  0 flow records
  2350 options data records, last sent 0:00:27 ago
  6 templates, last sent 0:12:27 ago
```

### 19.3.4.13 show flow tracking sampled flow-table

The **show flow tracking sampled flow-table** command displays information about the active flows maintained in the EOS.

#### Command Mode

EXEC

#### Command Syntax

```
show flow tracking sampled flow-table [ detail | dst-ip | dst-port | group | interface | protocol | src-ip | src-port | tracker | vlan | vrf ]
```

#### Parameters

- detail displays detailed flow records.
- dst-ip displays flow records based on destination IPv4 or IPv6 address.
- dst-port displays flow records based on a specified destination port.
- group displays flow records based on IPv4 or IPv6 flow groups.
- interface displays flow records based on ingress interface.
- protocol displays flow records based on the flow IP protocol.
- src-ip displays flow records based on source IPv4 or IPv6 address.
- src-port displays flow records based on a specified source port.
- tracker displays flow records based on flow tracker.
- vlan displays flow records based on a specified flow VLAN ID.
- vrf displays flow records based on flow VRF.

#### Examples

- This command displays information about the active flows on the device.

```
switch# show flow tracking sampled flow-table
Tracker: ftr1, Flows: 1
Group: IPv4, Flows: 1
VRF VLAN Source Destination Protocol Start Time Pkts Bytes
-----
red 42 10.10.1.1:0 10.20.1.2:0 UDP 2019-04-18 15:06:50 7 700
```

- This command displays detailed information about the active flows on the device.

```
switch# show flow tracking sampled flow-table detail
Tracker: ftr1, Flows: 1
Group: IPv4, Flows: 1
Flow: UDP 10.10.1.1:0 - 10.20.1.2:0, VRF: red, VLAN: 42
Start time: 2019-04-18 15:06:50.268734, Last packet time: 2019-04-18
15:07:03.607900
Packets: 15, Bytes: 1500, TOS: 0, TCP flags: none
Source MAC: 001c.73ee.bfe4, Destination MAC: 001c.7374.3b85
Ingress Interface: 'Ethernet1', Egress VLAN: routed, Egress
Interface: CPU
Next hop: unknown, BGP next hop: unknown (AS unknown), Source AS:
unknown
Source prefix length: 24, Destination prefix length: 32
```

### 19.3.4.14 show flow tracking sampled ipfix options-table

The **show flow tracking sampled ipfix options-table** command displays information about the sampled IPFIX options table available.

#### Command Mode

EXEC

#### Command Syntax

```
show flow tracking sampled ipfix options-table tracker [ flow-key | flow-tracker | interface | vrf ]
```

#### Parameters

- tracker displays the output for a specific flow tracker.
- flow-key displays the flow keys options table.
- flow-tracker displays the flow tracker options table.
- interface displays the interface options table.
- vrf displays the VRF options table.

#### Examples

- This command displays the sampled IPFIX options table for the tracker *ftr1*.

```
switch# show flow tracking sampled ipfix options-table
Tracker: ftr1
  Observation domain: ftr1, ID: 1
  Active interval: 30sec
  Inactive timeout: 120sec
  Selector algorithm: random(3)
  Sampling: 1/1024
  Flow tracking type: sampled(1)
  VRF Table, Template ID: 256, Scope: ingressVRFID
  VRF ID VRF Name
  -----
  0 default
  1 red
  16777215
  Interface Table, Template ID: 257, Scope: ingressInterface
  Interface ID Interface Name
  -----
  0 unknown
  3013 Ethernet1
  3014 Ethernet2

  1073741823 CPU
  1073741824 discard
  1074029945 Ethernet3/36/1.1
  1074292089 Ethernet3/36/1.2
  2147483648 multicast
  Flow Keys Table, Template ID: 258, Scope: templateId
  Template ID Flow Key Indicator
  -----
  261 0x7f
  262 0x7f
```

### 19.3.4.15 show flow tracking sampled ipfix template

The **show flow tracking sampled ipfix template** command displays information about the exported IPFIX data templates and options templates.

#### Command Mode

EXEC

#### Command Syntax

```
show flow tracking sampled ipfix template [ data | options | tracker ]
```

#### Parameters

- data displays the data templates.
- options displays the flow options template.
- tracker displays the flow tracker template.

#### Example

- This command displays the sampled IPFIX options table for the tracker *ftr1*.

```
switch# show flow tracking sampled ipfix template
Tracker: ftr1
  Data Template, Group: IPv4, Fields: 26, Template ID: 261
    ingressVRFID (234), 4 bytes
    vlanId (58), 2 bytes
    sourceIPv4Address (8), 4 bytes
    destinationIPv4Address (12), 4 bytes
    protocolIdentifier (4), 1 bytes
    sourceTransportPort (7), 2 bytes
    destinationTransportPort (11), 2 bytes
    sourceMacAddress (56), 6 bytes
    postDestinationMacAddress (57), 6 bytes
    octetDeltaCount (1), 8 bytes
    packetDeltaCount (2), 8 bytes
    flowStartMilliseconds (152), 8 bytes
    flowEndMilliseconds (153), 8 bytes
    flowEndReason (136), 1 bytes
    tcpControlBits (6), 2 bytes
    ingressInterfaceType (368), 4 bytes
    ingressInterface (10), 4 bytes
    postVlanId (59), 2 bytes
    egressInterface (14), 4 bytes
    ipClassOfService (5), 1 bytes
    bgpSourceAsNumber (16), 4 bytes
    bgpDestinationAsNumber (17), 4 bytes
    bgpNextHopIPv4Address (18), 4 bytes
    ipNextHopIPv4Address (15), 4 bytes
    sourceIPv4PrefixLength (9), 1 bytes
    destinationIPv4PrefixLength (13), 1 bytes

<-----OUTPUT OMITTED FROM EXAMPLE----->
```

---

### 19.3.4.16 show flow tracking sampled

The **show flow tracking sampled tracker** command displays information about the status of a specific tracker and the status of a specified exporter within that tracker. If no tracker is specified in the command, then all information about all trackers is displayed.

#### Command Mode

EXEC

#### Command Syntax

```
show flow tracking sampled [ tracker tracker_name [ exporter exporter_name ]]
```

#### Parameters

- tracker *tracker\_name* the specific flow tracker.
- exporter *exporter\_name* the specific exporter within the tracker.

#### Examples

- This command displays the status information of the tracker ftr1 and the exporter exp1.

```
switch# show flow tracking sampled tracker ftr1 exporter exp1
Flow tracking status
Type: Sampled
Running: yes
Sample rate: 1024
Tracker: ftr1
Active interval: 30000ms
Inactive timeout: 120000ms
Groups: IPv4, IPv6
Exporter: exp1
VRF: default
Local interface: Management1 (172.30.150.179)
Export format: IPFIX version 10, MTU 1500
DSCP: 48
Template interval: 3600000ms
Collectors:
172.31.22.131 port 4739
Active interfaces:
Et1
```

### 19.3.4.17 shutdown (sampled flow tracking)

The **shutdown** command disables sampled flow tracking for the specific exporter.

The **no shutdown** command enables sampled flow tracking for the specific exporter.

#### Command Mode

Sampled Flow Tracking Configuration

#### Command Syntax

**shutdown**

**no shutdown**

**default shutdown**

#### Example

- These commands enable sampled flow tracking for the specific exporter *exp1*.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# local interface Ethernet1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# no shutdown
```

---

### 19.3.4.18 `template interval`

The `template interval` command configures the interval at which templates are exported for a specific exporter. The default template interval is 3600000 milliseconds.

The `no template interval` and `default template interval` commands reset the interval rate to the default.

#### Command Mode

Sampled Flow Tracking Configuration

#### Command Syntax

```
template interval interval
```

```
no template interval
```

```
default template interval
```

#### Parameters

- *interval* the interval rate in milliseconds. The value ranges between 5000 and 3600000 milliseconds. The default rate is 3600000 milliseconds.

#### Example

- This command configures the interval of 3400000 milliseconds for the exporter *exp1*.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-exp-ftr1-exp1)# template interval 3400000
```

### 19.3.4.19 tracker

The `tracker` command configures a sampled flow tracker for a device.

The `no tracker` and `default tracker` commands remove the sampled flow tracker from the *running config*.

#### Command Mode

Sampled Flow Configuration

#### Command Syntax

```
tracker tracker_name
```

```
no tracker tracker_name
```

```
default tracker tracker_name
```

#### Parameters

- `tracker_name` the flow tracker name.

#### Example

- These commands configure the sampled flow tracker `ftr1`.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
```

## 19.4 sFlow

This chapter describes Arista's implementation of sFlow, including configuration instructions and command descriptions. Topics covered by this chapter include:

- [sFlow Conceptual Overview](#)
- [sFlow Configuration Procedures](#)
- [sFlow Configuration Commands](#)

### 19.4.1 sFlow Conceptual Overview

#### 19.4.1.1 sFlow Technology

sFlow is a multi-vendor sampling technology that continuously monitors application level traffic flow at wire speed simultaneously on all interfaces. sFlow provides gigabit speed quantitative traffic measurements without impacting network performance.

sFlow has the following network traffic monitoring characteristics:

- sFlow provides a network view of active route usage that measures network traffic.
- sFlow is scalable to 10 Gb/s without impacting switch performance or the network load.
- sFlow is implemented on a wide range of devices, without requiring additional memory and CPU.
- sFlow is an industry standard.

An sFlow configuration consists of:

- sFlow agents, embedded on network equipment, that monitor traffic and generate data.
- sFlow collectors that receive and analyze sFlow data.

Arista switches include an sFlow agent that monitors ingress data through all Ethernet interfaces.

---

#### 19.4.1.1.1 sFlow Agents

The sFlow agent is a software process that runs as part of the network management software within an Arista switch. It combines interface counters and flow samples into sFlow datagrams that are sent to an sFlow collector. Packets typically include flow samples and state information of the forwarding/routing table entries associated with each sample. Additional data can be gathered for entries originated by BGP.

The sFlow Agent performs minimal processing when packaging data into datagrams. Immediate data forwarding minimizes agent memory and CPU requirements.

#### 19.4.1.1.2 sFlow Collector

An sFlow collector is a server that runs software that analyzes and reports network traffic. Collectors receive flow samples and counter samples respectively as sFlow datagrams from sFlow agents.

Arista switches reference a collector's IP address and UDP port as a configurable setting through a CLI command. Arista switches do not include sFlow collector software.

#### 19.4.1.1.3 sFlow Data

The sFlow Agent uses two forms of sampling: statistical packet-based sampling of switched flows and time-based sampling of network interface statistics.

- **Switched flow sampling:** A sample is taken by either copying the packet's header or extracting feature data from the packet.
- **Interface statistics sampling:** Counter sampling extracts statistics by periodically polling each data source on the device.

sFlow implements flow sampling and counter sampling as part of an integrated system. An sFlow datagram incorporates both sample types.

#### 19.4.1.2 Arista sFlow Implementation

Arista switches provide a single sFlow agent instance that samples ingress traffic from all Ethernet and port channel interfaces. The switch provides two levels of settings for enabling sFlow:

- a global setting that enables packet sampling on the entire switch.
- interface settings that control sampling on individual interfaces when sFlow is globally enabled.

sFlow default settings include:

- global: sFlow and BGP sFlow export are globally disabled.
- Ethernet and port channel interfaces: sFlow is enabled on all interfaces when it is enabled globally. BGP sFlow export is likewise enabled on all interfaces when it is enabled globally.

The switch performs sFlow polling when sFlow is globally enabled. The CLI provides commands that globally disable sampling while counter polling remains enabled. Sample enabling is not controllable on individual interfaces.

The switch sends sFlow datagrams to the collector located at an IP address specified by a global configuration command. If the collector destination is not configured, the switch samples data without transmitting the resulting datagrams.

Although the CLI enforces the configured sampling rate limit, it may drop samples if it cannot handle the number of samples it receives over a specified period. Under normal operation, the maximum packet sample rate is one per 16384 packets. The CLI allows for higher sampling rates by using the dangerous keyword.

The switch can also be configured to allow the routing agent to export BGP information to the sFlow agent. When BGP sFlow export is enabled, sFlow will add BGP information to packets whose destination is a BGP route.

The following lists describe sFlows sampling behavior relative to different packet types:

- Packets that are sampled:
  - CPU
  - IP Options and MTU violations
  - Flooded packets
  - Multicast packets
- Packets that are not sampled:
  - LACP frames
  - LLDP frames
  - STP BPDUs
  - IGMP packets
  - PAUSE frames
  - PIM hello packets
  - CRC error frames
  - Packets dropped by ACLs or due to VLAN violations

### 19.4.1.3 sFlow and Mirroring

The sFlow and Mirroring is supported using the same interface for both a mirroring session and sFlow at the same time. But when sFlow and mirroring is configured on the same interface, the TAP Aggregation is not supported. And when TAP Aggregation mode is enabled, the interface configured as a source for both a mirroring session and sFlow will only mirror packets, and sFlow samples are not produced.

The sFlow and Mirroring are supported on the following switch series:

DCS-7280R, DCS-7280R2, DCS-7280E, DCS-7500R, DCS-7500R2, DCS-7500E, DCS-7050X, DCS-7060X, DCS-7250X, DCS-7260X, and DCS-7300X.

However, the following switches have a limitation:

DCS-7280R, DCS-7280R2, DCS-7280E, DCS-7500R, DCS-7500R2, and DCS-7500E.

When a mirroring session and sFlow is configured on a same interface for the above devices, the following packet types are not sampled though they are sampled with only sFlow.

- STP BPDUs
- LACP frames
- LLDP frames
- OSPF packets
- PIM HELLO packets
- Packets dropped due to VLAN violations

## 19.4.2 sFlow Configuration Procedures

Implementing sFlow on an Arista switch consists of configuring the following agent parameters:

1. Collector location address.
2. Agent source address.
3. Polling interval.
4. Sampling rate.

Optionally, sFlow can be configured to include output interface and traffic class information in samples using the `sflow sample` command, and to include BGP information in samples whose destination is a BGP route using the `sflow extension bgp` command.

After configuring the sFlow agent, sampling is initiated by globally enabling sFlow on the switch.

---

## Platform-specific Considerations

When BGP sFlow export is enabled on Arad platform switches (DCS-7280E and DCS-7500E), BGP information can be added to some sFlow packets with ECMP destinations.

DCS-7500E switches use actual hardware egress port information in sFlow packets. All other platforms use software simulation to determine the egress port.

## Configuring the Collector Location

The `sflow destination` command specifies the IP address and UDP port of an sFlow collector. The switch supports multiple collectors.

### Example

- This command configures the switch to send sFlow data to collectors at 10.42.15.12, port 6100 and 10.52.12.2 port 6343 (the default sFlow port).

```
switch(config)#sflow destination 10.42.15.12 6100
switch(config)#sflow destination 10.52.12.2
switch(config)#
```

## Configuring the Agent Source Address

The `sflow source` command specifies the source address that the switch places in all sFlow datagrams that it sends to the collector. This address is normally set to an IP address configured on the switch.

### Example

- This command configures 10.2.9.21 as the sFlow source address.

```
switch(config)#sflow source 10.2.9.21
switch(config)#
```

The `sflow source-interface` command can be alternatively used to specify the interface from which an IP address is derived that the switch places in all sFlow datagrams that it sends to the collector. This address is normally set to an IP address configured on the switch.

### Example

- This command configures VLAN interface 25 as the sFlow source interface. The switch enters the IP address for VLAN 25 in the source field of sFlow datagrams.

```
switch(config)#sflow source-interface vlan 25
switch(config)#
```

*running-config* cannot simultaneously contain `sflow source` and `sflow source-interface` commands.

## Configuring the Polling Interval

The `sflow polling-interval` command specifies the interval for sending counter data to the sFlow collector. The default interval is two seconds.

### Example

- This command configures the switch to send sFlow data every ten seconds.

```
switch(config)#sflow polling-interval 10
switch(config)#
```

## Configuring the Sampling Rate and Sample Contents

The `sflow sample` command sets the packet sampling rate. Packets are sampled at random intervals to avoid inaccurate sampling of periodic events. A rate of 16384 corresponds to an average sample of one per 16,384 packets. The default rate is 1048576.

### Example

- This command configures the sFlow sampling rate as 65536 (one per 65,536 packets).

```
switch(config)#sflow sample 65536
switch(config)#
```

The `sflow sample` command can also optionally configure sample packets to include information about the traffic class of the sample. Traffic class is communicated by rewriting the DSCP field in the sample packet.

By default, samples include information about the output interface. To remove this information, use the `[no] sflow sample output interface` command.

- These commands configure sFlow to include traffic class information in samples but to exclude output interface data.

```
switch(config)#no sflow sample output interface
switch(config)#sflow sample rewrite dscp
switch(config)#
```

## Enabling BGP sFlow Export

The `sflow extension bgp` command enables BGP sFlow export. When it is enabled, the routing agent will export the BGP routing table and autonomous system path information to the sFlow agent. When sFlow receives a sampled packets whose destination is a BGP route, it will look up the following additional BGP routing information and include it in the sample:

- next hop IP
  - AS numbers
  - AS system path to the destination
  - communities
  - local pref

On Arad platform switches (DCS-7280E and DCS-7500E), BGP sFlow export will also add the above BGP information to sample packets with ECMP destination routes unless they exit the switch via a trunk port or subinterface. When egress port is a trunk port or subinterface, the sample packet will only include AS path information from the first path of the ECMP route and a BGP next hop of 0.

On all other switch platforms, ECMP destination routes will include AS path information from the first path, but will identify the BGP next hop as 0.

**Note:** A BGP instance must be configured on the switch for BGP sFlow export to operate. See the Border Gateway Protocol(BGP) chapter for details.

### Example

- These commands configure a BGP instance in AS 50 and enable BGP sFlow export globally.

```
switch(config)#router bgp 50
switch(config-router-bgp)#exit
switch(config)#sflow extension bgp
switch(config)#
```

---

## Extended Switch and Router Information

By default, extended switch and router information is added to sFlow sample packets.

Extended switch information includes the following:

- source and destination VLANs and priorities

Extended router information includes the following:

- IP version and address of next-hop router
  - source and destination mask lengths

The **no** form of [sflow extension switch](#) and **no** form of [sflow extension router](#) commands prevent the addition of extended switch and router information to sFlow sample packets.

### Example

- These commands prevent extended switch and router information from being added to sFlow sample packets.

```
switch(config)#no sflow extension switch
switch(config)#no sflow extension router
switch(config)#
```

## Enabling sFlow

The [sflow run](#) command globally enables sFlow on the switch. The [sflow enable](#) command controls sFlow operation on Ethernet and port channel interfaces when sFlow is globally enabled. The [sflow enable](#) command has no effect when sFlow is globally disabled.

### Example

- These commands enable sFlow on the switch, then disables sFlow on Ethernet interface 10.

```
switch(config)#sflow run
switch(config)#interface ethernet 10
switch(config-if-Et10)#no sflow enable
switch(config)#
```

### 19.4.3 sFlow Configuration Commands

This section contains descriptions of sFlow commands.

#### Global Configuration Commands

- [sflow extension bgp](#)
- [sflow extension router](#)
- [sflow extension switch](#)
- [sflow destination](#)
- [sflow polling-interval](#)
- [sflow run](#)
- [sflow sample](#)
- [sflow source](#)
- [sflow source-interface](#)

#### Interface Configuration Commands

- [sflow enable](#)

#### Privileged EXEC Command

- [clear sflow counters](#)

#### sFlow Display Commands

- [show sflow](#)
- [show sflow interfaces](#)

---

### 19.4.3.1 clear sflow counters

The **clear sflow counters** command resets the global sFlow statistics, which includes the number of samples and sample pool. The hardware trigger count is not reset.

The [show sflow](#) command displays global sFlow statistics.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear sflow counters
```

#### Example

- This command resets the sFlow counters.

```
switch#clear sflow counters  
switch#
```

### 19.4.3.2 [no] sflow sample output interface

By default, sFlow samples include information about the output interface of the sampled packet. The **no sflow sample output interface** command prevents sFlow from including that information.

#### Command Mode

Global Configuration

#### Command Syntax

```
no sflow sample output interface
```

#### Examples

- This command configures sFlow to not include output interface information in samples.

```
switch(config)#no sflow sample output interface  
switch(config)#
```

---

### 19.4.3.3 sflow destination

The **sflow destination** command specifies an sFlow collector IP address and UDP port. The switch supports sFlow collector addresses through multiple sFlow destination commands in **running-config**.

The **no sflow destination** and **default sflow destination** commands remove the specified sFlow collector IP address by deleting the corresponding **sflow destination** command from **running-config**.

#### Command Mode

Global Configuration

#### Command Syntax

```
sflow destination dest_addr [UDP_PORT]
```

```
no sflow destination dest_addr [UDP_PORT]
```

```
default sflow destination dest_addr [UDP_PORT]
```

#### Parameters

- **dest\_addr** sflow collectors IP address.
- **UDP\_PORT** sFlow collectors data reception port. Options include:
  - **<No parameter>** port number 6343 (default).
  - **port\_num** port number. Value ranges from 0 to 65535.

#### Example

- This command configures the switch to send sFlow data to the collector located at 10.42.15.12; the collector receives the data through UDP port 6100.

```
switch(config)#sflow destination 10.42.15.12 6100
switch(config)#
```

### 19.4.3.4 sflow enable

The **sflow enable** command enables sFlow on the configuration mode interface when sFlow is globally enabled. By default, sFlow is enabled on all interfaces when sFlow is globally enabled (**sflow run**). The **sflow enable** command is required only when **running-config** contains a **no sflow enable** statement for the specified interface.

The **no sflow enable** command disables sFlow on the configuration mode interface. When sFlow is globally disabled, this command persists in **running-config** but has no effect on switch operation.

The **default sflow enable** command removes the corresponding **no sflow enable** command from **running-config** enabling sFlow capability on the interface.

#### Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

#### Command Syntax

```
sflow enable
```

```
no sflow enable
```

```
default sflow enable
```

#### Examples

- These commands enable sFlow on the switch and disable sFlow on Ethernet interface 12.

```
switch(config)#sflow run
switch(config)#interface ethernet 12
switch(config-if-Et12)#no sflow enable
switch(config-if-Et12)#
```

- This command removes the **no sflow enable** command for Ethernet interface 12 from **running-config**, enabling sFlow on the interface whenever sFlow is globally enabled.

```
switch(config-if-Et12)#sflow enable
switch(config-if-Et12)#
```

### 19.4.3.5 sflow extension bgp

The **sflow extension bgp** command enables BGP export to sFlow. When enabled, this feature the routing agent will export the BGP routing table and autonomous system path information to the sFlow agent. When sFlow receives a sampled packets whose destination is a BGP route, it will look up the following additional BGP routing information and include it in the sample:

- next hop IP
  - AS numbers
  - AS system path to the destination
  - communities
  - local pref

The **no sflow extension bgp** and **default sflow extension bgp** commands disable BGP export to sFlow by deleting the corresponding **sflow extension bgp** command from **running-config**.

**Note:** A BGP instance must be configured on the switch for BGP sFlow export to operate. See the Border Gateway Protocol chapter for details.

#### Command Mode

Global Configuration

#### Command Syntax

```
sflow extension bgp
no sflow extension bgp
default sflow extension bgp
```

#### Guidelines

BGP sFlow export behaves differently on different switch platforms as follows:

- DCS-7500E switches use actual hardware egress port information in sFlow packets. All other platforms use software simulation to determine the egress port.
- On Arad platform switches (DCS-7280E and DCS-7500E), BGP sFlow export works for sample packets with ECMP destination routes unless they exit the switch via a trunk port or subinterface. When egress port is a trunk port or subinterface, the sample packet will only include AS path information from the first path of the ECMP route and a BGP next hop of 0.
- On all other switch platforms, ECMP destination routes will include AS path information from the first path, but will identify the BGP next hop as 0.
- DCS-7500E switches use actual hardware egress port information in sFlow packets. All other platforms use software simulation to determine the egress port.

#### Example

- These commands configure a BGP instance in AS 50 and enable BGP sFlow export globally.

```
switch(config)#router bgp 50
switch(config-router-bgp)#exit
switch(config)#sflow extension bgp
switch(config)#
```

### 19.4.3.6 sflow extension router

By default, the switch provides extended router information in sFlow packets, including the IP version and address of the next-hop router and source and destination mask lengths.

The **no** version of the **sflow extension router** command prevents this information from being included in sFlow packets.

The **sflow extension router** and **default sflow extension router** commands restore the default behavior by deleting the corresponding **no sflow extension router** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
sflow extension router
no sflow extension router
default sflow extension router
```

#### Example

- This command prevents the switch from including extended router information in sFlow packets.

```
switch(config)#no sflow extension router
switch(config)#
```

---

### 19.4.3.7 sflow extension switch

By default, the switch provides extended switch information in sFlow packets, including source and destination VLANs and priorities.

The **no** version of the **sflow extension switch** command prevents this information from being included in sFlow packets.

The **sflow extension switch** and **default sflow extension switch** commands restore the default behavior by deleting the corresponding **no sflow extension switch** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
sflow extension switch
no sflow extension switch
default sflow extension switch
```

#### Example

- This command prevents the switch from including extended switch information in sFlow packets.

```
switch(config)#no sflow extension switch
switch(config)#
```

### 19.4.3.8 sflow polling-interval

The **sflow polling-interval** command specifies the counters polling interval. The switch uses this interval to schedule a ports counter data transmissions to the sFlow collector.

The default interval is two seconds.

The **no sflow polling-interval** and **default sflow polling-interval** commands revert the polling interval to the default of two seconds by removing the **sflow polling-interval** command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
sflow polling-interval interval_period
```

```
no sflow polling-interval
```

```
default sflow polling-interval
```

#### Parameters

- ***interval\_period*** polling interval (seconds). Value ranges from 0 to 3600 (60 minutes). Default is 2.

#### Example

- This command configures the switch to send sFlow counter data every ten seconds.

```
switch(config)#sflow polling-interval 10  
switch(config)#
```

---

### 19.4.3.9 sflow run

The **sflow run** command globally enables sFlow on the switch. The default sFlow global setting is **disabled**. sFlow cannot be enabled on individual interfaces when it is globally disabled.

The **sflow enable** interface configuration command controls sFlow operation on individual Ethernet and port channel interfaces when sFlow is globally enabled. When sFlow is enabled globally, sFlow is also enabled on all interfaces by default.

The **no sflow run** and **default sflow run** commands globally disable sFlow on the switch.

#### Command Mode

Global Configuration

#### Command Syntax

```
sflow run
```

```
no sflow run
```

```
default sflow run
```

#### Examples

- This command enables sFlow on the switch.

```
switch(config)#sflow run  
switch(config)#
```

- This command globally disables sFlow.

```
switch(config)#no sflow run  
switch(config)#
```

### 19.4.3.10 sflow sample

The **sflow sample** command sets the packet sampling rate. Packets are sampled at random intervals to avoid inaccurate sampling of periodic events; the packet sampling rate defines the average number of ingress packets that pass through an interface for every packet that is sampled. A rate of 16384 corresponds to an average sample of one per 16,384 packets. The switch may drop samples if it cannot handle the configured sample rate. Under normal operation, the maximum packet sample rate is one per 16384 packets. Higher sampling rates can be specified with the **dangerous** option.

By default, samples include information about the output interface. To remove this information, use the [\[no\] sflow sample output interface](#) command.

The **sflow sample** command can also optionally configure sample packets to include information about the traffic class of the sample. Traffic class is communicated by rewriting the DSCP field in the sample packet.

The **no sflow sample** and **default sflow sample** commands reset the packet sampling rate to the default of 1,048,576 and remove output interface and traffic class information from samples by removing the **sflow sample** command from the configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
sflow sample SAMPLE_RATE [rewrite dscp]
no sflow sample
default sflow sample
```

#### Parameters

- **SAMPLE\_RATE** size of the packet sample from which one packet is selected. Default sample size is 1048576 packets. Options include:
  - **recommended\_rate** Integer between 16384 to 16777215.
    - **dangerous any\_rate** permits overriding the recommended range of sampling rates. The *any\_rate* value range varies by platform:
      - fm6000** 1 to 65535
      - trident** 1 to 16777216

**rewrite dscp** configures sFlow to rewrite the DSCP field of sample packets to indicate the traffic class of the original packet.

#### Examples

- This command configures the sFlow sampling rate as 65536 (one per 65,536 packets).

```
switch(config)#sflow sample 65536
switch(config)#
```

- This command configures the sFlow sampling rate as 256 (one per 256 packets).

```
switch(config)#sflow sample dangerous 25
switch(config)#
```

- This command configures sFlow to include traffic class information in samples.

```
switch(config)#sflow sample rewrite dscp
switch(config)#
```

---

### 19.4.3.11 sflow source

The `sflow source` command specifies the IP address used in the **Agent** address field of the IPv4 sFlow datagram that the switch sends to the collector. This command cannot be used if *running-config* contains an `sflow source-interface` command.

The `no sflow source` and `default sflow source` commands remove the `sflow source` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
sflow source source_addr
```

```
no sflow source
```

```
default sflow source
```

#### Parameters

- ***source\_addr*** source IP address (dotted decimal notation).

#### Example

- This command configures 10.2.9.21 as the sFlow source address.

```
switch(config)#sflow source 10.2.9.21  
switch(config)#
```

### 19.4.3.12 sflow source-interface

The `sflow source-interface` command specifies the source IP address that is set to the IP's of the specified interfaces that the switch sends to the collector. Both, the Agent address in the IPv4 sFlow datagram as well as the source IP address sent to the collector are specified in sFlow packet. This command cannot be used if *running-config* contains an `sflow source` command.

The `no sflow source-interface` and `default sflow source-interface` commands remove the `sflow source-interface` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
sflow source-interface INT_NAME
```

```
no sflow source-interface
```

```
default sflow source-interface
```

#### Parameters

- **INT\_NAME** Interface type and number. Options include:
  - **interface ethernet** *e\_num* Ethernet interface specified by *e\_num*.
  - **interface loopback** *l\_num* Loopback interface specified by *l\_num*.
  - **interface management** *m\_num* Management interface specified by *m\_num*.
  - **interface port-channel** *p\_num* Port-Channel Interface specified by *p\_num*.
  - **interface vlan** *v\_num* VLAN interface specified by *v\_num*.

#### Example

- This command configures the sFlow source address as the IP address assigned to the loopback 0 interface.

```
switch(config)#sflow source-interface loopback 0  
switch(config)#
```

---

### 19.4.3.13 show sflow interfaces

The **show sflow interfaces** command displays the interfaces where sFlow is enabled.

The **show sflow** command displays configured sFlow parameters, operational status, and statistics.

#### Command Mode

EXEC

#### Command Syntax

```
show sflow interfaces
```

#### Examples

- This command displays the show sflow interface message when sFlow is globally disabled.

```
switch#show sflow interfaces
sFlow Interface (s):
-----
sFlow is not running
```

- This command displays the show sflow interface message when sFlow is globally enabled and enabled on all interfaces.

```
switch(config)#sflow run
switch(config)#show sflow interfaces
Default sFlow configuration for an interface: Disable
sFlow Interface (s):
-----
Ethernet1  running(Counter)
Ethernet2  running(Counter)
Ethernet3  running(Flow,Counter)
Ethernet4  running(Flow,Counter)
Ethernet5  running(Flow,Counter)
```

### 19.4.3.14 show sflow

The **show sflow** command displays configured sFlow parameters, operational status, and statistics.

The [show sflow interfaces](#) command displays the interfaces where sFlow is enabled.

#### Command Mode

EXEC

#### Command Syntax

```
show sflow [detail]
```

#### Parameters

- **detail** adds hardware sampling status and number of discarded samples to the information displayed.

#### Example

- This command displays the base sFlow information.

```
switch#show sflow
! Displaying counters that may be stale
sFlow Configuration
-----
Destinations: None (default)
Source(s):
  0.0.0.0 ( default ) ( VRF: default )

## 19.5 SNMP

This chapter describes the Arista switch SNMP agent and contains these sections:

- [SNMP Introduction](#)
- [SNMP Conceptual Overview](#)
- [Configuring SNMP](#)
- [SNMP Commands](#)

### 19.5.1 SNMP Introduction

Arista Networks switches support many standard SNMP MIBs, making it easier to integrate these platforms into existing network management infrastructures.

With only a few configurations, many public domain and commercially available network management tools can quickly manage Arista switches out of the box. Support of SNMP V2 groups and views and V3 security allow network managers to tune switch monitoring to match the administration policy of the IT organization.

## 19.5.2 SNMP Conceptual Overview

Simple Network Management Protocol (SNMP) is a protocol that provides a standardized framework and a common language to monitor and manage network devices.

### 19.5.2.1 SNMP Structure

The SNMP framework has three parts:

- **SNMP manager:** The SNMP manager controls and monitors network host activities and is typically part of a Network Management System (NMS).
- **SNMP agent:** The SNMP agent is the managed device component that manages and reports device information to the manager.
- **Management Information Base (MIB):** The MIB stores network management information.

The agent and MIB reside on the switch. Enabling the SNMP agent requires the definition of the manager-agent relationship. The agent contains MIB variables whose values the manager can request or change. The agent gathers data from the MIB and responds to requests for information. For a list of supported MIBs, please refer to the release notes for a specific EOS version.

This chapter discusses enabling the SNMP agent on an Arista switch and controlling notification transmissions from the agent. Information on using SNMP management systems is available in the appropriate documentation for the corresponding NMS application.

### 19.5.2.2 SNMP Notifications

SNMP notifications are messages, sent by the agent, informing of an event or a network condition. A **trap** is an unsolicited notification. An **inform** (or inform request) is a trap that includes a request for a confirmation that the message is received. Events that a notification can indicate include improper user authentication, restart, and connection losses.

For a list of supported traps, please refer to the release notes for a specific EOS version.

### 19.5.2.3 SNMP Versions

Arista switches support the following SNMP versions:

- **SNMPv1:** The Simple Network Management Protocol, defined in RFC 1157. Security is based on community strings.
- **SNMPv2c:** Community-string based Administrative Framework for SNMPv2, defined in RFC 1901, RFC 1905, and RFC 1906. Security is based on SNMPv1.
- **SNMPv3:** Version 3, as defined in RFCs 2273 to 2275.

### 19.5.2.4 SNMP Authentication and Encryption Methods

The following are the SNMP stronger Authentication and Encryption methods:

- **Authentication**
  - MD5
  - SHA-1
  - SHA-224
  - SHA-256
  - SHA-384

- SHA-512
- **Encryption**
  - AES
  - DES
  - AES-192
  - AES-256

**Note:** Please use the following minimums when using the stronger SNMPv3 encryption algorithm to avoid any interoperability issues.

- When using AES-192 for encryption/privacy, use a minimum of SHA-224 for authentication.
- When using AES-256 for encryption/privacy, use a minimum of SHA-256 for authentication.

### 19.5.3 Configuring SNMP

This section describes the steps that configure the switch SNMP agent to communicate with an SNMP manager, including the following:

- [Enabling and Disabling SNMP](#)
- [Enabling SNMP in a VRF](#)
- [Configuring Community Access Control](#)
- [Configuring SNMP Parameters](#)
- [Configuring the Agent to Send Notifications](#)
- [Extending the SNMP Agent Through Runtime Scripts](#)

#### 19.5.3.1 Enabling and Disabling SNMP

SNMP is enabled globally by issuing any [snmp-server community](#) or [snmp-server user](#) command. The [no snmp-server](#) command disables SNMP agent operation by removing all non-default `snmp-server` commands from *running-config*.

#### 19.5.3.2 Enabling SNMP in a VRF

By default, SNMP is enabled only in the **default** VRF. The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled.

To enable or disable SNMP in a VRF, use the [snmp-server vrf](#) command.

#### 19.5.3.3 Configuring Community Access Control

SNMP community strings serve as passwords that permit an SNMP manager to access the agent on the switch. A Network Management System (NMS) can access the switch only if its community string matches at least one of the switch's community strings.

The [snmp-server community](#) command configures the community string.

#### Example

This command adds the community string `ab_1` to provide read-only access to the switch agent.

```
switch(config)#snmp-server community ab_1 ro
switch(config)#
```

Community statements can reference views to limit MIB objects that are available to a manager. A view is a community string object that specifies a subset of MIB objects. The [snmp-server view](#) command configures the community string.

## Examples

- These commands create a view that includes all objects in the *system* group except for those in *system.2*.

```
switch(config)#snmp-server view sys-view system include
switch(config)#snmp-server view sys-view system.2 exclude
switch(config)#
```

- This command adds the community string *lab\_1* to provide read-only access to the switch agent for the previously defined view.

```
switch(config)#snmp-server community lab_1 view sys-view
switch(config)#
```

### 19.5.3.4 Configuring SNMP Parameters

This section describes these SNMP parameter configuration tasks:

- [Configuring the Engine ID](#)
- [Configuring the Group](#)
- [Configuring the User](#)
- [Configuring the Host](#)
- [Enabling Link Trap Generation](#)
- [Configuring the Chassis-id String](#)
- [Configuring the Contact String](#)
- [Configuring the Location String](#)

#### 19.5.3.4.1 Configuring the Engine ID

The `snmp-server engineID remote` command configures the name of a Simple Network Management Protocol (SNMP) engine located on a remote device. Use the `snmp-server engineID local` command for the local engine.

A remote agent's engine ID must be configured before remote users for that agent are configured. User authentication and privacy digests are derived from the engine ID and user passwords. The configuration command fails if the remote engine ID is not configured first.

**Note:** When the remote engine ID is changed, all user passwords associated with the engine must be reconfigured.

#### Example

This command configures DC945798CAB4 as the name of the remote SNMP engine located at 12.23.104.25, UDP port 162

```
switch(config)#snmp-server engineID remote 10.23.104.25 udp-port
DC945798CA
switch(config)#
```

#### 19.5.3.4.2 Configuring the Group

An SNMP group grants specific levels of SNMP access to group users. The `snmp-server group` command configures a new SNMP group.

This command configures *normal\_one* as an SNMPv3 group (authentication and encryption) that provides access to the *all-items* read view.

```
switch(config)#snmp-server group normal_one v3 priv read all-items
```

```
switch(config) #
```

#### 19.5.3.4.3 Configuring the User

Members of SNMP groups are called *users*. The `snmp-server user` command allows a new user to be added an SNMP group and configures that user's parameters. Remote users are configured by specifying the IP address or port number that accesses the user's SNMP agent.

##### Example

- This command configures the local SNMPv3 user *tech-1* as a member of the SNMP group *tech-sup*.

```
switch(config) #snmp-server user tech-1 tech-sup v3
switch(config) #
```

- This command configures the remote SNMPv3 user *tech-2* as a member of the SNMP group *tech-sup*. The remote user is on the agent located at *13.1.1.4*.

```
switch(config) #snmp-server user tech-2 tech-sup remote 13.1.1.4 v3
switch(config) #
```

#### 19.5.3.4.4 Configuring the Host

The `snmp-server host` command configures an SNMP host (to which SNMP traps will be sent). The `snmp-server host` command sets the community string if it was not previously configured.

##### Example

This command adds a v2c inform notification recipient at *12.15.2.3* using the community string *comm-1*.

```
switch(config) #snmp-server host 12.15.2.3 informs version 2c comm-1
switch(config) #
```

#### 19.5.3.4.5 Enabling Link Trap Generation

The `snmp trap link-change` command enables SNMP link trap generation on the configuration mode interface. SNMP link trap generation is enabled by default. If SNMP link trap generation was previously disabled, this command removes the corresponding `no snmp link-status` statement from the configuration. The `show snmp notification` command displays the SNMP link trap generation information.

##### Example

This command disables SNMP link trap generation on the *Ethernet 5* interface.

```
switch(config-if-Et5) #no snmp trap link-change
switch(config-if-Et5) #
```

#### 19.5.3.4.6 Specifying the Source Interface

The `snmp-server local-interface` command specifies the interface from where an SNMP trap originates. The `show snmp local-interface` command displays the interface of the IP address for SNMP traps.

##### Example

This command configures the *Ethernet 1* interface as the source of SNMP traps and informs.

```
switch(config) #snmp-server local-interface ethernet 1
```

```
switch(config)#
```

#### 19.5.3.4.7 Configuring the Chassis-id String

The chassis ID string is typically set to the serial number of the switch. The SNMP manager uses this string to associate all data retrieved from the switch with a unique identifying label. Under normal operating conditions, editing the chassis ID string contents is unnecessary.

The `snmp-server chassis-id` command configures the chassis ID string. The default chassis ID string is the serial number of the switch. The `show snmp` command displays the chassis ID.

##### Example

This command configures `xyz-1234` as the chassis-ID string, then displays the result.

```
switch(config)#snmp-server chassis-id xyz-1234
switch(config)#show snmp
Chassis: xyz-1234 <---chassis ID
8 SNMP packets input
  0 Bad SNMP version errors
  0 Unknown community name
  0 Illegal operation for community name supplied
  0 Encoding errors
  8 Number of requested variables
  0 Number of altered variables
  4 Get-request PDUs
  4 Get-next PDUs
  0 Set-request PDUs
21 SNMP packets output
  0 Too big errors
  0 No such name errors
  0 Bad value errors
  0 General errors
  8 Response PDUs
  0 Trap PDUs
SNMP logging: enabled
  Logging to taccon.162
SNMP agent enabled
switch(config)#
```

#### 19.5.3.4.8 Configuring the Contact String

The SNMP contact string is information text that typically displays the name of a person or organization associated with the SNMP agent.

The `snmp-server contact` command configures the system contact string. The contact string is displayed by the `show snmp` and `show snmp v2-mib contact` commands.

##### Example

These commands configure `Bonnie H at 3-1470` as the contact string.

```
switch(config)#snmp-server contact Bonnie H at 3-1470
switch(config)#
```

#### 19.5.3.4.9 Configuring the Location String

The location string typically provides information about the physical location of the SNMP agent. The `snmp-server location` command configures the system location string. By default, the system location string is not set.

---

## Example

These commands configure *lab-25* as the location string.

```
switch(config)#snmp-server location lab_25
switch(config)#show snmp v2-mib location
Location: lab_25
switch(config)#
```

### 19.5.3.5 Configuring the Agent to Send Notifications

The following steps are mandatory when setting up the SNMP agent to send notifications:

1. Configure the remote engine ID.
2. Configure the group.
3. Configure the user.
4. Configure the host.
5. Enable link trap generation on the interfaces.

[Configuring SNMP Parameters](#) describes each of these tasks.

### 19.5.3.6 Extending the SNMP Agent Through Runtime Scripts

The switch supports the execution of user supplied scripts to service portions of the OID space.

Scripts run under one of two operational modes:

- **Normal mode** scripts run over an indefinite period to process subsequent objects after the initial request. Maintaining an executing script avoids startup and connection delay each time an object requires processing.
- **One-shot mode** scripts process a single object, then terminate execution; requires the one-shot keyword.

Startup and data collection overhead is required for each request. In both modes, the SNMP server is blocked from serving other requests when waiting for script responses.

The [snmp-server extension](#) command configures the execution of user-supplied scripts to service portions of the OID space. Use the one-shot keyword to specify one-shot execution.

## Examples

- This command specifies the file *normal-example.sh*, located in flash as the script file that services the specified OID space in normal mode.

```
switch(config)#snmp-server extension .1.3.6.1.4.1.8072.2 flash:normal-
example.sh
switch(config)#
```

- Contents of the script file:

```
#!/bin/bash
while read cmd; do
  case $cmd in
    PING)
      printf "PONG\n"      ;;
    get)
      read oid
      printf "$oid\n"
      printf "integer\n"
      printf "42\n"      ;;      *)
      printf "NONE\n"
```

```
done ;; esac
```

- Testing the script:

```
switch(config)#show snmp mib get .1.3.6.1.4.1.8072.2
NET-SNMP-EXAMPLES-MIB::netSnmpExamples = INTEGER: 42
switch(config)#
```

- This command specifies the file *one-shot-example.sh*, located in flash as the script file that services the specified OID space in one-shot mode, executing once and then exiting.

```
switch(config)#snmp-server extension .1.3.6.1.4.1.8072.2
flash:one-shot-example.sh one-shot
switch(config)#
```

- Contents of the script file:

```
#!/bin/bash
oid="$2"
printf "$oid\n"
printf "integer\n"
printf "42\n"
```

- Testing the script:

```
switch(config)#show snmp mib get .1.3.6.1.4.1.8072.2
NET-SNMP-EXAMPLES-MIB::netSnmpExamples = INTEGER: 42
```

### 19.5.3.6.1 Normal Script Behavior

The first time the SNMP server requires a script result, it launches it with no arguments. The server communicates with the script through **stdin/stdout**. Before each request, the script is sent the string *PING\n* on **stdin**. The expected response from the script is printing *PONG\n* to **stdout**.

#### GET and GETNEXT Requests

For **GET** and **GETNEXT** requests, the script is passed two lines on **stdin**, the command (**get** or **getnext**) and the requested OID. The expected response from the script is the printing of three lines to **stdout**: the OID for the result varbind, the **TYPE**, and the **VALUE** itself.

[Table 67: Extension Script Type and Encoding](#) lists legal **TYPE** values and resulting **VALUE** encodings. If the command does not return an appropriate varbind, it should print *NONE\n* to **stdout** and continue running; this results in an SNMP *noSuchName* error or a *noSuchInstance* exception.

**Table 67: Extension Script Type and Encoding**

| Type string | SNMP type  | Encoding for script |
|-------------|------------|---------------------|
| integer     | Integer32  | integer             |
| unsigned    | Unsigned32 | integer             |
| gauge       | Gauge32    | integer             |
| counter     | Counter32  | integer             |
| counter64   | Counter64  | integer             |
| timetick    | TimeTicks  | integer             |
| ipaddress   | IpAddress  | a.b.c.d             |

|          |             |                    |
|----------|-------------|--------------------|
| objectid | ObjectID    | 1.3.6.1.42.99.2468 |
| octet    | OctetString | hexadecimal string |
| opaque   | Opaque      | hexadecimal string |
| string   | OctetString | ascii string       |

### SET Requests

For **SET** requests, script is passed three lines on stdin: the command (set), and the requested OID, and the **TYPE** and **VALUE**, both on the same line. If the assignment is successful, the expected script response is to print *DONE* to **stdout**. Indicated errors by writing one of the error strings described in **Set Request Error Strings** In each case, the command should continue running.

**Table 68: Set Request Error Strings**

|                     |                      |                |
|---------------------|----------------------|----------------|
| authorization-error | no-access            | too-big        |
| bad-value           | no-creation          | undo-failed    |
| commit-failed       | no-such-name         | wrong-type     |
| gen-error           | not-writable         | wrong-length   |
| inconsistent-name   | read-only            | wrong-encoding |
| inconsistent-value  | resource-unavailable | wrong-value    |

#### 19.5.3.6.2 One-Shot Script Behavior

The command should exit after it finishes processing a single object.

### GET and GETNEXT

For each GET or GETNEXT request, the script is invoked once for each OID in the space that it serves. It receives two arguments: -g for GET or -n for GETNEXT, and the requested OID.

The expected script response is the response varbind as three separate lines printed to stdout: the result OID, the type, and the value.

If the command does not return an appropriate varbind, then the script should exit without producing any output. This results in an SNMP **noSuchName** error, or a **noSuchInstance** exception.

Possible reasons that a command would not return an appropriate varbind includes:

- The specified OID didn't correspond to a valid instance for a GET request.
- There were no following instances for a GETNEXT.

### SET

A SET request results in the command being called with the arguments: -s, OID, TYPE and VALUE, where TYPE is a listed token. [Normal Script Behavior](#) indicates the type of the value passed as the third parameter.

When the assignment is successful, the script exits without producing any output. Errors are indicated by writing just the error name ([Normal Script Behavior](#)); the agent generates the appropriate error response.

## 19.5.4 SNMP Commands

### Global Configuration Commands

- `no snmp-server`
- `snmp-server chassis-id`
- `snmp-server community`
- `snmp-server contact`
- `snmp-server enable traps`
- `snmp-server engineID local`
- `snmp-server engineID remote`
- `snmp-server extension`
- `snmp-server group`
- `snmp-server host`
- `snmp-server local-interface`
- `snmp-server location`
- `snmp-server user`
- `snmp-server view`
- `snmp-server vrf`

### Interface Configuration Commands

- `snmp trap link-change`

### Display Commands

- `show snmp`
- `show snmp community`
- `show snmp engineID`
- `show snmp group`
- `show snmp local-interface`
- `show snmp mib`
- `show snmp notification host`
- `show snmp notification`
- `show snmp user`
- `show snmp v2-mib chassis`
- `show snmp v2-mib contact`
- `show snmp v2-mib location`
- `show snmp view`

---

### 19.5.4.1 no snmp-server

The `no snmp-server` and `default snmp-server` commands disable Simple Network Management Protocol (SNMP) agent operation by removing all `snmp-server` commands from *running-config*.

SNMP is enabled with any `snmp-server community` or `snmp-server user` command.

#### Command Mode

Global Configuration

#### Command Syntax

```
no snmp-server
```

```
default snmp-server
```

#### Example

- This command disables SNMP agent operation on the switch.

```
switch(config)#no snmp-server
switch(config)#
```

### 19.5.4.2 show snmp community

The `show snmp community` command displays the Simple Network Management Protocol (SNMP) community access strings configured by the [snmp-server community](#) command.

#### Command Mode

EXEC

#### Command Syntax

```
show snmp community
```

#### Example

- This command displays the list of community access strings configured on the switch.

```
switch>show snmp community  
Community name: public  
switch>
```

---

### 19.5.4.3 show snmp engineID

The **show snmp engineID** command displays the local SNMP engine information configured on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show snmp engineID
```

#### Example

- This command displays the ID of the local SNMP engine.

```
switch>show snmp engineid  
Local SNMP EngineID: f5717f001c730436d700  
switch>
```

#### 19.5.4.4 show snmp group

The `show snmp group` command shows the names of configured SNMP groups along with the security model, and view status of each group.

##### Command Mode

EXEC

##### Command Syntax

```
show snmp group [GROUP_LIST]
```

##### Parameters

- GROUP\_LIST the name of the group.
  - *<no parameter>* displays information about all groups.
  - *group\_name* the name of the group.

##### Field Descriptions

- groupname name of the SNMP group.
- security model security model used by the group: **v1**, **v2c**, **orv3**.
- readview string identifying the group's read view. Refer to the [show snmp view](#) command.
- writeview string identifying the group's write view.
- notifyview string identifying the group's notify view. This command displays the groups configured on the switch.

##### Example

```
switch>show snmp group
groupname : normal          security model:v3 priv
readview  : all            writeview: <no writeview
  specified>
notifyview: <no notifyview specified>
switch>
```

---

#### 19.5.4.5 show snmp local-interface

The `show snmp local-interface` command displays the interface whose IP address is the source address for SNMP traps.

##### Command Mode

EXEC

##### Command Syntax

```
show snmp local-interface
```

##### Example

This command displays the source interface for the SNMP notifications.

```
switch>show snmp local-interface  
SNMP source interface: Ethernet1  
switch>
```

### 19.5.4.6 show snmp mib

The **show snmp mib** command displays values associated with specified MIB object identifiers (OIDs) that are registered on the switch.

#### Command Mode

EXEC

#### Command Syntax

```
show snmp mib OBJECTS
```

#### Parameters

- OBJECTS object identifiers for which the command returns data. Options include:
  - get *oid\_1* [*oid\_2* ... *oid\_x*] values associated with each listed OID.
  - get-next *oid\_1* [*oid\_2* ... *oid\_x*] values associated with subsequent OIDs relative to listed OIDs.
  - table *oid* table associated with specified OID.
  - translate *oid* object name associated with specified OID.
  - walk *oid* objects below the specified subtree.

#### Example

- This command uses the get option to retrieve information about the sysORID.1 OID.

```
switch#show snmp mib get sysORID.1
SNMPv2-MIB::sysORID[1] = OID: TCP-MIB::tcpMIB
```

- This command uses the get-next option to retrieve information about the OID that is after sysORID.8.

```
switch#show snmp mib get-next sysORID.8
SNMPv2-MIB::sysORDescr[1] = STRING: The MIB module for managing TCP
implementations
```

### 19.5.4.7 show snmp notification host

The `show snmp notification host` command displays information for Simple Network Management Protocol notification. Details include IP address and port number of the Network Management System, notification type, and SNMP version.

#### Command Mode

EXEC

#### Command Syntax

```
show snmp notification host
```

#### Field Descriptions

- Notification host IP address of the host.
- udp-port port number.
- type notification type.
- user access type of the user.
- security model SNMP version used.
- traps details of the notification.

#### Example

- This command displays the hosts configured on the switch.

```
switch>show snmp notification host
Notification host: 172.22.22.20      udp-port: 162      type: trap
user: public                        security model: v2c
switch>
```

### 19.5.4.8 show snmp notification

The `show snmp notification` command displays the SNMP trap generation information.

#### Command Mode

EXEC

#### Command Syntax

```
show snmp notification
```

#### Example

This command displays the SNMP traps configured on the switch.

```
switch>show snmp notification
-----
Type                               Name                               Enabled
-----
entity                             entConfigChange                  Yes (default)
entity                             entStateOperDisabled            Yes (default)
entity                             entStateOperEnabled            Yes (default)
lldp                                lldpRemTablesChange            Yes (default)
msdpBackwardTransition             msdpBackwardTransition          Yes
msdpEstablished                   msdpEstablished                 Yes
snmp                               linkDown                        Yes
snmp                               linkUp                          Yes
snmpConfigManEvent                aristaConfigManEvent            Yes (default)
switchover                        aristaRedundancySwitchOverNotif Yes
test                               aristaTestNotification          Yes
switch>
```

### 19.5.4.9 show snmp user

The **show snmp user** command shows information about Simple Network Management Protocol (SNMP) users. Information that the command displays about each user includes their SNMP version, the engine ID of the host where they reside, and security information

#### Command Mode

EXEC

#### Command Syntax

```
show snmp user [USER_LIST]
```

#### Parameters

- **USER\_LIST** the name of the group.
  - *<no parameter>* displays information about all users.
  - *user\_name* specifies name of displayed user.

#### Example

This command displays information about the users configured on the switch.

```
switch>show snmp user  
User name: test  
Security model: v3  
Engine ID: f5717f001c73010e0900  
Authentication protocol: SHA  
Privacy protocol: AES-128  
Group name: normal  
switch>
```

---

#### 19.5.4.10 show snmp v2-mib chassis

The **show snmp v2-mib chassis** command displays the Simple Network Management Protocol (SNMP) server serial number or the chassis ID string configured by the [snmp-server chassis-id](#) command.

##### Command Mode

EXEC

##### Command Syntax

```
show snmp v2-mib chassis
```

##### Example

This command displays the chassis ID string.

```
switch>show snmp v2-mib chassis  
Chassis: JFL08320162  
switch>
```

### 19.5.4.11 show snmp v2-mib contact

The `show snmp v2-mib contact` command displays the Simple Network Management Protocol (SNMP) system contact string configured by the [snmp-server contact](#) command. The command has no effect if a contact string was not previously configured.

#### Command Mode

EXEC

#### Command Syntax

```
show snmp v2-mib contact
```

#### Example

This command displays the contact string contents.

```
switch>show snmp v2-mib contact
Contact: John Smith
switch>
```

---

### 19.5.4.12 show snmp v2-mib location

The `show snmp v2-mib location` command displays the Simple Network Management Protocol (SNMP) system location string. The [snmp-server location](#) command configures system location details. The command has no effect if a location string was not previously configured.

#### Command Mode

EXEC

#### Command Syntax

```
show snmp v2-mib location
```

#### Example

This command displays the location string contents.

```
switch>show snmp v2-mib location
Location: santa clara
switch>
```

### 19.5.4.13 show snmp view

The **show snmp view** command displays the information of a Simple Network Management Protocol configuration and the associated MIB. SNMP views are configured with the [snmp-server view](#) command.

#### Command Mode

EXEC

#### Command Syntax

```
show snmp view [VIEW_LIST]
```

#### Parameters

- VIEW\_LIST the name of the view.
  - *<no parameter>* displays information about all views.
  - *view\_name* the name of the view.
  -

#### Field Descriptions

- **First column** view name.
- **Second column** name of the MIB object or family.
- **Third column** inclusion level of the specified family within the view.

#### Example

These commands configure an SNMP view, then displays that view.

```
switch(config)#snmp-server view sys-view system include
switch(config)#snmp-server view sys-view system.2 exclude
switch(config)#show snmp view
sys-view system - included
sys-view system.2 - excluded
```

---

#### 19.5.4.14 show snmp

The `show snmp` command displays SNMP information including the SNMP counter status and the chassis ID string.

##### Command Mode

EXEC

##### Command Syntax

```
show snmp
```

##### Example

- This command displays SNMP counter status, the chassis ID, the previously configured location string, logging status and destination, and the VRFs in which the SNMP agent is operating.

```
switch>show snmp
Chassis: JFL08320162
Location: 5470ga.dc
2329135 SNMP packets input
  0 Bad SNMP version errors
  0 Unknown community name
  0 Illegal operation for community name supplied
  0 Encoding errors
  38132599 Number of requested variables
  0 Number of altered variables
  563934 Get-request PDUs
  148236 Get-next PDUs
  0 Set-request PDUs
2329437 SNMP packets output
  0 Too big errors
  0 No such name errors
  0 Bad value errors
  0 General errors
  2329135 Response PDUs
  0 Trap PDUs
SNMP logging: enabled
  Logging to 172.22.22.20.162
SNMP agent configured in VRFs: default
SNMP agent enabled in default VRF
switch>
```

### 19.5.4.15 snmp trap link-change

The **snmp trap link-change** command enables Simple Network Management Protocol (SNMP) link-status trap generation on the configuration mode interface. The generation of link-status traps is enabled by default. If SNMP link-trap generation was previously disabled, this command removes the corresponding **no snmp link-status** statement from the configuration to re-enable link-trap generation.

The **no snmp trap link-change** command disables SNMP link trap generation on the configuration mode interface.

The **snmp trap link-change** and **default snmp trap link-change** commands restore the default behavior by removing the **no snmp trap link-change** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration Interface-Loopback Configuration Interface-Management Configuration Interface-Port-channel Configuration Interface-VLAN Configuration Interface-VXLAN Configuration

#### Command Syntax

```
snmp trap link-change
no snmp trap link-change
default snmp trap link-change
```

#### Guidelines

The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the **default** VRF. Enable or disable SNMP in a VRF with the [snmp-server vrf](#) command.

#### Example

This command disables SNMP link trap generation on the Ethernet 5 interface.

```
switch(config-if-Et5)#no snmp trap link-change
switch(config-if-Et5)#
```

---

### 19.5.4.16 snmp-server chassis-id

The **snmp-server chassis-id** command configures the chassis ID string. The default chassis ID string is the serial number of the switch. The **show snmp** command displays the chassis ID.

The **no snmp-server chassis-id** and **default snmp-server chassis-id** commands restore the default chassis ID string by removing the **snmp-server chassis-id** command from the configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
snmp-server chassis-id id_text
no snmp-server chassis-id
default snmp-server chassis-id
```

#### Parameters

- *id\_text* chassis ID string

#### Example

These commands configure *xyz-1234* as the chassis-id string, then display the result.

```
switch(config)#snmp-server chassis-id xyz-1234
switch(config)#show snmp
Chassis: xyz-1234<---chassis ID
8 SNMP packets input
    0 Bad SNMP version errors
    0 Unknown community name
    0 Illegal operation for community name supplied
    0 Encoding errors
    8 Number of requested variables
    0 Number of altered variables
    4 Get-request PDUs
    4 Get-next PDUs
    0 Set-request PDUs
21 SNMP packets output
    0 Too big errors
    0 No such name errors
    0 Bad value errors
    0 General errors
    8 Response PDUs
    0 Trap PDUs
SNMP logging: enabled
    Logging to taccon.162
SNMP agent enabled
switch(config)#
```

### 19.5.4.17 snmp-server community

The **snmp-server community** command configures the community string. SNMP community strings serve as passwords that permit an SNMP manager to access the agent on the switch. The Network Management System (NMS) must define a community string that matches at least one of the switch community strings to access the switch.

The **no snmp-server community** and **default snmp-server community** commands remove the community access string from the configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
snmp-server community string_text [MIB_VIEW][ACCESS][ACL_NAMES]
```

```
no snmp-server community string_text
```

```
default snmp-server community string_text
```

#### Parameters

- *string\_text* community access string.
- MIB\_VIEW community access availability. Options include:
  - *<no parameter>* community string allows access to all objects.
  - *view view\_name* community string allows access only to objects in the *view\_name* view.
- ACCESS community access availability. Options include:
  - *<no parameter>* read-only access (default setting).
  - *ro* read-only access.
  - *rw* read-write access.
- ACL\_NAMES community access availability. Options include:
  - *<no parameter>* community string allows access to all objects.
  - *list\_v4* IPv4 ACL list.
  - *ipv6 list\_v6* IPv6 ACL list.
  - *ipv6 list\_v6 list\_v4* IPv4 and IPv6 ACL list.

#### Example

This command adds the community string *lab\_1* to provide read-only access to the switch agent.

```
switch(config) #snmp-server community lab_1 ro
switch(config) #
```

---

### 19.5.4.18 snmp-server contact

The `snmp-server contact` command configures the system contact string. The contact is displayed by the `show snmp` and `show snmp v2-mib contact` commands.

The `no snmp-server contact` and `default snmp-server contact` commands remove the `snmp-server contact` command from the *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
snmp-server contact contact_string
```

```
no snmp-server contact
```

```
default snmp-server contact
```

#### Parameters

- *contact\_string* system contact string.

#### Example

These commands configure *Bonnie H* as the contact string, then display the result.

```
switch(config)#snmp-server contact Bonnie H
switch(config)#show snmp
Chassis: xyz-1234
Contact: Bonnie H.
8 SNMP packets input
  0 Bad SNMP version errors
  0 Unknown community name
  0 Illegal operation for community name supplied
  0 Encoding errors
  8 Number of requested variables
  0 Number of altered variables
  4 Get-request PDUs
  4 Get-next PDUs
  0 Set-request PDUs
24 SNMP packets output
  0 Too big errors
  0 No such name errors
  0 Bad value errors
  0 General errors
  8 Response PDUs
  0 Trap PDUs
SNMP logging: enabled
  Logging to taccon.162
SNMP agent enabled
switch(config)#
```

### 19.5.4.19 snmp-server enable traps

The **snmp-server enable traps** command enables both Simple Network Management Protocol (SNMP) traps and SNMP inform requests; use the **snmp-server host** command to specify which will receive SNMP notifications. Sending notifications requires at least one **snmp-server host** command.

The **snmp-server enable traps** and **no snmp-server enable traps** commands, without a MIB parameter, specify the default notification trap generation setting for all MIBs. These commands, when specifying a MIB, control notification generation for the specified MIB. The **default snmp-server enable traps** command resets notification generation to the default setting for the specified MIB.

#### Command Mode

Global Configuration

#### Command Syntax

```
snmp-server enable traps [trap_type]
no snmp-server enable traps [trap_type]
default snmp-server enable trap [trap_type]
```

#### Parameters

- *trap\_type* controls the generation of informs or traps for the specified MIB:
  - *<no parameter>* controls notifications for MIBs not covered by specific commands.
  - *entity* controls entity-MIB modification notifications.
  - *lldp* controls LLDP notifications.
  - *msdpBackwardTransition* controls msdpBackwardTransition notifications.
  - *msdpEstablished* controls msdpEstablished notifications.
  - *snmp* controls SNMP-v2 notifications.
  - *switchover* controls switchover notifications.
  - *snmpConfigManEvent* controls snmpConfigManEvent notifications.
  - *test* controls test traps.

#### Examples

- These commands enables notification generation for all MIBs except spanning tree.

```
switch(config)#snmp-server enable traps
switch(config)#no snmp-server enable traps spanning-tree
switch(config)#
```

- This command enables spanning-tree MIB notification generation, regardless of the default setting.

```
switch(config)#snmp-server enable traps spanning-tree
switch(config)#
```

- This command resets the spanning-tree MIB notification generation to follow the default setting.

```
switch(config)#default snmp-server enable traps spanning-tree
switch(config)#
```

- This command enables switchover MIB notification generation, regardless of the default setting.

```
switch(config)#snmp-server enable traps switchover
switch(config)#
```

- 
- This command resets the switchover MIB notification generation to follow the default setting.

```
switch(config)# default snmp-server enable traps switchover  
switch(config)#
```

### 19.5.4.20 snmp-server engineID local

The `snmp-server engineID local` command configures the name for the local Simple Network Management Protocol (SNMP) engine. The default SNMP engineID is generated by the switch and is used when an engineID is not configured with this command. The `show snmp engineID` command displays the default or configured engine ID.

SNMPv3 authenticates users through security digests (MD5 or SHA) that are based on user passwords and the local engine ID. Passwords entered on the CLI are similarly converted, then compared to the user's security digest to authenticate the user.

**Note:** Changing the local engineID value invalidates SNMPv3 security digests, requiring the reconfiguration of all user passwords.

The `no snmp-server engineID` and `default snmp-server engineID` commands restore the default engineID by removing the `snmp-server engineID` command from the *running-config*

#### Command Mode

Global Configuration

#### Command Syntax

```
snmp-server engineID local engine_hex
no snmp-server engineID local
default snmp-server engineID
```

#### Parameters

- *engine\_hex* the switch name for the local SNMP engine (hex string).

The string must consist of at least ten characters with a maximum of 64 characters.

#### Example

- This command configures DC945798CAB4 as the name of the local SNMP engine.

```
switch(config)#snmp-server engineID local DC945798CAB4
switch(config)#
```

---

### 19.5.4.21 snmp-server engineID remote

The `snmp-server engineID remote` command configures the name of a Simple Network Management Protocol (SNMP) engine located on a remote device. The switch generates a default engineID; use the `show snmp engineID` command to view the configured or default engineID.

An SNMPv3 inform requires a remote engine ID to compute the security digest that authenticates and encrypts data transmitted to remote users. SNMPv3 authenticates users with MD5 or SHA through the engine ID and user passwords. CLI passwords are similarly authenticated.

**Note:** Changing the engineID value invalidates SNMPv3 security digests, requiring the reconfiguration of all user passwords.

The `no snmp-server engineID remote` and `default snmp-server engineID remote` commands remove the `snmp-server engineID remote` command from the configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
snmp-server engineID remote engine_addr [PORT] engine_hex
no snmp-server engineID remote engine_addr [PORT]
default snmp-server engineID remote engine_addr [PORT]
```

#### Parameters

- *engine\_addr* location of remote engine (IP address or host name).
- PORT udp port location of the remote engine. Options include:
  - *<No parameter>* port number 161 (default).
  - `udp-port port_num` port number. Ranges from 0 to 65535.
- *engine\_hex* the switch's name for the remote SNMP engine (hex string).

The string must have at least ten characters and can contain a maximum of 64 characters.

#### Example

This command configures DC945798CA as the engineID of the remote SNMP engine located at 10.23.10.25, UDP port 162.

```
switch(config)#snmp-server engineID remote 10.23.10.25 udp-port 162
DC945798CA
switch(config)#
```

### 19.5.4.22 snmp-server extension

The `snmp-server extension` command configures the execution of user supplied scripts to service portions of the OID space.

The `no snmp-server extension` and `default snmp-server extension` commands deletes the `snmp-server extension` command from the *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
snmp-server extension OID_space FILE_PATH [DURATION]
```

#### Parameters

- *OID\_space* OID branch serviced by the script, in numerical format.
- FILE\_PATH path and name of the script file. Options include:
  - file: file is located in the switch file directory.
  - flash: file is located in flash memory.
- DURATION the execution scope of the script.
  - *<no parameter>* script runs after initial request to process subsequent requests.
  - one-shot script processes a single object (runs once), then terminates.

#### Examples

This command specifies the file `example.sh`, located in flash, as the script file that services the listed OID space.

```
switch(config)#snmp-server extension .1.3.6.1.4.1.8072.2 flash:example
.sh
```

---

### 19.5.4.23 snmp-server group

The **snmp-server group** command configures a new Simple Network Management Protocol (SNMP) group or modifies an existing group. An SNMP group is a data structure that user statements reference to map SNMP users to SNMP contexts and views, providing a common access policy to the specified users.

An SNMP context is a collection of management information items accessible by an SNMP entity. Each item of may exist in multiple contexts. Each SNMP entity can access multiple contexts. A context is identified by the EngineID of the hosting device and a context name.

The **no snmp-server group** and **default snmp-server group** commands delete the specified group by removing the corresponding **snmp-server group** command from the configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
snmp-server group group_name VERSION [CNTX][READ][WRITE][NOTIFY]
```

```
no snmp-server group group_name VERSION
```

```
default snmp-server group group_name VERSION
```

#### Parameters

- *group\_name* the name of the group.
- VERSION the security model utilized by the group.
  - v1 SNMPv1. Uses a community string match for authentication.
  - v2c SNMPv2c. Uses a community string match for authentication.
  - v3 no auth SNMPv3. Uses a username match for authentication.
  - v3 auth SNMPv3. HMAC-MD5 or HMAC-SHA authentication.
  - v3 priv SNMPv3. HMAC-MD5 or HMAC-SHA authentication. AES or DES encryption.
- CNTX associates the SNMP group to an SNMP context.
  - *<no parameter>* command does not associate group with an SNMP context.
  - context *context\_name* associates group with context specified by *context\_name*.
- READ specifies read view for SNMP group.
  - *<no parameter>* command does not specify read view.
  - read *read\_name* read view specified by *read\_name* (string maximum 64 characters).
- WRITE specifies write view for SNMP group.
  - *<no parameter>* command does not specify write view.
  - write *write\_name* write view specified by *write\_name* (string maximum 64 characters).
- NOTIFY specifies notify view for SNMP group.
  - *<no parameter>* command does not specify notify view.
  - notify *notify\_name* notify view specified by *notify\_name* (string maximum 64 characters).

#### Example

This command configures normal\_one as SNMP version 3 group (authentication and encryption) that provides access to the **all-items read view**.

```
switch(config) #snmp-server group normal_one v3 priv read all-items
switch(config) #
```

### 19.5.4.24 snmp-server host

The `snmp-server host` command configures an SNMP host (to which SNMP traps will be sent) and sets the community string if it was not previously configured. The host is denoted by host location and community string. The command also specifies the type of SNMP notifications that are sent: a trap is an unsolicited notification; an inform is a trap that includes a request for a confirmation that the message is received

The configuration can contain multiple statements to the same host location with different community strings. For instance, a configuration can simultaneously contain all of the following:

- `snmp-server host host-1 version 2c comm-1`
- `snmp-server host host-1 informs version 2c comm-2`
- `snmp-server host host-1 version 2c comm-3 udp-port 666`
- `snmp-server host host-1 version 3 auth comm-3`

The `no snmp-server host` and `default snmp-server host` commands remove the specified host by deleting the corresponding `snmp-server host` statement from the configuration. When removing a statement, the host (address and port) and community string must be specified.

#### Command Mode

Global Configuration

#### Command Syntax

```
snmp-server host host_id [VRF_INST][MESSAGE][VERSION] comm_str [PORT]
no snmp-server host host_id [VRF_INST][MESSAGE][VERSION] comm_str [PORT]
default snmp-server host host_id [VRF_INST][MESSAGE][VERSION] comm_str [PORT]
```

#### Parameters

- *host\_id* hostname or IP address of the SNMP host.
- VRF\_INST specifies the VRF instance being modified.
  - *<no parameter>* changes are made to the default VRF.
  - *vrf vrf\_name* changes are made to the specified user-defined VRF.
- MESSAGE message type that is sent to the host.
  - *<no parameter>* sends SNMP traps to host (default).
  - informs sends SNMP informs to host.
  - traps sends SNMP traps to host.
- VERSION SNMP version. Options include:
  - *<no parameter>* SNMPv2c (default).
  - version 1 SNMPv1; option not available with informs.
  - version 2c SNMPv2c.
  - version 3 noauth SNMPv3; enables user-name match authentication.
  - version 3 auth SNMPv3; enables MD5 and SHA packet authentication.
  - version 3 priv SNMPv3. HMAC-MD5 or HMAC-SHA authentication. AES or DES encryption.
- *comm\_str* community string to be sent with the notification as a password.

Arista recommends setting this string separately before issuing the `snmp-server host` command. To set the community string separately, use the [snmp-server community](#) command.

- PORT port number of the host.
  - *<no parameter>* socket number set to 162 (default)
  - `udp-port p-name` socket number specified by *p-name*.

#### Guidelines

---

The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the **default** VRF. Enable or disable SNMP in a VRF with the [snmp-server vrf](#) command.

### Example

This command adds a version 2c inform notification recipient.

```
switch(config)#snmp-server host 10.15.2.3 informs version 2c comm-1
switch(config)#
```

### 19.5.4.25 snmp-server local-interface

The `snmp-server local-interface` command specifies the interface where SNMP originates informs and traps.

The `no snmp-server local-interface` and `default snmp-server local-interface` commands remove the inform or trap source assignment by removing the `snmp-server local-interface` command from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
snmp-server local-interface INTERFACE
no snmp-server local-interface
default snmp-server local-interface
```

#### Parameters

- `INTERFACE` Interface type and number. Values include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vrf vrf_name` The VRF in which SNMP is enabled. The keyword `default` specifies the default VRF.

#### Example

This command configures the Ethernet 1 interface as the source of SNMP traps and informs.

```
switch(config)#snmp-server local-interface ethernet 1
switch(config)#
```

---

### 19.5.4.26 snmp-server location

The **snmp-server location** command configures the system location string. By default, no system location string is set.

The **no snmp-server location** and **default snmp-server location** commands delete the location string by removing the **snmp-server location** command from the configuration.

#### Command Mode

Global Configuration

#### Command Syntax

```
snmp-server location node_locate
```

```
no snmp-server location
```

```
default snmp-server location
```

#### Parameters

- *node\_locate* system location information (string).

#### Example

These commands configure *lab-east* as the location string.

```
switch(config)#snmp-server location lab_east  
switch(config)#
```

### 19.5.4.27 snmp-server user

The `snmp-server user` command adds a user to a Simple Network Management Protocol (SNMP) group or modifies an existing user's parameters.

To configure a user, the IP address or port number of the device where the user's remote SNMP agent resides must be specified. A user's authentication come from the engine ID and the user's password. Remote user configuration commands fail if the remote engine ID is not configured first.

The `no snmp-server user` and `default snmp-server user` commands remove the user from an SNMP group by removing the user command from *running-config*.

**Note:** Please use the following minimums when using the stronger SNMPv3 encryption algorithm to avoid any interoperability issues.

- When using AES-192 for encryption/privacy, use a minimum of SHA-224 for authentication.
- When using AES-256 for encryption/privacy, use a minimum of SHA-256 for authentication.

#### Command Mode

Global Configuration

#### Command Syntax

```
snmp-server user user_name group_name [AGENT] VERSION [ENGINE][SECURITY]
```

```
no snmp-server user user_name group_name [AGENT] VERSION
```

```
default snmp-server user user_name group_name [AGENT] VERSION
```

#### Parameters

- *user\_name* name of user.
  - *group\_name* name of group to which user is being added.
  - AGENT Options include:
    - *<no parameter>* local SNMP agent.
    - *remote addr* [udp-port *p\_num*] remote SNMP agent location.
- addr* denotes the IP address; *p\_num* denotes the udp port socket (default port is 162).
- VERSION SNMP version; options include:
    - v1 SNMPv1.
    - v2c SNMPv2c.
    - v3 SNMPv3 .
  - ENGINE engine ID used to localize passwords. Available only if VERSION is v3.
    - *<no parameter>* Passwords localized by SNMP copy specified by *agent*.
    - localized *engineID* octet string of engineID.
  - SECURITY Specifies authentication and encryption levels. Available only if VERSION is v3. Encryption is available only when authentication is configured.
    - *<no parameter>* no authentication or encryption.
    - *auth a\_meth a\_pass* [*priv e\_meth e\_pass*] authentication parameters.
    - *a\_meth* authentication method: options are md5 (HMAC-MD5-96) and sha (HMAC-SHA-96).
    - *a-pass* authentication string for users receiving packets.
    - *e-meth* encryption method: Options are aes (AES-128) and des (CBC-DES).
    - *e-pass* encryption string for the users sending packets.

#### Example

---

This command configures the remote SNMP user *tech-1* to the *tech-sup* SNMP group.

```
switch(config)#snmp-server user tech-1 tech-sup remote 10.1.1.2 v3
```

### 19.5.4.28 snmp-server view

The `snmp-server view` command defines a view.

An SNMP view defines a subset of objects from an MIB. Every SNMP access group specifies views, each associated with read or write access rights, to allow or limit the group's access to MIB objects.

The `no snmp-server view` command deletes a view entry by removing the corresponding `snmp-server view` command from the *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
snmp-server view view_name family_name INCLUSION
```

```
no snmp-server view view_name [family_name]
```

```
default snmp-server view view_name [family_name]
```

#### Parameters

- *view\_name* Label for the view record that the command updates. Other commands reference the view with this label.
- *family\_name* name of the MIB object or family.

MIB objects and MIB subtrees can be identified by name or by the numbers representing the position of the object or subtree in the MIB hierarchy.

- INCLUSION inclusion level of the specified family within the view. Options include:
  - include view includes the specified subtree.
  - exclude view excludes the specified subtree.

#### Example

- These commands create a view named sys-view that includes all objects in the system subtree except for those in *system.2*.

```
switch(config)#snmp-server view sys-view system include
switch(config)#snmp-server view sys-view system.2 exclude
```

---

### 19.5.4.29 snmp-server vrf

The `snmp-server vrf` command enables SNMP in the specified VRF. By default, SNMP is enabled only in `default` VRF.

- User-defined VRFs: The `no snmp-server vrf` command disables SNMP in the specified VRF by removing the corresponding `snmp-server vrf` command from the *running-config*.
- Default VRF: The `no snmp-server vrf` command disables SNMP in the VRF by adding a `no snmp-server vrf default` statement to running-config

#### Command Mode

Global Configuration

#### Command Syntax

```
snmp-server vrf vrf_name
no snmp-server vrf vrf_name
default snmp-server vrf vrf_name
```

#### Parameters

- *vrf\_name* The VRF in which SNMP is enabled. The keyword **default** specifies the default VRF.

#### Guidelines

The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the **default** VRF. Enable or disable SNMP in a VRF with the `snmp-server vrf` command.

#### Example

These commands disable SNMP in the default VRF, then enable it in the user-defined VRFs named *magenta* and *columbia*.

```
switch(config)#no snmp-server vrf default
switch(config)#snmp-server vrf magenta
switch(config)#snmp-server vrf columbia
switch(config)#
```

## 19.6 VM Tracer

This chapter describes VM Tracer configuration and usage and contains these sections:

- [VM Tracer Introduction](#)
- [VM Tracer Description](#)
- [VM Tracer Configuration Procedures](#)
- [VM Tracer Configuration Commands](#)

### 19.6.1 VM Tracer Introduction

VM Tracer is a switch feature that determines the network configuration and requirements of connected VMware hypervisors. The switch uses VMware's SOAP XML API to discover VMware host server components, including:

- instantiated VMs with their network configuration (VLANs and distributed/virtual Switches).
- server hardware IPMI data which can be shown to the network manager.

VM Tracer also supports adaptive auto-segmentation, which automatically provisions and prunes VLANs from server-switched ports as VMs are instantiated and moved within the data center.

## 19.6.2 VM Tracer Description

Cloud operating systems manage large virtualized computing infrastructures, including software and hardware. Cloud operating systems consist of virtual machines and hypervisors:

- A virtual machine (VM) is a software implementation of a computer that operates as running on dedicated physical hardware. Multiple VMs share physical machine resources from a single physical device. Each VM is controlled by its operating system.
- A hypervisor, also called a virtual Machine Manager (VMM), is software that manages multiple operating systems running concurrently on a physical device.

VM Tracer tracks activity of VMs that are controlled by hypervisors connected to the switch's Ethernet or LAG ports. VM Tracer supports vSphere versions 6.0– 6.5. vSphere features include distributed virtual switches (DVS) and VM movement among VMware servers (VMotion).

vSphere components include:

- ESX and ESXi: hypervisors that run on VMware host server hardware.
- vCenter: centralized tool that manages multiple servers running VMware hypervisors.
- NSX for vSphere® (NSX-V): network virtualization platform delivering networking and security.

Monitoring VLAN based configurations requires vCenter access. Monitoring VXLAN based configurations requires access to vCenter and NSX-V. The following sections describe topologies that monitor these networks:

- [Monitoring VLAN Based Configurations](#)
- [Monitoring VXLAN Based Configurations](#)

### 19.6.2.1 Monitoring VLAN Based Configurations

vCenter manages ESX hosts and VMs through a central database. VM Tracer identifies interfaces connected to a specified ESX host and sends discovery packets (CDP or LLDP) on interfaces where VM Tracer is enabled. The ESX host updates the vCenter when it receives a discovery packet. VM Tracer reads this data from the vCenter through a SOAP XML API to associate the ESX host to the connected switch ports. The network topology of this configuration is displayed below.

**Figure 125: VM Tracer Topology – Monitoring VLAN Based Configurations**

VM Tracer connects to a maximum of four vCenters through a SOAP (Simple Object Access Protocol) API to discover VMs in the data centers that the vCenters manage. VM Tracer maintains a list of VMs in the data center and gathers network related information about each VM, including the number of Vnics (virtual network interface card), the MAC address of each Vnic, the switch to which it connects,

and the host on which it resides. VM Tracer also identifies the host NICs connected to the switch through the bridge MAC address and the interface port name. VM Tracer then searches for VMs on this host and connected to the vswitch or dvswitch whose uplink is mapped to the connected NIC.

For each connected interface, VM Tracer creates a VM Table that lists its active VMs, sorted by Vnic MAC address. Each VM entry includes its name, Vnic name, VLAN, switch name, datacenter name, and portgroup. An entry is deleted when the corresponding VM is removed, moved to a different host, or its Vnic is no longer part of the vswitch or dvswitch. An entry is added when a VM is created or moved to a host connected to the interface. VM Tracer monitors vCenter for VM management updates. If an interface goes down, all VM entries for that interface are removed from the VM Table.

### 19.6.2.2 Monitoring VXLAN Based Configurations

Monitoring VXLAN based configurations require access to the NSX for vSphere® (NSX-V), in addition to the configuration described in [Monitoring VLAN Based Configurations](#). Each VM Tracer session can communicate with one NSX-V through a REST interface over XML and gathers VXLAN information by polling it on a 30 second polling cycle. VXLAN data that the switch receives from the NSX-V includes:

- VNI range.
- VXLAN segment.
- Multicast address range.
- network scope.

The network scope specifies the virtual address space the VXLAN segments span and is defined by the server group (cluster) collections within the segments, which in turn contain a collection of distributed virtual switches (DVS) from ESX hosts within the clusters.

VM Tracer uses this information to build a network model. Communications with NSX-V requires a single polling thread that detects network connectivity and constantly updates the local data model.

The network topology of this configuration is displayed below.

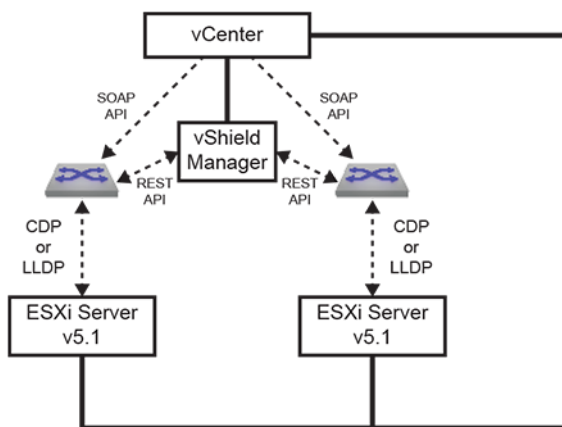

Figure 126: VM Tracer Topology – Monitoring VXLAN Based Configurations

### 19.6.3 VM Tracer Configuration Procedures

The following sections describe the session configuration process, configuring the NSX-V connection for VXLAN based configurations, and the procedure for enabling VM Tracer on individual interfaces. The switch defines vmtracer configuration mode and VMtracer mode:

- vmtracer configuration mode is a command mode for configuring VM Tracer monitoring sessions.
- VMtracer mode is defines an interface state where discovery packets are sent to attached vSwitches.

### 19.6.3.1 Configuring vCenter Monitoring Sessions

A VM Tracer session connects the switch to a vCenter server for downloading data about VMs and vSwitches managed by ESX hosts connected to the switch's ports. The switch supports four VM Tracer sessions.

The switch is placed in `vmtracer` configuration mode to edit session parameters, including the vCenter location and dynamic VLAN usage. Changes take effect by exiting `vmtracer` mode.

The `vmtracer session` command places the switch in `vmtracer` configuration mode for a specified session. The command either creates a new session or loads an existing session for editing.

- This command enters `vmtracer` configuration mode for the `system_1` session.

```
switch(config)#vmtracer session system_1
switch(vmtracer-system_1)#
```

In `vmtracer` configuration mode, the `url (vmtracer mode)`, `username (vmtracer mode)`, and `password (vmtracer mode)` commands specify the location and the account information that authenticates the switch. The URL parameter must reference a fully formed secure URL.

- These commands specify the IANA url along with the username and password that allow the switch to access the location.

```
switch(vmtracer-system_1)#url https://example.com/sdk
switch(vmtracer-system_1)#username a-switch_01
switch(vmtracer-system_1)#password abcde
switch(vmtracer-system_1)#
```

Default session settings allow auto-segmentation, or the dynamic allocation and pruning of VLANs when a VM managed by the ESX host connected to the switch is created, deleted, or moved to a different host. The `autovlan disable` command prevents auto-segmentation, regardless of VM activity. The `allowed-vlan` command specifies the VLANs that may be added when a VM is added or moved. By default, all VLANs are allowed.

- This command disables auto-segmentation.

```
switch(vmtracer-system_1)#autovlan disable
switch(vmtracer-system_1)#
```

- These commands enable auto-segmentation and limit the list of allowed VLANs to VLAN 1-2000.

```
switch(vmtracer-system_1)#no autovlan disable
switch(vmtracer-system_1)#allow-vlan 1-2000
switch(vmtracer-system_1)#
```

The `exit` command returns the switch to Global configuration mode and enables the VM Tracer session. `vmtracer` configuration mode can be re-entered for this session to edit session parameters.

- This command exits `vmtracer` configuration mode.

```
switch(vmtracer-system_1)#exit
switch(config)#
```

The `no vmtracer session` command disables the session and removes it from *running-config*.

- This command disables and deletes the `system_1` VM Tracer session.

```
switch(config)#no vmtracer session system_1
switch(config)#
```

---

### 19.6.3.2 Configuring vShield Monitoring Sessions

To monitor VXLAN based VMware configurations, the switch must communicate with a NSX for vSphere® (NSX-V). Vmtracer-vxlan configuration mode specifies the location and user account data that allows the switch to access a NSX-V within the configuration mode vmtracer session.

The switch is placed in vmtracer configuration mode to edit session parameters, including the vCenter location and dynamic VLAN usage. Changes take effect by exiting vmtracer mode.

The `vxlan (vmtracer mode)` command is executed from vmtracer mode for a specified session and places the switch in vmtracer-vxlan configuration mode for that session. Each VM Tracer session can be associated with one vShield instance.

- These commands create the vShield instance for the VMTracer session named vnet-1.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#
```

In vmtracer-vxlan configuration mode, the `url (vmtracer-vxlan mode)`, `username (vmtracer-vxlan mode)`, and `password (vmtracer-vxlan mode)` commands specify the vShield server's location and the account information that authenticates the switch to the vShield server. The url parameter must reference a fully formed secure url, such as **https://vcshield.democorp.com/sdk**.

- These commands specify the vShield's URL along with the username and password that allow the switch to access the vShield server.

```
switch(config-vmtracer-vnet-1-vxlan)#url https://vshieldserver.comp
any1.org/sdk
switch(config-vmtracer-vnet-1-vxlan)#username a-shield_01
switch(config-vmtracer-vnet-1-vxlan)#password home
switch(config-vmtracer-vnet-1-vxlan)#
```

### 19.6.3.3 Enabling VMtracer Mode

VMtracer mode is an interface setting that enables interfaces to send discovery packets to the connected vSwitch. The `vmtracer` command enables VMtracer mode on the configuration mode interface.

- These commands enable VMtracer mode on the Ethernet 3 interface.

```
switch(config)#interface Ethernet3
switch(config-if-Et3)#vmtracer vmware-esx
switch(config-if-Et3)#
```

The `no vmtracer` command disables vmtracer mode on the configuration mode interface.

- This command disables vmtracer mode on the Ethernet 3 interface.

```
switch(config-if-Et3)#no vmtracer vmware-esx
switch(config-if-Et3)#
```

### 19.6.3.4 Displaying VM Tracer Data

#### 19.6.3.4.1 Displaying Session Status

The `show vmtracer session` command displays information about the specified session.

Without the detail parameter, the command displays connection parameters and status for the vCenter associated to the specified session.

- This command displays connection parameters for the vCenter associated with the system\_1 session.

```
switch#show vmtracer session system_1
vCenter URL https://vmware-vcenter1/sdk
username arista
password arista
Session Status Disconnected
```

With the detail parameter, the command displays connection status and data concerning messages the vCenter previously received from ESX hosts connected to the switch.

- This command displays connection parameters and message details for the vCenter associated with the system\_1 session.

```
switch#show vmtracer session system_1 detail
vCenter URL https://vmware-vcenter1/sdk
username arista
sessionState Connected
lastStateChange 19 days, 23:03:59 ago
lastMsgSent CheckForUpdatesMsg
timeOfLastMsg 19 days, 23:14:09 ago
resonseTimeForLastMsg 0.0
numSuccessfulMsg 43183
lastSuccessfulMsg CheckForUpdatesMsg
lastSuccessfulMsgTime 19 days, 23:14:19 ago
numFailedMsg 1076
lastFailedMsg CheckForUpdatesMsg
lastFailedMsgTime 19 days, 23:14:09 ago
lastErrorCode Error -1 fault: SOAP-ENV:Client [no subcode]
"End of file or no input: Operation interrupted or timed out after
600s send
or 600s receive delay"
Detail: [no detail]
CheckForUpdates:
```

#### 19.6.3.4.2 Displaying VM Interfaces

The `show vmtracer interface` command displays the VM interfaces (Vnics) that are active on switch interfaces where vmtracer mode is enabled. For each Vnic, the command displays the name of the attached VM, the adapter name, its VLAN, the VM power state, and the presence status of its MAC address in the switch's MAC table.

This command displays the Vnics connected to all VM Tracer-enabled interfaces.

```
switch#show vmtracer interface

Ethernet8 : example.com
  VM Name VM Adapter VLAN Status
  esx3.aristanetworks.com vmk0 0 Up/Down
  vspheremanagement Network adapter 1 0 Up/Down

Ethernet15 : example.om
  VM Name VM Adapter VLAN Status
  Openview Network adapter 1 123 Up/Down
  VmTracerVm Network adapter 1 123 Down/Down

Ethernet23 : example.com
  VM Name VM Adapter VLAN Status
```

---

```
Ethernet24 : example.com
VM Name VM Adapter VLAN Status
```

### 19.6.3.4.3 Displaying VMs

The `show vmtracer vm` command displays VM interfaces (Vnics) accessible to the VM Tracer-enabled interfaces. For each active listed VM, the command displays its name, adapter, and the connected hypervisor.

- This command displays the VMs connected to all VM Tracer-enabled interfaces.

```
switch#show vmtracer vm
VM Name VM Adapter Interface VLAN
Openview Network adapter 1 Et15 123
vspheremangement Network adapter 1 Et8 0
VmTracerVm Network adapter 1 Et15 123
example.com vmk0 Et8 0
```

- This command displays connection data for the VMs connected to all VM Tracer-enabled interfaces.

```
switch#show vmtracer vm detail
VM Name Openview
  intf : Et15
  vnic : Network adapter 1
  mac : 00:0c:29:ae:7e:90
  portgroup : dvPortGroup
  vlan : 123
  switch : vds
  host : example.com
```

## 19.6.4 VM Tracer Configuration Commands

### Global Configuration Commands

- [vmtracer session](#)

### Interface Configuration (Ethernet and Port Channel) Commands

- [vmtracer](#)

### VMTracer Configuration Commands

- [allowed-vlan](#)
- [autovlan disable](#)
- [password \(vmtracer mode\)](#)
- [source-interface](#)
- [url \(vmtracer mode\)](#)
- [username \(vmtracer mode\)](#)
- [vrf \(vmtracer mode\)](#)
- [vxlan \(vmtracer mode\)](#)

### VMTracer-VXLAN Configuration Commands

- [password \(vmtracer-vxlan mode\)](#)
- [url \(vmtracer-vxlan mode\)](#)
- [username \(vmtracer-vxlan mode\)](#)

### VM Tracer Display Commands

- [show vmtracer all](#)
- [show vmtracer interface](#)
- [show vmtracer session](#)
- [show vmtracer session vcenter](#)
- [show vmtracer session vsm](#)
- [show vmtracer vm](#)
- [show vmtracer vm detail](#)
- [show vmtracer vnic counters](#)
- [show vmtracer vxlan segment](#)
- [show vmtracer vxlan vm](#)

---

### 19.6.4.1 allowed-vlan

The **allowed-vlan** command specifies the VLANs that may be added when a VM is added or moved from the hypervisor connected to the session specified by the vmtracer mode. By default, all VLANs are allowed.

#### Command Mode

Vmtracer Configuration

#### Command Syntax

```
allowed-vlan [VLAN_LIST]
no allowed-vlan
default allowed-vlan vlan
```

#### Parameters

- **VLAN\_LIST** The VLAN list or the edit actions to the current VLAN list. Valid *v\_range* formats include number, or number range.
  - *v\_range* The list consists of the *v\_range* VLANs.
  - **add** *v\_range* The *v\_range* VLANs are added to the current VLAN list.
  - **all** The list consists of all VLANs (1-4094).
  - **except** *v\_range* The list consists of all VLANs except for those specified by *v\_range*.
  - **none** The list of VLANs is empty.
  - **remove** *v\_range* The *v\_range* VLANs are removed from the current VLAN list.

#### Related Commands

- [vmtracer session](#) places the switch in vmtracer configuration mode.

#### Examples

- This command sets the list of allowed VLANs to 1 through 2000.

```
switch(vmtracer-system_1)#allow-vlan 1-2000
switch(vmtracer-system_1)#
```

- This command adds VLANs to 2501 through 3000.

```
switch(vmtracer-system_1)#allow-vlan add 2051-3000
switch(vmtracer-system_1)#
```

### 19.6.4.2 autovlan disable

Default VM Tracer session settings enable auto provisioning, which allows the dynamic assignment and pruning of VLANs when a VM attached to the ESX connected to the switch is created, deleted, or moved to a different ESX host. The autovlan setting controls auto provisioning.

The **autovlan disable** command disables auto provisioning, which prevents the creation or deletion of VLANs regardless of VM activity. The [allowed-vlan](#) command specifies the VLANs that may be added when a VM is added or moved. By default, all VLANs are allowed.

The **no autovlan disable** command enables the creation and deletion of VLANs caused by VM activity. This is the default setting.

#### Command Mode

Vmtracer Configuration

#### Command Syntax

```
autovlan disable
```

```
no autovlan disable
```

```
default autovlan disable
```

#### Related Commands

- [vmtracer session](#) places the switch in vmtracer configuration mode.

#### Example

- This command disables dynamic VLAN creation or pruning within the configuration mode VM Tracer session.

```
switch(vmtracer-system_1)#autovlan disable
switch(vmtracer-system_1)#
```

---

### 19.6.4.3 password (vmtracer mode)

The **password** command specifies the token that authorizes the username to the vCenter associated with the VM Tracer mode session.

#### Command Mode

Vmtracer Configuration

#### Command Syntax

```
password [ENCRYPTION] [password]
```

#### Parameters

- **ENCRYPTION** encryption level of the password.
  - <no parameter> *password* is a clear-text string.
  - **0** the *password* is a clear-text string. Equivalent to <no parameter>.
  - **7** the *password* is an encrypted string.
- *password* text that authenticates the username.
  - *password* is a clear-text string if ENCRYPTION specifies clear text.
  - *password* is an encrypted string if ENCRYPTION specifies an encrypted string.

#### Related Commands

- [vmtracer session](#) places the switch in vmtracer configuration mode.

#### Example

- This command configures abode as the clear-text string that authorizes the username a-switch\_01 located at example.com/sdk.

```
switch(vmtracer-system_1)#url https://example.com/sdk
switch(vmtracer-system_1)#username a-switch_01
switch(vmtracer-system_1)#password abcde
switch(vmtracer-system_1)#
```

#### 19.6.4.4 password (vmtracer-vxlan mode)

The **password** command specifies the token that authorizes the username on the NSX for vSphere® (NSX-V) server located at the URL configured for the configuration mode VM Tracer. The switch uses this account to access NSX-V information.

The **password** statement is replaced in **running-config** for the configuration mode interface by a subsequent **password** command. The statement is removed by deleting the NSX-V instance through a **no vxlan (vmtracer mode)** command in vmtracer configuration mode.

##### Command Mode

Vmtracer-vxlan Configuration

##### Command Syntax

```
password [ENCRYPTION] password
```

##### Parameters

- ENCRYPTION encryption level of the password.
  - <no parameter> *password* is a clear-text string.
  - **0** the *password* is a clear-text string. Equivalent to <no parameter>.
  - **7** the *password* is an encrypted string.
- *password* text that authorizes the username.
  - *password* is a clear-text string if ENCRYPTION specifies clear text.
  - *password* is an encrypted string if ENCRYPTION specifies an encrypted string.

##### Related Commands

- **vxlan (vmtracer mode)** places the switch in vmtracer-vxlan configuration mode.

##### Example

- This command configures 5678 as the clear-text string that authorizes the username admin to the NSX-V located at <https://example.com/sdk>.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#url https://example.com/sdk
switch(config-vmtracer-vnet-1-vxlan)#username admin
switch(config-vmtracer-vnet-1-vxlan)#password 5678
switch(config-vmtracer-vnet-1-vxlan)#exit
switch(config-vmtracer-vnet-1)#show active
vmtracer session vnet-1
  allowed-vlan 1-4094
  vxlan
    url https://example.com/sdk
    username admin
    password 7 s2Xq4GSB1YU=
switch(config-vmtracer-vnet-1)#
```

---

### 19.6.4.5 show vmtracer all

The `show vmtracer all` command displays VM Tracer data for all switches with the vSphere scope.

#### Command Mode

EXEC

#### Command Syntax

```
show vmtracer all
```

#### Example

- This command displays data for both switches in the vSphere scope.

```
switch>show vmtracer all
Switch : a109(10.10.30.109)
Ethernet49      : 10.102.28.3/10G
  VM Name      VM Adapter      VLAN      Status      State
  ABCD         Network adapter 2  native   Up/--      --

Switch : a164(10.10.30.(172.22.30.164)
Ethernet49      : 10.102.28.3/10G Storage Network/dvUplink1
  VM Name      VM Adapter      VLAN      Status      State
  WXYZ         Network adapter 2  native   Up/--      --
switch>
```

### 19.6.4.6 show vmtracer interface

The **show vmtracer interface** command displays the VM interfaces (Vnics) that are active on the VM Tracer enabled interface. For each Vnic, the command displays the name of the attached VM, the adapter name, its VLAN, the VM power state, and the presence status of its MAC address in the switch's MAC table.

#### Command Mode

EXEC

#### Command Syntax

```
show vmtracer interface [INT_NAME][INFO_LEVEL]
```

#### Parameters

- **INT\_NAME** the interfaces to be configured. Values include:
  - <no parameter> command returns information for all interfaces.
  - **ethernet** *e\_range* Ethernet interface range.
  - **port-channel** *p\_range* Port Channel interface range.

Valid *e\_range* and *p\_range* formats include number, number range, or comma-delimited list of numbers and ranges.

- **INFO\_LEVEL** specifies information that the command returns.
  - <no parameter> connection parameters and status for VM associated to specified sessions.
  - **detail** connection status and data concerning messages the VM.
  - **host** name of the connected host.

#### Examples

- This command displays the Vnics connected to all VM Tracer enabled interfaces.

```
switch>show vmtracer interface

Ethernet8 : example.com
  VM Name          VM Adapter      VLAN      Status
  esx3.aristanetworks.com  vmk0           0         Up/Down
  vspheremanagement  Network adapter 1  0         Up/Down

Ethernet15 : example.com
  VM Name          VM Adapter      VLAN      Status
  Openview         Network adapter 1  123      Up/Down
  VmTracerVm       Network adapter 1  123      Down/Down

Ethernet23 : example.com
  VM Name          VM Adapter      VLAN      Status
switch>
```

- This command displays the Vnics connected to the Ethernet 8 interface.

```
switch>show vmtracer interface Ethernet8

Ethernet8 : example.com
  VM Name          VM Adapter      VLAN      Status
  example.com      vmk0           0         Up/Down
  vspheremanagement  Network adapter 1  0         Up/Down
switch>
```

#### 19.6.4.7 show vmtracer session vcenter

The `show vmtracer session vcenter` command displays vCenter information for a specified VM Tracer session.

##### Command Mode

EXEC

##### Command Syntax

```
show vmtracer session session_name vcenter [INFO_LEVEL]
```

##### Parameters

- *session\_name* VM Tracer sessions for which the command returns information.
- **INFO\_LEVEL** specifies information that the command returns.
  - `<no parameter>` displays connection and status information for the specified vCenter.
  - **detail** displays connection, status, and history information for the specified vCenter.

##### Examples

- This command displays connection parameters for the vCenter associated to the abcde session.

```
switch>show vmtracer session abcde vcenter

Session          abcde
vCenter URL      https://vmware-vcenter5.1/sdk
username         Administrator
autovlan         enabled
allowed-vlans   1-4094
sessionState     Connected
switch>
```

- This command displays connection parameters and history details from the vCenter associated to the abcde session.

```
switch>show vmtracer session abcde vcenter detail

Session          abcde
vCenter URL      https://vmware-vcenter5.1/sdk
username         Administrator
autovlan         enabled
allowed-vlans   1-4094
SessionState     Connected
lastStateChange  2:46:50 ago
lastMsgSent      Query network hint message
timeOfLastMsg    0:00:20 ago
responseTimeForLastMsg 0.000102301000479
numSuccessfulMsg 998
lastSuccessfulMsg Query network hint message
lastSuccessfulMsgTime 0:00:20 ago
numFailedMsg     0
lastFailedMsg    --
lastFailedMsgTime never
lastErrorCode    --
switch>
```

### 19.6.4.8 show vmtracer session vsm

The `show vmtracer session vsm` command displays NSX-V information for a specified VM Tracer session.

#### Command Mode

EXEC

#### Command Syntax

```
show vmtracer session session_name vsm [INFO_LEVEL]
```

#### Parameters

- *session\_name* VM Tracer sessions for which the command returns information.
- INFO\_LEVEL specifies information that the command returns.
  - <no parameter> connection and status information for the specified NSX-V.
  - **detail** connection, status, and history information for the specified NSX-V.

#### Examples

- This command displays connection parameters for the NSX-V associated to the abcde session.

```
switch>show vmtracer session abcde vsm
```

```
Session          abcde
VShield URL      https://example.com/sdk
username         admin
sessionState     Connected
switch>
```

- This command displays connection parameters and history details from the vShield Manager associated to the abcde session.

```
switch>show vmtracer session abcde vsm detail
```

```
Session          abcde
VShield URL      https://vmware-vshield5.1/
username         admin

```

---

### 19.6.4.9 show vmtracer session

The **show vmtracer session** command displays vCenter and vShield connection information for a specified VM Tracer session.

#### Command Mode

EXEC

#### Command Syntax

```
show vmtracer session [SESSION_LIST]
```

#### Parameters

- **SESSION\_LIST** VM Tracer sessions for which the command returns information.
  - **<no parameter>** all configured VM Tracer sessions.
  - **session\_name** name of one VM Tracer session.

#### Examples

- This command displays connection parameters associated to the abcde session.

```
switch>show vmtracer session abcde
Session abcde
vCenter URL      https://example.com/sdk
username         Administrator
autovlan         enabled
allowed-vlans    1-4094
sessionState     Connected
VShield URL      https://vmware-vshield5.1.xyz.abcde.com
username         admin
sessionState     Connected

switch>
```

### 19.6.4.10 show vmtracer vm detail

The **show vmtracer vm detail** command displays connection data for VMs interfaces (Vnics) that are accessible to VM Tracer enabled interfaces.

#### Command Mode

EXEC

#### Command Syntax

```
show vmtracer vm [VM_LIST] detail
```

#### Parameters

- **VM\_LIST** The virtual machines for which the command displays information. Options include:
  - `<no parameter>` command returns information for all present VMs.
  - `vm_name` command returns information only for specified VM.

#### Examples

- This command displays connection data for the VMs connected to all VM Tracer enabled interfaces.

```
switch#show vmtracer vm vmcenter1
VM Name  vCenter1 Server App
Interface : Po45
vNIC     : Network adapter 1
MAC      : 00:31:22:8e:b8:41
Portgroup : VM Network
VLAN     : native
Switch   : Switch2
Status   : Down/Down
Host     : 10.22.18.28
Data Center : vcenter-5
switch>
```

- This command displays connection data for the VMs connected to all VM Tracer enabled interfaces.

```
switch>show vmtracer vm detail
VM Name  vCenter1 Server App
Interface : Po45
vNIC     : Network adapter 1
MAC      : 00:31:22:8e:b8:41
Portgroup : VM Network
VLAN     : native
Switch   : Switch2
Status   : Down/Down
Host     : 10.22.18.28
Data Center : vcenter-5

VM Name  vCenter2 Server App
Interface : Po45
vNIC     : vmk0
MAC      : 00:33:23:3c:e1:4e
Portgroup : Management Network
VLAN     : native

switch>
```

### 19.6.4.11 show vmtracer vm

The `show vmtracer vm` command displays VMs interfaces (Vnics) that are accessible to VM Tracer enabled interfaces. For each active VM, the command displays the name of the VM, its adapter, and the hypervisor to which it connects.

#### Command Mode

EXEC

#### Command Syntax

```
show vmtracer [INT_NAME] vm [VM_LIST]
```

#### Parameters

- `INT_NAME` the interfaces name Values include:
  - `<no parameter>` command returns information for all interfaces.
  - **interface ethernet** `e_range` Ethernet interface range.
  - **interface port-channel** `p_range` Port Channel interface range.

Valid `e_range` and `p_range` formats include a number, number range, or comma-delimited list of numbers and ranges.

- `VM_LIST` The virtual machines for which the command displays information. Options include:
  - `<no parameter>` command returns information for all present VMs.
  - `vm_name` command returns information only for specified VM.

#### Related Commands

- `show vmtracer vm detail` displays connection information for one or more specified VMs.

#### Examples

- This command displays the VMs connected to all VM Tracer enabled interfaces.

```
switch>show vmtracer vm
VM Name           Esx Host           Interface  VLAN    Status
vCenter1          172.22.28.8        Po45       native  Down/Down
vCenter2          172.22.28.8        Po45       native  Up/Up
vCenter3          172.22.28.8        Po45       11      Down/Down
vCenter4          172.22.28.8        Po45       native  Down/Down
VMKernel          Po43               native     Up/Up
demo vcenter 5 clone Po43               native     Up/Up
switch>
```

### 19.6.4.12 show vmtracerc vnic counters

The **show vmtracerc interface vnic counters** command displays input and output packet counts for VM interfaces (Vnics) that are active on the specified interface or VM.

#### Command Mode

EXEC

#### Command Syntax

```
show vmtracerc [ENTITY] vnic counters
```

#### Parameters

- **ENTITY** the virtual machine or interface over which statistics are gathered and displayed.
  - <no parameter> command returns information for all active VMs.
  - **interface ethernet** *e\_range* Ethernet interface range.
  - **interface port-channel** *p\_range* Port Channel interface range.
  - **vm** *vm\_name* command returns information for specified VM.

Valid *e\_range* and *p\_range* formats include a number, number range, or comma-delimited list of numbers and ranges.

#### Examples

- This command displays the Vnics connected to Ethernet interface 24.

```
switch>show vmtracerc interface ethernet 24 vnic counters
Physical Intf: Ethernet24
Host: 10.17.28.8/site1/dvUplink1
VM Name      vNic      Input Pkt/Byte/%      Output Pkt/Byte/%
vCenter1    Network adapter 2    2550/ 187175/ 0.6      6/ 360/ 0.0
vCenter2    Network adapter 2    418615/ 30678024/ 99.4  1904439/ 1145654613/100.0
Summary
switch>
```

### 19.6.4.13 show vmtracer vxlan segment

The **show vmtracer vxlan segment** command displays information about the VXLAN segments that are managed by the connected NSX for vSphere® (NSX-V).

#### Command Mode

EXEC

#### Command Syntax

```
show vmtracer segment ENTITY
```

#### Parameters

- **ENTITY** specifies the information that the command displays. Options include:
  - **<no parameter>** displays information for VXLAN segments.
  - **pool** displays resource pools available to segments.
  - **pool pool\_name** displays connection information about the specified pool.
  - **range** displays the VNI range of the managed segments.

#### Examples

- This command displays the VXLAN segments managed by the NSX-V.

```
switch>show vmtracer vxlan segment
Name                VNI      Multicast IP      Network Scope
-----
Eng Wire            5002     237.0.0.1         abcde
HR Wire             5000     237.0.0.2         abcde

switch>
```

- This command displays the resource pools available to the VXLANs.

```
switch>show vmtracer vxlan segment pool
Name                Description              Segments
-----
abcde Wire          Spans Cluster 1 and Cluster 2  Eng Wire, HR

switch>
```

- This command displays connection and packet information for the abcde pool.

```
switch>show vmtracer vxlan segment pool abcde
Name:                abcde
Description:         Spans Cluster 1 and Cluster 2
Segments:            Eng Wire, HR Wire

Vxlan Segment  Cluster  Host                VTEP IP                DVS        VLAN  MTU
Eng Wire       Cluster2 test2.example.com      10.168.200.1/24        dvs-test2  200  1600
Eng Wire       Cluster1 test2.example.com      10.168.100.1/24        dvs-test1  100  1600

HR Wire        Cluster2 test2.example.com      10.168.200.1/24        dvs-test2  200  1600

switch>
```

- This command displays the VNI range of the VXLAN segments.

```
switch>show vmtracer vxlan segment range

VNI Range                Multicast IP Range
-----
5000 - 5024              237.0.0.1 - 237.0.0.117
```

---

| Name                | VNI  | Multicast IP | Network Scope |
|---------------------|------|--------------|---------------|
| HR Wire             | 5002 | 237.0.0.1    | abcde         |
| Eng Wire<br>switch> | 5000 | 237.0.0.2    | abcde         |

---

#### 19.6.4.14 show vmtracer vxlan vm

The `show vmtracer vxlan vm` command displays the VXLAN segments, their VTEP IP numbers, and their VM endpoints that are managed by the connected NSX for vSphere® (NSX-V).

##### Command Mode

EXEC

##### Command Syntax

```
show vmtracer vxlan vm
```

##### Examples

- This command displays the VM endpoints of the VXLAN segments managed by the NSX-V.

```
switch>show vmtracer vxlan vm
Vxlan Segment      VTEP IP          VLAN  VMs
Eng Wire           192.168.200.1/24 200   Eng VM3, Eng VM2
Eng Wire           192.168.100.1/24 100   Eng VM1
HR Wire            192.168.100.1/24 100   HR VM2, HR VM1
HR Wire            192.168.200.1/24 200   --
switch>
```

### 19.6.4.15 source-interface

The **source-interface** command allows you to connect to a remote vCenter endpoint by using the primary address of the interface as the source IP address. If the interface is not specified, the source IP address is determined by the routing table.

The **no source-interface** and **default source-interface** commands restore default behavior by removing the **source-interface** command from the **running-config**.

#### Command Mode

Vmtracer Configuration

#### Command Syntax

```
source-interface [INTERFACE_NAME]
```

```
no source-interface
```

```
default source-interface
```

#### Parameters

- **INTERFACE\_NAME** specifies the interface for which the information is displayed. Options include:
  - **Ethernet** *e\_num* specifies the Ethernet interface number.
  - **Loopback** *l\_num* specifies the loopback interface number. Value ranges from 0 to 2100.
  - **Management** *m\_num* specifies the management interface number. The values are 1 or 2.
  - **Port-Channel** {*lag\_num* | *lag\_num.sub\_num*} specifies the port-channel interface number. Value of interface ranges from 1 to 2000. Value of sub-interface ranges from 1 to 4094.
  - **Tunnel** *tunnel\_num* specifies the tunnel interface number. Value ranges from 1 to 255.
  - **UnconnectedEthernet** *port\_num* specifies the unconnected Ethernet port number. Value ranges from 1 to 8.
  - **VLAN** *vlan\_num* specifies the VLAN interface number. Value ranges from 1 to 4094.

#### Related Commands

- [vmtracer session](#) places the switch in Vmtracer configuration mode.

#### Examples

- This command configures VM Tracer to use Ethernet interface 17 to derive the source address for session packets.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface Ethernet 17
switch(config-vmtracer-session-system_1)#
```

- This command configures a loopback interface 0 for VM Tracer session.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface Loopback 0
switch(config-vmtracer-session-system_1)#
```

- This command configures management interface 1 for VM Tracer session.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface management 1
switch(config-vmtracer-session-system_1)#
```

- This command configures port-channel interface 10 for VM Tracer session.

```
switch(config)#vmtracer session system_1
```

---

```
switch(config-vmtracer-session-system_1)#source-interface port-channel 10
switch(config-vmtracer-session-system_1)#
```

- This command configures tunnel interface 25 for VM Tracer session.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface tunnel 25
switch(config-vmtracer-session-system_1)#
```

- This command configures unconnected Ethernet interface 1 for VM Tracer session.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface unconnected Ethernet 1
switch(config-vmtracer-session-system_1)#
```

- This command configures VLAN interface 25 for VM Tracer session.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface vlan 25
switch(config-vmtracer-session-system_1)#
```

### 19.6.4.16 url (vmtracer mode)

The `url` command specifies the vCenter server location that is monitored by the session being edited by the current vmtracer mode. The command must reference a fully formed secure url.

#### Command Mode

Vmtracer Configuration

#### Command Syntax

```
url url_name
```

#### Parameters

- *url\_name* location of the vCenter server. Valid formats include IP address (dotted decimal notation) and fully qualified domain name.

#### Related Commands

- `vmtracer session` places the switch in vmtracer configuration mode.

#### Example

- This command specifies the location of the vCenter monitored by the system\_1 VM Tracer session.

```
switch(vmtracer-system_1) #url https://example.com/sdk
switch(vmtracer-system_1) #
```

---

### 19.6.4.17 url (vmtracer-vxlan mode)

The `url` command specifies the NSX for vSphere® (NSX-V) server location that is monitored for VXLAN information by the configuration mode VM Tracer session. The command must reference a fully formed secure URL.

The `url` statement is replaced in running-config for the configuration mode session by a subsequent `url` command. The statement is removed by deleting the NSX-V instance through a `no vxlan (vmtracer mode)` command in vmtracer configuration mode.

#### Command Mode

Vmtracer-vxlan Configuration

#### Command Syntax

```
url url_name
```

#### Parameters

- *url\_name* location of the NSX-V server. Valid formats include IP address (dotted decimal notation) and fully qualified domain name.

#### Related Commands

- `vxlan (vmtracer mode)` places the switch in vmtracer-vxlan configuration mode.

#### Example

- This command configures the location of the NSX-V monitored by the vnet-1 VM Tracer session.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#url https://example.com/sdk
switch(config-vmtracer-vnet-1-vxlan)#exit
switch(config-vmtracer-vnet-1)#show active
vmtracer session vnet-1
    allowed-vlan 1-4094
    vxlan
        url https://example.com/sdk
switch(config-vmtracer-vnet-1)#
```

### 19.6.4.18 username (vmtracer mode)

The **username** command identifies the switch's account name on the vCenter server. The switch uses this user name to access vCenter information.

#### Command Mode

Vmtracer Configuration

#### Command Syntax

```
username name_string
```

#### Parameters

- *name\_string* vCenter account user name. Parameter must match the user name configured on the vCenter.

#### Related Commands

- `vmtracer session` places the switch in vmtracer configuration mode.

#### Example

- This command configures the user name for the vCenter associated with the system\_1 session. The session uses this user name to log into the vCenter server.

```
switch(vmtracer-system_1)#username a-switch_01
switch(vmtracer-system_1)#
```

---

### 19.6.4.19 username (vmtracer-vxlan mode)

The **username** command identifies the switch's account name on the NSX for vSphere® (NSX-V) server located at the URL configured for the configuration mode VM Tracer. The switch uses this user name to access NSX-V information.

The **username** statement is replaced in **running-config** for the configuration mode interface by a subsequent **username** command. The statement is removed by deleting the NSX-V instance through a **no vxlan (vmtracer mode)** command in vmtracer configuration mode.

#### Command Mode

Vmtracer-vxlan Configuration

#### Command Syntax

```
username name_string
```

#### Parameters

- *name\_string* NSX-V account user name. Parameter must match a user name configured on the NSX-V.

#### Related Commands

- **vxlan (vmtracer mode)** places the switch in vmtracer-vxlan configuration mode.

#### Example

- This command configures the user name of admin for the NSX-V located at the URL specified by the URL command.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#url https://example.com/sdk
switch(config-vmtracer-vnet-1-vxlan)#username admin
switch(config-vmtracer-vnet-1-vxlan)#exit
switch(config-vmtracer-vnet-1)#show active
vmtracer session vnet-1
  allowed-vlan 1-4094
  vxlan
    url https://example.com/sdk
    username admin
switch(config-vmtracer-vnet-1)#
```

### 19.6.4.20 vmtracer session

The **vmtracer session** command places the switch in vmtracer mode for the specified session. The command creates a new session or loads an existing session for editing.

A VM Tracer session connects the switch to a vCenter server at a specified location, then downloads data about VMs and vSwitches managed by ESX hosts connected to switch ports. The switch supports a maximum of four VM Tracer sessions.

VM Tracer session parameters are configured in vmtracer mode. Parameters configured in vmtracer mode include the vCenter location and dynamic VLAN usage.

The **no vmtracer session** and **default vmtracer session** commands disable the session and remove its configuration from *running-config*.

#### Command Mode

Global Configuration

#### Command Syntax

```
vmtracer session name
no vmtracer session name
default vmtracer session name
```

#### Parameters

- *name* The label assigned to the VM Tracer session.

#### Commands Available in vmtracer Configuration Mode

- [allowed-vlan](#)
- [autovlan disable](#)
- [password \(vmtracer mode\)](#)
- [url \(vmtracer mode\)](#)
- [username \(vmtracer mode\)](#)
- [vxlan \(vmtracer mode\)](#)

#### Examples

- This command enters vmtracer mode for the system\_1 session.

```
switch(config)#vmtracer session system_1
switch(vmtracer-system_1)#
```

- This command disables the system\_1 VM Tracer session. The system\_1 session and all of its parameters are removed from *running-config*.

```
switch(config)#no vmtracer session system_1
switch(config)#
```

---

### 19.6.4.21 vmtracer

The **vmtracer** command enables vmtracer mode on the configuration mode interface. Interfaces with vmtracer mode enabled send discovery packets to the connected vSwitch.

The **no vmtracer** and **default vmtracer** commands disable vmtracer mode on the configuration mode interface by removing the corresponding **vmtracer** command from **running-config**.

#### Command Mode

Interface-Ethernet Configuration Interface-Port-channel Configuration

#### Command Syntax

```
vmtracer HOST_TYPE
no vmtracer HOST_TYPE
default vmtracer HOST_TYPE
```

#### Parameters

- **HOST\_TYPE** the type of hypervisor that controls the vSwitch to which the interface connects.
  - **vmware-esx** ESX or ESXI hypervisor (VMware).

#### Examples

- These commands enable vmtracer mode on the Ethernet 3 interface.

```
switch(config)#interface Ethernet 3
switch(config-if-Et3)#vmtracer vmware-esx
switch(config-if-Et3)#
```

- This command disables vmtracer mode on the Ethernet 3 interface.

```
switch(config-if-Et3)#no vmtracer vmware-esx
switch(config-if-Et3)#
```

### 19.6.4.22 vrf (vmtracer mode)

The `vrf` command allows the switch to communicate with a vCenter server by enabling VmTracer configuration mode. By default, VmTracer is enabled only in the `default vrf` command.

#### Command Mode

Vmtracer Configuration

#### Command Syntax

```
vrf vrf_name
```

#### Parameters

- *vrf\_name* specifies information of the corresponding VRF.

#### Example

- These commands place the VRF *vrf1* in the Vmtracer configuration mode.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#vrf vrf1
switch(config-vmtracer-session-system_1)#
```

---

### 19.6.4.23 vxlan (vmtracer mode)

The **vxlan** command places the switch in vmtracer-vxlan configuration mode. To monitor VXLAN based VMware configurations, the switch must communicate with a NSX for vSphere® (NSX-V). Vmtracer-vxlan configuration mode specifies the location and user account data that allows the switch to access a NSX-V within the configuration mode vmtracer session. Each VM Tracer session can be associated with one NSX-V instance.

The **no vxlan** and **default interface vxlan** commands delete the NSX-V instance from the configuration mode vmtracer session by removing all vmtracer-vxlan mode commands from **running-config**.

#### Command Mode

Vmtracer Configuration

#### Command Syntax

```
vxlan
no vxlan
default vxlan
```

#### Related Commands

- [vmtracer session](#) places the switch in vmtracer configuration mode.

#### Commands Available in vmtracer-vxlan Configuration Mode

- [password \(vmtracer mode\)](#)
- [url \(vmtracer mode\)](#)
- [username \(vmtracer mode\)](#)

#### Example

- These commands create the vShield instance for the VMTracer session named vnet-1.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#
```

## 19.7 MapReduce Tracer

This section describes Arista's implementation of MapReduce Tracer, including configuration instructions and command descriptions. Topics covered by this section include:

- [MapReduce Tracer Introduction](#)
- [MapReduce Tracer Configuration](#)
- [Displaying MapReduce Tracer Results](#)
- [MapReduce Tracer Command Descriptions](#)

### 19.7.1 MapReduce Tracer Introduction

MapReduce Tracer is a network tool that monitors Hadoop nodes that are directly connected to Arista switches. MapReduce Tracer requires the following:

- Hadoop clusters are deployed with a L3 design.
- The top of rack switch is the default gateway to all attached TaskTracker nodes.
- JobTracker RPC ports do not require authentication.
- Nodes cannot simultaneously belong to multiple Hadoop clusters.

- All TaskTrackers within a cluster are accessed through a common HTTP access port.
- The switch's DNS or static host configuration facilitates TaskTracker name resolution.

Map Reduce Tracer supports these Hadoop releases:

- Apache 0.20.205
- Apache 1.2.1
- Cloudera 3u6
- Cloudera 4.1.3
- Cloudera 4.3.0
- HortonWorks 1.3
- Cloudera 4.5.0

These sections briefly describe Hadoop, Hadoop data structures, and MapReduce Tracer.

### 19.7.1.1 Hadoop Description

Apache Hadoop is an open-source, Java-based software framework that supports large dataset storage and processing in a distributed computational environment. Hadoop is licensed under Apache License 2.0 and developed through a global community.

Hadoop facilitates application execution on systems composed of thousands of nodes utilizing petabytes of data. Its distributed file system facilitates rapid data transfer among nodes and supports continued operations when individual nodes fail or become inaccessible.

Hadoop Distributed File System (HDFS) is a distributed file-system that stores data on the commodity machines to provide high aggregate bandwidth across the cluster.

### 19.7.1.2 Hadoop Cluster Structure

A cluster is a group of servers that function as a single system to provide high availability through load balancing and parallel processing. A Hadoop cluster is a type of computational cluster designed for storing and analyzing large amounts of unstructured data in a distributed computing environment.

Typical Hadoop clusters include one master and multiple worker nodes. The master node consists of a TaskTracker, JobTracker, NameNode and DataNode. Worker nodes include a TaskTracker and DataNode.

### 19.7.1.3 Map Reduce

MapReduce is an algorithm that Hadoop implements to process large datasets by distributing parallel tasks to nodes within a cluster. The MapReduce program includes a Map procedure that filters data and a Reduce procedure that processes the data.

MapReduce manages task and data distribution to cluster nodes such that tasks are executed in parallel, and data transfers between cluster components support redundancy and fault tolerance.

The MapReduce engine consists of one JobTracker and multiple TaskTrackers – all nodes within the Hadoop cluster. The JobTracker receives MapReduce jobs from a client application and manages the completion of these jobs by submitting tasks to available TaskTracker nodes. If a TaskTracker fails to perform the assigned task, the JobTracker reschedules that part of the job to another node.

### 19.7.1.4 MapReduce Tracer Function

MapReduce Tracer is a feature that tracks and interacts with Hadoop nodes directly connected to Arista switches in a cluster. It communicates with a JobTracker to obtain a list of all nodes in a cluster and then queries JobTracker and TaskTrackers on these nodes for information regarding the jobs they are running and progress of those jobs. This creates a map of TaskTrackers with kinds of jobs they are running. Commands are available to display this data in tables through the CLI and EAPI.

---

MapReduce Tracer monitors only nodes that connect directly to the switch in L3 networks. Directly connected nodes use the top-of-rack switch as their default gateway and the switch learns ARP entries for these nodes. The list of nodes provided by JobTracker is filtered by tracking ARP entries to remove nodes that are not directly accessible.

MapReduce Tracer creates a database of nodes from the filtered list. After the database is created, the switch queries the JobTracker and TaskTrackers to obtain the following:

- The number of monitored Hadoop nodes.
- The list of monitored nodes, including their IP addresses.
- Jobs that the TaskTrackers are running.
- JobTracker and TaskTracker statistics.

MapReduce Tracer can simultaneously monitor multiple clusters. This means the directly connected TaskTracker nodes can belong to different clusters. A maximum of five clusters are supported per switch.

## 19.7.2 MapReduce Tracer Configuration

MapReduce Tracer configuration commands are structured into two configuration levels:

- Monitor-hadoop configuration mode is a child of global configuration mode and controls global MapReduce Tracer settings.
- Monitor-hadoop-cluster configuration mode is a child of Monitor-hadoop configuration mode and defines polling configurations that monitor individual Hadoop clusters.

These sections describe MapReduce Tracer configuration processes:

- [MapReduce Tracer Global Configuration](#)
- [Hadoop Cluster Access Configuration](#)

MapReduce Tracer functions after it is enabled globally. Each polling configuration can be individually enabled after the feature is enabled globally.

### 19.7.2.1 MapReduce Tracer Global Configuration

MapReduce Tracer global parameters are configured in Monitor-hadoop configuration mode. Tasks performed from this mode include specifying connection parameters to Hadoop clusters and globally enabling MapReduce Tracer.

#### Entering Monitor-Hadoop Configuration Mode

Monitor-hadoop configuration mode is entered by `monitor hadoop`. Monitor-hadoop configuration mode is not a group change mode; statements are stored in the *running-config* when they are entered through the CLI. The `exit` command returns the switch to global configuration mode.

#### Examples

- These commands place the switch in monitor-hadoop configuration mode.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#
```

- This command exits monitor-hadoop mode.

```
switch(config-monitor-hadoop)#exit
switch(config)#
```

- This command deletes all previously configured monitor-hadoop configuration mode commands.

```
switch(config)#no monitor hadoop
switch(config)#
```

### Globally Enabling MapReduce Tracer

MapReduce Tracer is globally enabled by the **no** version of the [shutdown \(Monitor-Hadoop\)](#). MapReduce Tracer is globally disabled by default.

#### Example

These commands globally enable MapReduce Tracer.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#no shutdown
switch(config-monitor-hadoop)#show active
  monitor hadoop
    no shutdown
switch(config-monitor-hadoop)#
```

### Creating a Cluster Monitor

A cluster monitor is created by entering monitor-hadoop-cluster mode with [cluster \(Monitor Hadoop\)](#). Each monitor is labeled with a cluster ID and probes one Hadoop cluster. When the command specifies a monitor with a previously defined cluster ID, subsequent commands edit that monitor's parameters. A monitor with a new cluster ID is created by a command that specifies a nonexistent cluster ID.

#### Example

These commands enter monitor-hadoop-cluster mode to edit a cluster monitor. The monitor's cluster-id is **CL2**.

```
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
switch(config-monitor-hadoop-CL2)#
```

### 19.7.2.2 Hadoop Cluster Access Configuration

Cluster monitors are configured in monitor-hadoop-cluster configuration mode. Each monitor corresponds to a hadoop cluster through these configurable parameters:

- JobTracker access parameters (address, port number, and username)
- TaskTracker access port
- Polling interval
- Cluster description
- Enabled setting

---

The minimum explicit configuration includes JobTracker address and username; default values are defined for all other parameters. By default, cluster monitors are disabled.

The `cluster (Monitor Hadoop)` command places the switch in monitor-hadoop-cluster mode for the specified monitor, where a cluster's connection parameters are specified. Monitor-hadoop-cluster mode is not a group change mode.

A cluster monitor is enabled by using the `no` version of the `shutdown (Monitor-Hadoop)` when MapReduce Tracer is globally enabled.

#### 19.7.2.2.1 JobTracker Configuration

A cluster's JobTracker is located on the master node and schedules work to the cluster's TaskTracker nodes. The `jobtracker (Monitor Hadoop Cluster)` command specifies connection parameters to the monitored cluster.

JobTracker parameters include its node location (IPv4 address or hostname), RPC port, and username. The default RPC port is **8021**. Location and username parameters do not have default values and must be explicitly configured.

##### Example

For the **CL2** monitor, these commands configure connection parameters to a JobTracker node at **10.4.4.4** with the username **account1**. The default RPC port (8021) is implicitly specified.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#jobtracker host 10.4.4.4
username account1
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
    jobtracker host 10.4.4.4 user account1
switch(config-monitor-hadoop-CL2)#
```

#### 19.7.2.2.2 TaskTracker Configuration

The `tasktracker (Monitor Hadoop Cluster)` command specifies the HTTP port that access TaskTrackers of the Hadoop cluster probed by the configuration mode monitor. The switch compiles a list of the cluster's TaskTracker addresses by periodically polling the cluster's JobTracker.

The default TaskTracker HTTP port is **50060**.

##### Examples

- For the **CL2** monitor, these commands configure a TaskTracker access port of **51000**.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#tasktracker http-port 51000
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
    tasktracker http-port 51000
switch(config-monitor-hadoop-CL2)#
```

- These commands restore the default TaskTracker HTTP access port address of **50060**.

```
switch(config-monitor-hadoop-CL2)#no tasktracker http-port
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
switch(config-monitor-hadoop-CL2)#show active all
monitor hadoop
  cluster CL2
    jobtracker rpc-port 8021
    tasktracker http-port 50060
    interval 10
    shutdown
switch(config-monitor-hadoop-CL2)#
```

### 19.7.2.2.3 Polling Interval Configuration

When the monitor configuration is complete, the switch polls the cluster's JobTracker to maintain the list of active TaskTracker nodes associated with the monitored cluster and compile Hadoop job statistics. The [interval \(Monitor Hadoop Cluster\)](#) command specifies the interval between polls to the JobTracker of the monitored cluster. The default interval is **10** seconds.

#### Example

This command sets the JobTracker polling interval to **25** seconds for the cluster monitored by the **CL2** MapReduce Tracer configuration.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#interval 25
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
    interval 25
switch(config-monitor-hadoop-CL2)#
```

### 19.7.2.3 MapReduce Tracer Example

The commands in this section create monitors that probe two Hadoop clusters, enables each monitor individually, then enables MapReduce Tracer globally. Monitor parameters for the clusters include:

- Cluster ID: **CL\_1**
  - Jobtracker: IP address: **10.15.2.2**; RPC port: **8021**; username: **xyz1**
  - TaskTracker: HTTP address **54000**
  - JobTracker polling interval: **10** seconds (default)
- Cluster ID: **CL\_2**
  - Jobtracker: IP address: **10.21.5.2**; RPC port: **9521**; username: **qrst4**
  - TaskTracker: HTTP address **50060** (default)
  - JobTracker polling interval: **5** seconds

#### Example

```
switch(config)#monitor hadoop
```

```

switch(config-monitor-hadoop)#cluster CL_1

switch(config-monitor-hadoop-CL_1)#jobtracker host 10.15.2.2
username xyz1
switch(config-monitor-hadoop-CL_1)#tasktracker http-port 54000
switch(config-monitor-hadoop-CL_1)#no shutdown
switch(config-monitor-hadoop-CL_1)#exit

switch(config-monitor-hadoop)#cluster CL_2
switch(config-monitor-hadoop-CL_2)#jobtracker host 10.21.5.2 rpc-
port 9521
switch(config-monitor-hadoop-CL_2)#interval 5
switch(config-monitor-hadoop-CL_2)#no shutdown
switch(config-monitor-hadoop-CL_2)#exit

switch(config-monitor-hadoop)#no shutdown
switch(config-monitor-hadoop)#show active
monitor hadoop
no shutdown
cluster CL_1
jobtracker host 10.15.2.2 user xyz1
tasktracker http-port 54000
no shutdown
!
cluster CL_2
jobtracker host 10.21.5.2 rpc-port 9521 user qrst4
interval 5
no shutdown

switch(config-monitor-hadoop)#show active all
monitor hadoop
no shutdown
cluster CL_1
jobtracker host 10.15.2.2 rpc-port 8021 user xyz1
tasktracker http-port 54000
interval 10
no shutdown
!
cluster CL_2
jobtracker host 10.21.5.2 rpc-port 9521 user qrst4
tasktracker http-port 50060
interval 5
no shutdown
switch(config-monitor-hadoop)#exit
switch(config)#

```

### 19.7.3 Displaying MapReduce Tracer Results

MapReduce Tracer display commands provide information about the configuration and activity on the monitored clusters.

This section contains the following topics:

- [MapReduce Tracer Status](#)
- [Cluster Configuration and Connections](#)
- [Job Lists](#)
- [Job Data](#)
- [TaskTracker Lists](#)
- [TaskTracker Connection and Activity](#)
- [Data Bursts](#)

### 19.7.3.1 MapReduce Tracer Status

MapReduce Tracer status is accessed through [show monitor hadoop status](#). Status information includes the enabled status and the number of monitored clusters, TaskTrackers, and locally running jobs.

#### Example

This command displays MapReduce Tracer status for all connected clusters and TaskTrackers.

```
switch>show monitor hadoop status

Last updated: 2013-10-06 18:14:23
Mapreduce Tracer status:
  Admin status                : Enabled
  Operational status          : Enabled
  Number of clusters configured : 3
  Number of local TaskTrackers : 4
  Number of jobs running locally : 4

switch>
```

### 19.7.3.2 Cluster Configuration and Connections

The following cluster configuration and connection information is available through these commands:

- Configuration and connection data for all monitored clusters –[show monitor hadoop cluster all](#).
- Configuration and connection data for a specified cluster –[show monitor hadoop cluster status](#).
- Connection and activity information for TaskTrackers in a specified cluster, on a specified node, or accessed through a specified interface –[show monitor hadoop tasktracker status](#).

#### Example

This command displays configuration and connection data for the **Cluster0** cluster.

```
switch>show monitor hadoop cluster Cluster0 status

Last updated: 2013-10-06 18:14:23
Cluster status for cluster: Cluster0
  Admin status                : Enabled
  JobTracker host              : host0
  JobTracker RPC port          : 9000
  JobTracker user              : user0
  JobTracker polling interval  : 100 seconds
  TaskTracker HTTP port        : 8800
  Operational status          : Enabled
  Active TaskTrackers          : 31
  Blacklisted TaskTrackers     : 1
  Decommissioned TaskTrackers  : 1
  Tracker expiry interval      : 20.0
  Map slots (used/total)       : 10/100
  Reduce slots (used/total)    : 11/110
  JobTracker heap size         : 1.04GB (max: 2.08GB)

switch>
```

### 19.7.3.3 Job Lists

The following commands display rosters of currently running job or jobs that previously ran:

- Jobs running on all monitored Hadoop clusters –[show monitor hadoop](#).
- Jobs running on a specified cluster and byte counter data –[show monitor hadoop cluster counters](#).
- Jobs that previously ran on a specified cluster –[show monitor hadoop cluster history](#).
  - Includes jobs that ran since the monitor was enabled, the switch was reloaded, or the job history was cleared ([clear monitor hadoop job-history](#)).
- Jobs running on a specified cluster –[show monitor hadoop cluster jobs](#).
- Jobs that ran on all configured clusters is accessed through-[show monitor hadoop history](#).
  - Includes jobs that ran since the monitor was enabled, the switch was reloaded, or the job history was cleared ([clear monitor hadoop job-history](#)).
- Jobs running on a specified TaskTracker and byte counter data –[show monitor hadoop tasktracker counters](#)

#### Examples

- This command displays the jobs that are running on all monitored clusters.

```
switch>show monitor hadoop

Last updated: 2013-10-06 18:14:23
Currently running jobs: 4
JobId   Job Name                Cluster   Maps(#!/%)  Reduces(#!/%)  Start Time

#### 19.7.3.4 Job Data

The following commands display information about jobs that are running or previously ran on monitored clusters. Available data include job identifiers, JobTracker ID, start time, stop time, data consumption, and progress statistics.

- Data consumption, start and stop times, and JobTracker ID for a specific job –[show monitor hadoop cluster history jobs](#).
- Data consumption, start and stop times, priority, JobTracker ID, and progress statistics for a specified job –[show monitor hadoop cluster jobs <job number>](#).
- HDFS (Hadoop Distributed File System) data consumption and and shuffle byte counters for a specified job –[show monitor hadoop cluster jobs counter](#).
- Data through and start time for jobs running on all monitored clusters –[show monitor hadoop counters](#).
- Progress statistics and start times are available for jobs running on specified TaskTracker –[show monitor hadoop tasktracker jobs](#).
- Job progress and byte counts of jobs running on a specified Hadoop cluster –[show monitor hadoop tasktracker running-tasks](#).
- Progress statistics, HDFS data consumption, start time, and progress information for the specified task of a running job –[show monitor hadoop tasktracker running-tasks cluster job task](#).
- Data consumption and start times for jobs running on a specified TaskTracker –[show monitor hadoop tasktracker counters](#).

#### Examples

- This command displays information about **job 1** that ran on cluster **Cluster0**.

```

switch>show monitor hadoop cluster Cluster0 history job 1

Job history data for job: HistoryJob1
Cluster           : Cluster0
Job Id            : 1
JT Id             : 201310110013

```

```

User                : HistoryUser1
Job start time     : 2013-10-06 17:57:43
Job end time       : 2013-10-08 00:31:03

Per Interface job counters:
Interface          TaskTracker      Bytes In      Bytes Out
-----
Ethernet7          TaskTracker2      26.08GB      13.04GB

switch>

```

- This command displays information about job 1 that is running on cluster **Cluster0**.

```

switch>show monitor hadoop cluster Cluster0 jobs 1

Last updated: 2013-10-06 18:14:23
Information for job: ReallyAVeryLongNameForAJob1 running on
cluster: Cluster0
Cluster            : Cluster0

17:37:43

switch>

```

### 19.7.3.5 TaskTracker Lists

These commands display lists of TaskTrackers that are active on monitored clusters:

- TaskTrackers on a specified cluster –[show monitor hadoop cluster tasktracker](#).
- TaskTrackers on all monitored clusters–[show monitor hadoop tasktracker all](#).

#### Example

This command displays the TaskTrackers on the **Cluster0** cluster.

```
switch>show monitor hadoop cluster Cluster0 tasktracker

Last updated: 2013-10-06 18:14:23
Total 2 TaskTrackers on cluster Cluster0:
Node          IP Address  Interface      Maps  Reduces
-----
TaskTracker1  10.100.0.1  Ethernet7      4     0
TaskTracker2  10.100.0.2  Port-Channel7  4     0

switch>
```

### 19.7.3.6 TaskTracker Connection and Activity

The following TaskTracker connection and activity data is available through these commands:

- Connection and activity information for TaskTrackers on a specified cluster or accessed through a specified interface –[show monitor hadoop tasktracker status](#).
- Data consumption for TaskTrackers connected to monitored clusters-[show monitor hadoop tasktracker all counters](#).

#### Example

This command displays connection and activity data for TaskTracker on the **TaskTracker1** node.

```
switch>show monitor hadoop tasktracker host TaskTracker1 status

Last updated: 2013-10-06 18:14:23
TaskTracker      : TaskTracker1
IP Address       : 10.100.0.1
Interface        : Ethernet7
State            : active
Running jobs     : 2
Running tasks    : 4
Map Tasks        : 4
Reduce Tasks     : 0
Total bytes read : 2.08GB
Total bytes written : 4.24MB

switch>
```

### 19.7.3.7 Data Bursts

The [show monitor hadoop traffic burst](#) command displays the largest data bursts for jobs running on a specified cluster or accessed through a specified node or interface. A data burst is the data consumed during a polling interval.

#### Example

This command displays traffic burst data for all running jobs that are accessible through **port channel interface 7**.

```
switch>show monitor hadoop traffic burst interface Port-Channel 7
```

---

Last updated: 2013-10-06 18:14:23

Bursts on Interface: 'Port-Channel7' in cluster: Cluster0

Top 2 input bursts:

| JobId | Job Name                        | Burst  | Time                |
|-------|---------------------------------|--------|---------------------|
| 1     | ShortName                       | 3.07GB | 2013-10-06 17:57:43 |
| 2     | ReallyAVeryLon\<br>gNameForAJob | 6.15GB | 2013-10-06 17:41:03 |

Top 2 output bursts:

| JobId | Job Name                        | Burst  | Time                |
|-------|---------------------------------|--------|---------------------|
| 1     | ShortName                       | 4.10GB | 2013-10-06 17:55:13 |
| 2     | ReallyAVeryLon\<br>gNameForAJob | 8.20GB | 2013-10-06 17:36:03 |

## 19.7.4 MapReduce Tracer Command Descriptions

### Global Configuration Commands

- [monitor hadoop](#)

### Clear Hadoop Monitor Commands

- [clear monitor hadoop burst-counters](#)
- [clear monitor hadoop job-history](#)

### Display Commands

- [show monitor hadoop](#)
- [show monitor hadoop cluster all](#)
- [show monitor hadoop cluster counters](#)
- [show monitor hadoop cluster history](#)
- [show monitor hadoop cluster history jobs](#)
- [show monitor hadoop cluster jobs](#)
- [show monitor hadoop cluster jobs <job number>](#)
- [show monitor hadoop cluster jobs counter](#)
- [show monitor hadoop cluster status](#)
- [show monitor hadoop cluster tasktracker](#)
- [show monitor hadoop counters](#)
- [show monitor hadoop history](#)
- [show monitor hadoop status](#)
- [show monitor hadoop tasktracker all](#)
- [show monitor hadoop tasktracker all counters](#)
- [show monitor hadoop tasktracker counters](#)
- [show monitor hadoop tasktracker jobs](#)
- [show monitor hadoop tasktracker running-tasks](#)
- [show monitor hadoop tasktracker running-tasks cluster job task](#)
- [show monitor hadoop tasktracker status](#)
- [show monitor hadoop traffic burst](#)

### Hadoop Commands

- [cluster \(Monitor Hadoop\)](#)
- [shutdown \(Monitor-Hadoop\)](#)

### Hadoop-Cluster Commands

- [description \(Monitor Hadoop Cluster\)](#)
- [interval \(Monitor Hadoop Cluster\)](#)
- [jobtracker \(Monitor Hadoop Cluster\)](#)
- [shutdown \(Monitor Hadoop Cluster\)](#)
- [tasktracker \(Monitor Hadoop Cluster\)](#)

---

### 19.7.4.1 clear monitor hadoop burst-counters

The `clear monitor hadoop burst-counters` command resets MapReduce Tracer burst counters for all jobs running on specified clusters.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear monitor hadoop burst-counters [CLUSTERS]
```

#### Parameters

- **CLUSTERS** Hadoop clusters for which command displays data. Options include:
  - **<no parameter>** All clusters.
  - **cluster *c\_name*** Cluster name.

#### Example

This command clears the burst counters for all jobs running on **CL2** cluster.

```
switch#clear monitor hadoop burst-counters cluster CL2
Cleared burst counters
switch#
```

### 19.7.4.2 clear monitor hadoop job-history

The `clear monitor hadoop job-history` command resets the job history database for all specified clusters.

#### Command Mode

Privileged EXEC

#### Command Syntax

```
clear monitor hadoop job-history [CLUSTERS]
```

#### Parameters

- **CLUSTERS** Hadoop clusters for which command displays data. Options include:
  - **<no parameter>** All clusters.
  - **cluster *c\_name*** Cluster name.

#### Example

This command clears the job history on the **CL2** cluster.

```
switch#clear monitor hadoop job-history cluster CL2
Cleared job history
switch#
```

---

### 19.7.4.3 cluster (Monitor Hadoop)

The **cluster** command is a monitor-hadoop command that places the switch in monitor-hadoop-cluster mode for configuring and enabling a MapReduce Tracer monitor for a Hadoop cluster. The command either accesses an existing monitor configuration or creates a monitor.

Monitor-hadoop-cluster configuration mode is not a group change mode; **running-config** is changed immediately upon entering commands. Exiting monitor-hadoop-cluster mode does not affect **running-config**. The **exit** command returns the switch to monitor-hadoop configuration mode.

The configuration mode monitor is enabled by the **no** version of the [shutdown \(Monitor Hadoop Cluster\)](#). Enabling a monitor also requires that MapReduce Tracer is globally enabled ([shutdown \(Monitor Hadoop Cluster\)](#)).

The **no cluster** and **default cluster** commands remove the specified Hadoop cluster configuration from **running-config**.

#### Command Mode

Monitor-hadoop Configuration

#### Command Syntax

```
cluster cluster_name
```

```
no cluster cluster_name
```

```
default cluster cluster_name
```

#### Parameters

- **cluster\_name** Hadoop cluster name.

#### Related Commands

- [monitor hadoop](#) places the switch in monitor-hadoop configuration mode.

#### Commands Available in Monitor-hadoop-cluster Configuration Mode

- [description \(Monitor Hadoop Cluster\)](#)
- [interval \(Monitor Hadoop Cluster\)](#)
- [jobtracker \(Monitor Hadoop Cluster\)](#)
- [shutdown \(Monitor Hadoop Cluster\)](#)
- [tasktracker \(Monitor Hadoop Cluster\)](#)

#### Examples

- These commands create the CL2 monitor and enters monitor-hadoop-cluster mode for the monitor.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
switch(config-monitor-hadoop-CL2)#
```

- These commands exit monitor-hadoop-cluster mode.

```
switch(config-monitor-hadoop-CL2)#exit
switch(config-monitor-hadoop)#show active
monitor hadoop
  cluster CL2
switch(config-monitor-hadoop)#
```

- These commands remove the CL2 monitor.

```
switch(config-monitor-hadoop)#no cluster CL2  
switch(config-monitor-hadoop)#show active  
switch(config-monitor-hadoop)#
```

---

#### 19.7.4.4 description (Monitor Hadoop Cluster)

The **description** command adds a text string to the configuration mode MapReduce Tracer cluster monitor. The string has no functional impact on the monitor.

The **no description** and **default description** commands remove the text string from the configuration mode monitor by removing the corresponding **description** command from **running-config**.

##### Command Mode

Monitor-hadoop-cluster Configuration

##### Command Syntax

```
description label_text
```

```
no description
```

```
default description
```

##### Parameters

- **label\_text** Character string assigned to the monitor configuration.

##### Related Commands

- [cluster \(Monitor Hadoop\)](#) places the switch in monitor-hadoop-cluster configuration mode.

##### Example

These commands add description text to the **CL2** monitor.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#description First Cluster
monitor hadoop
  cluster CL2
    description First Cluster
    jobtracker host 10.3.3.3 user JANE
switch(config-monitor-hadoop-CL2)#
```

### 19.7.4.5 interval (Monitor Hadoop Cluster)

The **interval** command specifies the polling interval between queries to the Hadoop cluster JobTracker specified by configuration mode statements. The switch polls a cluster's JobTracker to update its list of active TaskTracker nodes and the statistics of jobs running in the cluster. This command controls the frequency of these polls. The default interval is 10 seconds.

The **no interval** and **default interval** commands restore the default interval of 10 seconds by removing the **interval** command from *running-config*.

#### Command Mode

Monitor-hadoop-cluster Configuration

#### Command Syntax

```
interval period
no interval
default interval
```

#### Parameters

- **period** Interval (seconds) between JobTracker polls. Value ranges from **1** to **600**. Default is **10**.

#### Related Commands

- [cluster \(Monitor Hadoop\)](#) places the switch in monitor-hadoop-cluster configuration mode.

#### Example

This command sets the JobTracker polling interval to **25** seconds for the CL2 cluster configuration.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#interval 25
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
    interval 25
switch(config-monitor-hadoop-CL2)#
```

---

### 19.7.4.6 jobtracker (Monitor Hadoop Cluster)

The `jobtracker` command specifies JobTracker access parameters for the cluster monitored by configuration mode monitor statements. A cluster's JobTracker is located on the master node and schedules work to the cluster's TaskTracker nodes.

Parameters required to communicate with a JobTracker include its node location (IPv4 address or hostname), RPC port, and username. The default RPC port is 8021. Location and username parameters do not have default values and must be explicitly configured. A JobTracker command that specifies a partial parameter list modifies the existing corresponding `jobtracker` statement in *running-config*.

The `no jobtracker` and `default jobtracker` commands perform the following:

- removes the `jobtracker` statement from *running config* when it lists all command parameters.
- modifies the existing `jobtracker` statement when it lists a subset of command parameters.

#### Command Mode

Monitor-hadoop-cluster Configuration

#### Command Syntax

```
jobtracker [LOCATION][PORT][USER]
```

```
no jobtracker[LOCATION][PORT][USER]
```

```
default jobtracker [LOCATION][][USER]
```

All parameters may be placed in any order.

#### Parameters

- **LOCATION** Address or hostname of JobTracker node. Options include:
  - **<no parameter>** Location remains undefined or unchanged from a previous configuration.
  - **host ipv4\_addr** IPv4 address of master (JobTracker) node.
  - **host hostname** Hostname of master (JobTracker) node.
- **PORT** JobTracker RPC port number. Default value is 8021. Options include:
  - **<no parameter>** Port number remains unchanged from previous configuration.
  - **rdp-port port\_num** Port number of master (JobTracker) node. Value ranges from **1** to **65535**.
- **USER** Username that accesses JobTracker node. Options include:
  - **<no parameter>** Username remains undefined or unchanged from previous configuration.
  - **username name\_string** JobTracker username.

#### Related Commands

- [cluster \(Monitor Hadoop\)](#) places the switch in monitor-hadoop-cluster configuration mode.

#### Examples

- For the CL2 cluster configuration, these commands establish a connection to the JobTracker node at **10.4.4.4** with the username **account1**. The default RPC port (8021) is implicitly specified.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#jobtracker host 10.4.4.4 username
account1
switch(config-monitor-hadoop-CL2)#show active

monitor hadoop
  cluster CL2
    jobtracker host 10.4.4.4 user account1
```

```
switch(config-monitor-hadoop-CL2)#
```

- These commands modify the JobTracker configuration to specify an RPC port of **9000**.

```
switch(config-monitor-hadoop-CL2)#jobtracker rpc-port 9000  
switch(config-monitor-hadoop-CL2)#show active
```

```
monitor hadoop  
  cluster CL2  
    jobtracker host 10.4.4.4 rpc-port 9000 user account1  
switch(config-monitor-hadoop-CL2)#
```

---

### 19.7.4.7 monitor hadoop

The `monitor hadoop` command places the switch in monitor-hadoop configuration mode for configuring MapReduce Tracer monitors. A MapReduce Tracer monitor interacts with Hadoop cluster nodes that are directly attached to the switch. Tasks that the switch can perform through this interaction include:

- compile a list of nodes in the cluster.
- compile a list of jobs the nodes are running.
- download progress of the running jobs.

Monitor-hadoop configuration mode is not a group change mode; *running-config* is changed immediately upon entering commands. Exiting monitor-hadoop configuration mode does not affect *running-config*. The `exit` command returns the switch to global configuration mode. MapReduce Tracer is enabled in monitor-hadoop mode through the `no` version of the [shutdown \(Monitor Hadoop Cluster\)](#) command.

The `no monitor hadoop` and `default monitor hadoop` commands delete previously configured `monitor hadoop mode` configuration commands.

#### Command Mode

Global Configuration

#### Command Syntax

```
monitor hadoop
```

```
no monitor hadoop
```

```
default monitor hadoop
```

#### Commands Available in Monitor-hadoop Configuration Mode

- [cluster \(Monitor Hadoop\)](#)
- [shutdown \(Monitor Hadoop Cluster\)](#)

#### Examples

- These commands place the switch in monitor-hadoop configuration mode.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#
```

- This command exits monitor-hadoop mode.

```
switch(config-monitor-hadoop)#exit
switch(config)#
```

- This command deletes all previously configured monitor-hadoop configuration mode commands.

```
switch(config)#no monitor hadoop
switch(config)#
```

### 19.7.4.8 show monitor hadoop cluster all

The **show monitor hadoop cluster all** command displays configuration and connection information for all monitored Hadoop clusters.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop cluster all
```

#### Example

This command displays configuration and connection data for all connected Hadoop clusters.

```
switch>show monitor hadoop cluster all

Total number of clusters configured: 3
Cluster                : Cluster0
Admin status           : Enabled
JobTracker host        : host0
JobTracker RPC port    : 9000
JobTracker user         : user0
JobTracker polling interval : 100 seconds
TaskTracker HTTP port  : 8800

### 19.7.4.9 show monitor hadoop cluster counters

The `show monitor hadoop cluster counters` command displays a list of jobs running on the specified Hadoop cluster and data consumption associated with these jobs.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop cluster c_name counters
```

#### Parameters

- ***c\_name*** Cluster name.

#### Example

This command displays jobs running on cluster ***Cluster0***.

```
switch>show monitor hadoop cluster Cluster0 counters

Last updated: 2013-10-06 18:14:23
Counters for currently running jobs on cluster: Cluster0
JobId   Job Name                User Bytes In Bytes   Out Start   Time
-----
2       ShortName2              JobUser2  37.36GB  76.29MB    2013-10-06 17:37:43
1       ReallyAVeryLon\        JobUser1  37.36GB  76.29MB    2013-10-06 17:56:03
        gNameForAJob1

switch>
```

### 19.7.4.10 show monitor hadoop cluster history jobs

The `show monitor hadoop cluster history jobs` command displays data about the specified job. Hadoop jobs are identified by job number and the cluster that ran the job.

Data that the command returns include job identifiers, JobTracker ID, start and stop times, and data consumption.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop cluster c_name history jobs job_number
```

#### Parameters

- ***c\_name*** Cluster name.
- ***job\_number*** Job number. Value ranges from **0** to **2147483647**.

#### Example

This command displays information about **job 1** that ran on cluster **Cluster0**.

```
switch>show monitor hadoop cluster Cluster0 history job 1

Job history data for job: HistoryJob1
Cluster           : Cluster0
Job Id            : 1
JT Id             : 201310110013
User              : HistoryUser1
Job start time    : 2013-10-06 17:57:43
Job end time      : 2013-10-08 00:31:03

Per Interface job counters:
Interface         TaskTracker   Bytes In      Bytes Out
-----
Ethernet7         TaskTracker2   26.08GB      13.04GB

switch>
```

---

### 19.7.4.11 show monitor hadoop cluster history

The `show monitor hadoop cluster history` command displays all jobs that ran on the specified cluster. The list includes all jobs that ran since the switch was reloaded, the job history was cleared ([clear monitor hadoop job-history](#)), or MapReduce Tracer was enabled.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop cluster c_name history
```

#### Parameters

- ***c\_name*** Cluster name.

#### Example

This command displays the jobs that were ran on the cluster named ***Cluster0***.

```
switch>show monitor hadoop cluster Cluster0 history

Jobs history on cluster: Cluster0
JobId   Job Name                               Start Time   End Time     Bytes In     Bytes Out
-----
2       AReallyBigHist\
       oricalJobName                          2013-10-06  2013-10-09  26.08GB     13.04GB
       17:41:03                                06:47:43
2       AReallyBigHist\
       oricalJobName                          2013-10-06  2013-10-09  26.08GB     13.04GB
       17:41:03                                06:47:43
1       HistoryJob1                             2013-10-06  2013-10-08  26.08GB     13.04GB
       17:57:43                                00:31:03

switch>
```

### 19.7.4.12 show monitor hadoop cluster jobs counter

The `show monitor hadoop cluster jobs counter` command displays data consumption and progress statistics for the specified job.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop cluster c_name [jobs job_number] counter
```

#### Parameters

- ***c\_name*** Cluster name.
- ***job\_number*** Job number. Value ranges from *0* to **2147483647**.

#### Example

This command displays byte counters for the job named **1** that is running on the cluster named **Cluster0**.

```
switch>show monitor hadoop cluster Cluster0 jobs 1 counters

Last updated: 2013-10-06 18:14:23
Cluster : Cluster0
Job Name : ReallyAVeryLongNameForAJob1
Job Id : 1
Interface          HDFS Bytes Read   HDFS Bytes Written   Reduce Shuffle Bytes
-----
Port-Channel8      4.14GB            8.48MB                12.72MB
Port-Channel9      6.21GB            12.72MB               19.07MB

switch>
```

---

### 19.7.4.13 show monitor hadoop cluster jobs <job number>

The `show monitor hadoop cluster jobs<job number>` command displays information about the specified job. Hadoop jobs are identified by job ID and the cluster that is running the job.

Data that the command returns include time of update, job identifiers, start times, data consumption, and completion progress.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop cluster c_name [jobs job_number]
```

#### Parameters

- ***c\_name*** Cluster name.
- ***job\_number*** Job number. Value ranges from **0** to **2147483647**.

#### Example

This command displays information about **job 1** that is running on cluster **Cluster0**.

```
switch>show monitor hadoop cluster Cluster0 jobs 1

Last updated: 2013-10-06 18:14:23
Information for job: ReallyAVeryLongNameForAJob1 running on cluster:
Cluster0
  Cluster : Cluster0
  Id      : 1
  Name    : ReallyAVeryLongNameForAJob1
  User    : JobUser1
  Priority : veryHigh
  Running state : running
  Number of map tasks : 2
  Number of reduce tasks : 0
  Start time : 2013-10-06 17:56:03
  Bytes In  : 37.36GB
  Bytes Out : 76.29MB
  Map Progress : 12.34%
  Reduce Progress : 13.45%
  Cleanup Progress : 14.56%
  Setup Progress : 15.67%

switch>
```

#### 19.7.4.14 show monitor hadoop cluster jobs

The `show monitor hadoop cluster jobs` command displays a list of jobs that are running on the specified cluster.

##### Command Mode

EXEC

##### Command Syntax

```
show monitor hadoop cluster c_name jobs
```

##### Parameters

- ***c\_name*** Cluster name.

##### Example

This command displays the list of jobs running on cluster ***Cluster0***.

```
switch>show monitor hadoop cluster Cluster0 jobs

Last updated: 2013-10-06 18:14:23
Currently running jobs on cluster: Cluster0
JobId      Job Name          User           Maps    Reduces    Start Time
-----
2          ShortName2        JobUser2       2        0          2013-10-06 17:37:43
1          ReallyAVeryLon\  JobUser1       2        0          2013-10-06 17:56:03
          gNameForAJob1

switch>
```

---

### 19.7.4.15 show monitor hadoop cluster status

The `show monitor hadoop cluster status` command displays configuration and connection information for the specified cluster.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop cluster c_name status
```

#### Parameters

- ***c\_name*** Cluster name.

#### Example

This command displays configuration and connection data for the **Cluster0** cluster.

```
switch>show monitor hadoop cluster Cluster0 status

Last updated: 2013-10-06 18:14:23
Cluster status for cluster: Cluster0
  Admin status                : Enabled
  JobTracker host             : host0
  JobTracker RPC port         : 9000
  JobTracker user             : user0
  JobTracker polling interval : 100 seconds
  TaskTracker HTTP port       : 8800
  Operational status          : Enabled
  Active TaskTrackers         : 31
  Blacklisted TaskTrackers    : 1
  Decommissioned TaskTrackers : 1
  Tracker expiry interval     : 20.0
  Map slots (used/total)      : 10/100
  Reduce slots (used/total)   : 11/110
  JobTracker heap size        : 1.04GB (max: 2.08GB)

switch>
```

### 19.7.4.16 show monitor hadoop cluster tasktracker

The `show monitor hadoop cluster tasktracker` command displays a list of TaskTrackers in the specified cluster. The IP address and access interface is included in the table.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop cluster c_name tasktracker
```

#### Parameters

- ***c\_name*** Cluster name.

#### Example

This command displays the TaskTrackers on the **Cluster0** cluster.

```
switch>show monitor hadoop cluster Cluster0 tasktracker

Last updated: 2013-10-06 18:14:23
Total 2 TaskTrackers on cluster Cluster0:
Node           IP Address      Interface        Maps   Reduces
-----
TaskTracker1   10.100.0.1      Ethernet7        4      0
TaskTracker2   10.100.0.2      Port-Channel7    4      0

switch>
```

---

### 19.7.4.17 show monitor hadoop counters

The **show monitor hadoop counters** command displays byte counter data for all jobs running on clusters for which MapReduce Tracer is configured.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop counters
```

#### Example

This command displays byte counter data for all jobs running on clusters that the switch is accessing through MapReduce Tracer.

```
switch>show monitor hadoop counters

Last updated: 2013-10-06 18:14:23
Counters for running jobs:
JobId   Job Name                Cluster   Bytes In   Bytes Out   Start Time
-----
510002  ShortName12             Cluster1  37.36GB    76.29MB    2013-10-06 17:37:43

        gNameForAJob1
2       ShortName2              Cluster0  37.36GB    76.29MB    2013-10-06 17:37:43
1       ReallyAVeryLon\       Cluster0  37.36GB    76.29MB    2013-10-06 17:56:03
        gNameForAJob1

switch>
```

### 19.7.4.18 show monitor hadoop history

The **show monitor hadoop history** command displays jobs that ran on clusters for which MapReduce Tracer is configured. The list includes all jobs that ran since the switch was reloaded, MapReduce Tracer was enabled, or the job history was cleared ([clear monitor hadoop job-history](#)).

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop history
```

#### Example

This command displays data that jobs that previously ran on connected Hadoop clusters.

```
switch>show monitor hadoop history

Job history for all clusters:
JobId  Job Name                Cluster  Start Time  End Time    Bytes In  Bytes Out
-----
2      AReallyBigHist\        Cluster0  2013-10-06  2013-10-09  26.08GB  13.04GB

      17:57:43              00:31:03

switch>
```

---

#### 19.7.4.19 show monitor hadoop status

The `show monitor hadoop status` command displays system status for MapReduce Tracer.

##### Command Mode

EXEC

##### Command Syntax

```
show monitor hadoop status
```

##### Example

This command displays MapReduce Tracer status for all connected clusters and TaskTrackers.

```
switch>show monitor hadoop status
Last updated: 2013-10-06 18:14:23
Mapreduce Tracer status:
  Admin status           : Enabled
  Operational status     : Enabled
  Number of clusters configured : 3
  Number of local TaskTrackers : 4
  Number of jobs running locally : 4

switch>
```

### 19.7.4.20 show monitor hadoop tasktracker all counters

The **show monitor hadoop tasktracker all counters** command displays byte counters for the TaskTrackers of all monitored Hadoop clusters.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop tasktracker all counters
```

#### Example

This command displays byte counter data for the TaskTrackers servicing all MapReduce Tracer Hadoop clusters.

```
switch>show monitor hadoop tasktracker all counters

Last updated: 2013-10-06 18:14:23
Counters for all TaskTrackers:
Node           IP Address      Interface        Bytes Read      Bytes Written
-----
TaskTracker1   10.100.0.1      Ethernet7        2.08GB          4.24MB
TaskTracker3   10.100.0.3      Ethernet8        6.23GB          12.72MB
TaskTracker2   10.100.0.2      Port-Channel7    4.15GB          8.48MB
TaskTracker4   10.100.0.4      Port-Channel8    8.30GB          16.95MB

switch>
```

---

### 19.7.4.21 show monitor hadoop tasktracker all

The `show monitor hadoop tasktracker all` command displays a list of TaskTrackers that are on all monitored Hadoop clusters.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop tasktracker all
```

#### Examples

##### Example

This command displays the TaskTrackers of all monitored clusters that are connected to the switch.

```
switch>show monitor hadoop tasktracker all

Last updated: 2013-10-06 18:14:23
All local TaskTrackers:
Node          Cluster    IP Address    Interface      Maps    Reduces
-----
TaskTracker1  Cluster0  10.100.0.1    Ethernet7      4       0
TaskTracker3  Cluster1  10.100.0.3    Ethernet8      4       0
TaskTracker2  Cluster0  10.100.0.2    Port-Channel7  4       0
TaskTracker4  Cluster1  10.100.0.4    Port-Channel8  4       0

switch>
```

### 19.7.4.22 show monitor hadoop tasktracker counters

The `show monitor hadoop tasktracker counters` command displays a list of jobs running on the specified TaskTracker and output from byte counters associated with these jobs.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop tasktracker NODES counters
```

#### Parameters

- **NODES** TaskTracker node access point. Options include:
  - **host *hostname*** Node name.
  - **interface ethernet *e\_range*** Ethernet interfaces through which node connects.
  - **interface port-channel *p\_range*** Port channel interfaces through which node connects.

#### Examples

- • This command displays the jobs running on the TaskTracker on the **TaskTracker1** node.

```
switch>show monitor hadoop tasktracker host TaskTracker1 counters

Last updated: 2013-10-06 18:14:23
Running job for TaskTracker: TaskTracker1
JobId  Job Name          Cluster  Bytes In  Bytes Out  Start Time

switch>

### 19.7.4.23 show monitor hadoop tasktracker jobs

The `show monitor hadoop tasktracker jobs` command displays data about the jobs that are running on TaskTrackers located on the specified node or accessed through the listed interfaces.

Including a cluster parameter filters results to include data only from the cluster polled by the specified monitor.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop tasktracker NODES jobs [CLUSTERS]
```

#### Parameters

- **NODES** TaskTracker node access point. Options include:
  - **host *hostname*** Node name.
  - **interface ethernet *e\_range*** Ethernet interfaces through which node connects.
  - **interface port-channel *p\_range*** Port channel interfaces through which node connects.
- **CLUSTERS** Hadoop cluster for which command displays data. Options include:
  - **<no parameter>** TaskTracker on specified **NODE** can be in any cluster.
  - **cluster *c\_name*** TaskCluster on specified **NODE** must be in named cluster.

#### Examples

- This command displays data for jobs running on **TaskTracker1**.

```
switch>show monitor hadoop tasktracker host TaskTracker1 jobs

Last updated: 2013-10-06 18:14:23
Running job for TaskTracker: TaskTracker1
JobId  Job Name                Cluster  Maps(#!/%)  Reduces(#!/%)  Start Time
-----
1      ReallyAVeryLon\         Cluster0  2/12.34%    0/13.45%       2013-10-06 17:56:03
      gNameForAJob1
2      ShortName2              Cluster0  2/24.68%    0/26.90%       2013-10-06 17:37:43

### 19.7.4.24 show monitor hadoop tasktracker running-tasks cluster job task

The `show monitor hadoop tasktracker running-tasks cluster job task` command displays detailed data for the specified task.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop tasktracker NODE [running-tasks cluster name][ job jnum ][task tnum]
```

#### Parameters

- **NODE** TaskTracker node access point. Options include:
  - **host *hostname*** Node name.
  - **interface ethernet *e\_range*** Ethernet interfaces through which node connects.
  - **interface port-channel *p\_range*** Port channel interfaces through which node connects.
- ***name*** Cluster name.
- ***jnum*** Job number. Value ranges from **0** to **2147483647**.
- ***tnum*** Task number. Value ranges from **0** to **2147483647**.

#### Examples

- This command displays data for task 1 of job 1 on **TaskTracker1** of **Cluster0**.

```
switch>show monitor hadoop tasktracker host TaskTracker1 running-tasks
cluster Cluster0 job 1 task 1
```

```
Last updated: 2013-10-06 18:14:23
Task details for one task as given below:

### 19.7.4.25 show monitor hadoop tasktracker running-tasks

The `show monitor hadoop tasktracker running-tasks` command displays progress and byte counts of tasks executed by TaskTrackers located on the specified node or accessed through the listed interfaces.

Including a cluster-ID parameter filters results to include data only from the specified cluster.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop tasktracker NODES running-tasks [CLUSTERS][JOBS]
```

#### Parameters

- **NODES** TaskTracker node access point. Options include:
  - **host *hostname*** Node name.
  - **interface ethernet *e\_range*** Ethernet interfaces through which node connects.
  - **interface port-channel *p\_range*** Port channel interfaces through which node connects.
- **CLUSTERS** Hadoop cluster for which command displays data. Options include:
  - **<no parameter>** TaskTracker on specified **NODE** can be in any cluster.
  - **cluster *c\_name*** TaskCluster on specified **NODE** must be in named cluster.
- **JOBS** Job list. Options include:
  - **<no parameter>** all jobs.
  - **job <0 to 2147483647>** Specifies number of single job.

#### Examples

- This command displays data for tasks running on TaskTracker named **TaskTracker1**.

```
switch>show monitor hadoop tasktracker host TaskTracker1 running-tasks

Last updated: 2013-10-06 18:14:23

#### 19.7.4.26 show monitor hadoop tasktracker status

The **show monitor hadoop tasktracker status** command displays connection and activity information for the TaskTracker on the specified clusters or accessed through the specified interface. The following command formats display the listed TaskTracker information:

- **show monitor hadoop cluster *c\_name* tasktracker status**: TaskTrackers on specified cluster.
- **show monitor hadoop tasktracker *node* status**: TaskTrackers on specified nodes or interfaces.
- **show monitor hadoop tasktracker all status**: all connected TaskTrackers.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop cluster c_name tasktracker status
```

```
show monitor hadoop tasktracker NODES status
```

```
show monitor hadoop tasktracker all status
```

#### Parameters

- *c\_name* Cluster name.
- **NODES** TaskTracker node access point. Options include:
  - **host *hostname*** Node name.
  - **interface ethernet *e\_range*** Ethernet interfaces through which node connects.
  - **interface port-channel *p\_range*** Port channel interfaces through which node connects.

#### Examples

- This command displays connection and activity information for all TaskTrackers connected through Ethernet interfaces 7 and 8.

```
switch>show monitor hadoop tasktracker interface Ethernet7,8 status
```

```

### 19.7.4.27 show monitor hadoop traffic burst

The **show monitor hadoop traffic burst** command displays the largest data bursts for specified Hadoop cluster jobs. A data burst is the data consumed during a polling interval. The command displays input and output burst:

- Input bursts include bytes written to the host.
- Output bursts include bytes written by the host.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop [CLUSTERS] traffic burst [NODE]
```

#### Parameters

- **CLUSTERS** Hadoop clusters for which command displays data. Options include:
  - **<no parameter>** All clusters.
  - **cluster *c\_name*** Cluster name.
- **NODES** TaskTracker node access point. Options include:
  - **host *hostname*** Node name.
  - **interface ethernet *e\_range*** Ethernet interfaces through which node connects.
  - **interface port-channel *p\_range*** Port channel interfaces through which node connects.

#### Examples

- This command displays traffic burst data for all running jobs.

```
switch>show monitor hadoop traffic burst
Last updated: 2013-10-06 18:14:23
Bursts on Interface: 'Ethernet7' in cluster: Cluster0
Top 2 input bursts:
JobId  Job Name                Burst      Time

### 19.7.4.28 show monitor hadoop

The `show monitor hadoop` command displays a list of jobs that are running on all monitored Hadoop clusters.

#### Command Mode

EXEC

#### Command Syntax

```
show monitor hadoop
```

#### Example

This command displays the jobs that are running on all monitored clusters.

```
switch>show monitor hadoop

Last updated: 2013-10-06 18:14:23
Currently running jobs: 4
JobId  Job Name                Cluster  Maps (#/%)  Reduces (#/%)  Start Time

switch>
```

### 19.7.4.29 shutdown (Monitor Hadoop Cluster)

The **shutdown** command disables MapReduce Tracer for the configuration mode cluster. Globally disabling MapReduce Tracer ([show monitor hadoop](#)) also disables the function on the individual cluster. Enabling MapReduce Tracer for the cluster requires the function to be enabled globally and for the individual cluster.

The **no shutdown** command configures the MapReduce Tracer setting as **enabled** for the configuration mode cluster. The **shutdown** and **default shutdown** commands disable MapReduce Tracer for the cluster by removing the corresponding **no shutdown** command from **running-config**.

#### Command Mode

Monitor-hadoop-cluster Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

#### Related Commands

- [cluster \(Monitor Hadoop\)](#) places the switch in monitor-hadoop-cluster configuration mode.

#### Example

- These commands globally enable MapReduce Tracer, then enables it for the **CL2** cluster.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#no shutdown
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#no shutdown
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
    no shutdown
switch(config-monitor-hadoop-CL2)#exit
switch(config-monitor-hadoop)#show active
monitor hadoop
  no shutdown
  cluster CL2
    no shutdown
switch(config-monitor-hadoop)#
```

- These commands disable MapReduce Tracer for the **CL2** cluster. MapReduce Tracer remains globally enabled.

```
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#shutdown
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
switch(config-monitor-hadoop-CL2)#exit
switch(config-monitor-hadoop)#show active
monitor hadoop
  no shutdown
  cluster CL2
switch(config-monitor-hadoop)#
```

---

### 19.7.4.30 shutdown (Monitor-Hadoop)

The **shutdown** command globally disables MapReduce Tracer on the switch. Enabling MapReduce Tracer for an individual cluster requires the feature to be globally enabled through this command and enabled for the individual cluster through the [shutdown \(Monitor Hadoop Cluster\)](#) command. By default, MapReduce Tracer is globally disabled.

The **no shutdown** command globally enables MapReduce Tracer. The **shutdown** and **default shutdown** commands globally disable MapReduce Tracer by removing the corresponding **no shutdown** command from *running-config*.

#### Command Mode

Monitor-hadoop Configuration

#### Command Syntax

```
shutdown
```

```
no shutdown
```

```
default shutdown
```

#### Related Commands

- [monitor hadoop](#) places the switch in monitor-hadoop configuration mode.

#### Examples

- These commands globally enable MapReduce Tracer.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#no shutdown
switch(config-monitor-hadoop)#show active
monitor hadoop
no shutdown
switch(config-monitor-hadoop)#
```

- This command globally disables MapReduce Tracer.

```
switch(config-monitor-hadoop)#shutdown
switch(config-monitor-hadoop)#show active
switch(config-monitor-hadoop)#
```

### 19.7.4.31 tasktracker (Monitor Hadoop Cluster)

The **tasktracker** command specifies the HTTP port for accessing TaskTrackers of the Hadoop cluster monitored through configuration mode statements. The switch compiles a list of the cluster's TaskTracker addresses by periodically polling the cluster's JobTracker ([jobtracker \(Monitor Hadoop Cluster\)](#)). The default TaskTracker HTTP port is **50060**.

The **no tasktracker** and **default tasktracker** commands restore the configuration mode TaskTracker HTTP port to **50060** by removing the corresponding **tasktracker** command from **running-config**.

#### Command Mode

Monitor-hadoop-cluster Configuration

#### Command Syntax

```
tasktracker http-port port_number
no tasktracker http-port
default tasktracker http-port
```

#### Parameters

- **port\_num** TaskTracker HTTP port number. Value ranges from **1** to **65535**. Default value is **50060**.

#### Related Commands

- [cluster \(Monitor Hadoop\)](#) places the switch in monitor-hadoop-cluster configuration mode.

#### Examples

- These commands specify a TaskTracker HTTP port address of **51000**.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#tasktracker http-port 51000
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
    tasktracker http-port 51000
switch(config-monitor-hadoop-CL2)#
```

- These commands restore the default TaskTracker HTTP port address of **50060**.

```
switch(config-monitor-hadoop-CL2)#no tasktracker http-port
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
switch(config-monitor-hadoop-CL2)#show active all
monitor hadoop
  cluster CL2
    jobtracker rpc-port 8021
    tasktracker http-port 50060
    interval 10
    shutdown
switch(config-monitor-hadoop-CL2)#
```
